The bones of the shoulder, forming the scapular arch, are unlike those of any other mammals, and resemble those of reptiles. At the top of the sternum is a T-shaped bone, formed by the union of the two clavicles, corresponding to the *furculum* in the bird's skeleton, and to the clavicles and interclavicle of the reptile. The coracoid bones, which in other mammals are mere processes of the scapula, are here extremely large, and assist in strengthening the scapular arch; they are produced beyond the socket of the humerus (the glenoid cavity), so as to articulate with the sternum. The pelvis is provided with marsupial bones. The ovaries are analogous to those of the Sauropsida (reptiles and birds), the right ovary being comparatively undeveloped, while the left forms a racemiform mass. The orifices of the urinary canals, the intestinal canal, and the generative canal open, as in birds and reptiles, into a common cloaca, from which circumstance the order Monotremata derives its name. The ova (as has been shown by Poulton for Ornithorhynchus, and by Beddard and Caldwell for Echidna) are of large size, and contain an immense amount of yolk, as in the reptile or bird. Caldwell has discovered also the important fact that the early stages of development are like those of a reptile, and has confirmed the earlier discovery that these mammals lay eggs furnished

with a thick shell. The Echidna carries its eggs in its pouch, but the Ornithorhynchus deposits them in its burrow. The mammary glands, of which there is only one on each side, are not provided with nipples, but open by simple slits on each side of the abdomen. It has been proved, moreover, that the mammary glands are altogether different from those of other mammals, and only functionally resemble them.

This order includes only two or three species, all natives of Australia or Van Diemen's Land, which, however, form two families—the Ornithorhynchidæ (see ORNITHORHYNCHUS) and the Echidnidæ (see ECHIDNA). It appears probable from what is now known of the teeth of Ornithorhynchus that some of the Mesozoic mammalian remains which were formerly referred to the Marsupialia are really those of Monotremata. The literature of the group is fully referred to in *The Catalogue of Marsupialia and Monotremata* (British Museum).

Monreale, a city of Sicily, 5 miles SW. of Palermo. The 'royal mount,' from which it gets its name, is 1231 feet high, and on it stands the famous cruciform Norman cathedral (1176), which measures 333 by 132 feet, and within is entirely covered with mosaics. Pop. 13,898.

Monro, ALEXANDER, founder of the medical school of Edinburgh, styled *primus* to distinguish him from his son and successor, was born in London, September 8, 1697. His grandfather, Sir Alexander Monro, a colonel in the army of Charles II. at the battle of Worcester in 1651, was afterwards an advocate at the Scottish bar. Alexander studied at London under Hawksbee, Whiston, and Cheselden, at Paris under Bouquet, and at Leyden under Boerhaave, and after 1719 lectured at Edinburgh on anatomy and surgery. His lectures, with those of Alston on botany, led to the founding of the medical school, when Monro was appointed professor of Anatomy in 1721. He was received into the university in 1725. For forty years he lectured regularly on anatomy and surgery from October to May, students coming from all parts of Britain to hear him. Of the establishment of the Royal Infirmary of Edinburgh he was one of the two principal promoters, and he there delivered clinical lectures. In 1759 he resigned the anatomical chair to his youngest son, Dr Alexander Monro, but continued his clinical lectures at the Infirmary. His principal works are *Osteology* (1726), *Essay on Comparative Anatomy* (1744), *Observations Anatomical and Physiological* (1758), and an *Account of the Success of Inoculation of Smallpox in Scotland* (1765). He died July 10, 1767. He was a Fellow of the Royal Society of London, and of various foreign societies. A collected edition of his works, with *Life*, was issued by his son (1781).

ALEXANDER MONRO, *secundus* (1733-1817), youngest son of the preceding, studied at Edinburgh, Berlin, and Leyden, and succeeded his father in the chair of Anatomy, and as secretary of the Royal Society of Edinburgh. He published works on the nervous system (1783), on the physiology of fishes (1785), and on the brain, the eye, and the ear (1797).—He again was succeeded by his son, ALEXANDER MONRO, *tertius* (1773-1859), who wrote on hernia, and on the stomach, and an *Anatomy of the Human Body* (4 vols. 1813).

Monroe, a city of Michigan, on the Raisin River, 2 miles by a ship-canal from Lake Erie, and 40 miles by rail SSW. of Detroit. It contains a number of flour-mills, a woollen-mill, and other manufactures. Pop. (1890) 5281.

Monroe, JAMES, fifth president of the United States, was born in Westmoreland county, Virginia, April 28, 1758, the descendant of a family

of Scottish extraction which had emigrated to Virginia a century before. He entered William and Mary College at the age of eighteen, but soon threw aside his books, with a number of his fellow-students, to join the army under Washington. He was present at several battles, and was wounded at Trenton; he afterwards attained the rank of lieutenant-colonel as an aide-de-camp and military commissioner, but was disappointed in his efforts to obtain a commission in a Virginia regiment, and attached himself to Jefferson, with whom he studied law. In 1782 he was elected to the assembly of Virginia and appointed one of the executive council. Next year he was returned to congress, where he sat for three years, and in 1785 was chairman of a committee whose report ultimately led to the conventions at Annapolis and Philadelphia in 1786 and 1787, at which the constitution of the United States was framed. Monroe himself was a member of the Virginia convention held to consider the ratification of the proposed constitution, which, along with Patrick Henry and other States' Rights men, he opposed, fearing the power and encroachment of the Federal government. He was a member of the United States senate from 1790 to 1794, and offered a determined opposition to Washington and the Federalists; yet the government appointed him to succeed Gouverneur Morris as minister to France, where he made himself very popular with the revolutionary government, until he was recalled in 1796 for displaying too decided French sympathies. On his return he published (1797) an attack on the executive for their treatment of him, and, although Washington himself, who had then retired, took no notice of it, the book brought on a bitter controversy and made Monroe the darling of the Democrats. He was governor of Virginia from 1799 to 1802, and then Jefferson sent him as an extra plenipotentiary to France, where in 1803 he and Robert R. Livingston effected the purchase of Louisiana (q.v.). The next four years were spent in less successful diplomacy at London and Madrid; he failed in his negotiations with Spain for the cession of Florida, whilst a treaty which he finally concluded with Great Britain provided neither against the impressment of American seamen nor for an indemnity for American losses by seizures at sea, and Jefferson refused to refer it to the senate. Monroe promptly returned home and drew up another defence, and the Virginians endorsed his conduct and policy by a third time electing him to the assembly. In 1811 he was again chosen governor of Virginia. In the same year Madison made him secretary of state; this post he retained till 1817, and during 1814-15 he acted also as secretary of war.

In 1816 Monroe was elected president of the United States, and four years later he was re-elected almost unanimously; the acquisition of Florida from Spain (1819), and the settlement of the vexed question respecting the extension of slavery by the Missouri Compromise, by which, after the reception of Missouri as a slave-state, the institution was prohibited above the line of latitude 36° 30', helped to secure this result. His most popular acts, perhaps, were the recognition of the independence of the Spanish American republics, and the promulgation in a message to congress (1823) of what has since been called the 'Monroe Doctrine.' This utterance embodied the principle, 'in which the rights and interests of the United States are involved, that the American continents . . . are henceforth not to be considered as subjects for future colonisation by any European power. . . . With the existing colonies or dependencies of any European power we have not interfered, and shall not interfere. But with the

governments who have declared their independence and maintained it, and whose independence we have . . . acknowledged, we could not view any interposition for the purpose of oppressing them, or controlling in any other manner their destiny, by any European power, in any other light than as the manifestation of an unfriendly disposition towards the United States.' In 1825 Monroe retired to his seat at Oak Hill, Loudon county, Virginia, where he acted as justice of the peace, a regent of the university of Virginia, and member of the state convention; but a profuse generosity and hospitality caused him to be overwhelmed with debt, and he found refuge with his relations in New York, where he died in 1831—like his predecessors, Adams and Jefferson, on the 4th of July. In 1858 his remains were removed to Richmond. Monroe was an upright and consistent statesman, and a faithful servant of his country, though he had not the brilliant talents of some of his great contemporaries.

See the *Lives* by John Quincy Adams (1850) and Daniel C. Gilman (in 'American Statesmen' series, 1883); also G. F. Tucker's *Concise History of the Monroe Doctrine* (Boston, 1885).

Monrovia. See **LIBERIA**.

Mons (Flem. *Bergen*), the capital of the Belgian province of Hainault, on the Trouille, 38 miles SSW. of Brussels. Its fortifications, renewed and strengthened since 1818, were demolished in 1862; but the country around can be laid under water. The Canal de Condé connects Mons with the Scheldt. The church of St Waudru (1450-1589) is a masterpiece of Gothic; and there are a town-hall (1458), a belfry (1662) 275 feet high, a good library, &c. The manufactures include woollen and cotton goods, cutlery, and sugar; whilst the vicinity forms an extensive coalfield. Pop. (1875) 24,539; (1889) 26,056. Mons, occupying the site of one of Cæsar's camps, was made the capital of Hainault by Charlemagne in 804. France, Spain, and Austria often contended for its possession. See Boussu's *Histoire de Mons* (2 vols. 1868).

Monsignore, a title of honour given to prelates of the Roman Catholic Church. Formerly in France the corresponding title of *Monseigneur* was allowed to all high dignitaries of the church, to the princes of the blood-royal, to the higher nobles, and to the presidents of the superior law-courts. But from the time of Louis XIV. *Monseigneur* without further addition was appropriated as the title of the Dauphin.

Monsoon is derived from the Arabic *Mausim*, 'a set time,' 'season,' and was for long applied to those winds prevailing in the Indian Ocean which blow from the south-west from April to October, and from the opposite direction, or north-east, from October to April. The monsoons, in common with all winds whether regular or irregular, depend primarily on an unequal distribution of temperature and moisture over that portion of the earth's surface where they occur, which in their turn give rise to an unequal distribution of atmospheric pressure. From this unequal distribution of the mass of the earth's atmosphere winds take their rise—winds being simply the flow of the air from a region of higher towards a region of lower pressure, or from where there is a surplus to where there is a deficiency of air. The term monsoon has in recent years come to be used with a wider significance than formerly; it is now generally applied to the winds connected with all continents which are of regular occurrence with the periodical return of the seasons. The winds of Australia are thus strictly monsoonal; over the greater part of North America the prevailing winds have a well-marked monsoonal character; similarly, monsoons

occur on the coasts of Brazil, Peru, North Africa, and all other regions that happen to lie between regions whose temperature, and necessarily their pressures also, differ markedly from each other at different times of the year. See WINDS.

Monstrance (Lat. *monstrare*, 'to show'), called also OSTENSORY, the sacred utensil employed in the Catholic Church for the purpose of presenting the consecrated host for the adoration of

Monstrance.

the people, as well while it is carried in procession as when it is exposed upon the altar on occasions of special solemnity and prayer. It consists of two parts, the foot or stand upon which it rests, and the repository or case in which the host is exhibited. The latter contains a small semi-circular holder called the *lunula*, or crescent, in which the host is fixed; and it appears anciently to have been of a cylindrical or tower-shaped form, in the central portion of which, consisting of a glass or crystal cylinder, the host was placed. At present it is more commonly in the form of a star or sun with rays, the central portion of

which is of glass or crystal, and serves to permit the host to be seen. This portion, or at least the crescent, is of gold or of silver gilt; the rest is generally of the precious metals, or at least gilt or silvered, although the lower portion is occasionally of bronze artistically wrought.

Monstrosity is the term applied in human and comparative anatomy to an aberrant formation of the body consequent upon early disturbances in the developmental processes in the embryo. Teratology (*teras, logos*), the special and very interesting branch of biology which deals with the causes of such occurrences and with the classification of the 'monsters' so produced, has been advanced by the researches of Geoffroy Saint-Hilaire, Förster, and others to the position of a special science, and one that throws a valuable sidelight on that of normal embryology. The malformations to be dealt with may affect the whole organism or portions only of its structure. Monsters are, however, usually classified under three headings: (1) Those with exaggerated or supernumerary parts (*monstra per excessum*); (2) those lacking parts (*monstra per defectum*); and (3) those with abnormally arranged parts (*monstra per fabricam alienam*). Those of the first class, where supernumerary limbs or a double head or trunk exist, are generally recognised as due to the more or less complete fusion of two or more embryos, originally separate, during the process of development. Cases of this kind which have from time to time been carefully described, figured, or preserved in museums show that almost every possible degree of fusion of separate embryos may occur, resulting in a correspondingly great variety in the shapes of the monsters produced. Two otherwise complete bodies may be attached by an external bond, as in the case of the Siamese twins; or the one may be wholly or partially enclosed by the tissues of the other. A case of such complete inclusion is found in the Hunterian

Museum. Much more frequently, however, but imperfect relics of the one remain attached to, or fused with, the fully-developed structures of the other. Thus arise two-headed monsters, those with double trunks or double sets of limbs, and those in which a shapeless mass representing the blighted embryo remains attached to the fully-formed body of the twin organism. In this same class of monsters by exaggeration must be placed also cases of general or local gigantic development, due not to fusion of separate embryos but to general or local precocity of growth in the tissues of a single organism. Not less interesting are monsters of the second class, where entire parts of the body may be suppressed during development. Here again it is shown that the non-development may occur in any region and to any extent; consequently numerous and widely separated varieties of monster are found in this class. The suppression of parts varies likewise in degree, and in its effect upon the viability of the organism. For instance, a headless or brainless monster is of necessity incapable of living; whereas one with suppression of a limb is viable, and might more properly be described as a case of congenital deformity. In the third class are the cases of transposition of viscera, malposition of limbs, congenital dislocations of joints, &c. See DEFORMITIES, CLUB-FOOT, and, for monstrosity in plants, TERATOLOGY.

Montagnana, a town of Northern Italy, 32 miles SW. of Padua. Pop. 3200.

Montagnards, or simply MONTAGNE, 'the Mountain,' the name given to the extreme democratic politicians in the first French Revolution, because they seated themselves on the highest benches of the hall in which the National Convention met. The body included both Jacobins and Cordeliers; its principal members were Danton, Marat, Robespierre, St Just, and Collot d'Herbois, the men of 'the Reign of Terror.' The antagonistic party were 'the Plain,' the Girondists (q.v.), who sat on the lowest benches, on the floor of the house. After the overthrow of the Girondists this part of the house was styled 'the Marsh or Swamp,' and included all the members whose votes were under the control of 'the Mountain.' In 1848 the extreme party in the National Assembly, composed of revolutionary democrats and communists, sometimes flattered itself by assuming the title of 'the Mountain.'

Montagu. The illustrious family of Montagu springs from Drogo de Montacute, who came from Normandy with the Conqueror. Sixth in descent from him was Simon de Montacute, grandfather of the William de Montacute created Earl of Salisbury in 1337, many of whose successors have been great historical personages. The subsequent family of Montagu descended from Simon (younger brother of the third Earl of Salisbury), who was the ancestor of Sir Edward Montagu, Speaker of the House of Commons and afterwards Lord Chief-justice, who died in 1557. His son, Sir Edward Montagu of Boughton, had six sons; Edward, the eldest, was made Baron Montagu of Boughton; and his grandson Ralph, third baron, was (1689) created Earl of Montagu, and in 1705 Duke of Montagu. In his son John the male line of the first Baron Montagu became extinct. The third son of Edward of Boughton was Sir Henry Montagu, the famous lawyer and orator, who was Lord Chief-justice, and created Lord Montagu of Kimbolton, and afterwards (temp. Charles I.) Earl of Manchester (q.v.). His son (second earl) was a general in the parliamentary army, who gained distinction by his victory over Prince Rupert at Marston Moor, but subsequently gave in his adhesion to Charles II. on his restoration. The fourth Earl of Manchester was

an enthusiastic follower of William III., fighting with him at the battle of the Boyne, and taking part in the siege of Limerick; he was eventually created Duke of Manchester in 1719 by George I. His descendant, the eighth duke, succeeded in 1890. The sixth son of Edward of Boughton was Sir Sydney Montagu, whose son, Edward, was a considerable mathematician, and serving first in the army, then in the navy, became the first sole commander of the English navy, and was created by Charles II. Lord Montagu of St Neots, Viscount Hinchinbroke, and Earl of Sandwich. His descendant, the eighth earl, succeeded in 1884.

Montagu, LADY MARY WORTLEY, born about 1690 at Thoresby, Nottinghamshire, was the eldest daughter of Evelyn Pierrepont, Earl (afterwards Duke) of Kingston. She was a clever, attractive child, the pride and delight of her father, who, having lost his wife in 1694, and continuing a widower, introduced his daughter to society, and made her preside at his table at a very early age. When she was only eight years old he introduced her to the famous *Kit-Cat Club*, and she was formally admitted a member. In 1712 she married, without the consent of her father, Edward Wortley Montagu, eldest son of the Hon. Sydney Montagu, and grandson of the first Earl of Sandwich. For more than three years after her marriage she lived at Wharnccliffe Lodge, near Sheffield, where her son was born, her husband during this time being kept principally in London by his parliamentary duties. On the accession of George I. Mr Montagu obtained a seat at the Treasury Board, and from this time Lady Mary lived in London, where she gained a brilliant reputation by her wit and beauty, and was on terms of intimate friendship with Addison and Pope, and other literary men of the day. In 1716 Mr Montagu was appointed ambassador to the Porte, and in August of that year he set out for Constantinople, accompanied by his wife. They remained abroad till 1718, and during this time Lady Mary wrote the well-known *Letters* to her sister, the Countess of Mar, Pope, and other friends. The *Letters* give a true description of Eastern life and manners, and are written in a clear, lively style, sparkling with wit and humour. While in Turkey she witnessed Inoculation (q.v.), and introduced it into England on her return, having so much faith in its safety that she tried it first on her own son. The next twenty years of her life she passed in England, and fixed her abode at Twickenham, where she renewed her intimacy with Pope, and then quarrelled with him, the immediate cause of the quarrel being the publication by Lady Mary of six satirical sketches entitled *Town Eclogues*. In 1739, for reasons which are not well known, she left England and her husband, from whom, however, she parted on very good terms, though they never met again. She lived in Italy, first on the shores of the Lake of Iseo, and afterwards at Venice till 1761, when, at the request of her daughter, the Countess of Bute, she returned to England. She died August 21, 1762. A collected edition of her works, with Life, was published by her great-grandson, Lord Wharnccliffe (3 vols. 1837; 3d ed. 1887).

Montague, CHARLES. See HALIFAX (LORD).

Montaigne, MICHEL EYQUEM DE, was the third son of Pierre Eyquem, Seigneur de Montaigne. He was born in 1533 on the family estate in Perigord. His father had ideas of his own on the subject of education, and his third son was to have the full benefit of them. The first novel step was the putting of Michel out to nurse in a village on the estate, that he might be early inured to simple habits of living, and learn to sympathise with the lot of the poor. Whether or

not the result of this early association, it is the fact that in his after life Montaigne always spoke of his poorer neighbours with a respect and kindness of tone remarkable in the age and class to which he belonged. It was the received opinion at the period of Montaigne's childhood that no boy could grow into a creditable citizen without a severity of discipline which would now be called brutal terrorism. It was the distinctive feature of Pierre de Montaigne's system, however, that boyhood should be made as happy as parents and teachers could make it, and in the upbringing of his famous son he was even whimsically humane. Every morning he had the boy awaked by the sound of some musical instrument, because he had heard 'that it disturbs the tender brain of children to awake them suddenly.' As he wished to make his son a scholar, and Latin was, therefore, an indispensable acquisition, he had the idea of converting a task into a natural pleasure. Till the age of six the boy was taught to speak no language but Latin, his tutor (a German), his parents, and even the domestics addressing him in that language. The result was that in the conversational command of Latin Montaigne had from boyhood the advantage of the best scholars of the day. His father was less successful in a novel method he also adopted in having him taught Greek.

When Montaigne reached the age of six his father 'allowed himself to be won over to common opinion,' and sent him to a school in the neighbouring city of Bordeaux—the Collège de Guienne, then, he himself tells us, the best in all France. His father, who as a former mayor had considerable influence in the city, 'made several stipulations against the rules of colleges, though, all the same, it still remained a college.' At this school Montaigne remained for seven years, boarding in the rooms of his successive teachers, among whom were two scholars of European celebrity, George Buchanan and Marc-Antoine Muret. The course of study in the college was almost exclusively the reading of Latin authors, and in after life Montaigne affirmed that, so far as he could judge, all these years were lost.

As a third son he had to choose between law and the church—only the eldest having the privilege of wearing the sword. All his life Montaigne had an insuperable difficulty in making up his mind, and on this occasion his father saved him the trouble by setting him to the study of law. In what school he pursued his legal studies has not been discovered, all that we know of them being summed up in his own sentence—'While a child I was plunged up to the ears in law, and it succeeded.' From the age of thirteen to twenty-four Montaigne is almost lost sight of. Casual references in his *Essais* prove that during this period he was frequently in Paris, that he knew something of court life, and that he took his full share of its pleasures. His legal studies received their reward in his appointment as member of the Court of Aids in the district of Perigord; and in 1557, by the consolidation of this court with the Parlement of Bordeaux, Montaigne became a city counsellor. The office was an honourable one; but it was little to Montaigne's taste, who, in truth, is never weary of telling us that every form of restraint was against all his natural inclinations. It was during his tenure of this office, however, that he formed his famous friendship with Etienne de la Boétie, a relation which he always regarded as the happiest and most memorable of his life. To Montaigne La Boétie seemed in gifts of soul and intellect the equal of the greatest characters of antiquity. From the writings La Boétie left behind him (a series of sonnets, and a political pamphlet advocating extreme republicanism), it seems probable that

Montaigne exaggerated his friend's powers. However this may be, the memory of La Boétie, who died at the age of thirty-two, was the one thought that never failed to raise Montaigne above himself, and that adds the one romantic touch to his epicurean temper.

Montaigne held the office of counsellor for about thirteen years; but of this period of his life, also, no definite history has been recovered. From incidental remarks of his own we gather that he was familiar with the court of Francis II., that he saw and greatly admired Mary Queen of Scots, and that at some time or other he was 'gentleman of the bedchamber in ordinary,' an office that did not necessitate residence at court. From Charles IX. he received the order of St Michel, instituted by Louis XI., and once a coveted honour, but in Montaigne's day somewhat faded in its lustre. At the age of thirty-four he married Françoise de la Chassaine, the daughter of one of his fellow-counsellors in Bordeaux, though in taking the step he assures us that he merely yielded to convention, as of his own inclination 'he would not have married Wisdom herself.' As the times went, Montaigne was a faithful and considerate husband; but he makes no secret that his wife held but a subordinate place in his thoughts. He lost 'two or three' children (the expression is his own) in their infancy, and was survived by one daughter, of whom, as he speaks little in his writings, it may be concluded that she was bound to him by no peculiar tie of affection. A year after his marriage, at the request of his father, he translated the *Natural History* of Raymond de Sebond, a Spaniard, who in the preceding century had professed theology, philosophy, and medicine at Toulouse. This translation is noteworthy as being Montaigne's first effort in literature, and as having afterwards supplied the text for one of his most famous essays, the *Apologie de Raymond Sebond*, in which he exhibits in all its bearings the full scope of his sceptical philosophy. Two years later he published certain literary remains of his friend La Boétie.

In 1571, his two elder brothers being dead, Montaigne succeeded his father in the family estate, and here till his death in 1592 he lived the life of a country gentleman, varied only by a few visits to Paris, and by eighteen months' travel in Germany, Switzerland, and Italy. It was during this period that he achieved his immortality. Finding on his retirement to his château that some mental occupation was imperatively necessary to save him from morbid fancies, he began those *Essais* which were to give him a place among the first names in literary history. If we know few incidents regarding this period of his life, we have at least the minutest record of his entire surroundings, of his daily manner of life, of his tastes, his habits, his speculations and imaginings. In June 1580, partly on account of his health, and partly from his strong natural curiosity to know strange countries, he set out on the prolonged course of travel above mentioned. His record of this journey, dictated to his secretary, and partly written in his own hand in French and Italian, was discovered in his château, and first published in 1774. While at the baths of Lucca, the announcement came to him that he had been unanimously elected mayor of Bordeaux. In accordance with his distaste for practical life, he at first refused the appointment, but at the instance of his friends and on the command of Henry III. he withdrew his declinature. The office, which had been held by his father before him, was of high military as well as civil rank, his immediate predecessor having been the Duc de Biron, one of the marshals of France. In spite of his natural indolence and indecision, he must have performed his duties to the satisfaction of the citizens, as they

did him the unusual honour of re-election. Of his last years the only circumstance deserving special record is his relation with Mademoiselle de Gournay, who won his heart by her enthusiastic admiration of his essays when she was only nineteen. After a meeting in Paris a romantic friendship sprang up between them, which lasted till Montaigne's death; and it is to Mademoiselle de Gournay, his *filie d'alliance*, as he called her, that we owe a valuable edition of his *Essais*, inscribed by her to Cardinal Richelieu in 1635. Montaigne in his later years suffered much from stone and gravel, but at the last he died of quinsy after a few days' illness in his sixtieth year, 13th September 1592. Notwithstanding the free expression of scepticism in his writings, he devoutly received the last offices of the church.

The conclusive attestation to Montaigne's varied power is the fact that three centuries after his death the circle of his readers widens every year, and that he has now almost as large a following of antiquaries as Shakespeare himself. Of his admirers in every generation it has also to be remarked that they are of all types of mind and creed, and that among them are found men like Pascal, who, while separated from him as by an abyss on all the fundamental problems of life, have acknowledged their debt to his fearless and all-questioning criticism. To have thus commanded the attention of the acutest intellects of every age since his own by haphazard remarks, devoid of all method, and seemingly inspired by the mere caprice of the moment, could be the privilege only of a mind of the highest originality, of the very broadest sympathies, and of a nature capable of embracing and realising the largest experience of life. In achieving this distinction, what are reckoned among his chief defects have doubtless stood him in as good stead as his merits. His inconclusive philosophy, his easy opinions on many points of morals, his imperfectly developed sense of duty, the total absence of any heroic strain in his nature, were but the necessary conditions of that general attitude towards men and things which make him the unique figure he is in the history of European literature.

There are two English translations of Montaigne, one by Florio (q.v.), which was used by Shakespeare, and another by Charles Cotton (q.v.), revised by Hazlitt (1865). See St John, *Life of Montaigne*; Lucas Collins, *Montaigne*; Emerson, *Representative Men*; Mark Pattison, *Essays* (1889); Dean Church, *Miscellaneous Essays* (1888); Alphonse Brun, *La Vie Publique de Michel Montaigne*; Payen, *Nouveaux Documents inédits ou peu connus sur Montaigne*. There are admirable editions of the *Essays* by Courbet and Royer (5 vols. 1873-91), and by Moutheau and Jonaust (7 vols. 1886-88).

Montalcino, a cathedral city of Central Italy, stands on a hill (1900 feet), 22 miles SSE. of Siena. Pop. 2353.

Montalembert, CHARLES FORBES RENÉ DE, born in London, May 15, 1810, was the eldest son of a noble French *émigré* and his English wife. His grandfather, Mr Forbes, a retired Indian merchant, living at Stanmore, near Harrow, had charge of him from an early age, as his father went back to France with the restored Bourbons and was rewarded for his zeal in their service by being named a peer of France and minister-plenipotentiary to Stuttgart. When Charles was eight years old he was sent to school at Fulham, but was there for a very short time, as the following year his grandfather died, and he went to his parents in Paris. He was fourteen when the head of the Collège St Barbe induced them to place him under a regular course of study. At sixteen he entered the college, and left it at nineteen to join his father, then ambassador at Stockholm. He returned to Paris in 1829, and during a period of uncertainty as to his future career occupied himself by writing an

article upon Sweden, which appeared in the *Revue Française*. In 1830 he went to Ireland, and, returning full of enthusiasm for religious freedom, at once eagerly joined himself to the Abbé Lamennais and Lacordaire in their enterprise of the *Avenir*, the well-known High Church Liberal newspaper. In 1831 Montalembert and Lacordaire opened a free school in Paris, which was immediately closed by the police, and a prosecution commenced against the schoolmasters. The death of Montalembert's father at this time having raised him to the peerage, he appealed to be tried by his peers, and pleaded with great eloquence the cause of the church and the common interests of religious liberty. Though he was reprimanded and fined 100 francs, this defeat had the effect of a victory. In the same year the *Avenir* was temporarily suspended, and finally given up, being condemned by the pope. After this Montalembert for a time withdrew from France and lived in Germany, where he was inspired with the idea of writing the *History of St Elizabeth*, which was published in 1836. In 1835 he returned to Paris, and made his first speech as a member of the Chamber in defence of the liberty of the press.

He married a daughter of Count Felix de Mérode in 1836. The winter of 1842 he spent in Madeira for his wife's health, and while there wrote a pamphlet entitled *Devoir des Catholiques dans la Question d'Enseignement*, in which he protested against the monopoly of education by the French University, and pleaded for free education, or, in other words, religious education guaranteed by common liberty. For this cause he fought unweariedly in parliament till it was won. His protests against tyranny, however displayed, came to a climax in a great speech in January 1848 upon Switzerland. The Revolution took place a month later; and in April Montalembert was elected a member of the National Assembly. When the *coup d'état* of December occurred he supported Louis Napoleon till the confiscation of the Orleans property. Then he at once resigned his post as a member of the Consultative Commission, and became from henceforth a determined opponent of the imperial régime. He was elected to the Academy on February 5, 1852, and from that time occupied himself with literary work. After a visit to England in 1855, he wrote *L'Avenir politique de l'Angleterre*. Three years later he published an article in the *Correspondant*, called 'Un Debat sur l'Inde au Parlement Anglais,' in which he made such exasperating allusions to the imperial government that he was prosecuted and sentenced to six months' imprisonment and a fine of 3000 francs. The sentence was, however, remitted by the emperor. He published the two first volumes of his great work, *Les Moines d'Occident*, in 1860, and completed it in 1867. He also wrote *Une Nation en Deuil: la Pologne* (1861), *L'Eglise libre dans l'Etat libre* (1863), *Le Pape et la Pologne* (1864), &c. During the last ten years of his life he suffered from the malady of which he died in Paris on 13th March 1870, sixteen days after writing his celebrated letter on papal infallibility.

Montalembert was one of the best French orators of his day, a great statesman and author, an accomplished man of the world, and a devoted, noble-minded son of the church. He loved freedom more than all the world, and the Catholic religion more than freedom; and thus, while he fought all his life for freedom, in questions of faith he submitted his will and intelligence to the judgment of Rome. See the Memoir by Mrs Oliphant (2 vols. 1872).

Montana, one of the north-western states of the American Union, extends from 104° to 116° W. long., and from 44° 15' to 49° N. lat., and is bounded N. by the Canadian provinces of Alberta

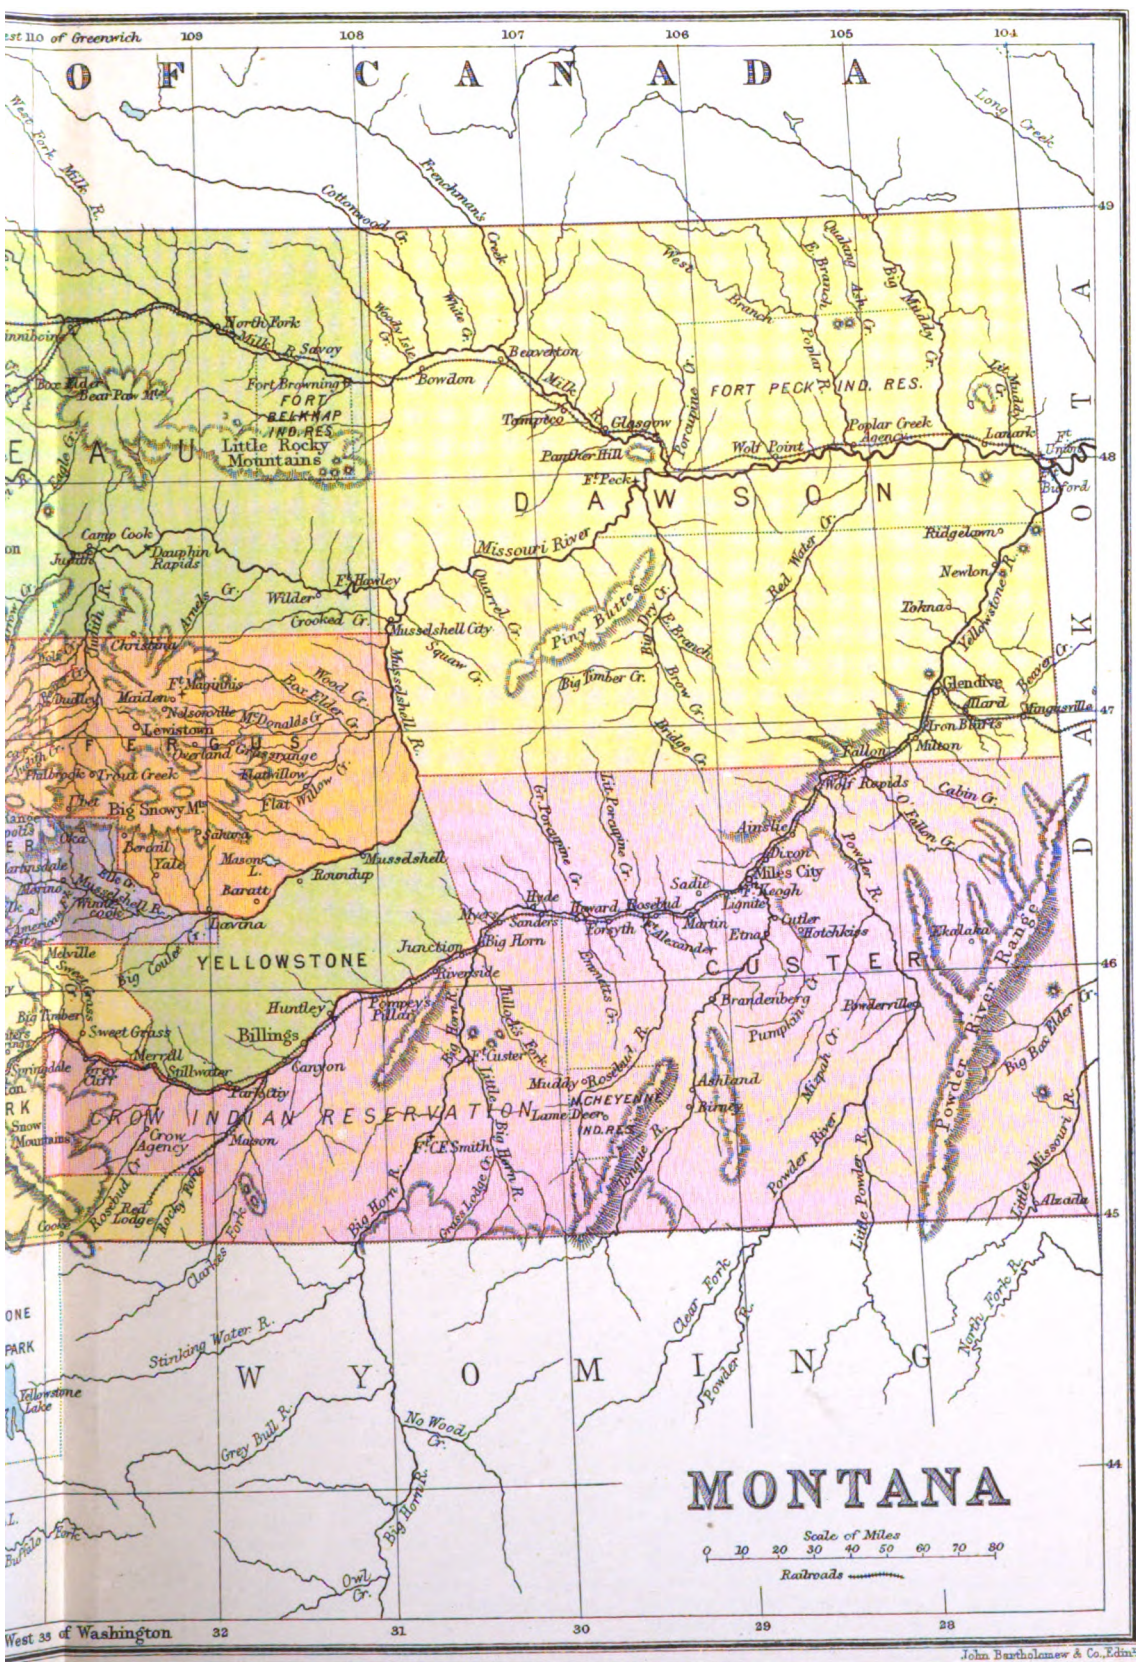

and Assiniboia, E. by North and South Dakota, S. by Wyoming and Idaho, and W. by Idaho. In area—146,080 sq. m., or nearly five times the size of Scotland—it ranks third among all the states and territories, but in population only 44th: Delaware is 71 times less, and has one-fourth more inhabitants.

The Rocky Mountains, with their subsidiary ranges, occupy fully one-fifth of the surface, in the south and west; the rest of the state is made up of valleys or high, rolling prairies, treeless, but yielding nutritious grasses. The head-waters of two of the largest rivers in North America—the Columbia and Missouri—have their sources in Montana. The mean elevation of the state is about 3000 feet; the average height of the Rocky Mountains—whose sides are covered with dense forests of pine, fir, and cedar—is about 6000 feet, while the highest peaks rise to 10,000 or 12,000 feet. The Yellowstone National Park (q.v.) forms part of the southern boundary of the state. In the south-east the Bad Lands extend into the state from Wyoming (q.v.). The climate of Montana is more moderate than that of the Dakotas and Minnesota, since the warm westerly winds prevail more than the north winds in winter here; there are but few excessively cold days, and, as there is little moisture in the air, the winters are less chilly and more exhilarating than in the east. The atmosphere is remarkable for its clearness, and cyclones are unknown.

The soil of Montana contains all that is needed for sustaining vegetation, but it is almost valueless without irrigation; with that, however, the yield of grains and vegetables is enormous. There are already hundreds of irrigating ditches within the state, and the federal government is locating storage reservoirs all along the Rocky Mountain range, to store water for this purpose from the melting snows in spring-time. It is calculated that 20,000,000 acres of land can thus be brought under cultivation. Placer mining being practically exhausted, a large part of the population has turned its attention to stock-raising, for which Montana is better suited than for agriculture. The prairies produce several varieties of bunch grass, which cures on the stalk in August, and retains all its nourishing qualities throughout the year; stock on the range receive no other feed, summer or winter, and very little shelter is required.

But the great industry of Montana is the mining and reduction of her gold, silver, lead, and copper ores. Her minerals first attracted emigration, and have hitherto been her principal wealth. The first systematic working of placer mines for gold commenced in 1862; in 1863 the first gold-quartz mill was built. According to the U.S. Treasury Reports, the total value of gold and silver produced in Montana from 1862 to and including 1889 was: gold, \$178,589,421; silver, \$108,992,319; total, \$287,581,740. The annual value of the lead produced is over \$1,000,000. The total yield of copper up to 1882 was 4044 long tons; in 1882-89 it was 215,992 tons. The value of these four metals in 1889 exceeded \$40,000,000.

History.—The portion of Montana east of the Rocky Mountains was part of the Louisiana Purchase; that lying to the west formerly composed a part of Oregon and Washington states. It was first visited by the French in 1742-43, and by Lewis and Clarke in 1804-6; these were followed by fur-traders and trappers, and by Jesuit missionaries, who established schools for Indian boys and girls. Gold was discovered in 1861, and mining began in earnest the following year. In 1864 the territory was organised, and on 8th November 1889 Montana became a state of the Union. Education, for a frontier state, is well

organised, and the exhaustion of the placer mines and the spread of railways have contributed to drive away the worst elements of the early population and replace them with industrious settlers. The chief towns include the capital, Helena (q.v.), Butte City (10,723), and Virginia City. Pop. (1870) 20,595; (1880) 39,159; (1890) 132,159, including some 1500 Chinese and 12,500 Indians. Troubles with the latter have been frequent: in 1876 General Custer (q.v.) and his command were all killed on the Little Big Horn by the Sioux.

Montanism, a heresy which grew up within the Christian church in the second half of the 2d century; its founder was Montanus, a religious enthusiast who appeared at Ardaban in Phrygia in the year 156, with a mission to purify and reorganise the church. Christianity had now become adopted by men in all classes, and already it had to a great extent ceased to be what it was originally—a society of enthusiastic devotees shut off from the world. At the same time the church adapted to her use everything of value in the social and political arrangements of the world around her, and thus fitted herself for the rôle of a great world-religion. Side by side with this growing secularism there sprang up a natural reaction in favour of the old discipline and severity, and nowhere was this so strong as in Phrygia, where it was linked with a belief in a new and final outpouring of the Spirit. Here there quickly formed themselves societies of *spiritual* Christians who gladly hailed the appearance of the 'Paraclete,' and were gradually compelled to withdraw from the church, branded as Montanists and Kataphrygians. Montanus selected the small Phrygian towns of Pepuza and Tymion as the Jerusalem of the church, and for twenty years his movement was limited to Phrygia and the surrounding district. He himself enjoyed a continuance of the prophetic gift, as well as the two women Prisca and Maximilla; his most zealous missionaries were Alcibiades and Theodotus. The persecution that began after the year 177 spread the movement wider by deepening the earnestness of conviction in those that held fast their faith. In Phrygia they were sternly repressed by the bishops, and formally excommunicated; but elsewhere than in Asia Minor they did not at once leave the church, but formed small conventicles within it. In Gaul and Rome it was long held that communion should be maintained with them. But gradually separation became necessary, as the Montanists became stronger in their demand for a return to primitive discipline, for more fasting, the prohibition of second marriages, and a severer life generally. Denunciation and exclusion produced their natural effect in making them still more narrow, severe in their judgments, and arrogant in their asceticism. At Carthage a numerous body of Montanists had grown up, and from 202 to 207 they strove hard, but in vain, to remain within the church, but at length quitted it because it refused to recognise the new outpouring of the Spirit. It was now that the great Tertullian joined their ranks, having become profoundly convinced of the necessity for a return to primitive Christianity in order to heal the secularism of the church. Montanism survived in the East till the 4th century; in the West it was ever less aggressive, and did not grow up until the Catholic Church had firmly established its organisation. Therefore it never became more than a mere sect; and from a genuine desire for reform and simplicity it degenerated into an artificial strictness and mere legalism. Yet down to 400 A.D. there were still Tertullianists at Carthage.

See Ritschl's *Entstehung der Altkatholischen Kirche* (2d ed. 1857); De Soyres, *Montanism and the Primitive Church* (1878); Bonwetsch, *Die Geschichte des Montanismus* (1881); Weissäcker in *Theol. Lit.-Zeitung* (1882); and Harnack, *Das Mönchthum, seine Ideale und seine Geschichte* (2d ed. 1882).

Montargis, a town in the French department of Loiret, 47 miles E. by N. of Orleans, with a fine church (12th century—1868) and ruins of a vast castle, once 'le berceau des Enfants de France.' Here in 1371 is said to have occurred the famous judicial combat between 'the dog of Montargis' and Macaire its master's murderer. The dog not only showed the spot in the forest of Bondy where its dead master was buried, but singled out the murderer, and, when Charles VI. granted the ordeal of battle to test his guilt, the dog flew at his throat and so proved its charge upon his body. Pop. (1872) 8196; (1886) 10,984.

Montauban, the capital of the French department of Tarn-et-Garonne, on the river Tarn, 31 miles N. of Toulouse. A well-built, handsome place, it has a modernised brick bridge (1335), 224 yards long; a fine cathedral (1739) in the Italian style; and a monument (1871) to Ingres, the painter, a native. Besides considerable woollen manufactures, it carries on a great trade in wine, grain, leather, &c. Montauban was founded in 1144 by Count Alphonse of Toulouse, became the seat of a bishop in 1317, embraced the Reformation in 1560, and acquired historical celebrity as the great stronghold of the Huguenots, being vainly besieged for three months by De Luynes for Louis XIII. in 1621. It suffered much in the Dragonnades; but nearly half the inhabitants still are Protestants, and maintain a theological college. Pop. (1872) 18,855; (1886) 22,431.

Montbéliard (Ger. *Mömpelgard*), a town in the French department of Doubs, 48 miles N.E. of Besançon. It lies in a valley between the Vosges and Jura Mountains, is surmounted by an old château (now a prison), and carries on manufactures of watch-springs, watchmaking tools, and cotton. A possession of the House of Würtemberg from 1397, it was a Protestant centre from 1525, was formally ceded to France in 1801, and suffered much in the Franco-German war. Cuvier was a native; and there is a statue of him, as also of Colonel Denfert, the heroic defender of Belfort. Pop. (1872) 5865; (1886) 9055, mostly Lutherans.

Mont Blanc, the highest mountain in Europe (if we regard the Caucasus, q.v., as Asiatic), 15,782 feet above sea-level, is situated in France, close to the Italian frontier, 40 miles S. of the Lake of Geneva. The waters which spring from its western slopes are drained off to the Rhone, those which originate on the east side to the Po. It rises into several sharp peaks (*aiguilles*) and forms great glaciers—the Glacier du Géant, Mer de Glace, &c. In 1760 Saussure offered a prize for the discovery of a practicable route to the summit of Mont Blanc, which was gained, in June 1786, by Balmat and Paccard, guides. Saussure himself ascended the mountain the following year; and since Albert Smith published a description of his ascent in 1851 the mountain has been ascended by several hundreds; indeed, more than fifty parties climb it annually. It has been the most conspicuous for accidents of all Alpine peaks; twenty-four persons had perished in accidents on it down to 1886. See *Chambers's Journal*, August 1886, and, for an illustration, see ALPS. There is an observatory (1890) at a height of 14,470 feet.

Montbrison, a French town in the department of Loire, 35 miles SW. of Lyons, with mineral wells and some ribbon manufacture. Pop. 6235.

Montcalm. Louis Joseph, Marquis de Montcalm Gezan de Saint Vêran, was born in the château of Candiac, near Nîmes, 29th February 1712. At fifteen he entered the army. In 1746

he was severely wounded and made prisoner at the battle of Piacenza. In 1756 he assumed command of the French troops in Canada, and soon after his arrival captured the British post of Oswego. The succeeding summer he crossed Lake George with about 8000 French and Indians, and captured Fort William Henry. After the French had taken possession of the fort, the defenceless prisoners, comprising men, women, and children, were massacred by the Indians. Montcalm has been blamed even by his apologists for not foreseeing the danger, and taking effectual measures to avert it. In 1758 General Abercromby advanced on Ticonderoga with 15,000 regulars and provincial troops. The place was defended by Montcalm with a much smaller force of regular troops. The British troops displayed heroic daring and courage, but after repeated attempts to force the defences, which were in themselves almost impregnable, and were defended with great gallantry, they withdrew with a loss of about two thousand men. This French success was, however, much more than counterbalanced by the loss of Louisbourg and Fort Duquesne about the same time. Montcalm then removed to Quebec, and prepared to defend it against a British attack. Of the 16,000 troops under his command the majority were militia and Indians. In 1759 General Wolfe ascended the St Lawrence with about 8000 troops, and a naval force under Admiral Saunders. After repeated attempts to scale the heights of Montmorency, and a severe repulse about the end of July, he surprised a French outpost before dawn on 13th September, scaled the heights with about 5000 men, gained the plateau of Quebec, and formed in line of battle on the Plains of Abraham. In the battle that ensued the French ultimately broke in disorder and retreated on the city. Montcalm tried in vain to rally his force, and, having been borne back by the pressure of the retreat, he was mortally wounded at the St Louis gate, and died the following morning, 14th September 1759. See the article WOLFE; Parkman's *Montcalm and Wolfe* (Boston, 1884); and Faigairolle's *Montcalm devant la Postérité* (Paris, 1886).

Mont Cenis, or MONTE CENISIO, an Alpine peak and pass between Savoy and Piedmont. Height of the mountain, 11,792 feet; of the pass, 6884 feet. Over the pass a road was constructed (1802-10) by Falbironi, under Napoleon's orders, at an expense of £300,000. Thirteen miles west of the pass a railway tunnel, $7\frac{1}{2}$ miles long, was begun in 1857 on the Italian side, and in 1863 on the French, and was finished in 1870 at a cost of £3,000,000. Through this tunnel passes one of the main continental overland routes from London *via* Paris to Brindisi, for Asia, Australia, and East Africa.

Mont-de-Marsan, capital of the French department of Landes, at the confluence of the Midou and Douze, 92 miles by rail S. of Bordeaux. It has a mineral spring and manufactures of chemicals, iron, &c. Pop. (1872) 7441; (1886) 10,714.

Mont de Piété, called in Italy MONTE DI PIETÀ, a charitable institution the object of which is to lend money to the poor at a moderate rate of interest. It was closely modelled on the 'Monte', a precursor of the modern bank, in which the creditors, or the parties who supplied the capital, formed a close corporation, with privileged claims upon certain sources of income. These conditions were designed to avoid the laws against usury. But the Monte di Pietà did not at first levy regular interest, only a small percentage to cover the expenses of administration. The earliest of these institutions was established at Orvieto in 1463; and another followed at Perugia, 1467; yet the right

to levy for the expenses of management was only conceded in 1515. The system was introduced in Spain, France, Belgium, Germany, the Netherlands, and Mexico. There exists at Paris a national pawn-broking establishment, called Mont de Piété, which charges 9 per cent. on all loans to pay the working expenses. The surplus gain is handed over to the public charity funds. See Blaize, *Des Monts de Piété* (2 vols. 1856), and PAWNBROKING.

Mont-Dore-les-Bains, a village of Auvergne, in the department of Puy de Dôme, 26 miles SSW. of Clermont-Ferrand. It lies 3412 feet above the sea-level, in a picturesque valley, through which the river Dordogne flows, and which is bordered on both sides by rugged volcanic hills, and closed towards the south by a semicircle of jagged mountains, the highest point of which, the Pic de Sancy (6188 feet), is the loftiest mountain in central France. The Mont Dore mineral springs, which were used by the Romans, are of great value in affections of the throat and most diseases of the respiratory organs, as also in the earlier stages of rheumatism. There are eight powerful springs in full operation, seven of these having a temperature which varies between 102° and 114°, while La Source Sainte Marguerite is comparatively cold. The water contains bicarbonates of soda, iron, and arsenic. The ordinary population of the village is about 1400, but the baths, which are every year becoming better known, are thronged during the short season (July to September) with visitors from all parts.

Montebello Casteggio, a village of Northern Italy, 14 miles S. by W. of Pavia, where the Austrians were defeated by a French army under General Lannes (afterwards Duke of Montebello), after a desperate conflict, 9th June 1800. In May 1859 the Austrians were again defeated here by the united French and Piedmontese army.

Monte Carlo, a small town in the territory of Monaco (q.v.), 1 mile NE. of the town of Monaco, notorious on account of its gaming-tables, and the numerous suicides of ruined gamblers.

Monte-Casino, the monastery built (529) by St Benedict, founder of the great Benedictine order, stands on beetling cliffs, in a magnificent situation, 70 miles by rail NW. of Naples and 92 SE. of Rome. It has been four times destroyed—in 589 by the Longobards, in 884 by the Saracens, in 1030 by the Normans, and in 1349 by an earthquake. It was dissolved in 1866; but a few monks still remain. In 1313 the abbot was elevated to episcopal rank, and from 1504 he was official 'head of all the abbots of the Benedictine order.' The existing church, replacing one erected in 1068, was built in 1727, and possesses an 11th-century Byzantine bronze portal, mosaics, frescoes, carvings, &c. The former monastic buildings contain valuable archives, a picture-gallery, a library of 40,000 volumes, 30,000 charts, 500 incunabula, and a seminary. See Tosti, *Storia della Badia di Monte Cassino* (1843), *Archivio Cassinese* (1847), and Mackey's *Life of Bishop Forbes* (1888).

Monte Catini, a watering-place of Italy, by rail 30 miles NW. of Florence and 19 E. of Lucca. Its mineral springs are saline, range between 82° and 86° F., and are efficacious for abdominal complaints, scrofula, and dysentery. The season lasts from May to September. Near here the Florentines were defeated by the Pisans in 1315.

Monte Cristo, an uninhabited islet of granite off the Italian coast, 26 miles S. of Elba. For the novel whose hero bears this name, see DUMAS.

Montecuculi, RAIMONDO, COUNT, was born at Modena in 1608, and entered the Austrian service, distinguishing himself during the Thirty Years' War (especially at Breitenfeld and Nördlingen), in

a campaign against the Turks (1664), and against the French under Turenne on the Rhine (1672-75). He was made a Prince of the Empire and Duke of Melfi, and died at Linz, 16th October 1681. A second edition of his *Opere Complete* appeared in 1823; there is a Life by Campori (1876).

Montefiore, SIR MOSES, a Jewish philanthropist, descendant of a wealthy family of bankers, was born in Leghorn, October 24, 1784, where his parents happened to be sojourning. His grandparents had emigrated from Leghorn to London in 1750. In 1812 he married Judith Cohen (1784-1862), a lady who went hand in hand with him in all his many schemes of philanthropy. As a stockbroker he soon achieved great success. In 1818 he was elected president of the Spanish and Portuguese community. From 1829 onwards he took a prominent part in the struggle for removing the civil disabilities of English Jews (see JEWS). In 1835 he was one of the parties to the contract for the £15,000,000 given as compensation to the slave-owners. He was for a time High Sheriff of Kent, and, after long exclusion and repeated re-election, was legally admitted as Sheriff of London in 1837. In that year he was knighted, and in 1846 was raised to a baronetcy in recognition of his meritorious public services. He distinguished himself by his practical sympathy with his oppressed countrymen in various parts of the East, chiefly in Poland, Russia, Roumania, and Damascus. He made seven journeys to the East, the first being in 1827 and the latest in 1874, chiefly for the amelioration of the condition of his countrymen. At Bucharest, during an anti-Jewish ferment, he boldly faced the mob at the risk of his life. He was presented with the freedom of the City of London in 1873, and an address in 1883. In memory of his wife he endowed a Jewish college at Ramsgate in 1865. In his hundredth year he was still hale and well, but died 29th July 1885. See *Diaries of Sir Moses and Lady Montefiore* (2 vols. 1890).

Montego Bay, a port on the north coast of Jamaica (q.v.).

Montégut, ÉMILE, a clever French critic, was born at Limoges, June 24, 1826, and early made a reputation by a series of brilliant studies on English literature. He contributed to the *Revue*, the *Moniteur Universel*, the *Revue des Deux Mondes*, and other journals, and has published books of travel, a study of Marshal Davout, and translations of Shakespeare, Macaulay's History, and Emerson's Essays. Books of altogether exceptional value in their critical insight are *Poètes et Artistes de l'Italie* (1881); *Types Littéraires, et Fantaisies Esthétiques* (1882); *Essais sur la Littérature Anglaise* (1883); *Nos Morts contemporains*; *Les Écrivains modernes de l'Angleterre* (2 vols.); *Livres et Âmes des Pays d'Orient*; *Mélanges critiques*; and *Dramaturges et Romanciers* (1890).

Montélimar, a town in the French department of Drôme, near the Rhone, 85 miles S. of Lyons by rail, with some manufactures of silk, hats, and morocco leather. Pop. 9445.

Montem. See ETON.

Montenegro (the Italian translation of the native name *Cernağora*, 'Black Mountain'), an independent state in the Balkan Peninsula, between Herzegovina and Albania, about 80 miles long by 70 broad. Its area was extended in 1878 by the addition of a large district on the north, a long narrow strip right down its east side to Lake Scutari, and the port and district of Antivari on the south, on the Adriatic, and again in 1880 by the addition of the port and district of Dulcigno, also on the Adriatic. The area, thus extended, is officially quoted as 3255 sq. m.—a private estimate is

3486 sq. m.—considerably less than half the size of Wales. Beyond the low coastal fringe, which has a climate like that of the south of France, comes a rugged mountain-region ranging up to 6500-8000 feet, not in a series of chains, but in a confusing maze of peaks and gigantic crags and blocks, wild ravines and gorges, fissures and natural caves, the bare gray crystalline rock being everywhere visible. In this region the streams in some cases have underground channels, and even pass for miles, beneath the mountains. The centre of the country is occupied by the branching valleys of the rivers Zeta and Moratcha, which flow south into Lake Scutari. East and north of them the mountains are well wooded, principally with beech and pine, and afford good pasturage to the sheep, goats, and cattle of the people. The climate in these mountainous regions is characterised by temperate heat in summer and a rigid winter. Comparatively little of the surface is cultivated, except in the coast region; it is too sterile. Yet agriculture is the principal occupation of the people; of industry there is virtually none. All the farms are small, the fields often patches of soil a few square yards in extent clinging to the mountain-side. The land in most cases belongs to the family, not to the individual, and woods and pastures are common to the clan. Maize, rye, oats, barley, potatoes, capsicums, tobacco, with fruits in the south, are the more important products. Wine for home consumption is grown on the shores of Lake Scutari; and the mulberry is cultivated for silkworms. The same lake, and some of the rivers flowing into it, yield an abundance of fish, especially of scorantza or bleak. The exports, consisting chiefly of cattle, goats, hides, smoked fish and mutton, cheese, sumach, fruits, and wine, reach the annual value of £200,000. The imports, for the most part wheat, gunpowder, hardware, groceries, cloth, and glass, average in value about one-tenth of the exports. Nearly all the trade is in the hands of the Austrians, and passes through their port of Cattaro. Good roads connect the chief towns or villages in the south; bridle-paths and footpaths only exist in the rest of the country.

The Montenegrins, a race of primitive mountaineers, whose principal business in life has for generations been to fight the Turks, are a brave, warlike, and simple people, noted for their honesty and their chastity. The men are stalwart and handsome, but the women, who until recent years did all the hard work whilst the men fought, or idled, or hunted, soon grow old and lose their good looks. The people live in small stone houses, in small villages—there is not a town, strictly so called, in all Montenegro. They belong to the Servian branch of the Slavs, number (1890) 236,000, and belong, except about 10,000 Mohammedans and 4000 Roman Catholics, to the Greek Orthodox Church, the head of which is the emperor of Russia. The native head of the church is the Archbishop of Cetinje. The monastery of Ostrog is visited by large numbers of pilgrims every year. There is a Roman Catholic archbishop at Antivari. In the 14th century the country, known as the principality of Zeta, was tributary to the Servian empire; but, when the latter was subjugated by the Turks (1389), Zeta, assisted by fugitive Servians, successfully maintained its independence. From that time down to 1880 the Montenegrins have waged almost incessant war against their hereditary foes, the Turks. In 1516, when the last prince of the second native dynasty abdicated his throne, the people elected their bishop to be ruler over them; and the little state was governed by ecclesiastical princes (vladikas) down to 1851, when Danilo I. of the Nyegush clan, and nephew of the last vladika, persuaded the people to separate the civil from the

ecclesiastical functions, and to elect him their secular prince, and declare the throne hereditary in his family. The prince is an absolute sovereign; but he is assisted by a state council and a ministry of six members. The government both of the country and of the family is really, however, patriarchal, the will of the prince deciding all things only in so far as it does not conflict with the will of the people. During the last quarter of the 19th century the little land has progressed greatly in civilisation; education has made rapid strides, the men have taken to cultivating their fields, and roads have been constructed; while the old militia has been converted into a standing army of 30,000 men, though not more than 100 serve permanently, as a bodyguard to the prince. An arms-factory has been established at Rieka and ammunition-factories at Rieka and Cetinje. The last-named village is the capital. The empress of Russia supports a higher school for girls at Cetinje. Crime is almost unknown. Podgoritz and Rieka are the chief trading-places. The state income amounts to about £60,000 per annum, a portion of which is a subsidy from Russia (since 1856); the expenditure is not known. There is a state debt of £100,000 owing to Austria and £70,000 owing to Russia. Montenegro has no money of her own; she uses chiefly Austrian paper and Turkish silver. The vladika Peter II. (1830-51) is accounted one of the greatest poets who have written in Servian. In their patriotic songs and ballads the Montenegrins possess a treasure of great value, and of great influence upon the national temperament. The first Slavonic books to be printed were issued from presses at Cetinje and Rieka in the end of the 15th century.

See Denton, *Montenegro* (1877), where earlier books are referred to; E. A. Freeman in *Macmillan's Magazine* (1876); Gopoevic, *Montenegro und die Montenegriner* (1877); Schwarz, *Montenegro* (in German, 1882); W. Carr, *Montenegro* (Stanhope Essay, 1884); and H. O. Brown, *A Winter in Albania* (1888).

Montenotte, a small village of Northern Italy, 26 miles W. of Genoa, where Napoleon won his first victory over the Austrians, on 12th April 1796.

Montepulciano, a town of Italy, a bishop's see, situated on a high hill, 43 miles by rail SE. of Siena. It was the birthplace of Politian and Bellarmine, and is famous for its red wine. Pop. 2952.

Montereau, a town in the French department of Seine-et-Marne, at the confluence of the Seine and Yonne, 49 miles SE. of Paris. At the bridge here, in 1419, Jean-sans-Peur, Duke of Burgundy, was assassinated in the presence of the young Dauphin, afterwards Charles VII.; and in the immediate vicinity Napoleon, on February 18, 1814, gained his last victory over the allies. Pop. 7519.

Monterey, capital of the Mexican state of Nuevo Leon, lies in a fertile plateau-valley, by rail 670 miles N. of Mexico city. It is a well-built town, with a thriving trade, and contains a cathedral, seminary, and schools of law and medicine. Pop. 16,000. Founded in 1599, it was taken by General Taylor in 1846.

Monte Rosa, an Alpine mountain mass with four principal peaks, in the Pennine ridge which separates the Swiss canton of Valais from Italy. The highest peak, the Dufourspitze, 15,217 feet high, is extremely difficult of ascent, and was first climbed by Mr Smyth in 1855.

Monte Sant' Angelo, a city of Southern Italy, 28 miles NE. of Foggia. It stands 2790 feet above sea-level, on one of the Gargano hills, and is famed for its exquisite honey. Pop. 15,109.

Monte Sarchio, a town of Southern Italy, 13 miles NW. of Avellino. Pop. 5238.

Montespan, FRANÇOISE ATHÉNAIS, MARQUISE DE, mistress of Louis XIV., was born in 1641, the daughter of Gabriel de Rochechouart, Duc de Mortemart, and married in 1663 the Marquis de Montespan, and became attached to the household of the queen. Her beauty and wit captivated the heart of the king, and about 1668 she became his mistress, without, however, as yet supplanting La Vallière. The marquis was flung into the Bastille, next banished to his estates, and finally in 1676 his marriage was formally annulled. Montespan reigned till 1682, and bore the king eight children, which were legitimised, but at last her influence paled before the rising star of the astute widow of Scarron, afterwards Madame de Maintenon, whom she had engaged as governess to her children. Gradually she lost all hold over the king, and in 1687 left the court, in 1691 Paris itself. Later, like so many women of her class, she found relief in devotion, and died 27th May 1707. See her *Mémoires* (2 vols. 1829), and the studies by A. Houssaye (6th ed. 1864) and Clément (1868).

Montesquieu, CHARLES DE SECONDAT, BARON DE LA BRÈDE ET DE, a celebrated French writer on politics and law, was born 18th January 1689, at the château La Brède, near Bordeaux. Jacques de Secondat, the father of the future author, was second son of the Baron de Montesquieu, president and chief-justice of the parliament of Guienne. Charles-Louis de la Brède, as Montesquieu was called, after studying the ancient classics, philosophy, and law, became councillor of the parliament of Bordeaux in 1714, and its president in 1716, succeeding his uncle, who left him all his property on condition of his assuming the name and title of Montesquieu. The young president discharged the duties of his office faithfully, but he gave himself by preference to the study of nature under the influence of Newton. In his discourses before the Academy of Sciences of Bordeaux he dealt with the causes of echoes and of the weight and transparency of bodies, and with the use of the renal glands, and sketched a project of a physical history of the earth (*Discours Académiques*, 1716-21). But defective vision compelled him to abandon experimental research. His first great literary success was the publication of his *Lettres Persanes* in 1721. These contain a satirical description of the contemporary manners, customs, and institutions of society in France, and owed much of their popularity to the ingenuity of their form and the piquancy of their style. Two Persians, Rica and Usbek, are represented as coming from Persia to Paris, and exchanging their impressions by letters to each other, as well as corresponding with their friends at home. The idea was borrowed from Dufresny, and it has been frequently imitated since. The libertinage, the political decadence, and the irreligious insincerity of the first years of the regency that followed the death of Louis XIV. are limned with masterly art. For his delineations of Persian manners and institutions he drew from the accounts of Sir John Chardin and other travellers; but his vivid, and at times wantonly sensuous, imagination created most of his situations and characters. Along with much that is frivolous and ephemeral, the *Persian Letters* contain solid reflections on the nature and relations of social institutions, and an adumbration of the author's later views on government, toleration, and the influence of climate on population, customs, and religion. In 1725 Montesquieu wrote and published anonymously at Paris a prose poem entitled *Le Temple de Gnide*, in the artificial French style of the time. Returning to Bordeaux, he read to the Academy a treatise on duty from the Stoic standpoint, and delivered an admirable discourse on the motives which ought to give

encouragement in the sciences (1725). Eager for larger observation and enjoyment of the life of society, and weary of the routine of his parliamentary duty, he sold his office in 1726, and then settled in Paris. Thereafter he travelled for three years in order to observe and study the political and social institutions of other countries. He visited Vienna, where he studied the constitutions of Hungary and Poland; Venice, where he formed a close friendship with Lord Chesterfield; and Rome, where he studied Italian art, and was favourably received by the pope. He then passed by Switzerland and the Rhine to Holland, where he again met Chesterfield, who took him to England. He remained in England from October 1729 to August 1731, mixing with its best society, frequenting the Houses of Parliament, studying the political writings of Locke, and analysing the organisation and working of the English constitution, whose essential principles he may be said to have discovered. After returning to France he divided his time between Paris and La Brède, mingling the pursuit of pleasure and an unostentatious charity with the preparation of his great works on the science of politics and law.

His *Considérations sur les Causes de la Grandeur des Romains et de leur Décadence*, the ablest, if not the most important, of his works, appeared in 1734. In it he surveys the vast political development of ancient Rome from the rude beginnings of the Eternal City till the Turks gathered around the walls of Constantinople, and his elucidation of the causes that determined the character and detail of the movement may be regarded as the first genuine application of the modern scientific spirit to history, and as an enduring contribution to its philosophy. His characterisations of the great Romans, his analysis of complex influences, his filiation of events, his estimates of political and social causation have been generally accepted and reproduced by subsequent historians. His great monumental work on the spirit of laws, *De l'Esprit des Lois*, appeared in 1748 in 2 vols. at Geneva. It was the product of all the work of his life, and of the deliberate and concentrated effort of twenty years. Although published anonymously and put on the Index, the work passed through twenty-two editions in less than two years; and it soon vindicated its claim to be the most original and popular book ever published on the science of law. Montesquieu indicated his consciousness of its originality by prefixing to it the epigraph: *Prolem sine matre creatam*. French Jurists of the 16th century, Cujas and others, had led the way to the historical treatment of Roman law, and Domat had written a chapter on 'the nature and spirit of laws,' but the universalisation of the historical and comparative method in dealing with the reason and relations of all laws is Montesquieu's own, and he applies it more lucidly, and also more widely than Vico did. By the spirit of laws he means their *raison d'être* in time, their historical causation, or the natural and social conditions by which their origination, development, and forms are determined. The discussion of the influence of climate was the most characteristic element of the work; it advances beyond the old abstract discussions of right, and, although pushed in some points too exclusively, it formed the prelude to all the more recent work of the positive and ethnological school. The analysis of the forms and principles of government carried the subject farther than had been done by any one since Aristotle; and the exposition of the constitutional government of England, with its clear distinction of the legislative and executive powers, made an advance upon Locke, and held up the free English constitution to the admiration and

imitation of all Europe. The influence of Montesquieu's great work upon political and legal thought directly, and upon government and laws indirectly, was immense. It came too late to save France from the political errors that culminated in the Revolution, but it inspired and guided its best thinkers and its greatest men. In 1750 he published a clever *Défense de l'Esprit des Lois*, followed afterwards by *Lysimaque* (1748), a striking dialogue on despotism, *Arsace et Isménie*, a romance, and an essay on taste in the *Encyclopédie*. Severe study had exhausted his energy and still further weakened his eyes till he became totally blind. He died at Paris 10th February 1755, aged sixty-six, in the calm enjoyment of his great reputation.

The best edition of Montesquieu's works is that of E. Laboulaye (7 vols. Paris, 1875-79); that of Lahure (3 vols. 1856) is convenient and serviceable. There are English and other translations of the *Lettres Persanes*, and a commentary by Meyer (1841). The *Spirit of Laws* was soon translated into English by T. Nugent (new ed. by Prichard, with D'Alembert's Analysis, 2 vols. Bohn, 1878). Vian's *Histoire de Montesquieu, sa Vie et ses Œuvres* (2d ed. 1879) is the fullest biography and bibliography. The smaller monograph by A. Sorel (Eng. ed. by G. Masson, 1887) is excellent; that by Zevort (1887) may also be mentioned.

Monteverde, CLAUDIO, composer and harmonist (1568-1643). See HARMONY, MUSIC.

Montevideo, the capital of the republic of Uruguay, is situated on the north shore of the La Plata estuary, about 125 miles E. by S. of Buenos Ayres. It was built originally on a low promontory between the ocean and a horseshoe-shaped bay, 2 miles across; but its extensive suburbs now stretch far into the flat country behind, and have crept round the bay to the landmark which gives the city its name—the Cerro, a smooth, isolated cone, 505 feet high, crowned with a lighthouse and an old fort. At its base there are nearly a score of great *saladeros*, or beef-salting establishments, where 200,000 cattle yearly are killed; and here, too, is the largest of the city's dry-docks. The city proper covers an area of about 5 square miles, the old town, on the little peninsula occupying nearly one square mile; and the sea-breezes make its climate both pleasant and healthy. Montevideo is an attractive town, with broad streets exceptionally well paved—Mulhall declares the Calle 18 de Julio, which is 85 feet wide, 'incomparably the finest street in South America.' The houses are flat-roofed, mostly of two or three stories, and often crowned with small square belvederes. High above these rises the cathedral (133 feet), with two side towers and a dome covered with green and blue and yellow tiles. The next most prominent building is the large opera-house; and others are the town-hall, the custom-house, the exchange, the Cabildo (law-courts and parliament house), the school of arts and trades, the university, the museum, the English and Basque churches, two convents, the Hospital de Caridad (330 beds) and the British hospital (60 beds), the extensive public markets, and several of the banks and hotels. Trams run in all directions—there are over 55 miles of lines; there are local electric lighting and telephone companies, and a submarine telephone to Buenos Ayres; and water is brought by a pumping-main from the river Santa Lucia, a distance of 34 miles.

The depth of water in the bay ranges from 9 to 15 feet, and vessels of heavy draught are compelled to anchor in the roadstead outside, which is exposed and often very rough. If a proper port had been constructed in the years before 1864, when the Buenos Ayres trade was diverted by the Paraguayan war, Montevideo might have permanently taken the place now occupied by the Argentine

capital; as it is, possessing the advantage of a large natural harbour, it may even yet become again a dangerous rival, should the necessary harbour-works ever be constructed. It has communication by steamer with the United States and Europe, and on five days a week with Buenos Ayres. Its foreign trade is that of Uruguay (q.v.). The manufactures are more numerous than important, but have increased of late years nearly as fast as the population. In 1877 there were 110,167 inhabitants, in 1889 there were 214,682; of these no less than 98,477, or nearly one-half, were foreigners. This foreign element—mainly drawn from Italy, France, and Spain, and engaged principally in retail trade—is a very noticeable feature of Montevideo life.—A fort was built on the Cerro, by the Spaniards, in 1717, and the first settlement of the town made in 1726; a century later (1828) it became the capital of the newly-formed republic of Banda Oriental. Its later history will be found under URUGUAY. See books on the river Plate by Mulhall (5th ed. 1885) and Levey (2d ed. 1890), and Vincent's *Around and About South America* (1890).

Montez, LOLA, adventuress, was born in 1818 at Limerick, and was christened Marie Dolores Eliza Rosanna, her father being an Ensign Gilbert, her mother of Spanish descent. Taken out to India, she there lost her father by cholera; and, her mother having remarried, Dolores (or 'Lola') was sent home in 1826 to Europe, and brought up at Montrose, in Paris, and at Bath. To escape the match, arranged by her mother, with a gouty old judge, she eloped with a Captain James, whom in July 1837 she married at Neath; but the marriage ended in a separation and in her return from India (1842). She now turned dancer, coming out at Her Majesty's Theatre; and after visits to Dresden, Berlin, Warsaw, St Petersburg, and Paris (where she formed a *liaison* with Dujarrier, a young Republican editor, who fell in a duel), she came towards the close of 1846 to Munich. There she soon won an ascendancy over the eccentric artist-king, Louis I., who created her Countess of Landsfeld, and allowed her £5000 a year. For more than a twelvemonth she was all-powerful, her power directed in favour of Liberalism and against the Jesuits; but the revolution of 1848 sent her once more adrift on the world. Again she married (this time a Lieutenant Heald), a marriage as unlucky as the first; and, after touring (1851–56) through the States and Australia, and after two more 'marriages' in California, in 1858 she delivered in New York a series of lectures written for her by C. Chauncey Burr. She died, a penitent, at Astoria, Long Island, on 17th January 1861, her last four months devoted to ministering in a Magdalen asylum near New York, and was buried in Greenwood Cemetery. See her *Autobiography* (1858), and *The Story of a Penitent* (1867).

Montezuma, the name of two of the emperors of Mexico. Montezuma I., the most able of the Mexican emperors, ascended the throne about 1437, and soon after commenced a war with the neighbouring monarch of Chalco, which resulted in the annexation of that kingdom to Mexico. He next crushed a confederacy of the Tlascalans, and reigned safely till his death in 1471. Montezuma II., the last of the Mexican emperors, succeeded to the throne in 1502. Already distinguished as a warrior, henceforth he devoted his chief attention to the improvement of the laws, and indulged his taste for pomp and luxury at the cost of heavy taxation, leading to frequent revolts among his subjects. When Cortes landed in Mexico with his small army in 1519 Montezuma tried to buy off the dreaded enemy, but all his temporising could

not prevent the conqueror's progress to his capital. Soon he himself was practically a prisoner in the Spanish camp, and when the citizens rose in revolt Cortes brought out Montezuma in order to pacify them; but an accidental wound from a stone flung from amongst the crowd of his own subjects proved a climax to all the indignities he had suffered. He repeatedly tore the bandages from his wound, and soon after died broken-hearted, June 30, 1520. Some of his children adopted the Christian religion, and his eldest son received from Charles V. the title of Count of Montezuma. One of his descendants was viceroy of Mexico from 1697 to 1701. His last descendant, Don Marsilio de Teruel, Count of Montezuma, was banished from Spain by Ferdinand VII., and afterwards from Mexico, on account of his liberal opinions, and died at New Orleans in 1836. See CORTES.

Montferrat, formerly an independent duchy of Italy, between Piedmont, Milan, and Genoa, now forming part of the kingdom of Italy. It consisted of two separate portions, both lying between the Maritime Alps and the Po, and having a united area of over 1300 sq. m. The capital was Casale. After the downfall of the Frankish empire, Montferrat was ruled by its own marquises till the beginning of the 14th century. This house sent its most illustrious sons to take part in the Crusades, especially Conrad, the defender of Tyre against Saladin, and the competitor with Guy de Lusignan for the crown of Jerusalem; and Boniface, who became ruler of Thessalia. Iolande or Irene, sister and heiress of the last male of the house, was empress of Constantinople; her second son became the founder of the family of Montferrat-Palaologus, which became extinct in 1533, and Montferrat then passed to the Gonzagas of Mantua. In 1631 the Dukes of Savoy obtained a portion of Montferrat, and in 1703 the remaining portion.

Montfort, L'AMAURI, the name of a noble French house, traditionally descended from a marriage (end of 10th century) between the heiress of Montfort and Epemon and William of Hainault, great-grandson of Baldwin, Count of Flanders, the third husband of Judith, daughter of Charles the Bald. The name was taken from the castle of Montfort between Paris and Chartres. Its most famous members were the great Simon de Montfort and his father, Simon IV., Comte de Montfort and Earl of Leicester, subsequently Comte de Toulouse, the ruthless persecutor of the Albigenes. He was born about the year 1160, went on a fruitless crusade to Palestine, but began about 1208 the more congenial crusade of extermination against the harmless heretics in the south of France. He was killed by a stone at the siege of Toulouse, 25th June 1218. See ALBIGENSES.

Montfort, SIMON DE, Earl of Leicester, the fourth son of the preceding, and of Alice de Montmorency, was born about the beginning of the 13th century. The title of Earl of Leicester came to him by his grandmother, Amicia de Beaumont, sister and co-heiress of Robert, Earl of Leicester; and in 1230 we find him in England, where he was well received by Henry III., and confirmed in his title and estates two years later. He married in 1238 the king's youngest sister Eleanor, who had been betrothed to the Earl of Pembroke, and who, in the grief of an enthusiastic girl of sixteen, at his death had taken in her haste a vow of perpetual chastity, but never proceeded to take the veil. The marriage aroused the jealousy of the barons and the denunciations of the church, whereupon Simon repaired to Rome, and there succeeded by gold in obtaining the pope's sanction. In June 1239 he was godfather at the baptism of Prince Edward, but three months later

was denounced as an excommunicated man, and driven from his presence by the king. Simon crossed to France, but soon returned and was nominally reconciled. It is probable that he went on crusade to the Holy Land, but at anyrate he was again in England by 1242. We know but little of his life during the next six years, save that he lived the while at Kenilworth in intimate friendship with Robert Grosseteste, Bishop of Lincoln, and the learned Franciscan, Adam Marsh. Meantime the whole community was becoming exasperated by the misgovernment and faithlessness of the king, the extortionate exactions of the pope, and the fresh influxes of aliens on whom the court lavished its favours.

In 1248 Simon was sent as king's deputy to Gascony, and there he put down the prevalent disaffection with a heavy hand. But his jealous master listened eagerly to the complaints brought against his vigorous rule, and actually arraigned him before a special commission of inquiry, which only acquitted him after a lengthened trial. Earl Simon resigned his post in the winter of 1252-53, and returned to England, where he again comes into prominence in 1258 in the last act of the constitutional struggle. Bad harvests, famine, and fresh exactions of Rome, added to the rapacity of foreign parasites and protégés of the king, at length exhausted the endurance of the country, and in 1258 the barons appeared in arms at the parliament at Westminster, demanding the expulsion of all foreigners, and next the appointment of a committee of twenty-four—twelve from the king and twelve from the barons—to govern the realm. Later in the year the parliament met again at Oxford, and drew up the famous Provisions of Oxford, which the king swore solemnly to observe. A council of fifteen with a baronial majority was formed to advise the king; the old parliaments were superseded by a body of twelve chosen by the barons, to meet three times a year in order to transact business along with the fifteen; and foreigners were to surrender their castles—a self-denying ordinance in accordance with which, Simon himself set the example by giving up Kenilworth and Odiham. This was almost entirely a baronial policy, and did little for the sub-tenants, with whom Prince Edward now began to intrigue for influence, whilst ere long breaches followed amongst the barons themselves, so that by 1261 the king felt strong enough to announce that the pope had declared the Provisions null and void. All men now looked to Earl Simon as leader of the barons and the whole nation alike, and he at once took up arms against the king. After some varying success, both sides agreed to submit to the arbitration of Louis IX. of France, who decided in the *Mise of Amiens* for an unconditional surrender to the royal authority. London and the Cinque Ports at once repudiated the agreement, and Simon hastily collected his forces, surprised the king's army at Lewes, and captured the young prince, May 24, 1264.

After his victory he arranged the *Mise of Lewes*, by which matters were anew to be submitted to arbitration. There were to be three electors, Earl Simon, the Earl of Gloucester, and the Bishop of Hereford, who were to appoint nine councillors to nominate the ministers of state. To aid these councillors in their task a parliament was called, in which, together with the barons, bishops, and abbots, there sat four chosen knights from each shire, and for the first time two representatives from certain towns. This was the fullest representation of England that had yet been convened, and may be looked upon as in a special sense the germ of our modern parliaments. But the great earl's constitution was premature; the barons soon

began to be dissatisfied with the rule of Simon the Righteous, the arrogance of his sons injured his influence, and the young Earl of Gloucester abandoned him and went over to the king. Prince Edward, escaping from confinement by a stratagem, combined with Gloucester and fell with vastly superior force upon Simon at Evesham, and completely defeated him, August 4, 1265. The earl died upon the field, and his body was barbarously mutilated by Edward's soldiers, but the people and the native clergy, with the true instinct of a democracy, cherished him as a saint. His memory was enshrined in song and ballad, and miracles were ascribed to him long after his death.—The famous *Song of Leves* is the most complete extant contemporary statement of the views of the constitutional party, of which Simon de Montfort was the champion and martyr. It was first printed by Thomas Wright in his *Political Songs* (1839) for the Camden Society, but a more adequate edition, furnished with introduction and notes, is that by C. L. Kingsford (Oxford, Clarendon Press, 1890).

See Blaauw, *Barons' War* (1844; 2d ed. 1871); vol. ii. (1876) of Stubbs' *Constitutional History of England*; and the special Lives by Reinhold Pauli (1867; Eng. trans. by Una M. Goodwin, 1876), M. Creighton (1876), and especially G. W. Prothero (1877).

Montgolfier, JOSEPH MICHAEL (1740-1810), and JACQUES ETIENNE (1745-99), two brothers, the sons of a manufacturer at Annonay, distinguished as the inventors of the first kind of Balloons (q.v.).

Montgomerie, ALEXANDER, Scottish poet, was born most probably at Hessilhead Castle, near Beith, in Ayrshire, about 1545. He was related to the noble House of Eglinton, was first in the service of the Regent Morton, next of the king, and was awarded a pension of 500 merks a year. Traditionally he lived at Compton Castle, near Kirkcudbright, where enthusiastic readers have recognised the scenery of his principal poem. He travelled in France, Flanders, and Spain, was small in stature, given to drinking, and unhappy in his amours. He became devout in his later years, and was dead before 1615. Montgomerie had something of the tastes of the scholar, but his poems, especially the *Sonnets*, reveal a pitiful meanness and servility of character. His pasquinades are savage without being strong, his *Flying between Montgomerie and Polwart* [Sir Patrick Hume] merely coarse, vulgar, and unclean. It is a war of words in feeble imitation of the famous piece of Dunbar. Montgomerie's miscellaneous poems are mostly amatory in character, and are laboured in style; his devotional poems are poor; but his fame rests securely on the *Cherrie and the Slae*, which at once leapt into popularity, and really contains fine work, in spite of Pinkerton. Its earlier portion is a love-piece; the later, a moral and didactic poem. Here at least there is real freshness and descriptive power, with dexterous mastery of rhyme. There are editions by Dr David Irving (1821), and Dr J. Cranston for the Scottish Text Society (1886-87).

Montgomery, the capital of Alabama, is on the left bank of the Alabama River, some 400 miles above Mobile. It contains a fine state-house and a handsome Masonic hall, and has a large number of manufactories, including foundries, flour-mills, steam cotton-gins, a cotton factory, and oil-works. Several railways meet here, and the river is navigable for steamboats all the year round; an active trade is carried on, and large quantities of cotton, especially, are shipped. Montgomery became capital of Alabama in 1847, and was for a time the capital of the Confederate States. Pop. (1880) 16,713; (1890) 21,883.

Montgomery, a district of the Punjab, in the Multan division, and bounded by the Sutlej. The area is 5574 sq. m.; pop. (1881) 426,529. Its capital, Montgomery, midway between Lahore and Multan, has but 3500 inhabitants. It was named in 1865 after the governor of the Punjab.

Montgomery, FLORENCE SOPHIA, a popular writer of books for children, is the daughter of Sir Alexander Leslie Montgomery, Bart., of The Hall, County Donegal. Her first book, *A Very Simple Story* (1867), was warmly praised by Whyte-Melville. Of its successors the chief are the widely popular but not entirely satisfactory *Misunderstood* (1869), *Thrown Together* (1872), *The Town Crier* (1874), *Seaforth* (1878), *Peggy*, and *other Tales* (1880), and *The Blue Veil* (1883).

Montgomery, GABRIEL, COMTE DE, a French knight of Scottish extraction, and an officer in the Scottish Guard of the king of France, was born about 1530. At a tournament given, 30th June 1559, by Henry II. in honour of his daughter's marriage with Philip of Spain, the king insisted upon young Montgomery entering the lists with him. Montgomery reluctantly complied, and, the shaft of his broken lance entering the king's visor at the eye, Henry was borne insensible from the ground, and so continued for eleven days, when he died. Montgomery, though blameless, felt it impossible to remain about the court, and retired to the family estate in Normandy, afterwards travelling in Italy and England. On the commencement of the religious wars in 1562 he returned to support the Protestant cause, and defended Rouen with great bravery. In the third religious war he was one of the leaders of the Protestants, and gained many advantages over the royalists in Languedoc and Béarn. During the massacre of St Bartholomew he happened to be in Paris, but escaped by the swiftness of his horse, and took refuge, first in Jersey, then in England. In April 1573 he appeared off Rochelle with a small fleet, but failed in accomplishing anything, and was obliged to retire. Next year, at the head of a band of Huguenots, he landed in Normandy, and commenced war there; but being compelled at last to surrender the castle of Domfront, where he had entrenched himself, he was carried to Paris; and although the general to whom he surrendered had assured him of his life, he was beheaded, 27th May 1574.

Montgomery, JAMES, minor poet, was born at Irvine, Ayrshire, 4th November 1771, the eldest son of a Moravian pastor, and at six was sent to Fulneck (q.v.) in Yorkshire. He there spent ten dreamy years, and then was dismissed as unfit for the ministry; but meanwhile he had read by stealth many of the poets, and had tried his own hand at verse-making. After four years of various employment—with a baker at Mirfield (from this place he ran away), a general dealer at Wath, and a bookseller in London—in 1792 he became clerk to the editor of the Radical *Sheffield Register*. In 1794 he started a weekly paper of his own, the *Sheffield Iris*; and this he continued to edit till 1825. In 1795 he was fined £20, and sentenced to three months in York Castle, for striking off some copies of a 'seditious' ballad; in 1796 it was £30 and six months for describing a Sheffield riot. Yet by 1832 he had become a moderate Conservative; and in 1835 he accepted from Peel a government pension of £150. He died, unmarried, at Sheffield, 30th April 1854. His collected Poetical Works (4 vols. 1849) include *The Common Lot* (1805), *The Wanderer of Switzerland* (1806), *The West Indies* (1809), *The World before the Flood* (1813), *Greenland* (1819), and *The Pelican Island* (1827). 'Bland and deeply religious,' these poems have outlived their vogue; but ten at least of his hymns

keep their place in the hymnals. His *Memoirs* by Holland and Everett (7 vols. 1854-56) is perhaps the worst Life in the language.

Montgomery, ROBERT, poetaster, was born at Bath in 1807, the son of one Gomery, a famous clown. In 1830 he entered Lincoln College, Oxford; in 1833 took his B.A. with a fourth class; in 1835 was ordained; and, with the exception of four years in Glasgow (1838-42), was minister of Percy Street Chapel, London, until his death at Brighton on 3d December 1855. Of his thirty-one works in verse and prose, two—*The Omnipresence of the Deity* (1828; 29th ed. 1855) and *Satan* (1830)—are still remembered, but only by Macaulay's onslaught in the *Edinburgh Review* for April 1830.

Montgomeryshire, an inland county of North Wales, 40 miles long and 35 broad, bounded NE. and NW. by the counties of Denbigh and Merioneth, E. by Shropshire, and S. and SW. by Radnorshire and Cardiganshire. Area, 773 sq. m., or 495,089 acres, of which more than one-third is laid down in permanent pasture, and 58,277 acres are under tillage. Pop. (1831) 65,700; (1881) 65,718; (1891) 58,003. Its surface is for the most part barren, and in places mountainous, Plinlimmon (2469 feet), on the Cardiganshire border, the Berwyn Mountains in the NE., and the Breidden Hills—some 12 miles E. of Shrewsbury—being the principal elevations; but towards the English border its character changes, and the predominating feature is that of a series of fertile and well-wooded valleys, in which grain of all kinds, but chiefly oats, is raised, and a small area is under cultivation as fruit orchards. On the uplands the soil is poor, and principally adapted for pasturing the large flocks of sheep reared thereon. The Severn, with its tributary the Vyrnwy, and the Dovey—alike noted for their fishing—are the most important rivers, whilst Offa's Dyke (q.v.) traverses the south-east corner of the county. The mineral wealth of Montgomeryshire is not great, but lead and zinc are mined, and slates, slabs, and limestone quarried. Of manufactures, that of Welsh flannel at Newtown is the most extensive. The county comprises nine hundreds, the municipal boroughs of Llanidloes and Welshpool, and sixty-eight parishes. One representative is returned to the House of Commons for the county, as also one for the Montgomeryshire district of boroughs—viz. Llanfyllin, Llanidloes, Machynlleth, Montgomery, Newtown, and Welshpool, which too are the chief towns. The County Council consists of fifty-six members.—The county town Montgomery is 7 miles S. of Welshpool. Pop. 1194.

Month. This, the earliest of the natural cycles to be observed, was at first reckoned from new moon to new moon. That period is now called a *lunation* by astronomers to distinguish from *sidereal month*, the time in which the moon passes round the ecliptic to the same star, and from the *tropical month*, reckoned from the moon's passing the equinox till she again reaches it. Those three periods are also called, respectively, synodic month = 29.5306 days, stellar month = 27.3217 days, and periodic month = 27.3216 days. The first, or 'lunar month' proper, consists of 29 days, 12 hours, 44 minutes, 3 seconds. The 'solar month' is the time which the sun takes to pass through 30° (see CALENDAR, CHRONOLOGY). From the month, by subdivision, was obtained the week, used by the Chaldeans, Indians, Egyptians, and others from prehistoric times; and as soon as the year became an object of measurement there were numberless attempts to reconcile the solar computation of time with the lunar. The Attic year was of twelve months, alternately 29 and 30 days long, each month being divided into three decades.

The Jews, Arabians, and Turks still reckon by the lunar months of 29 and 30 days, and are therefore compelled, like the ancient Greeks, to insert an intercalary or 'embolismic' month. The French republicans in 1793 divided the year into twelve months of 30 days, with five odd days (six in leap year) to be utilised as national festivals, each month being subdivided into three decades of 10 days each, as with the ancient Greeks. Another distribution of the months has since been suggested, should such opportunity again occur—viz.: 1st, 3d, 5th, 7th, 9th, 11th months, each 30 days; 2d, 4th, 6th, 8th, 10th months, each 31 days; and the remaining month 30 days in the ordinary year and 31 in leap year. The existing 'calendar' or 'civil' months are as irregular in length as they were left by the Romans; the 4th, 6th, 9th, and 11th having 30 days, the second 28 days (or 29 in leap year), and the seven others 31 days. To complicate this disorder, a month in English law is 'a lunar month or 28 days unless otherwise expressed;' 'a lease for twelve months is only for 48 weeks' (Blackstone, ii. 141). Besides the archaic division of the month into four, as already mentioned, the early Greeks of Homer's time and previously seem to have had only two parts, the earlier half and the 'waning half;' and a trace of that probably remained in the Roman *Ides*, the middle or dividing day of each month.

Montholon, CHARLES TRISTAN DE, Count of Lee, an associate of Napoleon I. at St Helena, was born at Paris, 1782. Having served six years in the navy, he entered the army in 1798, and took part in a number of campaigns, being severely wounded at Wagram. Napoleon made him his chamberlain in 1809, and entrusted him with minor diplomatic missions. During the Hundred Days, after the emperor escaped from Elba, Montholon was Napoleon's adjutant-general. He accompanied his master to St Helena, and along with Gourgaud published *Mémoires pour servir à l'Histoire de France sous Napoléon, écrits à Ste-Hélène sous sa dictée* (8 vols. Paris, 1822-25). He afterwards published *Récits de la Captivité de Napoléon à Ste-Hélène* (1846). In the proclamations which Louis Napoleon issued on his landing at Boulogne in 1840, Montholon was named chief of his staff, and on this account was condemned by the Chamber of Peers to twenty years' imprisonment; he regained his freedom after the February revolution (1848), having published in 1846 *Récits de la Captivité de Napoléon à Ste-Hélène* (2 vols.). He died 24th August 1853.

Monthyon. See MONTYON.

Monti, VINCENZO (1753-1828), an Italian poet of the classical school, remarkable for his political tergiversation, anti-French, Napoleonist, pro-Austrian in turn. He was professor at Pavia, and, under Napoleon, state historiographer. His translation of the *Iliad* is admirable.

Montilla, a town of Spain, 23 miles SSE. of Cordova by rail. Pop. 13,207.

Montjole St Denis, the French war-cry, old at least as Wace's day (12th century), from the hill near Paris on which St Denis (q.v.) underwent the joy of martyrdom. See HERALD.

Montluçon, a town in the French department of Allier, on a castle-crowned hill whose base is washed by the Cher, 202 miles S. of Paris. It owes its rapid development to the opening up of the Commeny coalfield, and has large iron-works and plate-glass manufactories. Pop. (1872) 20,251; (1886) 26,250. Néris-les-Bains, 18 miles SE., is the *Neriomagus* of the Romans—of whom many traces are left—and since 1821 has again risen into repute through its warm alkaline mineral waters (126° F.). Pop. 1675.

Montmartre. See PARIS.

Montmédy, a town and fortress in the French department of Meuse, 25 miles N. of Verdun and 31 miles by rail SE. of Sedan, consists of two portions, the citadel and upper town overlooking the lower town, which lies in the valley of the Chiers, a tributary of the Meuse. Built and fortified in 1235, it was taken by the French in 1542, 1555, 1596, and 1657; they, after it was definitely assigned to them by the peace of the Pyrenees (1659), had it reconstructed and re-fortified by Vauban. It was, however, captured by the Germans in 1815 and again in 1870. Pop. 2740.

Montmorency, a river of Quebec, a tributary of the St Lawrence, famous for its beautiful falls, 8 miles NE. of Quebec. Here the stream is 100 feet wide, and the falls have a sheer descent of 250 feet.

Montmorency, ANNE, first DUC DE, Marshal and Constable of France, born 15th March 1492, belonged to one of the oldest and greatest of the noble families of France. Brought up along with Francis I., he distinguished himself by his gallantry and military skill at Marignano (1515) and in the defence of Mézières, and was taken prisoner along with his sovereign in the battle of Pavia (1525). In consequence of his efforts to win his master freedom, and his successful warring against the emperor's armies, he was made Constable in 1538; but, being suspected by the king of siding with the Dauphin against him, he was banished from court in 1541. On the accession of Henry II. (1547) he was restored to his former position and dignities. In 1557 he commanded the French army which suffered the terrible defeat of St Quentin at the hands of the Spaniards, in which he was again taken prisoner. During the minority of Charles IX. Montmorency, with the Duke of Guise and the Marshal St André, composed the triumvirate which opposed the influence of Catharine de' Medici. In 1562 he commanded the royal army against the Huguenots at Dreux, and was taken prisoner a third time. In the following year he drove the English out of Havre. He again engaged Condé at St Denis (1567), but received a fatal wound, of which he died at Paris on the following day, 11th November 1567. See Life by Decrue (2 vols. Paris, 1885-89).

Montmorency, HENRI, second DUC DE, grandson of the famous Constable de Montmorency, was born at Chantilly, 30th April 1595. His godfather was Henry IV., who always called him his 'son.' When he was seventeen years of age Louis XIII. made him admiral and viceroy of Canada, and in the following year governor of Languedoc. During the religious wars of 1621 and the following years Montmorency commanded the Catholics in the south against Rohan, was almost captured at the siege of Montpellier (1622), took the islands of Ré and Oléron from the defenders of Rochelle (1625), and penetrated into Piedmont (1630). But Richelieu, jealous of his popularity, provoked him into rebellion along with the king's brother, Gaston, Duke of Orleans. Marshal Schomberg was sent against him, defeated him at Castelnaudary, and took him prisoner. Montmorency, covered with wounds, was carried to Toulouse, sentenced to death by the parliament, and, notwithstanding the intercession of King Charles I. of England, the pope, the Venetian Republic, and the Duke of Savoy, was beheaded, 30th October 1632. Montmorency was distinguished for his amiability and the courtesy of his manners, as well as for his valour.

Montoro, a town of Spain, on the Guadalquivir, 26 miles ENE. of Cordova. Pop. 13,293.

Montpelier, the capital of Vermont since 1805, is on the Winoski or Onion River, 206 miles by

the trade of Duluth and Fort William on Lake Superior, of Chicago and Milwaukee on Lake Michigan, Collingwood and Goderich on Lake Huron, Buffalo and Cleveland on Lake Erie, Hamilton, Toronto, Kingston, and Oswego on Lake Ontario. These canals afford a continuous course of water-communication extending from the Straits of Belle Isle to Port Arthur at the head of Lake Superior, a distance of 2260 miles. The aggregate length of the St Lawrence canals is 70½ miles. Montreal is the headquarters of the Grand Trunk Railway, the Canadian Pacific Railway, the South-Eastern Railway, the Central Vermont Railway. These great roads open up by means of various connections the whole railway-system of the United States and Canada, and the Canadian Pacific Railway has a through line from Montreal to Vancouver City in British Columbia, a distance of 2906 miles. In the boot and shoe manufacture over 3000 hands are employed, in clothing-factories over 2500, in tobacco-factories about 3000, in the breweries about 500; and in the workshops of the railways an army of men are employed. There are also rubber-factories, sawmills, sack-factories, tool-factories, silk-factories, cotton-mills, and an endless variety of small industries which receive encouragement from the protection afforded by the tariff. Montreal has therefore been strongly in favour of the protective system.

Of the Episcopal churches, Christ Church Cathedral has a tower 224 feet in height, and St George's of 230 feet. The Catholic churches are numerous and some of them splendid: St Peter's Church is a repetition on a smaller scale of the church at Rome; Notre Dame holds 10,000 people; St Patrick's is the church of the Irish Catholics. In the French churches the preaching is generally in the French language. The Presbyterians have eight larger and several smaller churches, the Methodists have eleven, and other denominations also are well represented. In all there are seventy-four churches in the city. Education in Montreal is conducted under the law of the province of Quebec. It is denominational in character, the vast majority of the schools being of course Roman Catholic. The Protestant schools are under the control of a special board. The taxes on Catholics go to the Catholic schools, the taxes on Protestants to Protestant schools. McGill University, which obtained its charter in 1821, has been an active establishment since 1852; over 1200 graduates claim it as Alma Mater. Laval University of Quebec has a branch at Montreal; the seminary of St Sulpice, founded in 1657, is a theological institution, training about 300 pupils at one time; the Presbyterian College, chartered in 1865, has an endowment and property amounting to over a quarter of a million of dollars; the Wesleyan Theological College was founded in 1873; and others in the long list are the Congregational College, the Anglican Diocesan College, St Mary's College, founded in 1848 by the Jesuits, the academic hall of which holds 1200 people, and the pupils in attendance numbering about 350, the Jacques Cartier Normal School, under the control of the provincial government, the Christian Brothers' Schools, the schools and convents of the congregation of Notre Dame, the schools and convents of the Sacred Heart. McGill College has a library of 25,000 volumes, the Advocates' Library has 15,000 volumes, the Presbyterian College Library 10,000 volumes; the Mechanics' Institute, the Fraser Institute, and the Y.M.C.A. have also libraries of some value. There are about fifty papers published in the city, including six French and five English dailies, and ten French and eight English weeklies. The *Quebec Gazette* (1764) was the first paper published in Canada; the *Montreal Gazette* (1778) is the next oldest, and

is the leading journal still. There are musical, art, and historical associations also which maintain in Montreal a taste for art, literature, and science not common in colonial commercial cities. Among the chief philanthropic institutions are the General Hospital, costing \$40,000 a year; the Protestant House of Industry, to which 20,000 people a year have access; the Y.M.C.A. building; the Dispensary, aiding about 10,000 persons a year; the Gray Nuns' Hospital (1755), which is also a founding hospital; the Hôtel Dieu (1644), with 350 beds, receiving over 3000 persons per annum, and costing about \$35,000 a year for maintenance.

History.—Montreal was purchased from the president of the Hundred Associates of France, a trading corporation, by Abbé Olier and Dauversière, who were moved by religious enthusiasm to establish institutions there; it was actually founded by Maisonneuve, the leader and military head of the enterprise of Olier and Dauversière, who landed at Montreal (*Ville-Marie de Montreal*) on the 18th May 1642. The early history of the city was one of continuous struggles against the Iroquois Indians, by whom the whole island was more than once devastated up to the very palisades of the town's defences; and in 1660 the Indians almost exterminated the population not actually within the feeble defences. In 1722 the city was fortified with a bastioned wall and ditch. In September 1760, the year following the capture of Quebec by Wolfe, Montreal was surrendered by the French governor, De Vaudreuil, to the British, under Lord Amherst and General Murray. In 1776-77 the city was occupied by the invaders from the revolted colonies, who did their best to coerce or cajole the Canadians into joining in the rebellion. In 1777 the British forces advanced from Quebec, and Montreal was evacuated by the invaders. Since that time the history of the city has been peaceful. The war of 1812-14 did not disturb its progress. The rebellion of 1837 for a moment ruffled its political serenity; but all its modern history has been the history of constitutional development, of business progress, of educational advancement, and of growth in population.

Montreux, a group of villages on the north shore of the Lake of Geneva, 15 miles by rail SE. of Lausanne. The name properly belongs to one small hamlet, but is popularly extended so as to include the adjoining villages of Clarens, Vernex, Veytaux, &c., with a population of 8019. The beautiful situation and mild climate of 'the Swiss Nice' attract many invalids to the place, which abounds with hotels and *pensions*. Near it is the castle of Chillon. See Steiger's *Der Kurort Montreux* (Zur. 1886).

Montrose, a seaport of Forfarshire, 76 miles NNE. of Edinburgh and 42 SSW. of Aberdeen. It stands on a level peninsula between Montrose Basin (a tidal loch, measuring 2 by 1½ miles, but almost dry at low-water) and the mouth of the river South Esk. A fine suspension bridge (1829), 432 feet long, leads to Inchbrayock or Rossie Island, in the Esk's channel, and is continued thence by a drawbridge; and there is also a railway viaduct (1883). Montrose has a plain town-hall (1763-1819); a large parish church (1791-1834), with a steeple 200 feet high; an academy (1820); a lunatic asylum (1868), 2 miles NNW.; good links; and a wet-dock (1840). The foreign trade—timber its staple—is chiefly with the Baltic and Canada; and the average tonnage of ships entering the port exceeds 90,000 tons per annum. Flax-spinning is the principal industry; and ropes, canvas, soap, &c. are also manufactured. Montrose was the birthplace of Robert Brown, botanist; Joseph Hume; Sir Alexander Burnes;

and Paul Chalmers, R.S.A. It has memories, too, of Edward I., the two Melvilles, the Great Marquis, the Old Pretender, Dr Johnson, and Lola Montez. A royal burgh since 1352 and earlier, it unites with Arbroath, Brechin, Forfar, and Bervie to return one member to parliament. Pop. (1851) 15,238; (1881) 14,973; (1891) 13,048. See Mitchell's *History of Montrose* (Montrose, 1866).

MONTROSE, JAMES GRAHAM, MARQUIS OF, belonged to a family which can be traced back to the year 1128, and which since 1325 had been settled at Old Montrose, in Maryton parish, Forfarshire, near Montrose town. It had been ennobled with the titles of Lord Graham (1451) and Earl of Montrose (1505); and three of its members had fallen at the battles of Falkirk, Flodden, and Pinkie; whilst another, Sir William Graham, early in the 15th century married for his second wife Mary, daughter of Robert III.—a marriage from which sprung the Grahams of Claverhouse. John, third Earl of Montrose, was chancellor and, after James VI.'s accession to the English crown, viceroy of Scotland. His successor, John, married Lady Margaret Ruthven, eldest sister of the unfortunate Earl of Gowrie; and the issue of this union was five daughters and one son, James, the 'great marquis,' who was born in 1612 at Old Montrose. His mother died in 1618, his father in 1626. Next year the young earl was sent to the university of St Andrews by his guardian and brother-in-law, Archibald Lord Napier, son of the famous inventor of logarithms. He was proficient in all field-sports, and an apt if not ardent student, besides exhibiting a genuine love of literature, which his stormy after-life never destroyed. In 1629 he married Magdalene Carnegie, daughter of the first Earl of Southesk, and he lived at Kinnaird Castle, his father-in-law's seat, till in 1633, on attaining his majority, he left Scotland to travel in Italy, France, and the Low Countries.

On his way home, in 1636, he had an audience with Charles I., but, owing to the machinations of the Marquis of Hamilton, was coldly received; and he had not been long back in Scotland before by the 'canniness of Rothes' he was 'brought in' to the ranks of the king's opponents, at this time comprising the great mass of the Scottish nation. Montrose returned in the very year (1637) when the tumults broke out in Edinburgh on the attempt to introduce Laud's Prayer-book; and he was one of the four noblemen selected to compose the 'Table' of the nobility, which, along with the other Tables of the gentry, the burghs, and the ministers, drew up the famous National Covenant (q.v.). In the summer of 1638 he was despatched to Aberdeen, to coerce it into subscription; and in 1639 he made three military expeditions thither. On the first occasion (30th March) he employed conciliation; Baillie laments his 'too great' humanity. On the second (25th May) he imposed on the city a fine of 10,000 merks, but, though his soldiers committed some acts of pillage, he resisted the importunities of the Covenanting zealots to give 'Meroz' to the flames, and Baillie again complains of 'his too great lenity in sparing the enemy's houses.' The arrival at Aberdeen by sea of the Earl of Aboyne, Charles's lieutenant of the north, with reinforcements, caused Montrose to retreat, followed by the earl and the Gordon Highlanders; but at Meagra Hill, near Stonehaven, on 15th June, he won a complete victory, and four days later, after storming the Bridge of Dee, he was once more master of Aberdeen. The citizens expected some bloody punishment for their well-known Episcopalian leanings, but again Montrose agreeably disappointed their fears, again to be upbraided by the Committee of Estates for not having burned the town.

News now arrived of the 'pacification of Berwick,' and terminated the struggle in the north. Charles invited several of the Covenanting nobles to meet him at Berwick. Among those who went was Montrose; and the Presbyterians dated what they regarded as his apostasy from that interview. His political position was certainly different after his return. In the General Assembly which met in August 1639 he showed symptoms of disaffection towards the Covenant; and one night, it is said, a paper was affixed on his chamber-door, '*Invictus armis, verbis vincitur*.' In the second Bishops' War, when, on 20th August 1640, 25,000 Scots crossed the Tweed, Montrose was the first to plunge into the stream; but that very month, with eighteen other nobles and gentlemen, he had entered into a secret engagement at Cumbernauld against the dictatorship of Argyll, to whom and the zealots Montrose was as hostile now as he ever had been to Hamilton and the 'sometime pretended prelates.' It leaked out that he had been secretly communicating with the king; and when the Scottish parliament met (November 1640) he was cited to appear before a committee. The affair of the 'Cumbernauld Bond' was brought up; but nothing came of it, though some of the fiery spirits among the clergy 'pressed,' says Guthrie, 'that his life might go for it.' Next June Montrose with three others was accused of plotting against Argyll, and confined till November in Edinburgh Castle. Clarendon's story that Montrose, about this period, offered to the king to assassinate Argyll and Hamilton may safely be set aside; but to Hamilton he owed the rejection of his two proposals in the following year to raise the royalist standard in the Highlands.

In 1644, however, he quitted his forced inaction at Oxford, where he had been residing with Charles, and, disguised as a groom, made his way into Perthshire, with the rank of lieutenant-general in Scotland and the title of Marquis of Montrose. At Blair-Athole he met 1200 Scotch-Irish auxiliaries under Alister Maccoll Keitache Macdonell ('Col-kitto'), and placed himself at their head, the clans quickly rallying round him. Marching south, on 1st September he fell on the Covenanting army, commanded by Lord Elcho, at Tippermuir, near Perth, and gained a signal victory. He next defeated a force of Covenanters at Aberdeen (13th September), and took possession of the city, which was this time abandoned for four days to all the horrors of war. The approach of Argyll, at the head of 4000 men, compelled Montrose, whose forces were far inferior in numbers and discipline, to retreat. He plunged into the wilds of Badenoch, recrossed the Grampians, and suddenly appeared in Angus, where he wasted the estates of more than one Covenanting noble. Having obtained fresh supplies, he once more returned to Aberdeenshire, with the view of raising the Gordons; narrowly escaped defeat at Fyvie in the end of October; and again withdrew into the fastnesses of the mountains. Argyll, baffled, returned to Edinburgh, and threw up his commission. Montrose, receiving large accessions from the Highland clans, planned a winter campaign, marched south-westward into the country of the Campbells, devastated it frightfully, drove Argyll himself from his castle at Inveraray, and then wheeled north intending to attack Inverness. The 'Estates' at Edinburgh were greatly alarmed, and, raising a fresh army, placed it under the command of a natural son of Sir William Baillie of Lamington. He arranged to proceed by way of Perth, and take Montrose in front, while Argyll should rally his vast array of vassals, and fall on him in the rear. The royalist leader was in the Great Glen of Albin, the basin of the Caledonian

Canal, when he heard that Argyll was following him. He instantly turned on his pursuer and surprised and utterly routed him at Inverlochy, 2d February 1645. Fifteen hundred of the Campbells were slain, only four of Montrose's men. He then resumed his march northward, but did not venture to assault Inverness, his wild mountaineers being admirably fitted for rapid irregular warfare, but not for the slow work of beleaguering. So, directing his course eastward, he passed with fire and sword through Moray and Aberdeenshire. Baillie and Hurry, his lieutenant, were at Brechin, but Montrose by a dexterous movement eluded them, captured and pillaged Dundee (3d April), and escaped safely into the Grampians. On 4th May he routed Hurry at Auldearn, near Nairn, and on 2d July inflicted a still more disastrous defeat on Baillie himself at Alford in Aberdeenshire. 'Before the end of the summer,' he sent word to Charles, 'I shall be in a position to come to your Majesty's aid with a brave army;' and towards the end of the month he marched southward with upwards of 5000 men. He was followed by Baillie, who picked up reinforcements by the way, and who on 15th August again risked a battle at Kilsyth, but was defeated with frightful loss, 6000 of the Covenanters being slain. This, the last and most signal of Montrose's six splendid victories, seemed to lay Scotland at his feet, but the clansmen slipped away home to secure their booty, and Aboyne withdrew with all his cavalry. Still, with 500 horse and 1000 infantry, he had entered the Border country, when, on 13th September, he was surprised and hopelessly routed by 6000 troopers under David Leslie at Philiphaugh, near Selkirk. Escaping to Athole, he again endeavoured, but vainly, to raise the Highlands; and on 3d September 1646 he sailed for Norway, whence he proceeded to Paris, Germany, and the Low Countries.

Here it was that news reached him of Charles I.'s execution, whereat he swooned, and then reviving, 'swore before God, angels, and men to dedicate the remainder of his life to the avenging the death of the martyr.' So, on behalf of Charles II., he undertook a fresh invasion of Scotland, and from Orkney passed over to Caithness, his little army almost annihilated by shipwreck. Neither gentry nor commons would join him; but he pushed on to the borders of Ross-shire, where, at Invercharron, his dispirited remnant was cut to pieces by Strachan's cavalry, 27th April 1650. He fled into the wilds of Sutherland, and was nearly starved to death, when he fell into the hands of Macleod of Assynt, who sold him to Leslie. He was conveyed with all possible contumely to Edinburgh, where, dressed like a gallant bridegroom, he was hanged in the Grassmarket on a lofty gallows, 21st May 1650. Eleven years afterwards his mangled remains were collected from the four airts, and buried in St Giles's, where a stately monument was reared to him in 1888. He left a son, James, the 'good Marquis' (c. 1631-69), whose grandson in 1707 was created Duke of Montrose.

Montrose's few poems, all burning with passionate loyalty, are little known, save the one famous stanza commencing, 'He either fears his fate too much.' That has the right ring, one would think; and yet its ascription to Montrose is doubtful, first put forward in Watson's *Collection of Scots Poems* (1711). There are four portraits of Montrose—by Jameson (1629 and 1640), Dobson (1644), and Honthorst (1649). Of the inner man the finest estimate is Mr Gardiner's: 'When once he had chosen his side, he was sure to bear himself as a Paladin of old romance. If he made any cause his own, it was not with the reasoned calculation of a statesman, but with the fond enthusiasm of

a lover. When he transferred his affections from the Covenant to the king, it was as Romeo transferred his affections from Rosaline to Juliet. He fought for neither King nor Covenant, but for that ideal of his own which he followed as Covenanter or Royalist. He went ever straight to the mark, impatient to shake off the schemes of worldly-wise politicians and the plots of interested intriguers. Nature had marked him for a life of meteoric splendour, to confound and astonish a world, and to leave behind him an inspiration and a name which would outlast the ruins of his hopes.'

See the Latin Memoirs by his chaplain, Dr Wishart (Amst. 1647; Eng. trans. 1756); Mark Napier's *Memoirs of Montrose* (1838; 4th ed. 1856); Lady Violet Greville's *Montrose* (1886); and Mr S. R. Gardiner's *History of England* (vols. viii.-x. 1884), *Great Civil War* (vols. i.-ii. 1886-89), and article in the *Dict. of Nat. Biog.* (vol. xxii. 1890).

Montserrat (Lat. *Mons Serratus*, so named from its saw-like outline), a mountain of Catalonia, in north-east Spain, 30 miles NW. of Barcelona. Its height is 4055 feet; and 'its outline,' says Ford, 'is most fantastic, consisting of cones, pyramids, buttresses, ninepins, sugar-loaves.' The pious Catalonians aver that it was thus shattered at the Crucifixion. Every rift and gorge is filled with box-trees, ivy, and other evergreens. From the topmost height the eye wanders over all Catalonia. The mountain, however, owes its celebrity to the Benedictine abbey built half-way up it, with its wonder-working image of the Virgin, and to the thirteen hermitages formerly perched like eagles' nests on almost inaccessible pinnacles. In 1811 the French, under Suchet, plundered the abbey, burned the library, shot the hermits, and hanged the monks (who had given shelter to their emigrant brethren at the Revolution). The place suffered still more in 1827, when it became the stronghold of the Carlist insurrection.

Montserrat, one of the Lesser Antilles, belonging to Britain, lies 27 miles SW. of Antigua. It is about 11 miles in length, 7 in breadth, and has an area of 32 sq. m. Pop. (1881) 10,083, of whom 1400 were at Plymouth, the chief town. Estimated pop. (1887) 11,000. The surface is very mountainous (3000 feet), and heavily timbered. Sugar and limes and lime-juice are the principal products. The island, governed by a president and a legislative council, is the healthiest in the West Indies. The imports average nearly £25,000, and the exports £21,100. The island was discovered in 1493, and colonised by the British in 1632. It has remained in their hands ever since, except for two short intervals (1664-68 and 1782-84), when it was in the possession of France.

Mont St Michel. See ST MICHEL.

Montyon Prizes, rewards for signal instances of disinterested goodness discovered throughout the year, awarded by the French Academy, according to the will of Jean-Baptiste-Robert Auger, Baron de Montyon (1733-1820), who bequeathed £120,000 to public hospitals, and the remainder of his fortune to give sums of money to poor patients on leaving Paris hospitals, and to found the prizes since connected with his name. Already in 1782 he had originated the prize of virtue, but on his return to France in 1815 he arranged the scheme in its final form. The Academy of Sciences awards annually a prize of 10,000 francs to the individual who has discovered the means of making any mechanical occupation more healthy, another of equal value for improvements in medicine and surgery; while the Forty themselves award the prize of virtue, and another to the writer of the work likely to have the greatest beneficial influence on morality—both alike of 10,000 francs a year.

manner in which the moon moves over the surface of the sky, changing place like a driving cloud, though not with the same rapidity.

We can reduce all such motions to movements in the two easily-noted directions, first, *north* and *south*; secondly, *east* and *west*. And it is most convenient to take the sun as our point of reference. Sometimes the moon is north of the sun, and sometimes south, sometimes east of it, and sometimes west. It moves, then, in *both* of our two directions. But when we compare the east and west motion with the north and south we soon note an important difference. The east and west motion is continuously and steadily *from west to east*, carrying the moon right round the heavens; starting at new moon near the sun, and progressing until at full moon nearly the whole breadth of the sky separates them; then still progressing, until the sun is approached again from the opposite side. In fact, if the sun stood still at its setting for a lunar month, we should see the moon soar steadily *upwards* in the western sky, cross the whole expanse of heaven, and pass down below the eastern horizon. Then it would continue its course, returning to the sun, *beneath our feet*, and reach nearly its original position. To perform this cycle the moon takes 29·53 days, which is called its *synodical period*. If we took a bright star as the starting-point and goal of the moon's circle, instead of the sun, we should find the moon only take 27·32 days to return to the star. This is called the moon's *sidereal period*. The cause of the difference is that the star is steady in its position, while the sun slowly moves in his annual course in the same direction as the moon, which therefore has to *overtake* the sun when returning to him. Thus the motion from west to east is always in the same direction; but this is not the case with the north and south motion. While performing its cycle from west to east, say in the month of March, the moon begins by travelling northward at first, but latterly swings as far southward. In autumn the reverse is the case (see below). In December full moon occurs at the most northern point of its course, and in June at the southernmost. In winter, therefore, we have at *night* most light from the full moon, and in summer least. In March the *evenings* have least moonlight, and in September they have most. Attentively considering all these movements, we soon see that the moon travels round the earth in a curve not differing very much from a circle, for as it always appears nearly of the same size, it must remain constantly at nearly the same distance from the earth.

We have now almost insensibly passed from the observation of apparent motions to the idea of an *orbit* or *path*, which the moon traverses. And this leads at once to the consideration of the nature of this orbit, or the moon's *real* motions. Accurate observation reveals that the moon's distance from the centre of the earth is not the same in different parts of its orbit. It varies in apparent diameter from a maximum of 33' 31" to a minimum of 29' 21". As this variation forbids the idea that the orbit is a circle concentric with the earth, so it also forbids the idea that it is a circle eccentrically placed in regard to the earth. The true form is found to be that of an ellipse having an eccentricity of 0·05491, with the earth in one of the foci. This ellipse is, however, continually distorted by various *inequalities* to be noticed hereafter, chiefly due to the sun's attractive energy, which continually contends with that of the earth for the mastery over its satellite.

The lunar orbit is inclined to the ecliptic (or earth's orbit) at an angle of 5° 8' 40". The points where the two intersect are called the *Nodes* (q.v.), and the line joining them the *line of nodes*. The

point of her orbit nearest the earth is the *perigee*, that most distant is the *apogee*, and the line joining them is called the *line of apsides*. Both the line of nodes and line of apsides change their place, the former turning completely round in 6793·391 days = 18·6 years, the latter in 3232·57 days = nearly 9 years. These motions take place, however, in opposite directions: the line of apsides revolves *with* the moon's orbital motion, the line of nodes *against* it. These motions are due to the sun's disturbing influence (see PERTURBATIONS). Each day, on an average, the moon describes 13° 10' 35" of the circle of her path. To do this requires, at its distance, an actual velocity of 2273 miles per hour. This velocity is found to be exactly what is required to balance the moon's *weight*, supposing that to be reduced in proportion to the square of its distance from the earth. Thus Newton concluded that the force retaining the moon in its orbit is simply its *weight*, or the mutual gravitation between it and the earth. This conclusion is verified by the elliptic form of the orbit, and the place of the earth in one focus. For an orbit of this form is produced by a force varying inversely as the square of the distance. Both the form of the orbit, then, and the varying nature of the force governing it, as well as the powerful disturbing influence of the sun, cause variations in the moon's velocity. Usually these are allowed for by taking as a foundation the *mean* or average angular velocity given above, and considering its variations under the title of *inequalities*, which must all be allowed for if the moon's place in the sky is to be predicted with accuracy at any time.

First in order is the *elliptic inequality* discovered by Hipparchus. It is caused by the quicker or slower motion of the moon as it passes over the nearer or more distant parts of its elliptic orbit. Its value is 6' 18" nearly. Secondly, there is the *annual equation* (discovered by Tycho Brahé), a *yearly* effect, arising from the increase and diminution of the sun's disturbing force, as the earth approaches or leaves the sun in its annual course. This amounts to 11' 10", and, as our earth is nearer the sun in winter and farther off in summer, it causes the moon to be behind its mean place in the first part of the year and before it in the later months. Thirdly, there is the *variation* (discovered by Abul-Wefa). This arises from the changes in direction and amount of the sun's disturbing force, which are caused by the moon's motion in its own orbit. Its effect on the moon's longitude may amount to 39' 31". Fourthly, there is the *evection*, depending on the position of the axis of the moon's orbit, and the line of nodes, with regard to the sun. Its effects are complicated, but may amount to 1° 16' 27" on the moon's longitude, and 8' 57" on its latitude.

Besides these, the *parallactic inequality* is interesting, as giving a means of calculating the sun's distance from our earth. The sun's disturbing action varies in amount as the moon in its orbit is nearest or farthest away from the sun. This variation depends on the ratio of the moon's distance to that of the sun; so that, knowing the amount of the inequality and the distance of the moon, a value may be found for the sun's distance. Hansen showed by this means that the value long received for the sun's distance required to be diminished. See PARALLAX, SUN.

The *secular acceleration* of the moon was discovered by Halley in 1693 from a comparison of the times of Eclipses (q.v.) many centuries apart. This inequality is an increase of the moon's mean motion by about 12" per century. It is partly due to a slow change in the form of the earth's orbit, by which the sun's disturbing force is slightly *lessened*, which is equivalent to an increase of the

earth's attractive force, whereby the moon's angular velocity is increased. This part will, however, compensate itself in the course of ages. It is partly also due to a slow lengthening of the day—i.e. the period of the earth's rotation, which arises from the frictional action of the tides, that act like a brake upon the earth's surface. This portion remains uncompensated, of course.

The moon's distance from the earth is obtained by observations of its place from two widely-separated stations, such as the observatories at Greenwich and the Cape of Good Hope. If simultaneously observed from these, the moon will not appear to both observers in the same position among the stars; the amount of difference in apparent position depending on its distance from the earth at the time. From this difference is deduced the moon's *horizontal* parallax. This is the change in the moon's place which would be noted by an observer on shifting his place from the centre of the earth to a point on its surface where the moon would be seen on the *horizon*. The moon's mass being very nearly $\frac{1}{81}$ th of the earth's, the force of lunar gravity at the moon's surface is then such that any object would weigh there only 0.15 of its weight at the earth's surface, and a falling body would there only traverse 2.48 feet in the first second of its course. The moon's rotation on its axis agrees in period with its revolution round the earth, so that, as has been said, we have

tion. The delicate colouring and shade of terrestrial scenery is entirely absent. All is marked in white and black, or in various shades of yellowish gray. Nothing like mist, cloud, or vapour has ever been seen, except in some doubtful instances on the floor of the crater Plato, or other deep depressions. There is neither water to furnish vapour, nor atmosphere fit to bear clouds. Observation of the stars occulted by the moon (see OCCULTATIONS) confirms this, and, if there be even an attenuated atmosphere, it cannot have more than $\frac{1}{1000}$ th of the surface-density of our own. Bessel's maximum value for this of $\frac{1}{1000}$ has been shown by Neison to be too small, and it is not improbable that the moon possesses an atmosphere of extreme rarity, having a surface-density of probably about $\frac{1}{1000}$ th that of the earth. Vegetation and animal life appear to be equally absent from the moon, and the best modern theories of its state require us to regard the surface as either bare rock and sand, or as ice and snow. These theories have arisen in the attempt to explain the strange forms of the lunar surface. These forms have been classified, and the arrangement commonly in use is followed here as convenient. But it must not be regarded as a really scientific one. For some formations, while in their general aspect belonging to one class, might really be assigned to other classes in other respects.

The term *Mare* (Lat.) has been applied to the large dark plains, an example of which is the *Mare Crisium*, easily seen as an oval dark spot near the edge of the new moon. There are also large level areas which are brighter, and to which no special name has been attached. To one large irregular dark plain the title of *Oceanus Procellarum* has been given. The terms *Palus* (marsh), *Lacus* (lake), and *Sinus* (gulf) have been somewhat fancifully used to denote smaller dark areas.

Under the broad title *craters* have been grouped many formations, so different from one another that selenographers now divide them into walled plains, mountain-rings, ring-plains, crater-plains, craters, craterlets, crater-pits, crater-cones, and depressions—names expressive enough of more or less circular ramparts varying in size from 150 miles in diameter to a few hundred yards, and in depth, or height of walls, ranging from 18,000 feet downwards. In some parts of the lunar surface these literally swarm, crossing and interrupting one another, smaller ones perched on the edge or sides of larger ones, and, generally, in the flat bottom of the larger ones several of the smaller kinds are sure to be seen. Any moderately good telescope will show the larger kinds. Besides these there are the true

Fig. 2.—The Moon, first quarter (inverted, as seen through telescope). (From Photograph through the Great Lick Telescope, by Prof. S. W. Burnham.)

always the same side presented to our view. Occasionally, however, we see a little round one or other edge owing to *Libration* (q.v.).

From these conditions of size, density, and mass we should expect that, while presenting some features of agreement, in most respects the moon would differ widely from the earth in *physical condition*. Even to the naked eye some peculiarities are obvious. Attentively watching the full moon, we soon become familiar with its irregularly-spotted surface, which *never changes*. It cannot then be like that of the earth, which is often obscured by clouds and mist. The telescope confirms this impression. All the details of the lunar surface are hard, cold, and glaring in their delineation.

most respects to terrestrial chains. These range from 20,000 feet in height downwards, and where their profile is seen at the edge of the lunar disc they form distinct *notches*. The lunar *rills* (so named by Schröter, their discoverer, in 1787) are clefts or cracks in the surface, passing often right through mountains and valleys, sometimes for a distance of 300 miles, their breadth being relatively so small as to give them the appearance of true cracks.

Most striking of all lunar appearances are the broad white *rays*, which diverge from some of the principal lunar ring-plains. Those proceeding from *Tycho* extend, in one case at least, nearly 2000 miles. There are hundreds of them, and they

range from 10 to 20 miles broad. They pass right on over mountains and plains, partaking of the shape of the surface at all points, but distinct from it in brightness. There are seven principal systems of these inexplicable streaks.

To denote the relative brightness of lunar formations a scale is used, the brightest being called 10°, and the less bright 9°, 8°, &c., down to 0°. These formations are variously named. The principal mountain ranges have been named after those on the earth. The craters are named after astronomers or philosophers, as Tycho, Plato, Aristotle, &c. The different parts of these, and smaller objects near them, are known by Greek or Roman letters, attached to the name of the chief object. Greek letters are used for peaks and hills, Roman letters for craters and depressions. Capital letters imply *measured* objects. For rills the letters ϕ , ξ , ψ , χ , θ , and η are chiefly used. But there are occasional variations from these rules, as in the case of most astronomical nomenclature.

These peculiar appearances, so different from those around us on the earth, have much puzzled astronomers. The usual theory attributes them to volcanic action, combined with shrinkage of the lunar globe on cooling. A recent theory explains them as the result of slow glaciation, the craters being lakes, around whose margins the quickly condensed vapour from their surfaces has fallen in mountains of ice. The craters are vents for water-vapour, and their cones masses of ice. To this theory the extreme rarity of the lunar atmosphere is favourable, but it cannot be said, any more than the volcanic theory, to meet all the difficulties. No thoroughly satisfactory explanation has as yet been proposed.

The total amount of light given by the full moon is probably less than $\frac{1}{400,000}$ of the sun. Its photographic intensity, however, has admitted of several fine photographs being taken, notably by Rutherford of New York, and recently by the fine telescope of the Lick Observatory, California.

Harvest-moon.—At or about the time of harvest in the north temperate zone the sun in its annual course is approaching the celestial equator, which it crosses from north to south on September 22. On that date it sets close to the exact western point of the horizon. If it happens to be then also full moon, the moon rises that evening as the sun sets, and is at its rising opposite the sun, or close to the exact eastern point of the horizon. Thus it begins to give light at sunset, and continues to do so until sunrise, when it sets opposite to the sun, just as the latter rises. This arrangement holds good without any great change for several days, so that there is practically no darkness, especially if the weather be fine. The full moon which thus illumines the autumn nights is called the *harvest-moon*. No other full moon in the year rises for so many days in succession so soon after sunset. If the date of full moon be not exactly September 22, still the same phenomena occur, though not with the same perfection, and the longer the interval between full moon and that date the less perfect they are. This is because the full moon, being on September 22, coincides with the time when the moon (being at full moon necessarily *opposite* the sun) is crossing the celestial equator from south to north, at which time its northward motion is most rapid. The position of any body on the Celestial Sphere (q.v.) determines the time of its rising at any place in our latitudes, and, if that position be altered, the time of rising will be altered also. If it moves *southward* the moon will tend to rise *later*, if it moves *northward* it will tend to rise *earlier*. We have seen that the moon's northward motion is most rapid when crossing the equator. Hence it has then a strong tendency to rise earlier each

evening. But its motion towards the east (or *downwards*, when it is on the eastern horizon) gives it a tendency to rise later. These opposite tendencies, in the case of the September full moon, approach a balance, if the observer be in the latitude of northern Europe. Therefore the moon in that case rises only a few minutes later each evening for about a week. Farther north, about lat. $64\frac{1}{2}^\circ$, a balance is attained, and for two evenings the moon rises at the same time. Still farther north it rises *earlier* the second evening. But the most generally observed phenomena are of course those to be seen between latitudes 40° and 60° , which consist in the nearly full moon rising but little after sunset for several days in succession. In these latitudes of the southern hemisphere March enjoys the benefit of the harvest-moon, as September does in the north. And as celestial appearances are reversed to observers in different hemispheres, it follows that, when we have most benefit from the full moon, our neighbours at the antipodes have least.

The best charts of the moon's surface are those by Lohrmann, Beer, and Mädler, Schmidt of Athens (a gigantic work), and the Committee of the British Association. For further information readers may consult *Der Mond*, by Beer and Mädler (1837); *The Moon*, by Ed. Neison (1876); *The Moon*, by Nasmyth and Carpenter (1874; new ed. 1885); and for the lunar theory, popularly treated, Airy's *Gravitation*, and Sir J. Herschel's *Outlines of Astronomy*.

Superstitions regarding the Moon.—The moon was anciently an object of worship, and even in the 17th century she was supposed by the common people of England to exercise great influence over human affairs. The times for killing animals for food, gathering herbs, cutting down wood for fuel, sowing seeds of various kinds, were all regulated by the 'age' of the moon, and these set periods were considered to be a necessary part of practical knowledge, and ignorance or neglect of them to be infallibly productive of loss. There were similarly defined periods for taking particular medicines and attempting the cure of particular diseases. Many such superstitions prevailed till a recent period in the Highlands of Scotland, favourable or unfavourable consequences from any occurrence being predicted according to the age of the moon at the time it happened. Throughout Scotland the waning moon was considered to have an evil influence, and full or new moon to be the most auspicious season for commencing any enterprise. The same opinion was held in Scandinavia and Germany, and the history of all nations teems with similar superstitions. The special influence of the moon on persons of weak or wavering reason is preserved in our words *lunatic* and *moon-struck*, and is still an article of popular belief. Amongst mere superstitions must be ranked the old and widespread belief that the changes of the moon influence the weather on the earth, bringing about fair or rainy, settled or stormy weather; so that from the moon's periods predictions as to the weather may be made. The only known weather influence is a slight but appreciable tendency to dispersion of clouds shortly after full moon. See the article ECLIPSES.

In the Edda we read that 'Mundilföri had two children—a son, Máni ('moon'), and a daughter, Sól ('sun');' and in German the moon is masculine and the sun feminine to this day. It was the same in Anglo-Saxon, although modern English has in this matter followed the classic mythology, in which Phœbus and Sol are gods and Selene, Luna, and Diana are goddesses; Grimm (*Deutsche Mythologie*, p. 666) quotes an old invocation to the 'New Moon, gracious lord' (Neuer Mon, Holder Herr), for increase of wealth; and down to recent times

the German people were fond of speaking of 'Frau Sonne' and 'Herr Mond' ('lady sun' and 'lord moon'). The same inversion (as it appears to us) of gender is found among the Lithuanians and Arabians, and even the ancient Mexican Meztle ('moon') was masculine. Among the Slavs, according to Grimm, the moon is masculine, a star feminine, and the sun neuter. See the Rev. T. Harley's *Moon-lore* (1886), itself containing a good bibliography.

Moon. MOUNTAINS OF THE, have played a mysterious part in African geography since the days of Ptolemy, who indicated them as containing the sources of the Nile. Their exact position was not known; they were generally figured on mediæval maps as a high range crossing the entire continent from Abyssinia to the Gulf of Guinea. As modern enterprise has opened up the interior of Africa, different mountain-chains and peaks have been identified as Ptolemy's Mountains of the Moon—for instance, the mountains of Abyssinia, the groups of Kenia and Kilima-Njaro, the so-called Kong (q.v.) Mountains inland from the Gulf of Guinea, and finally Mr Stanley's Ruwenzori and its fellows.

Moonshiners, a term in popular use in America, especially in the south-eastern states, for illicit distillers of whisky.

Moonstone. See FELSPAR.

Moonwort (*Botrychium lunaria*), an interesting fern, native of Britain, and widely distributed over northern Europe, penetrating to within the Arctic regions and Asia, and along with the few other species of which the family is composed appearing also in North America. The plant is of simple structure, consisting of a root-stock bearing a single erect stem from 3 to 6 inches high. A single pinnate leaf springs from the stem about midway from root to apex, the segments being half-moon shaped, pale green, and of thick consistence. The fructification is developed on a branched spike, pyramidal in outline, from 1 to 2 inches long, the branches all turning to one side. *B. virginicum*, the largest growing species, is named the Rattlesnake Fern, from the circumstance that it generally abounds in places frequented by that reptile.

Moor. See BOG, PEAT, WASTE LANDS; and for Grouse Moors and Moorfowl, see GROUSE.

Moore, DR JOHN, the author of *Zeluco*, was born in 1730 at Stirling, an Episcopal minister's son. Educated at Glasgow, he there studied medicine, and there began to practise, with Smollett's and his own old master, Dr Gordon, for his partner, after spending some time in Holland (as army surgeon), in London, and in Paris. As medical attendant to the young Duke of Hamilton he travelled six years on the Continent, and on his return (1778) settled in London. His *View of Society and Manners in France, Switzerland, Germany, and Italy* (4 vols. 1779-81) was well received; but the novel *Zeluco* (1789), which suggested Byron's *Childe Harold*, is to-day the least forgotten of his works. These include two other novels, *Medical Sketches*, and a couple of books on the French Revolution. Dr Moore died at Richmond, 21st January 1802. See the Memoir by Dr R. Anderson prefixed to his *Complete Works* (7 vols. 1820).

Moore, SIR JOHN, English general, born at Glasgow, 13th November 1761, was eldest son of the preceding. He entered the army as ensign when only fifteen, and first distinguished himself in the descent upon Corsica (1794); he served in the West Indies (1796), in Ireland during the rebellion of 1798, and in Holland in 1799. He was in Egypt in 1801 with the army under Abercromby, and obtained the Order

of the Bath for his services in command of the reserve. When war again broke out in 1802 Moore served in Sicily and Sweden. In 1808 he was sent with a corps of 10,000 men to strengthen the English army in the Peninsula. He arrived in Mondego Bay, August 19, and assumed the chief command on the return to England of Sir H. Burrard. In October he received instructions to co-operate with the forces of Spain in the expulsion of the French from the Peninsula. He moved his army from Lisbon with the intention of advancing by Valladolid to unite himself with the Spanish general Romana, and threaten the communications between Madrid and France. But the apathy of the Spaniards, the successes of the French in various parts of the Peninsula, and, above all, the folly and intrigues of his own countrymen, soon placed him in a critical position. Yet he had determined to make a bold advance from Salamanca to attack Soult when the news reached him that Madrid had fallen, and that Napoleon was marching to crush him at the head of 70,000 men. Moore's forces amounted to only 25,000 men, and he was consequently forced to retreat. In December he began a disastrous march from Astorga to Coruña, a route of near 250 miles, through a desolate and mountainous country, made almost impassable by snow and rain, and harassed by the enemy. The soldiers suffered intolerable hardships, and arrived at Coruña in a very distressed state. It was impossible to embark without fighting, and Soult was in readiness to attack as soon as the troops should begin to embark. The battle was mainly one of infantry, for the cavalry after destroying their horses had gone on board, and the bulk of the artillery, for which the ground was not adapted, had also been withdrawn. On the 16th January 1809 the French came on in four strong columns. A desperate battle ensued. While animating the 42d Regiment in a brilliant charge in an early stage of the action, Moore was struck by a cannon-ball on the left shoulder and died in the moment of victory. The French were defeated with the loss of 2000 men; and the dead leader was buried at night just before the embarkation of his troops. The British army in this expedition lost their magazines and 6000 soldiers. Soult, with a noble feeling of respect for his valour, raised a monument to Moore's memory on the field of battle, and at home another was erected in St Paul's Cathedral. His uncommon capacity was sustained by the purest virtue and governed by a disinterested patriotism, while a certain heroic ascendancy of character and the singular beauty of his person powerfully impressed every one who came near him. Wolfe's verses on the burial of Sir John Moore have helped to keep his memory green. See the *Life* by his brother (2 vols. 1834), and Napier's *Peninsular War* (vol. i.).

Moore, THOMAS, the 'Bard of Erin,' was born at 12 Aungier Street, Dublin, on 28th May 1779, the son of a Catholic grocer. From the school where Sheridan had been educated, and where he himself became a 'determined rhymers,' he passed in 1794 to Trinity College, and thence, after taking his B.A., proceeded in 1799 to London to keep terms at the Middle Temple. He brought with him a translation of Anacreon, which came out in 1800, dedicated to the Prince of Wales, his patron then, but the butt from 1813 of his satire. It proved a great hit, and, with his musical talent, procured him admission to the best society. In 1801 followed the *Poetical Works of the late Thomas Little*, whose pretty erotics were a good deal blamed, and very widely read. In 1803, through Lord Moira's influence, he was appointed registrar of the Admiralty court at Bermuda. He went there to arrange for a deputy, and, after a tour in

the States and in Canada, returned in a twelve-month to England—the democratic notions of his Dublin days toned down by his transatlantic experience. For his *Odes and Epistles* (1806) he was sharply taken to task in the *Edinburgh*. The bulletless duel with Jeffrey was the consequence, over which Byron made so merry, but which left the non-combatants fast friends for life. In 1811 he married an actress, good Bessy Dyke (1793–1865), and, after living successively in Leicester-shire, in Derbyshire, and at Hornsey near London, in 1817 they settled at Sloperton Cottage, near Bowood, Lord Lansdowne's seat, in Wiltshire.

Meanwhile, among other fugitive pieces, Moore had published the earlier of the *Irish Melodies* (ten parts, 1807–34) and *The Twopenny Post-bag* (1812), whose tropes at once glittered and stung. Now he became anxious to emulate his brother-poets, who published in quartos. He fixed on an oriental subject, and in 1817 the long-expected *Lalla Rookh* appeared, dazzling as a firefly; and the whole English world applauded. After the publication he went with Rogers to Paris, and there wrote *The Fudge Family* (1818). For *Lalla Rookh* the Longmans paid him 3000 guineas; the *Irish Melodies* brought in £500 a year; but Moore had 'a generous contempt for money,' and about this time his Bermuda deputy embezzled £8000. Moore's liability was reduced by compromise to £1000, which he ultimately paid by his pen; but in 1819, to avoid arrest, he went to Italy with Lord John Russell. He spent five days at Venice with Byron (his friend since 1811), went on with Chantrey to Rome, and then with his family fixed his abode in Paris, where he wrote *The Loves of the Angels* (1823) and a prose romance, *The Epicurean* (1827). He returned in 1822 to Sloperton; and here, except for occasional 'junketings' to London, Scotland, and elsewhere, he passed his last thirty years. To those years belong the *Memoirs of Captain Rock* (1824), the *History of Ireland* (1827), and the *Lives of Sheridan* (1825), Byron (q.v., 1830), and Lord Edward Fitzgerald (1831). In 1835 he received a pension of £300, but his last days were clouded by sorrow and suffering—the loss of his two sons, and the decay of his mental faculties. 'I am sinking,' he writes to Rogers in 1847, 'into a mere vegetable.' He died on 25th February 1852, and was buried in Bromham Churchyard.

Moore in his lifetime was popular as only Byron; but to-day he ranks far below Wordsworth, Shelley, Keats. His muse was a spangled dancing-girl—light, airy, graceful, but soulless. *The Loves of the Angels*, his most ambitious effort, falls beneath even the Byronic standard; *Lalla Rookh*, again, is brilliant, but fatiguing. He is best in his lyrics; and even in them there is a certain sameness, with their eternal 'love of one's country, of the wine of other countries, and of the women of all countries.' See his *Memoirs, Journal, and Correspondence*, 'edited' by Lord John Russell (8 vols. 1852–56).

MOOR-HEN. See WATER-HEN.

Moor Park. See FARNHAM.

Moors, a vague ethnographical expression applied to people whose geographical frontiers have been constantly shifting. First given (Mauri) to the inhabitants of the kingdom and subsequent Roman province of Mauretania, comprising within variable limits the whole country west of Numidia, now called Algeria and Morocco, later on it included the inhabitants of the whole of Africa north of the Sahara and Atlas from Tripoli westwards. Here for some three centuries flourished the great African church of Tertullian, Cyprian, and Augustine; in 429 the country was overrun by the Arian

Vandals from Spain, but was recovered for the Byzantine emperors by Belisarius (533–36); invaded by the Arabs in 647, it was speedily subdued, and the Moors embraced Mohammedanism as quickly as they had embraced Christianity, and have clung to it ever since. From 1830 these countries have been gradually occupied and colonised by the French, with the exception of Tripoli and Morocco. The Arab slave-dealers and mixed Arab and Negro clans to the south are sometimes called the *Moors* of the western Soudan. In early or prehistoric times it is possible that the inhabitants north of the Atlas and of southern Spain, the builders of the megalithic monuments, may have been of the same race in both continents.

Whether in Algeria or in Morocco the Moors cannot be considered as a pure race. Some authorities take them as nearly equivalent to the Berbers, even the nomad tribes; others restrict the name to an admixture of Arab blood, and call Moors only the more settled Arabic-speaking population of the towns. According to some the Arabic stock is the Semitic element, the Berber or native is the Hamitic element in the resultant Moor. Though still numerous, the town Moors seem destined to dwindle before the European colonists. The more nomad Berber or Kabyle tribes will probably maintain their ground.

In European history the term is applied in a general way to the inhabitants of the Barbary states under Turkish rule, and to the actual inhabitants of Morocco, but in a special sense to the Arab and Berber conquerors and occupants of Spain from 711 to 1492. Within twenty years from their first landing these tribes had overrun the whole of Spain except the Asturias, had got possession of the Narbonnaise (719), had raided into France, till finally repulsed by Charles Martel near Tours in 732. For a short time one calif ruled the whole of Islam from beyond Bagdad to the Atlantic. When in 750 the Abbasside califs overthrew the Omniades (Califs), a descendant of the latter, Abdurrahman I., escaped and founded the califate of the West at Cordova in 755. His dynasty lasted till the degradation of Hashim III. in 1031. Then after a period of anarchy the Almoravides (Berbers) succeeded from 1086 to 1147; the Almohades followed from 1130 to 1232. The greater part of Spain had now been lost, but the Beni-Nasr held Granada from 1232 to 1492. The chief steps of the Spanish re-conquest are the taking of Toledo, 1085; Saragossa, 1118; Valencia, by Jaime I. of Aragon, 1238; Seville, 1248; Murcia, 1260; Granada, 1492. The first of these invaders of Spain were mainly of Arab blood, and brought with them capacities of civilisation. From the 8th to the close of the 11th centuries the Spanish Moors in architecture, literature, science, industry, manufacture, and agriculture were far in advance of any northern European race of that date; no other people in western Europe could have then built a cathedral like the mosque of Cordova (784–793); in philosophy and in the terms of mathematical and astronomical science they have left their impress on most of the languages of western Europe. Only in religion were they inferior, and even here their toleration of the Christians, though contemptuous, contrasts favourably with that of the Christians towards the Moors after the conquest. But after the 12th and 13th centuries the conditions were reversed. The Moors had no reserve of civilisation or of increasing resources to fall back upon in northern Africa; they were degenerating, while behind Christian Spain was a Europe ever growing more civilised and richer in resources of every kind. The conquest was retarded by the division and intestine struggles of the Christian kingdoms; but these same causes told far more fatally on the Moors.

There were never more than five or six separate Christian kingdoms; but the Moorish states were at times divided among over twenty little kings, and every dynasty in succession fell to pieces through intestine strife. The latest researches, especially in numismatics, are continually adding fresh proofs of this disunion, and augmenting the number of petty independent princes or chiefs. The advance of the Turks westward after the taking of Constantinople (1453) was too late to help their co-religionists in Spain. Barbarossa established himself in Barbary in 1518; but he failed at Malta in 1551 and 1565, and after the battle of Lepanto (1571), however much the Moors might harass Spain, there was no real danger of a reconquest. Their piratical efforts only served to raise a hatred between two chivalrous races who had once respected each other and to carry it to the bitterest fanaticism.

Tabino (Madrid, 1876); *The History of the Mohammedan Dynasties in Spain*, by P. de Gayangos (2 vols. Lond. 1840); *Histoire des Musulmans d'Espagne*, by R. P. A. Dozy (4 vols. Leyden, 1861); *Recherches sur l'Histoire et la Littérature de l'Espagne*, by R. P. A. Dozy (2 vols. 3d ed. Leyden, 1881); *De causis cur Mohammedanorum cultura*, &c., by R. P. A. Dozy (1869); *The Moors in Spain*, by Stanley Lane-Poole (Lond. 1887); *Libro de Agricultura*, by Abou Zacaria (2 vols. Seville and Madrid, 1878). The Arabic authorities are being collected and published in Spain and elsewhere. Several new MSS. have been lately discovered by Sr. Codera in the mosques of Tunis and Algeria.

Mooruk. See CASSOWARY.

Moose. See ELK.

Moquis, a tribe of Pueblo Indians, about 1800 in number, living in seven colonies in western Arizona.

Moradabad, a town of British India, the centre of a large trade in country produce, stands on the Ramganga, 100 miles E. by N. of Delhi. West of the town, and separated from it by the gaol, are the cantonments. The place is noted for its metal-work, especially brass and tin inlay. Other objects of industry are chintz and cotton cloth. Pop. (1881) 67,387.—The district has an area of 2281 sq. m., and a pop. (1881) of 1,155,173.

Moraine. The masses of rock which, by atmospheric action, are separated from the mountains bounding the valleys along which glaciers flow, find a temporary resting-place on the surface of the ice, at the margin of the glacier, and are carried along with it, but so slowly that they form a continuous line along each margin. These lines of debris are called *lateral moraines*. When two glaciers unite, the two inner moraines unite also and form one large trail in the middle of the trunk glacier, and this is called a *medial moraine*. A large portion of these rocky fragments at length reach the end of the glacier, and here the melting ice leaves it as a huge mound, which is known as a *terminal moraine*. The rock-debris, sand, clay, gravel, &c., which are dragged forward underneath the ice, are called *ground-moraines*, or *moraines profondes*. See GLACIER, BOULDER-CLAY.

Moralities. See MYSTERIES.

Moral Philosophy. See ETHICS.

Morano, a city of Southern Italy, built on a hill in a wild neighbourhood, 37 miles NNW. of Cosenza. Pop. 8259.

Morar. GWALIOR.

Morat (Ger. *Murten*), a town of 2364 inhabitants, in the Swiss canton of Freiburg, 12 miles ESE. of Neuchâtel and 48 by rail NNE. of Lausanne, lies on the Lake of Morat (3½ by 2

miles, 1428 feet above sea-level). Here, on 22d June 1476, the Swiss gained a victory over Charles the Bold, Duke of Burgundy.

Morata, OLYMPIA, a 16th-century scholar, was born at Ferrara in 1528, the daughter of the poet Fulvio Pellegrino Morato (who died in 1547). Already in her sixteenth year she gave public lectures in her native city; but, having in 1548 married the German physician Andreas Grundler, she followed him to Germany and became a Protestant. Driven from place to place by the religious wars, and reduced to penury, she died at Heidelberg, 26th October 1555, leaving numerous Latin and Greek poems, mainly on religious subjects (edited 1558, 1870, &c.), a treatise on Cicero, dialogues, letters, &c. See the Monograph by Bonnet (4th ed. Paris, 1865).

Moratin, LEANDRO FERNANDEZ DE, comic poet, was born at Madrid, March 10, 1760, and was the son of a poet. In 1790 appeared his first and best comedy, *El Viejo y la Nina*; it was followed by *La Comedia nuova*, *El Baron*, *La Mogigata*, and *El si de las Niñas*. Godoy conferred several ecclesiastical benefices upon him; Joseph Bonaparte made him chief royal librarian; but after 1814 he took refuge in Paris. He died in Paris, June 21, 1828.

Morava. See MARCH (river).

Moravia (Ger. *Mähren*), a crown-land of the Austrian empire, is bounded NE. by Silesia, SE. by Hungary, S. by Lower Austria, and NW. by Bohemia. Area, 8579 sq. miles; pop. (1870) 2,017,274; (1880) 2,153,407. It is enclosed on all sides by mountains, being separated from Silesia by the Sudetes, from Bohemia by the Moravian chain, and from Hungary by the Carpathian Mountains; while branches of these various chains intersect the whole country except in the south, where there are extensive plains rising to about 800 feet. Numerous small rivers flow south-east, and fall into the March or Morava, from which the country derives its name, and which joins the Danube. The Oder rises among the mountains on the north-east, and soon leaves the country. Moravia is essentially an agricultural region. On the whole the soil is rich, 56 per cent. being cultivated and 14 meadows and grass, and the temperature is more genial than in other European countries lying on the same parallel. The principal crops are rye and oats; then come barley, wheat, potatoes, beet-root, leguminous plants, and many fruits and vegetables. The breeding of all the usual varieties of domestic animals is actively prosecuted. The principal mineral products are coal and iron, with some graphite. The principal branches of industry are the manufacture of woollen, linen, and cotton goods, and beet-root sugar. Silk-weaving, lace-making, iron-founding, tanning, brewing, distilling, and the manufacture of chemicals, glass, paper, tobacco, and furniture also flourish. Brünn (q.v.), the capital, is the chief emporium for the manufactures, and Olmütz (q.v.) the principal cattle-mart. The former university at Olmütz is now represented by a theological faculty, and by a large technical institute at Brünn. The majority (95 per cent.) of the people belong to the Church of Rome. By nationality 70 per cent. are Slavs (Czechs and Moravians) and 29 per cent. Germans.

Moravia was anciently occupied by the Quadi, who were succeeded after the 5th century by the Rugii, the Heruli, and the Longobardi, and finally in the 6th century by the Slavonians. Charlemagne brought the people under nominal subjection. Christianity was first established in the middle of the 9th century by Cyril (q.v.) and Methodius. In 871 its ruler was made a duke by

the emperor; he subdued the Bohemians and incorporated their country with his own. From 1029 it was associated with Bohemia, and at the close of the century was erected into a margraviate, and declared a fief of Bohemia, to be held from the crown by the younger branches of the royal house. On the death of Lewis II. at the battle of Mohacz in 1526, Moravia, with all the other Bohemian lands, fell to Austria, in accordance with a pre-existing compact of succession between the reigning dynasties. In 1849 it was formally separated from Bohemia, and declared a distinct province and crown-land. See Dudík, *Mährens allgemeine Geschichte* (11 vols. 1860-86).

Moravians, otherwise known as Herrnhuters, The Church of the Brethren, or The Unity of the Brethren, are a small body of Protestants who claim to be the modern representatives of the ancient church of the Bohemian Brethren (see BOHEMIA), or *Unitas Fratrum*, which first took a definite shape in 1467, when the followers of Peter of Chelcizky, a pious layman and a contemporary of Huss, formed themselves into a separate ecclesiastical community on the apostolic model. They held that all Christians should lay aside distinctions of rank, abstain from military service and the use of oaths, and live in literal accordance with the teaching of Christ. These views forced them to keep aloof from both sections of the Hussites proper, and, though there may have been Waldenses amongst them, they owed very little at any period of their history to these crypto-Protestants. At the synod of 1467 three elders, a bishop, and two presbyters were chosen by lot, and received ordination probably from a Waldensian priest, though the first beginnings of the church are wrapped in a mist of confused traditions and miraculous tales. Under the influence of Lucas of Prague, a man of strong character and great literary talent, the Brethren in 1494 abandoned their levelling ideas, but maintained their stern and rigid discipline, and by the beginning of the 16th century there were between 300 and 400 churches in the Unity. They had much friendly intercourse with Luther, but stood out for the celibacy of the clergy, the doctrine of works, and congregational purism. For a time, however, the Unity was under the influence of Lutheran ideas, though the Brethren had naturally a much stronger sympathy with Calvinism. From the commencement of its history times of persecution alternated with times of repose, and many of the Brethren, especially in the early part of the 16th century, were forced to flee to Poland and Prussia. In 1570 the Polish branch united with the Reformed Church, and, though in 1600 the Bohemian and Moravian branches included two-thirds of the population and most of the nobility, the Brethren having got mixed up with the revolution which ended so disastrously in 1620, by 1627 the church was entirely broken up and destroyed. In 1722 some of the Moravian descendants of the suppressed Unity, who had been roused by the preaching of a carpenter, Christian David, a converted Roman Catholic, resolved to emigrate, and were allowed by the pious young Count Zinzendorf (1700-80) to settle on a part of his property in Saxony, close to the Austrian frontier. The first company consisted of two brothers, their wives, four children, two relations, and David, but these were soon joined by other emigrants from Moravia and Bohemia, and by pious and fanatical people of various nationalities. Five years later the settlers at Herrnhut ('The Lord's Keeping') amounted to over three hundred. They at first attended the parish church, but soon began to quarrel among themselves and with the Lutheran pastor, and adopted wild and extravagant views. Owing to the exertions of

Zinzendorf peace was restored, and the settlers formed themselves into a society in communion with the Lutheran Church, and drew up certain rules for their guidance in all matters of religion and conduct, the chief of these being that all in Herrnhut should live in love with all their brethren and with all the children of God in all religions.

Twelve elders were chosen to be the teachers and overseers of the community, and these came to be assisted afterwards by male and female 'labourers' of all sorts, including 'inspectors' of spiritual nuisances, and even of the work done and the goods sold by the Brethren. August 13th of this year (1727) is still celebrated as the spiritual birthday of the renewed church. By 1733 the Society had become a distinct church, and in 1735 the first bishop was elected and was ordained by Jablonski, court chaplain in Berlin, one of the two surviving guardians of the precious apostolical succession, which had been handed down by Amos Comenius, the last bishop of the old Unity. Although the Moravians imitated certain parts of the constitution and practice of the original church, much of what was peculiar in their views and discipline is to be traced to Zinzendorf, who was consecrated bishop in 1737, and was their 'advocate' until his death in 1760. The members of the community were divided into 'bands,' which met to exchange experiences, to study the Bible, to sing and pray, and there was a special division, still maintained, into 'choirs,' which consisted respectively of unmarried men, unmarried women, married couples, widowers, widows, boys and girls. Some of the 'choirs' had their own houses, where the members lived under the direction of a brother or sister. There were two daily services in which all joined, and hourly prayer was kept up night and day by certain members of the bands, while every morning the Brethren were supplied with a text as a 'watchword.' Love-feasts were introduced by Zinzendorf, and are still held, though the practice of feet-washing before the communion has been abandoned. All important matters, even marriage, were decided by an appeal to the 'lot,' and, as Zinzendorf taught that death was a joyous journey home, the departure of a brother or sister was announced by blowing a trumpet, each 'choir' having its own peculiar air.

Various branch settlements were established in Germany, America, and Britain, and in these the Herrnhut arrangements were strictly carried out; but, when this was not possible, congregations were set up, or societies were created, composed of members of other Protestant churches, as Brethren might belong to either of the three 'tropes'—the Lutheran, the Reformed, or the Moravian. These 'diaspora' societies contain at present 70,000 members, and the German 'diaspora' mission is the most important part of the home-work of the Brethren. Some of the Moravians came into contact with the Wesleys and Whitefield, and had considerable influence on their views, and they were even patronised by Anglican dignitaries, but partly owing to misrepresentation and partly owing to injudicious conduct on the part of some of the Brethren, their use of certain foolish hymns and sensuous and grotesque language in reference to the wounds of Christ, bitter opposition was roused against them both in England and the Continent. Since the middle of the 18th century the home-history of the Unity has been uneventful.

At present the executive government of the church is vested in the Elders Conference of the Unity, a clerical body composed partly of bishops and partly of presbyters. This conference carries out the injunctions of the synod, the supreme court of the church, which meets every ten

years at Herrnhut. At the meeting in 1889, a synodal resolution was passed practically abolishing the use of the lot. There are also provincial synods and conferences, and each congregation is governed by its own Elders' Conference, which consists of all the male and female 'labourers.' The bishops, of whom there are eighteen, enjoy no special privileges in the way of rank or salary, but have the sole power of ordaining. The ordinary church service is largely liturgical, and hymn-singing has always been a prominent feature of Moravian worship. The Moravians have no formal confession, though at an early period they declared their adhesion to the Augsburg Confession, and the litany which is used on Easter Sunday and two other Sundays is really a creed. The Unity is divided into three provinces: the British, with 38 congregations and 5408 members; the German, with 27 congregations and 8374 members; and the American, with 66 congregations and 17,848 members. At Ayr, in Scotland (the birthplace of James Montgomery), there is a congregation with 65 members. The Moravian Church has all along been distinguished for its missionary and educational activity, and is *par excellence* the missionary church of Christendom. The first mission, that to the West Indian slaves, was started in 1732, and soon after stations were established in Greenland (q.v.), Lapland, North and South America, South Africa, and other countries, and enthusiastic Brethren tried even to convert the Gypsies. At present the church has 111 stations with 22 filials, served by 343 missionaries and 1659 native assistants, who minister to 29,971 communicants and 55,835 baptised adults, and carry on 232 schools with 19,794 scholars. The Moravians have also had an important leper mission in Jerusalem since 1867. The actual annual expenditure is about £50,000. The Brethren have 12 boarding and 13 day schools in Britain, with 1810 pupils; 20 boarding and 22 day schools in Germany, with 2769 pupils; and 4 schools in America, with 500 pupils.

See histories of the Brethren by Holmes (1828), Schweinitz (1885), Bost (1848; and Eng. trans.); and in German by Gindely (1868) and Goll (1882); on their constitution, by Seiffert (1866); on their missions, by Thompson (1883), and in German, by Reichel (1874); also *Moravian Schools and Customs* (1889); besides the numerous German lives of Zinzendorf (1772-1888).

Moray, JAMES STUART, EARL OF, by Protestants called the 'Good Regent,' was the natural son of James V. of Scotland, by Margaret, daughter of John, fourth Lord Erskine, whom James in 1536 thought seriously of marrying, even though she had already wedded Sir Robert Douglas of Lochleven. Born about 1533, in 1538 he was made prior *in commendam* of St Andrews, in 1556 joined the Reformers, and almost immediately became the head of the Protestant party in Scotland. In 1561 he was despatched to France to invite his half-sister, Queen Mary, to return to her kingdom; and on her arrival he acted as her prime-minister and chief adviser. In 1562 she created him Earl of Mar; but that earldom being claimed by Lord Erskine, the title of Earl of Moray was in 1564 conferred instead on Lord James, who had meanwhile put down the Border banditti, and defeated Huntly at Corrichie. Strongly opposed to the marriage of Mary to Darnley (1565), he is falsely alleged before it to have endeavoured to seize the pair near Lochleven; and after it he openly appealed to arms, but was easily put to flight by the queen, and forced to take refuge in England. He did not return to Edinburgh till 10th March 1566, the day after Rizzio's murder, to which he was certainly privy. In April 1567 he withdrew to France, but in the following August was recalled

by the nobles in arms against Mary, and found her a prisoner at Lochleven, and himself appointed regent of the kingdom. In his famous interview with the queen on the 15th he 'behaved himself rather like a ghostly father unto her than like a counsellor.' On Mary's escape, he defeated her forces at Langside, near Glasgow (13th May 1568), and afterwards was one of the commissioners sent to England to conduct the negotiations against her. He then, as always, acted with extreme wariness; and after his return to Scotland by his vigour and prudence he succeeded in securing the peace of the realm, and settling the affairs of the church. But on 20th January 1570 he was shot at Linlithgow by James Hamilton of Bothwellhaugh, who was instigated thereto by Mary's adherents, and prompted also, it may be, by personal enmity. He was buried in St Giles's, Edinburgh. Of his ambition there can hardly be question; still, the most different estimates have been formed of his character, according to men's estimates of Mary. See **MARY QUEEN OF SCOTS**, and works there cited.

Moray Firth, an indentation of the German Ocean, on the north-east coast of Scotland, measuring 21 miles across its entrance from Tarbet Ness, in Ross-shire, to Stotfield Head, near Lossiemouth in Elginshire, and 39 miles thence to the mouth of the river Beaulie. The name is sometimes applied in a wider sense to the whole extent of sea between Kinnaird's Head in Aberdeenshire and Duncansbay Head in Caithness.

Morayshire. See **ELGINSHIRE**.

Morbihan, a maritime department of France, formed out of ancient Brittany, with the Atlantic on the south and Finistère on the west. Area, 2624 sq. m.; pop. (1872) 490,352; (1886) 535,256. The coast is much indented, and has a multitude of bays, promontories, harbours, and islands. The largest island is Belle Isle (q.v.). The department forms a plateau of no great elevation, partly cultivated, partly occupied by extensive tracts of heath and marsh (see **BRITTANY**). Morbihan is divided into the four arrondissements of Vannes, L'Orient, Ploermel, and Pontivy. The chief town is Vannes (q.v.), but the most populous is L'Orient (q.v.). Many ancient customs still prevail in Morbihan; communal proprietorship survives there, and in some of the islands the *cure*, assisted by a council of notables, governs the people in a patriarchal fashion.

Mordants. See **DYEING**.

Mordaunt, CHARLES. See **PETERBOROUGH**.

Mordvins, a Finnic race, now however greatly intermingled with the Russians, who dwell along the middle course of the Volga, from the government of Nijni-Novgorod to that of Samara. They number about 790,000.

More, HANNAH, was the fourth daughter of the village schoolmaster of Stapleton, near Bristol, where she was born in 1745. As a child she showed great quickness of apprehension and a good memory. Her sisters were sent to a school in Bristol, and when the eldest was twenty-one they opened a boarding-school there, to which Hannah went when she was twelve years old. She wrote verses at an early age, and in 1762 she published *The Search after Happiness*, a pastoral drama. In 1773 she went on a visit to London, and was introduced to the Garricks, and by them to Dr Johnson, Burke, Sir Joshua Reynolds, and the best literary society of London. During this period of her life she wrote two tales in verse, and two tragedies, *Percy* and *The Fatal Secret*, both of which were acted. While in London she went a great deal into society, but gradually found this mode of life to be unsatis-

factory, and was led by her religious views to withdraw from it. After the publication of her *Sacred Dramas*, she retired to Cowslip Green, a cottage near Bristol, where she did much to improve the condition of the poor in her neighbourhood by establishing schools for their instruction. She still continued her literary work, and helped by her writings to raise the tone of English society. Her essays on *The Manners of the Great* and *The Religion of the Fashionable World* (a pamphlet on *Village Politics*), her novel *Cælebs in Search of a Wife*, and a tract called *The Shepherd of Salisbury Plain* are some of the most popular of her works. In 1828 she moved from Barley Wood, a house she had built for herself near Cowslip Green, and took up her abode at Clifton, where she died, September 7, 1833. See the *Life* by Roberts (2 vols. 1838), and the *short Life* by Miss Yonge (1888).

MORE, HENRY, one of the Cambridge Platonists, was born at Grantham in Lincolnshire in 1614. He was educated at Eton and Christ's College, Cambridge, revolted early against the Calvinism of his parents, and gave himself entirely to philosophy, especially to Plato and more particularly the Neoplatonist writers. He took his Bachelor's degree in 1635, his Master's in 1639, when he was elected fellow of his college. Here he remained all his life, nor could he be prevailed upon to accept church preferment. He lived in an atmosphere of unusual spiritual elevation, and exercised a great influence on the young men that gathered round him. Among his pupils was a young lady of family who became Viscountess Conway, and at whose seat of Ragley in Warwickshire More often stayed. This lady's sympathies with the mystic and the occult extended also to Van Helmont and Valentine Greatrakes, and she ultimately found rest among the Quakers. More's earlier rationality gradually gave place to hopeless mysticism and theosophy, and his successive works decline correspondingly in value. He died September 1, 1687, and was buried in the chapel of his college. His *Divine Dialogues* (1668) is a work of altogether unusual interest. His *Opera Theologica* were collected in 1675, his *Opera Philosophica* in 1678. See the *Life* by Richard Ward (1710), and Tulloch's *Rational Theology in England in the Seventeenth Century* (vol. ii. 1874).

MORE, SIR THOMAS, was born in Milk Street, London, in 1478. His father, who subsequently became Sir John More, Justice of the Queen's Bench, was a man of character and talent, with a high sense of parental responsibility. More received his first instruction in Latin, then the basis of all education, in one of the most famous English schools of the time—that of St Anthony, Threadneedle Street, London. In after-life More wrote Latin with all the facility, though not with the classical purity, of the best Italian scholars of the Revival of Learning. When he attained his fifteenth year his father, after the fashion of the time, placed him as page in the household of Archbishop Morton, to whose virtues More afterwards paid the highest tribute in his *Utopia*. Morton, on his side, formed the highest expectations of More, and was in the habit of saying to the nobles who dined with him: 'This child here waiting at the table, whosoever shall live to see it, will prove a marvellous man.'

By Morton More was sent to Oxford, where the Renaissance was now represented by such men as Colet and Linacre, both of whom had travelled and studied in Italy. From Linacre he appears to have learned Greek, and from Colet he received a spiritual impulse which gave a direction to his entire life and opinions. From Colet More also learned those novel methods of biblical interpreta-

tion which Colet himself may have learned from Savonarola in Florence. By his acquaintance with the classics therefore, and by his enlightened views regarding the theology and the traditions of the church, More was emphatically a man of the new order. When, some time after leaving Oxford (probably about 1498), he first met Erasmus, both at once felt that they were in entire sympathy on all the deepest questions of the time.

It was his father's wish that he should follow the same profession as himself. Having completed his legal studies, first at New Inn and afterwards at Lincoln's Inn, he acted for three years as reader in Furnival's Inn. It marks the religious basis of More's character that he spent the next four years in the Charterhouse of London in 'devotion and prayer.' By his marriage with the eldest daughter of Mr Colte, a gentleman of Essex, he definitively made choice of a secular career. During the last years of Henry VII. he became under-sheriff of London and member of parliament, in which latter capacity he gave serious offence to the king by protesting against the excessive dowry demanded by Henry from parliament on the occasion of his daughter's marriage with James IV. of Scotland.

On the accession of Henry VIII. (1509) a brilliant prospect was opened up to More. It was Henry's ambition to surround himself with men of genius and accomplishments; and More had by this time attained a European reputation in the world of learning. As ambassador on two occasions to the Low Countries he had also given proofs of his tact and capacity for business. More, however, had little inclination for public life, and it was only after much hesitation that he took service under Henry. Introduced to the king through Wolsey, he rose rapidly in dignity and in the royal favour. He became Master of Requests (1514), Treasurer of the Exchequer (1521), and Chancellor of the Duchy of Lancaster (1525). For a time the king showed him every mark of personal attention—paying him unexpected visits at his house in Chelsea 'to be merry with him.' Congratulated on these marks of favour by his son-in-law Roper, More, who had divined Henry's real character from the first, replied: 'If my head would win him a castle in France it should not fail to go.' As speaker of the House of Commons (1523), More, on the occasion of Wolsey's demand for a subsidy of which the House disapproved, received the great cardinal in a manner that made him exclaim: 'Would to God you had been at Rome, Mr More, when I made you speaker.' More, however, still continued to enjoy Henry's favour; and on two occasions was sent on missions of importance to Francis I. and the Emperor Charles V.

On the fall of Wolsey in 1529, More, against his own strongest wish, was appointed to the office of Lord Chancellor. Seeing from the first where the king's divorce from Catharine of Aragon must eventually lead, he knew that only one fate could be in store for himself. In the discharge of his office he displayed a primitive virtue and simplicity, being 'ready to hear every man's cause, poor and rich, and keep no doors shut from them.' The one stain on his character as judge is the harshness of his sentences for religious opinions. In passing such sentences More acted only in the spirit of the time; but in his *Utopia* he had shown the clearest conception of the sacredness of the individual conscience. 'The Utopians,' he says, 'put the unbelievers to no punishment, because that they be persuaded that it is in no man's power to believe what he list.' More sympathised with Colet and Erasmus in their desire for a more rational theology and for radical reform in the manners of the clergy, but like them also he had no promptings to break with the historic church. He could look only with

displeasure, therefore, on the successive steps which led Henry to the final schism from Rome. In 1532 he resigned the chancellorship, and retired into private life. The disapproval of his policy by such a man as More could not be disregarded by Henry, and various attempts were made to win him over. Nothing, however, could shake the constancy of More, and his death became a mere matter of time and policy. The opportunity came in 1534. In that year Henry was declared head of the English Church; and More's steadfast refusal to recognise any other head of the church than the pope led to his sentence for high-treason after a harsh imprisonment of more than a year. The manner in which he met his death, while it is one of the commonplaces of English history, strangely illustrates an inveterate habit of his nature—the disposition to jest with the most serious questions and on the most momentous occasions. As, on 7th July 1535, he mounted the scaffold he exclaimed to a stander-by: 'Friend, help me up; when I come down again I can shift for myself;' and raising his head after it had been laid on the block, he bade the executioner stay till he had put aside his beard, 'for,' said he, 'it never committed treason.'

More was twice married; but only by his first wife had he any family. In no life of More should his daughter Margaret, the wife of his biographer Roper, pass unmentioned. By her high character and accomplishments, but above all by her pious devotion to her father, she holds a place among the illustrious women of English history.

One of the distinguished characters in the political history of England, More also ranks high in the history of its literature. By his Latin *Utopia* (1516; Eng. trans. 1556) he takes his place with the most eminent humanists of the Renaissance, and he was the one literary Englishman of the 16th century well-known and admired on the Continent. In his *History of King Richard III.* (1513) he produced what may be regarded as the first book in classical English prose. In his personal character More was the most attractive and lovable of men; and his tragic end gave the crown to the moral beauty of his life. From Erasmus's sketch of him we realise all his virtues and all his attractions; but realise also that he was a winning rather than an imposing figure. He had ingenuity rather than insight; not infrequently his wit passed into levity and even into flippancy; and there was in his character a strain of morbidness and superstition which precluded him from the largest and humanest views of men and things. In 1886 he was beatified.

See Roper, *Life of Sir Thomas More* (first printed 1626); Lord Campbell, *Lives of the Chancellors*; Mackintosh, *Lardner's Cabinet Encyclopædia*; Seebohm, *Oxford Reformers*; D. Nisard, *Renaissance et Réforme*; also works cited at HENRY VIII., WOLSEY, and FISHER.

Morea, the name borne since the middle ages by the ancient Peloponnesus (q.v.) of Greece. Several theories have been proposed of the origin and meaning of the word. It is usually said to be derived from *morus*, 'a mulberry'—the outline of the peninsula bearing a resemblance to the leaf of that tree; others, however, such as Fallmerayer, trace it back to the Slavonic *more*, 'the sea,' which nearly encircles the Morea. After being overrun by the Goths and Vandals, it became a prey, in the second half of the 8th century, to Slav invaders, who were gradually subdued and civilised by the Byzantine emperors. In 1205 the peninsula was conquered by the Normans, who formed its western portion into a feudal principality subject to the crown of Sicily. Michael VIII. Palæologus reconquered the country after 1261; but the principality of Achaia remained in the family of Villehardouin till 1346, when the male line became

extinct. Various claimants now arose, and much strife and confusion ensued. At length, in 1461, the greater portion of the Morea fell into the hands of the Turks, the remainder being held by Venice, who abandoned it in 1540. Venice reconquered the Morea in 1684, but again lost it to the Turks in 1714. For its later history, see GREECE.

Moreau, JEAN VICTOR, the greatest general of the French Republic, except Bonaparte, was born, 11th August 1761, at Morlaix, in Brittany, the son of an advocate, and was sent to study law at Rennes. On the outbreak of the Revolution he was chosen to command the volunteers from Rennes, served under Dumouriez in 1793, and displayed such military talent that in 1794 he was made a general of division; he took an active part in reducing Belgium and Holland under Pichegru in that and the following year. When Pichegru fell under suspicion, the Directory appointed Moreau, in the spring of 1796, to the chief command on the Rhine and Moselle. He crossed the Rhine at Kehl, defeated Latour at Rastatt and the Archduke Charles at Ettlingen, and drove the Austrians back to the Danube. But, owing to the defeat and retreat of Jourdan, he was obliged to make a desperate effort to regain the Rhine, which he accomplished, notwithstanding great difficulties, in a retreat that established his reputation for generalship more than all his previous victories. A suspicion of participation in the plots of Pichegru led to his being deprived of his command after the *coup d'état* of 18th Fructidor. In the following year (1798) he succeeded Schérer in the command of the army in Italy, which was hard pressed by the Russians and Austrians. By a retreat conducted with consummate skill, he saved the French army from destruction. The Directory, nevertheless, deprived him of the chief command, and gave it to Joubert. But Moreau remained with the army at Joubert's request to be present at the battle of Novi. Early in the engagement Joubert was killed and Moreau again assumed the command, and conducted the defeated troops to France. The noble disinterestedness of Moreau's character, his military talent, and his political moderation induced the party of Sieyès, which overthrew the Directory, to offer him the dictatorship of France; he declined it, but lent his assistance to Bonaparte on 18th Brumaire. Receiving the command of the army of the Rhine, Moreau gained victory after victory over the Austrians in the campaign of 1800, drove them back behind the Inn, and at last won the great and decisive battle of Hohenlinden (q.v.). A strong feeling of jealousy against Moreau now took firm root in Napoleon's mind. He accused his rival of participation in the plot of Cadoudal (q.v.) and Pichegru against his life, had him arrested, brought to trial, and found guilty on insufficient evidence, 9th June 1804. A sentence of two years' imprisonment was pronounced; Napoleon commuted it into banishment, and Moreau went to America, and settled in New Jersey. There he remained until 1813, when he accompanied the emperor of Russia and the king of Prussia in the march against Dresden. Fortunately for his fame he did not live to invade his country, for here, as he stood talking to the Emperor Alexander on 27th August, a French cannon-ball broke both his legs. Amputation was performed, but he died at Laun in Bohemia, 2d September 1813. He was buried in St Petersburg. See the studies by C. Jochmus (Berl. 1814) and A. de Beauchamp (trans. Lond. 1814).

Morecambe Bay, an inlet of the Irish Sea, separates the main portion of Lancashire from the detached portion of Furness. It is about 10 miles in average breadth and 18 miles in length, and

receives the Leven, the Kent, and the Lune. The depth of water in the bay is never great except in the channels of the rivers.

Moreen. See MOIRE.

Morel (*Morchella*) is a genus of Discomycete fungi, of which a number of species (*M. esculenta*, *deliciosa*, *bohemica*, &c.) are commonly eaten fresh and preserved in central and southern Europe. In Germany the morel is so highly prized that, as it often springs up where trees have been burned, the forests were often destroyed for its sake, till this had to be restrained by severe penalties.

Morelia, capital of the Mexican state of Michoacan, is situated, among gardens and orchards, in a valley 6400 feet above sea-level, 115 miles (234 by rail) W. by N. of Mexico city. It contains a cathedral and seminary, and manufactures cotton, tobacco, and candles. Morelia, which from 1541 to 1828 was called Valladolid, was the birthplace of the patriot Morelos, in whose honour the name was changed, and of Iturbide, the short-lived emperor of Mexico. Pop. 25,000.

Morella, a town of Spain, 80 miles N. by E. of Valencia, was the stronghold of Cabrera, the Carlist general, who scaled the castle on 25th January 1839. It was retaken in July 1840 by Espartaco. Pop. 7190.

Morepork. See PODARGUS.

Morel, LOUIS (1643–80), was born in Provence, took orders, and was for five years a noted preacher at Lyons, where in 1674 he published *Le Grand Dictionnaire Historique, ou le Melange Curieux de l'Histoire sacrée et profane* (in 1 vol. folio). In 1675 he went to Paris, and laboured at the expansion and improvement of this important work till his death. The best edition is the 20th (Paris, 1759), in 10 vols. folio. It was translated into Spanish, Italian, and English, Jeremy Collier adding to this an appendix or supplement filling a folio volume. The geographical and historical articles have become obsolete, but the biographical part is still valuable.

Moresnet, a small neutral territory between Belgium and Prussia, 5 miles SW. of Aix-la-Chapelle, and containing about 70 acres. There is on it a village of 3000 inhabitants.

Moreton Bay, on the east coast of Queensland, Australia, is formed inside the islands of Moreton and Stradbroke, the former 20 miles and the latter 33 miles in length, and both about 5 miles in greatest breadth. The bay is 40 miles long by 17 broad; its southern half is dotted with islands and sandbanks. It receives the six considerable streams, Nerang, Pimpama, Logan, Brisbane, Pine, and Caboolture. The entrance at the north end is practicable at all times for vessels of the largest size; the entrance between Moreton and Stradbroke Islands is narrow, and less safe.

Moreton-bay Chestnut, a genus of plants so named because of the supposed resemblance in form and qualities of the seeds to the sweet chestnut of Europe. *Castanospermum australe* is the only species of the genus known. It belongs to the sub-order Papilionaceæ of the natural order Leguminosæ, and is a native of Queensland, Australia. The tree grows to the height of from 70 to 100 feet, with spreading branches clothed with pinnate leaves about a foot long. The flowers—bright yellow, and red—are succeeded by cylindrical pendulous pods of a bright brown colour, 6 to 8 inches long generally, containing about four seeds each, which are roundish but somewhat flattened on one side. Though likened to the sweet chestnut, they are much inferior in delicacy of flavour, being very astringent; but they are somewhat improved when roasted.

Morgagni, G. B. (1682–1771), founder of pathological anatomy and professor at Padua. See ANATOMY.

Morgan, MOUNT. See MOUNT MORGAN.

Morgan, AUGUSTUS DE. See DE MORGAN.

Morgan, HENRY. See BUCCANEERS; also J. C. Hutcheson, *Sir Henry Morgan* (1890), and Howard Pyle, *The Buccaneers and Marooners of America* (1891).

Morgan, LADY, novelist, was born (Sydney Owenson) in Dublin on the Christmas-day of 1780 or thereby—'cold, false, erroneous, chronological dates' she protests against. Her father, a theatrical manager, fell into difficulties; and the clever, bold, lively young woman resolved to support the fortunes of the family, first as governess, afterwards as author. She had had 'somewhat mysterious relations' with at least one admirer, Sir Charles Ormsby, when in 1812 she was married off-hand to Thomas Charles Morgan, M.D. (1783–1843), whom the Lord-lieutenant knighted for the occasion. For the next quarter of a century, excepting two long visits to the Continent, the pair made Dublin their home; but in 1837 Lord Melbourne gave her a pension of £300, and next year they removed to London. Here she died on 16th April 1859, having continued busy with her pen and her tongue to the last. Her twenty-two works—rattling novels, verse, travels, &c.—include *St Clair* (1804), *The Wild Irish Girl* (1806), *O'Donnel* (1814), *France* (1817), and *Italy* (1821). Her silly but not unamusing *Memoirs* were edited by Hepworth Dixon (2 vols. 1862).

Morgan, LEWIS HENRY, an American archaeologist, was born at Aurora, New York, 21st November 1818, graduated at Union College in 1840, and became a lawyer at Rochester. He served in the state assembly (1861) and senate (1868), and died December 17, 1881. Morgan's earliest work, *The League of the Iroquois* (1851), was the first account of the organisation and government of an Indian tribe; but even more valuable are his *Systems of Consanguinity and Affinity of the Human Family* (1869), and his treatise on *Ancient Society* (1877). He also published *Houses and House-life of the American Aborigines* (1881), and an account of the beaver.

Morgana, FATA. See FATA MORGANA.

Morganatic Marriage (perhaps from Goth. *morgjan*, 'to limit'; perhaps Ger. *morgengabe*, a gift given by the husband to the wife after marriage; Littré suggests *morgen*, 'morning'—a wedding celebrated privately in the morning), sometimes called *Left-handed marriage*, a lower sort of matrimonial union, which as a civil engagement is completely binding, but fails to confer on the wife the title or fortune of her husband, or on the children the full status of legitimacy or right of succession. In Germany it came in very early times to be accepted as a principle that *Ebenbürtigkeit*, or equality of birth between husband and wife, was essential to a proper marriage. The lower nobility were of course not *Ebenbürtig* with the higher nobility, nor the best born commoners with the lower nobility. Now the rule only concerns reigning houses and the higher nobility. But still members of German princely houses entering into marriages of this kind with their inferiors in rank (as frequently happens) contract merely morganatic unions. The marriage, for instance, in 1851 of Prince Alexander of Hesse to the Countess Julie von Hauke, from which sprang the Battenberg family, was a morganatic one. Handfasting (q.v.) in Scotland had a certain resemblance. The Royal Marriage Act, 12 Geo. III. chap. 11, reduces to a position somewhat like that of morganatic unions

every marriage in the royal family of Great Britain not previously approved by the sovereign under the Great Seal, provided the prince entering into it is under twenty-five, and every such marriage of a prince above twenty-five which is disapproved by parliament. Thus, peerages and most biography books make no mention of the Duke of Cambridge's marriage with Miss Featherstone, an actress; their children bear the name of Fitzgeorge. See ROYAL FAMILY.

Morgarten, a mountain slope on the east margin of Lake Egeri, in the canton of Zug, Switzerland, is the place where 1400 men of the Swiss Forest Cantons—Schwyz, Uri, and Unterwalden—won a great victory over 15,000 Austrians, November 15, 1315.

Morghen, RAPHAEL SANZIO CAVALIERE, a famous engraver, was born at Naples, June 19, 1758. His first instructor was his father, a mediocre engraver of German origin. But he gave such indications of talent that at the age of twenty he was sent to Rome to study under Volpato, then considered the best engraver in Italy, whose daughter he married in 1781. His progress was very marked, and even his first works obtained great success. Raphael's celebrated figures in the Vatican of 'Poetry' and 'Theology' were engraved by him in 1781; and he afterwards produced a succession of engravings of a very high class from many of the masterpieces of art: amongst these may be mentioned Raphael's 'Madonna della Seggiola' and the 'Transfiguration'; the 'Madonna del Sacco,' by Andrea del Sarto; the 'Duke of Moncado,' by Van Dyck; and by his burin, Da Vinci's 'Last Supper,' notwithstanding its decay, has been rendered with such consummate skill as to lessen the regret felt for the evanescent condition of the original work. He accepted an invitation from the grand-duke to reside at Florence, with a pension of 400 scudi and a free residence, under condition of establishing a school of engraving; and he received marked attentions from the Emperor Napoleon, to whom in 1811 he dedicated his engraving from the 'Transfiguration,' the grand result of sixteen years of labour. He died at Florence, April 8, 1833. His Life, with a portrait and catalogue of his works to the number of 254, was published by his pupil, Niccolò Palmarino. The works of Morghen will always hold a very prominent place in the history of Engraving (q.v.). See Fred. R. Halsey, *Raphael Morghen's Engraved Works* (New York, 1885).

Morgue, a building in Paris, just behind the cathedral of Notre Dame, where the dead bodies of persons unknown, found either in the river (Seine) or in the streets, are exposed to public view for three days. The corpses are put under a glass case, on sloping slabs of marble. When a corpse is identified, it is handed over to the relatives or friends of the deceased, on payment of costs and dues; otherwise it is interred at the expense of the city. The number of bodies yearly exposed in the Morgue is about 300, of which five-sixths are those of males.—There are morgues in Berlin, and in Boston, New York, Brooklyn, Philadelphia, Chicago, and other American towns.

Moriah, MOUNT. See JERUSALEM.

Morier, JAMES, an English novelist, born in 1780, served from 1810 to 1816 at the court of Persia, first as secretary of legation, subsequently as envoy. In 1812 he published his *Travels in Persia, Armenia, and Asia Minor to Constantinople*, and in 1818 *A second Journey through Persia, Armenia, and Asia Minor*. The minute and familiar acquaintance he had acquired with the manners and customs of the Persians was seen in his highly-interesting series of eastern romances:

The Adventures of Hajji Baba of Ispahan (3 vols. 1824), with its continuation, *Hajji Baba in England* (2 vols. 1828); *Zohrab* (1832); *Ayesha* (1834); and *The Mirza* (1841). His other novels are *Abel Allnut* (1837), *The Banished* (1839), and *Martin Tontrond* (1842). Morier died at Brighton 23d March 1849.

Morinus. Jean Morin, a French theologian (1591-1659), wrote on ecclesiastical antiquities, and ranks as one of the founders of biblical criticism mainly in virtue of his editions and notes on the Samaritan Pentateuch and the Targum (in the Paris Polyglott), and his *Exercitationes* on the Hebrew and Greek text of the Bible.

Morion, an iron or steel headpiece without visor. See ARMOUR.

Moriscos. Moriscos is the name usually given to the Moors who remained in Spain after the taking of Granada in 1492; Mozarabes or Muzarabes, to the Christian Spaniards who lived in the parts of Spain under Moorish rule; Mudejares, to the Moors who submitted to the Christians in the earlier periods of the re-conquest.

To take first the *Mozarabes*. Christianity was freely, if contemptuously, tolerated under the Moorish rule. Occasional outbursts of fanaticism used to take place. These were often provoked by Christians defiantly seeking martyrdom, as in Cordova in the 9th century; this persecution lasted intermittently till 953, when it well-nigh ceased. The Mozarabes kept their ancient liturgy, though many of them had ceased to understand Latin, and spoke and wrote Arabic only, writing even Latin and Spanish with Arabic characters. They occasionally held councils, but indifference prevailed, and the Spanish conquerors were more astonished at the laxity of the Mozarabes than at their constancy in retaining their old faith. For Mozarabic liturgy, see LITURGY.

Mudejares.—Moorish names appear first in the 9th century as inhabitants of the country, and witnesses to documents, under Spanish rule. One of the earliest capitulations or fueros granted to them is that of Huesca (1081); by this and subsequent fueros (Tudela, 1115, &c.) the widest toleration was extended to them; they were allowed full exercise of their religion, laws, language, dress, and customs. The fuero of Jativa granted by Jaime I. of Aragon (1251) even provides that if any Saracen should become a Christian he should lose his landed property; that of Siliebar, near Seville (1255), allows them to build a castle for their defence. These capitulations seem to have been fairly observed till the 14th century, when a change of tone becomes apparent. In 1301 the Moors of Aragon were compelled to wear a distinctive dress, and in the next century their privileges were greatly curtailed; recantation was forced upon them. The Mudejares of Aragon, Valencia, and Castile had hitherto been faithful, had served loyally in war even against Moors, had taken the royal side in all popular movements; even as late as 1528 they appealed to their well-proved loyalty to the crown.

But their situation was greatly impaired by the incorporation among them of the *Moriscos*, after the fall of Granada (1492). The terms of the capitulation of Granada were to the full as liberal as those under which the Mudejares had lived loyally in Aragon, Valencia, and Castile for three or four centuries. Under Talavera, the first Archbishop of Granada, some attempt was made to observe these conditions, and with happy results. But the bigotry of Cardinal Ximenes, violating the capitulation, led to a rising in the Alpuxarras (1500-2) and to the expulsion of the Moriscos of Castile and Leon; though in 1503 and in 1510

Ferdinand forbade the expulsion of those of Aragon and Valencia. At the close of the rising in the Alpujarras the alternative of exile or of baptism had been offered to the Moriscos. Those who chose exile went to swell the number of the Corsairs of Algeria and the Barbary States, who were henceforth a standing danger and annoyance to Spain. The newly-converted Moriscos (New Christians as they were called) became the objects of the severities of the Inquisition; as doubtful Christians they were regarded with greater jealousy and suspicion than as professed Mohammedans. Under danger of relapse their children were taken from them, and their young men sent to the galleys. In the war of the Germania in Valencia (1520) they were ruthlessly massacred by the populace, but were still faithful to the king and to the nobles who respected their privileges. The ever-increasing persecution provoked a still more serious rising under Philip II. in Granada. It was put down after two years of warfare by Don John of Austria (1568-70); many of the Moriscos, and especially the women, were given to the soldiers as slaves, and the rest, who did not emigrate, were removed to Castile, Valencia, and Murcia. The action of the Corsairs, avenging on Spain the wrongs of their fellow-countrymen, ruining the commerce, carrying off Christian captives, ravaging the coasts so that for leagues along the south-east it remained uncultivated, increased the bitterness against the Moriscos, who were suspected of being in league with the Corsairs, and directing their forays. Many returned openly to their ancestral faith; spasmodic attempts at genuine conversion proved fruitless; in 1599 the Archbishop of Valencia reported the conversion of one Morisco woman only as the result of a year's labour. Harsher measures were tried and failed; persecution only made them cling more firmly to their faith; partial expulsion only augmented the number of the Corsairs; and at last they were forbidden to leave the country by sea. The hatred, however, of Philip II. against the Protestants was stronger than his dislike of the Moriscos, and his reign is marked by constant vacillations in his policy towards them; and their lot cannot have been absolutely intolerable, for one charge against them was that their numbers increased continually while that of the old Christians diminished. The fear and suspicion aroused on both sides made it difficult for Spaniards and Moriscos, new and old Christians, to live together. After so many breaches of faith the Moriscos could trust no promise made to them by king or church. To the Spaniards it seemed intolerable to have an intestine foe, while the kingdom was so sorely pressed from without; and churchmen taught the king that anything, short of the extermination which he might commit with a safe conscience, was a mercy. In 1582 the total expulsion was first mooted; it was decided on in principle in 1599. In 1609-10 the whole of the Moriscos were expelled the kingdom, either by sea from Valencia, or through the Pyrenees from Aragon and Castile. All their goods were confiscated, except what they could turn into money, or carry with them on their persons; robbery, murder, assault, excesses of every kind against them marked their track; all their children under four years of age were taken from them to be brought up as Christians; over 500,000 Moriscos, chiefly agricultural labourers or farmers, left the country in which their people had dwelt for so many centuries. The results to Spain were like those which subsequently followed the emigration of the Huguenots from France. Even this does not end the story; the descendants of the children forcibly kept behind, or of those really converted to Christianity, were regarded with horror, and were constantly denounced to the

Inquisition. For nearly a century afterwards we find decrees of particular provinces expelling families for being descendants of the Moriscos. A taint of Moorish blood was sufficient to prevent the holding of any public office, even in the smallest municipality.

See *Guerra de Granada*, by Diego de Mendoza; *Rebellion y Castigo de los Moriscos del Reino de Granada*, by L. del Marmol Carvajal (both in vol. xxi. of Rivadeneyra's *Biblioteca de Autores Espanoles*); *Estado Social y Politico de los Mudjares de Castilla*, by F. Fernandez y Gonzalez (Madrid, 1886); *Condicion Social de los Moriscos de España*, by Florencio Janer (Madrid, 1887); *La Expulsion de los Moriscos Espanoles*, by M. Danvila y Collado (Madrid, 1889).

Morison, COMMANDER. See ZADKIEL.

Morison, JAMES COTTER, author and Positivist, was born in 1831, and educated at Highgate grammar-school and Lincoln College, Oxford. His first work was his masterpiece, *The Life and Times of St Bernard* (1863). His latest, *The Service of Man, an Essay towards the Religion of the Future* (1886), attracted much attention, but it was commenced when sickness had already seized him, and it does not adequately represent his views. He was one of the founders and first proprietors of the *Fortnightly Review*. His intellectual gifts were associated with a most genial and kindly nature; he was reputed one of the best talkers of his time in French as well as English, and had long projected a work on the history of France, but owing to ill-health it was never fairly begun. He died February 25, 1888.

Morison, ROBERT, botanist, was a native of Aberdeen, born in 1620. Having borne arms as a royalist in the civil wars, he retired to France when his sovereign's cause collapsed, and took the degree of doctor at Angers (1648). Two years later he became superintendent of the garden formed at Blois by Gaston, Duke of Orleans. After the Restoration he was appointed by Charles II. one of his physicians, 'botanist royal,' and 'professor' of Botany at Oxford. He was knocked down by a coach in London, and died the following day, 10th November 1683. His chief work is *Plantarum Historia Universalis Oxoniensis* (1680).

Morisonianism. See EVANGELICAL UNION.

Morlaix, a picturesque and flourishing port of France, in the Breton department of Finistère, on the tidal Dossen, 6½ miles from the sea and 38 ENE. of Brest. It has many quaint timbered houses, a huge railway viaduct 207 feet high, and manufactures of tobacco, paper, &c. Vessels of 400 tons can reach the quays. Moreau was a native. Pop. (1872) 12,723; (1886) 14,174. See BERNARD OF MORLAIX.

Morland, GEORGE, painter, was born in London, 26th June 1763, the eldest son of Henry Morland, crayonist (1712-97), to whom at fourteen he was articled for seven years, and who brought him up with extreme rigour. No sooner, then, had he become his own master than he went hopelessly and utterly to the bad. His marriage in 1786 had no power to check him; and his whole after-life was a downward course of debt and dissipation. He was regular only in this, that 'every day he got thoroughly intoxicated, and then generally would lie all night long on the floor.' Yet he worked hard and rapidly, in the last eight years of his life turning out nearly nine hundred paintings and more than a thousand drawings. His strength lay in country subjects (pigs, Gypsies, and stable interiors); his sea-pieces, also numerous, are not so good. He died of brain-fever in a Holborn sponging-house, 29th October 1804. See his *Life* by G. Dawe (1807).

Morley, a municipal borough in the West Riding of Yorkshire, 5 miles SW. of Leeds, with woollen manufactures, coal-mines, and stone quarries. Mentioned in Domesday, it became a borough only in 1885. Pop. (1881) 15,011; (1891) 18,725.

Morley, HENRY, English author, was born in London, September 15, 1822, and educated at the Moravian School, Neuwied-on-the-Rhine, and King's College, London, where he edited the *King's College Magazine*. After practising medicine at Madely, Shropshire, from 1844 till 1848, and keeping school for the next two years at Liscard, Liverpool, he settled down with some reluctance in London to literary work in connection with *Household Words* and the *Examiner*. Of the latter he was joint-editor from 1856 to 1859, and sole editor from that year till 1864. He was English lecturer at King's College for eight years previous to 1865, when he became professor of English Language and Literature at University College, London, an office which he resigned in 1889. In 1889 he contributed the article on English Literature to this work. In 1870 he was appointed examiner in English Language, Literature, and History to the university of London. His numerous writings include *How to make Home Unhealthy* (1850); *A Defence of Ignorance* (1851); *Lives of Palissy* (1852), *Jerome Cardan* (1854), and *Cornelius Agrippa* (1856); *Memoirs of Bartholomew Fair* (1857), reprints of his essays in *Household Words*; two volumes of *Fairy Tales* (1859-60); *English Writers to Dunbar* (2 parts, 1864-66), worked up anew into the first 4 vols., 1887-89, of a projected complete history of English literature in 20 volumes; annotated editions of the *Spectator* (1868) and *Boswell's Life of Johnson* (1886); *Tables of English Literature* (1870); *Clement Marot and other Studies* (1871); *A First Sketch of English Literature* (1873); *Library of English Literature* (5 vols. 1876-82); and *Of English Literature in the Reign of Victoria* (1881). No man has done so much to make classical literature (both English and foreign through English translations) accessible to the people as Henry Morley through his admirable series, Morley's Universal Library, embracing 63 volumes at a shilling each (1883-88); Cassell's National Library, embracing 209 volumes at the price of threepence each (1886-90); and the Carisbrooke Library, a series of half-crown volumes issued in alternate months from September 1888.

Morley, JOHN, M.P., was born at Blackburn, 24th December 1838; he was educated at Cheltenham and Lincoln College, Oxford, and, after taking his degree in 1859, was called to the bar, but chose literature as a profession. The best known of his books are *Edmund Burke* (1867), *Critical Miscellanies* (1871 and 1877), *Voltaire* (1872), *On Compromise* (1874), *Rousseau* (1876), *Diderot and the Encyclopædists* (1878), *Richard Cobden* (1881). From 1867 till 1882 he edited the *Fortnightly Review*; and he has edited the 'English Men of Letters' series. He is an honorary LL.D. of Glasgow. Though possessing great literary faculty and power of phrase, Mr Morley's desire has not been merely to write a readable book or to transmit knowledge, but always to make character stronger and deeper. He seems oppressed by the triviality of life; he feels that only the best is worth an effort, but that this is worth all effort, while indifference and mediocrity of aspiration are the greatest curses of mankind. In politics he has been throughout life a pronounced Radical, and in religious questions he has long stood far apart from the great majority of his countrymen.

He unsuccessfully contested Blackburn in 1865, and Westminster in 1880. From 1880 to 1883, when

he was elected for Newcastle-on-Tyne, Mr Morley was editor of the *Pall Mall Gazette*. His articles in favour of Home Rule written then, and followed up by action in the House of Commons and speeches in the country in 1885, did much to influence public opinion before Mr Gladstone's change of policy was known. In 1886 he became Irish Secretary till the dissolution which followed the rejection of the Home Rule Bill in that year. In 1890, during the difficulty as to the leadership of the Irish party, he directly supported Mr Gladstone. As a speaker Mr Morley has certainly succeeded in the country; he has few of the superficial gifts of an orator, but he never fails to convey to a public audience an irresistible impression of earnestness and sympathy, which has given him a personal hold on men's minds. Though not an advocate of state interference, he wishes politics to be regarded as a means for raising the oppressed, and elevating national character. His political opponents say that Mr Morley is a man of letters, more fitted to write history than to make it, but seized with a perverse desire to be a politician. Time will show whether to that earnest courage, which helped him to make a mark in literature, he adds the penetrating insight into the affairs of the moment and the quickness of decision which are also essential to the highest success in public life. See the *Review of Reviews* for December 1890.

Morley, SAMUEL, merchant and philanthropist, was born in Homerton, October 15, 1809. He entered his father's hosiery warehouse in Wood Street when sixteen, was methodical and punctual in his habits, and his influence was early felt in the business, in which he shared the chief responsibility along with his brother John from 1840 till 1854, when he became sole head of the concern. About 3000 persons were employed in its seven factories. He was returned to parliament for Nottingham, in the Liberal interest, in 1865; was unseated on petition; represented Bristol, 1868-85, and declined a peerage which was offered to him in the latter year. Like Lord Shaftesbury, Morley was identified with many religious and philanthropic movements. He also gave £6000 towards the erection of a Nonconformist memorial hall, and during 1864-70 contributed £14,000 towards the erection of Congregational chapels. He died September 5, 1886. See *Life* by Hodder (1887).

Mormons, or, as they call themselves, the Church of Jesus Christ of Latter-day Saints. The founder of this religious organisation was Joseph Smith, who was born at Sharon, Vermont, on 23d December 1805. He was the son of a farmer, and at the age of ten removed with his parents from the state of Vermont to Palmyra, in the state of New York, and four years later to the neighbouring town of Manchester. It was here, according to his claim, that he received in 1820 his first revelation—his divine call as a prophet of the Most High, with no less authority and power than were wielded by the ancient seers and prophets of biblical fame. Prior to this he had belonged to no religious body, though of a spiritual turn of mind, with a leaning toward Methodism. He declared that no less a visitation than that of the Father and the Son, of two persons of the Trinity, was vouchsafed to him. His second visitation from the unseen world was on the evening of 21st September 1823. A glorious personage appeared at his bedside, and, announcing himself as a messenger from the presence of God, 'called me by name and said unto me . . . that God had a work for me to do, and that my name should be had for good and evil among all nations, kindreds, and tongues. . . . He said there

was a book deposited, written upon golden plates, giving an account of the former inhabitants of this continent, and the source from whence they sprung. He also said that the fullness of the everlasting gospel was contained in it, as delivered by the Saviour to the ancient inhabitants. Also, that there were two stones in silver bows deposited with the plates, and the possession and use of these stones was what constituted seers in ancient or former times, and that God had prepared them for the purpose of translating the book. . . . While he was conversing with me about the plates, the vision was opened to my mind that I could see the place where the plates were deposited, and that so clearly and distinctly that I knew the place again when I visited it.' This visitation was supplemented by others, the same angel appearing to him thrice that night, and afterwards paying him several visits and instructing him at length in relation to his prophetic mission. The spot where the records lay concealed was described as being 'on the west side of a hill, not far from the top, about 4 miles from Palmyra, in the county of Ontario, and near the mail-road which leads thence to the little town of Manchester.' Thither the youth repaired the next day, and was shown the plates as he had been promised, but was not permitted to take them. Four years later, however, after due disciplinary probation, on the night of September 22, 1827, the angel of the Lord delivered the sacred records into his hands. They were engraved on plates nearly 8 inches long by 7 wide, a little thinner than ordinary tin, and bound together by three rings running through the whole. The volume was altogether about 6 inches in thickness, a part of which was sealed. The characters, letters, or hieroglyphics upon the unsealed part were small and beautifully engraved. They represented an unknown language, which Mormons have called the 'Reformed Egyptian.' Along with them were found the Urim and Thummim, described by the angel; by means of this instrument, which is said to have borne some resemblance to a pair of spectacles, the Lord enabled the young man to translate the ancient records into English. He read off by the aid of the Urim and Thummim to his associate and scribe, Oliver Cowdery, or other clerks, who wrote down the words exactly as he gave them. The first edition of the *Book of Mormon* (5000 copies) was published at Palmyra, New York, in 1830. It contained a prefatory testimonial, signed by Oliver Cowdery, David Whitmer, and Martin Harris, to the effect that an angel of God came down from heaven and showed them the plates from which Joseph Smith translated the *Book of Mormon*; and this was followed by the testimony of eight other witnesses, among them Joseph's father and two brothers, who affirmed that 'Joseph Smith, junior,' had shown them the golden plates containing the engravings. These were the only persons who were permitted to see them. They were returned to the angel after the work of translation was done. Only the unsealed portion of the plates was translated, the sealed remainder being reserved, with a promise of translation at a future time.

These records contain the primitive history of America from its settlement by a colony that came from the Tower of Babel, at the time of the confusion of tongues, to the beginning of the 5th century of the Christian era. These primitive colonists of North America were called Jaredites. They were a race highly favoured of heaven, but degenerated and became wicked and corrupt, the sun of their civilisation finally setting in a sea of blood and civil strife, in which millions of souls were slaughtered. But a new race came directly

from Jerusalem about 600 B.C., and in time peopled both North and South America. The founders of the new colony were Lehi and his wife, his four sons Laman, Lemuel, Sam, and Nephi, with their wives; Zoram, a servant, and his wife; in all sixteen persons. They landed on what is now the coast of Chili, in South America. After Lehi's death quarrels broke out among the brothers. The Lord had appointed Nephi to be the ruler of the new race of colonists, but his jealous elder brothers rebelled, and were cursed by the Almighty for their iniquities, and condemned to have dark skins, this punishment to continue in their posterity. They became 'an idle people, full of mischief and subtlety, which did seek in the wilderness for beasts of prey.' They were known as Lamanites, and, according to the *Book of Mormon*, were the ancestors of the American Indians. The Nephites became highly civilised and prosperous, were fair and beautiful to look upon, and were greatly blessed of the Lord, though often ungrateful for his goodness. Both Nephites and Lamanites increased and multiplied, but were almost continually at war with each other. About the time of the Crucifixion, awful earthquakes, darkness, and destruction announced that event. Shortly afterwards Christ himself appeared out of heaven to the more righteous Nephites. He showed them his wounded side and the print of the nails in his hands and feet, instructed them in the truths of his gospel, healed the sick, blessed children, administered the sacrament, chose twelve apostles, and gave them power to found his church with the same orders of priesthood, the same ordinances, gifts, powers, and blessings as in the Old World. After a prolonged season of peace, the result of the spread of the work of Christ, which at one time was received by both Nephites and Lamanites, hostilities between the two races were resumed, gradually the purity of their faith declined, and finally, about the year 385 A.D., a decisive conflict, similar to that which had destroyed the Jaredites in the same locality, took place near the hill Cumorah, where the Nephites were almost totally annihilated. The Lamanites remained a dark and benighted race, to people the waste of ruin, and faintly perpetuate in their customs and traditions the story of the illustrious past. Shortly before the battle of Cumorah, a Nephite prophet named Mormon had been commissioned of God to write an abridgment of the history of his people, from the records kept by their various prophets and rulers, to be hidden in the earth till God should see fit to bring it forth and 'unite it with the Bible for the accomplishment of his purposes in the last days.' This abridgment, written upon golden plates, was concealed in the hill by Moroni, a son of Mormon, and one of the survivors of the battle of Cumorah. He it was who appeared as an angel to Joseph Smith and told him where the plates were deposited. Such is the famous *Book of Mormon*, believed by the Latter-day Saints (hence called Mormons and Mormonites) to be of equal authority with the Jewish and Christian scriptures, and to form an indispensable supplement to them, containing God's revelations to the New, as the others to the Old World.

The work being published, attention was speedily drawn to it. The opponents of the Saints alleged that it was made up from a romance written by a quondam clergyman named Solomon Spaulding (1761-1816). This the Mormons emphatically deny, and the discovery of the original MS. of that romance by President Fairchild of Oberlin College, 1884, corroborates their denial. Undeterred by ridicule and hostility, the Mormon prophet and his associates declared that the

millennium was nigh at hand, that the Indians would soon be converted, and that the new Jerusalem, the Zion of the last days, where the Saints would finally gather to prepare for the coming of the Lord in his glory, was to be built in the heart of the American continent. America, they claimed, was the land of Joseph, bestowed upon him and his posterity for ever by the blessing of the patriarch Jacob, as recorded in Genesis and Deuteronomy. The prophet's house was frequently beset by mobs and 'evil-designing persons'; several times he was shot at and very narrowly escaped; but his courage and zeal continued to bring him disciples, and on April 6, 1830, the Church of Jesus Christ of Latter-day Saints was legally organised, with six members, at the house of Peter Whitmer, in Fayette, Seneca county, New York. Several months prior to this the Aaronic priesthood, restored by an angel who said that he was John the Baptist, was conferred upon Joseph Smith and Oliver Cowdery, and later they were ordained to the Melchizedek priesthood by the apostles Peter, James, and John. The new religion spread rapidly and gained many converts. Branches of the church were established in New York, Pennsylvania, Ohio, the British provinces, and the New England states. The prophet was fiercely attacked by the leaders and preachers of the other religious denominations, but held his ground firmly. Though but poorly educated, he was a formidable opponent in the polemical field. In January 1831, in compliance with revelation, the church removed westward and established its headquarters at Kirtland, Ohio, where it began to thrive amazingly. In the summer of 1831 a colony from Kirtland migrated to Missouri, where they purchased lands in Jackson county, which had been revealed to the Mormon prophet as the chosen site for the city of Zion. At a place called Independence his colonists concentrated themselves, established a printing-press, started a monthly periodical, the *Evening and Morning Star*, and continued to preach zealously and make proselytes to their faith. Their success and rapid increase here, as elsewhere, raised up enemies. Secret societies were formed to expel them from Missouri, their houses were attacked by mobs, their periodicals were stopped, their printing-press confiscated, their bishop tarred and feathered, and numberless other outrages committed against them. Finally, in the autumn of 1833, the entire community, numbering about 1500 souls, were driven from their homes, whipped, plundered, many of them killed, and the survivors expelled from Jackson and scattered through the adjoining counties. The main body of the refugees found a resting-place and kindly welcome in Clay county.

Meanwhile the Saints in Ohio had suffered some persecution. On the night of March 5, 1832, at Hiram, Portage county, a mob broke into a house where the prophet was sleeping, tore him from the arms of his wife, hurried him to an adjoining meadow, tarred and feathered him, and forced aqua fortis into his mouth. Sidney Rigdon, his associate, was similarly handled and rendered temporarily insane. Later on Smith was assailed by divers vexatious prosecutions, but each time came off victorious. He set up a mill, a store, and a bank in Kirtland, and continued his propagandist labours with great success. In June 1833 the building of a temple in Kirtland was commenced. Shortly afterwards a printing-press was established in the city, and Oliver Cowdery recommenced the publication of the *Evening and Morning Star*. In July 1834 the Mormon prophet visited for the third time his people in Missouri. He was accompanied by 204 persons, mostly young men. This was the 'Zion's Camp' expedition, the

object of which was to relieve the wants of their afflicted brethren who had been driven from their homes in Jackson county, and, if possible, effect a reconciliation between them and their former neighbours. They purchased lands in Caldwell county, Missouri, where they settled and founded the city of Far West. At Kirtland on February 14, 1835, the Twelve Apostles of the church were chosen, and soon after the council of the Seventies, their co-labourers in the ministry, was called into existence, and sent forth with the apostles to begin the work of 'pruning the Lord's vineyard for the last time.'

In June 1837 Heber C. Kimball, Orson Hyde, Willard Richards, Joseph Fielding, and others left Kirtland for England, and landed at Liverpool, July 20. Three days later they began preaching in Preston, and met with such remarkable success that within the next eight months, at the expiration of which time Kimball and Hyde returned to America, they had converted and baptised about 2000 people. The British mission was the first foreign mission of the Mormon Church.

On account of apostasy and persecution Kirtland was now pretty much abandoned by the Saints, the main body of them with the prophet and other leading elders migrating to the new 'Stake of Zion' in Missouri. They settled in Caldwell, Daviess, Clinton, Carroll, and Ray counties, where they bought land and improved it. At Far West, Caldwell county, the corner-stone of a temple was laid, a printing-office was established, and a monthly paper, called *The Elder's Journal*, published. But an election riot in August 1838, in Gallatin, Daviess county, where attempts were made to prevent the Mormons from voting, and some of them were obliged to defend themselves against assailants, was made the pretext for further acts of violence and rapine, from which the Saints in the outlying settlements were sufferers. The mob even burned the houses and laid waste the property of some of their own sympathisers in order to make it appear the work of the Mormons, who were falsely accused of deeds similar to those of which they were the victims. The result was a general uprising. The militia of the state was called out to suppress the riots, but took side with the mob against the unpopular Mormons. Governor Boggs issued an order for them to be 'exterminated or driven from the state,' and commanded Major-general Clark with several thousand troops to proceed at once to Far West and execute the decree. To this overwhelming force the inhabitants of the city peaceably surrendered, though compelled to look on and see their city sacked and pillaged, their wives and daughters outraged and insulted, and a number of their brethren killed by the mob and the soldiery. The Mormon leader and about seventy others were retained as prisoners, and the body of their followers, on penalty of death, ordered to leave the state forthwith. From twelve to fifteen thousand people in the autumn and winter of 1838 crossed the Mississippi, and were kindly received in the neighbouring state of Illinois. Joseph Smith and the other prisoners were tried by court-martial (November 1) and condemned to be shot, but escaped execution.

The Mormon prophet next rallied his people on the banks of the Mississippi, principally at or near Commerce, Hancock county, Illinois, where they again purchased homes and founded the city of Nauvoo (q.v.). This region though naturally fertile was then a mere wilderness, but Mormon thrift and industry soon made it 'blossom as the rose.' The legislature of Illinois granted a liberal charter to Nauvoo, and a body of Mormon militia was formed under the name of the 'Nauvoo Legion,' with the prophet himself as its commander. Meanwhile the Twelve Apostles, with Brigham Young at

their head, had preached a wonderfully successful mission in the British Isles, whence they sent many hundreds of converts across the Atlantic. Within five years the Mormons numbered in Illinois about 20,000 souls.

After a few years of comparative peace and prosperity the tempest of persecution again burst upon the Mormon community. Governor Ford ordered into service several hundred men, had Joseph Smith arrested with his brother Hyrum, and immured in Carthage gaol, Willard Richards and John Taylor accompanying them. In the afternoon of June 27, 1844, a mob of about 150 men with blackened faces broke into the gaol and shot the two brothers Smith dead, also severely wounding John Taylor. The assassins were never brought to justice. Mormonism was now thought to be doomed, but under the leadership of Brigham Young it survived the shock of its prophet's martyrdom: 'the blood of the martyrs' proved, as ever, to be 'the seed of the church.' But the anti-Mormons were determined on the removal of the entire community of Latter-day Saints from the state, and the Mormon leaders, seeing no alternative but to comply with this demand or experience a repetition of the murderous scenes of Missouri, finally resolved once more to abandon their homes, and seek a haven of peace and safety in or beyond the Rocky Mountains. Accordingly, on 1st February 1846 a thousand families left Nauvoo, crossing the Mississippi on the ice. At Council Bluffs, on the Missouri River, in the month of July 1846, Captain J. L. Allen of the United States army called on the Mormons to raise a battalion for service in the Mexican war. The exiles speedily raised the five hundred troops required, though it took nearly all their able-bodied men. The families left at Council Bluffs, unable in the absence of the battalion to proceed farther that season, crossed the Missouri and established 'Winter Quarters,' now Florence, Nebraska. Meanwhile the residue of the community left behind in Nauvoo, after a gallant defence of their city against the mob, which in violation of treaty came upon them in overwhelming numbers, were expelled from their homes and thrown shelterless upon the western shore of the Mississippi.

In the spring of 1847 Brigham Young at the head of a picked band of pioneers, 143 men, 3 women, and 2 children, started from Winter Quarters for the Rocky Mountains. They arrived in the valley of the Great Salt Lake, the site of their present beautiful city, on July 24, and began to plough the ground and put in crops the same day. Seven hundred more wagons arrived that autumn, and 1000 wagons in the autumn of 1848. In December 1847 Brigham Young was chosen president of the church—an office left vacant since the death of Joseph Smith—with Heber C. Kimball and Willard Richards as his counsellors in the First Presidency. In 1849 the provisional government of the state of Deseret was organised at Great Salt Lake City, a state constitution adopted, and a delegate sent to congress to ask for admission into the Union. The petition was refused, but in September 1850 congress created Utah a territory, and President Fillmore appointed Brigham Young governor, which office he held from 3d February 1851 until 11th April 1858, when he was succeeded in that office by Alfred Cumming. In 1857 the Mormons were falsely charged with being in a state of rebellion against the government, and President Buchanan sent a considerable military force to Utah. Young and his people fearing military excesses, and remembering the fate of Far West and Nauvoo, kept the army east of the Wasatch Mountains until the next spring, when arrangements were made for the peaceable entry of the troops, the Mormons having abandoned their city and

surrounding parts and removed south, with the avowed determination of burning every building and reducing Utah to its former condition of barrenness if vindictively pursued. They were not, however, molested. The troops passed quietly through the city and encamped in Cedar Valley, about 40 miles south-west, and the people returned to their homes. Since then their cities and settlements have extended from Idaho through Utah into Wyoming, Colorado, Nevada, Arizona, New and Old Mexico. The Mormons also have a settlement in British America. In Utah they have three temples in St George, Logan, and Manti, and a fourth, an imposing edifice, in Salt Lake City.

The Mormons have sent many missionaries to the British Isles and nearly every other European country, also to Australasia, Africa, Palestine, the East and West Indies, China, Burma, Siam, South America, and the Society, Sandwich, and Samoan Islands, and from most of these places have gathered numerous converts. In 1849 the Perpetual Emigration Fund was established, to assist poor Saints in distant lands to emigrate to Utah. Annual and semi-annual general conferences of the whole church are held, generally at Salt Lake City, and quarterly conferences in the various 'stakes,' and usually in the various missionary fields.

Organisation.—The ecclesiastical authorities of the Church of Jesus Christ of Latter-day Saints comprise two priesthoods—the Melchizedek or High Priesthood, and the Aaronic or Levitical, which is the lesser priesthood. The latter ministers in temporal things, the former in spiritual things, though having general authority and supervision over the whole. Apostles, seventies, high-priests, patriarchs, and elders belong to the Melchizedek priesthood, bishops, priests, teachers, and deacons to the Aaronic. The highest authority in the church is the First Presidency, consisting of the president of the whole church and two counsellors. There have been four of these presidents—viz. Joseph Smith (martyred June 27, 1844), Brigham Young (born June 1, 1801, died August 29, 1877), John Taylor (born November 1, 1808, died in exile July 23, 1887), and Wilford Woodruff (born March 1, 1807). The death of the president dissolves the First Presidency, the authority of which then devolves upon the next highest council, the Twelve Apostles, who nominate his successor. Since the death of Joseph Smith, selection has invariably been made of the president of the Twelve Apostles to preside over the church. The third body is the Seventies, of whom there are one hundred councils (commonly termed quorums), each of seventy members, each council having seven presidents, included in the seventy. The seven presidents of the first council of seventies preside over all the councils of seventies. The duties of the above three bodies are general rather than local. The cities and settlements of the Saints are organised into stakes, each usually covering one county. Each stake has a president, assisted by two counsellors, also a high council of twelve members (who are high-priests), presided over by the president of the stake and his two counsellors. Each stake is divided into several wards, presided over by a bishop and his two counsellors. The high-priests of any stake form a council indefinite in number. A council of elders consists of 96 members; of priests, 48; of teachers, 24; of deacons, 12. An apostle is a special witness to all the world. The Twelve Apostles are a travelling presiding high council, to build up the church and regulate the affairs of the same in all nations, as well as at home, under the direction of the First Presidency, when there is a First Presidency. A seventy's duty is to travel and minister under

the direction of the apostles. The special office of a patriarch is to administer patriarchal blessings. Apostles, patriarchs, high-priests, seventies, bishops (if high-priests), and elders can preach, baptise (invariably by immersion), lay on hands for the gift of the Holy Ghost, and minister in various other ordinances of the church. Neither priests, teachers, nor deacons can lay on hands for the gift of the Holy Ghost, but a priest may preach and baptise. Neither a teacher nor a deacon can baptise or administer the sacrament, which all the other officers named may do. The special duty of a teacher is to visit and teach the members in order to promote morality and faithfulness. The special duty of a deacon is to attend to minor temporalities, and to assist the teacher in his duties.

Doctrine.—The articles of faith of the Church of Jesus Christ of Latter-day Saints: 'We believe in God, the Eternal Father, and in his Son, Jesus Christ, and in the Holy Ghost. We believe that men will be punished for their own sins, and not for Adam's transgression. We believe that through the atonement of Christ all mankind may be saved, by obedience to the laws and ordinances of the gospel. We believe that these ordinances are (1) faith in the Lord Jesus Christ; (2) repentance; (3) baptism by immersion for remission of sins; (4) laying on of hands for the gift of the Holy Ghost. We believe that a man must be called of God by "prophecy and by the laying on of hands," by those who are in authority, to preach the gospel and administer in the ordinances thereof. We believe in the same organisation that existed in the primitive church—viz. apostles, prophets, pastors, teachers, evangelists, &c. We believe in the gifts of tongues, prophecy, revelation, visions, healings, interpretation of tongues, &c. We believe the Bible to be the word of God, as far as it is translated correctly; we also believe the *Book of Mormon* to be the word of God. We believe all that God has revealed, all that he does now reveal, and we believe that he will yet reveal many great and important things pertaining to the kingdom of God. We believe in the literal gathering of Israel and in the restoration of the ten tribes; that Zion will be built upon this [American] continent; that Christ will reign personally upon the earth, and that the earth will be renewed and will reach its paradisaic glory. We claim the privilege of worshipping Almighty God according to the dictates of our own conscience, and allow all men the same privilege, let them worship how, where, or what they may. We believe in being subject to kings, presidents, rulers, and magistrates, in obeying, honouring, and sustaining the law. We believe in being honest, true, chaste, benevolent, virtuous, and in doing good to all men; indeed, we follow the admonition of Paul—"We believe all things, we hope all things," we have endured many things, and hope to be able to endure all things. If there is any thing virtuous, lovely, or of good report or praiseworthy, we seek after these things' (Joseph Smith).

They also believed in the patriarchal order of marriage, as practised by Abraham, Jacob, and other ancient worthies; they held that it is right and proper, under certain restrictions, for a man to have more than one wife, providing he is chaste and upright in his conduct and otherwise worthy of the privilege. Their marriages are 'for time and all eternity,' as they believe in the perpetuation of the family relationships hereafter. Joseph Smith received the 'revelation on the eternity of the marriage covenant, including plurality of wives,' July 12, 1843, but it was not published to the world until August 29, 1852. A woman, among the Mormons, who does not marry and bear children is regarded as not having fulfilled all the law of her own being. A defence of

the system has been set up on moral grounds, as well as on the ground of revelation. They declare that prior to the advent of the Pacific railroads (which, by the way, the Mormons helped to construct), and the consequent influx of 'Gentile' civilisation, their community was free from the horrible vices and degrading social evils that prevail elsewhere; fornication and adultery were unknown; there were no prostitutes, no vile seducers, no illegitimate children. Their wives are asserted to be happy, virtuous, and healthy, and their social and domestic purity and felicity challenge the highest commendation.

Congress has legislated repeatedly against the polygamic feature of their faith. An anti-polygamy law, passed in 1862, remained practically a dead letter, only one conviction being secured in twenty years, and that in a test case, upon evidence furnished by the defendant. For years after the passing of the act referred to congress permitted a Mormon delegate, who had several wives, to hold his seat in the House of Representatives; but in 1882 he was denied that right, and a monogamic Mormon was sent in his stead to congress. In March 1882 an act supplementing the law of 1862 was passed, making it an offence punishable by fine and imprisonment for a man to marry more than one wife or to cohabit with more than one woman. This act, popularly known as the Edmunds Law, was applied specially against the Mormons, and was rigorously enforced. In July 1887 a constitutional convention, composed entirely of monogamic Mormons, who were vastly in the majority in the church, met at Salt Lake City, and, adopting a constitution for the 'state of Utah,' containing a clause prohibiting and punishing polygamy and unlawful cohabitation, applied once more—the fifth time in the history of the territory—for admission to the Union as a state. Like all the previous applications, however, this was refused. Finally, in September 1890 President Woodruff issued a proclamation declaring that the church no longer teaches the doctrine of polygamy or plural marriages, and accepts the United States law prohibiting such marriages; and this declaration was afterwards confirmed in conference.

[The foregoing article is written from the Mormon point of view by the historiographer of the church. For the massacre of an emigrant band of 'Gentiles' at Mountain Meadow in 1877, see DANITES. The grounds upon which the Mormons were refused admittance to the full rights of American citizenship were stated in November 1889 to be these: 'That the Mormon Church is a treasonable organisation hostile to the government of the United States, and that the oaths administered to its members in the Endowment House, on the occasion of their passing through the initiation mysteries of "endowment," bind them to render implicit obedience not only in things spiritual, but also in things temporal and political, to the priests and officers of their church, and to avenge the death of the prophets Joseph and Hyrum Smith—this under penalty of death for disobedience. The reasons for refusing Utah admission to the status of a state of the Union will fall away when the Mormons give full and satisfactory proofs that they have really abandoned polygamy, and when the constitution of the United States shall have been so amended as to prohibit polygamy in all parts of the Union.' These facts and reasons the Mormons deny. Yet from the proclamation referred to in the last paragraph above, it is evident that they determined to fulfil the requirements of the law, and to obtain their territory's admission as a state. The Mormon Church is believed to number about 250,000 members, of whom 110,000 are in Utah. In the year 1890 there were 3000 Mormons in New Zealand and

3142 in Great Britain. A body calling themselves the Reorganised Church of Jesus Christ of Latter-day Saints, and presided over by Joseph Smith, son of the founder of the Mormon Church, seceded in 1860. They now number 25,000, and their headquarters are in the states of Iowa and Illinois. They claim to be the orthodox Mormons and repudiate their co-religionists of Utah, on the ground that Brigham Young was a usurper, and that plural marriage is a device of Young and his associates devised after Smith's death and suppressed for a time for politic reasons.—ED.]

The *Book of Mormon* has been translated into several foreign languages, as also the *Doctrine and Covenants*, the *Hymn-book*, and the *Voice of Warning*. Besides these, the principal Mormon publications are *Life of Joseph Smith, Key to Theology, Spencer's Letters, Compendium of the Doctrines of the Gospel, Life of Heber C. Kimball, Autobiography of Parley P. Pratt, Story of the Book of Mormon, Catechism for Children, Snow's Poems, Harp of Zion, Correspondence of Palestine Tourists*, and many minor works. The Mormon periodicals at present published embrace twenty in the United States, one in England (Liverpool), two in Scandinavia, and one in Switzerland. The territory of Utah supports the university of Deseret; it takes rank, however, as a classical and normal school. Besides the official Mormon literature, J. H. Kennedy's *Early Days of Mormonism* (1888) and H. H. Bancroft's *History of Utah* (1889), which contains a full bibliography, may be consulted.

Morning Glory. See CONVULVULUS.

Morny, CHARLES AUGUSTE LOUIS JOSEPH, DUC DE, a French statesman, believed to have been the son of Queen Hortense and of the Comte de Flahault, and consequently half-brother of Louis Napoleon. He was born in Paris, 23d October 1811, and adopted by the Comte de Morny. He entered the army in 1832, and served with some distinction in Algeria; but he soon abandoned a military life, and in 1838 made his début in the world of industry as a manufacturer of beet-root sugar. Ever after that time he was mixed up in all sorts of commercial and financial speculations—railway companies, canal companies, French and foreign mining companies, credit societies, and various industrial enterprises. Chosen a deputy in 1842, he quickly attained a prominent position on account of his aptitude for dealing with financial questions. After the revolution of 1848 he became attached to the cause of his half-brother, and was the leader of the subtle and treasonable policy of the Elysée. He took a prominent part in the *coup d'état*, and became minister of the Interior. In 1854–56, and again in 1857–65, he was president of the *Corps Législatif*, which he succeeded in reducing to subservience; and was ambassador to Russia during 1856–57, where he married the rich and handsome Princess Trubetskoi. He died 10th March 1865. The character of the 'Duc de Mora' in Daudet's *Nabab* is based on this clever and unscrupulous politician.

Moroni, GIOVANNI BATTISTA, painter, was born at Albino, near Bergamo, about 1510, and was a pupil of Il Moretto of Brescia (1498–1555), whose real name was Alessandro Bonvicino; both these men excelled as portrait-painters. Indeed, of the North Italians, Moroni ranks next to Titian, who greatly admired his portraits. The attitudes in Moroni's pictures are easy and natural, the draperies well managed, and the predominant tone of colour is silvery. An excellent example of his style is the 'Tailor' in the National Gallery, London, where there are also four other portrait-pieces from his brush. Moroni likewise painted sacred subjects of the usual types, now in the Brera at Milan, at Bergamo, at Verona, and other places in North Italy. He died 5th February 1578.

Morocco, or **MAROCCO**, known to the natives as *Maghreb-el-Aksa*, 'the farthest west,' is an empire or sultanate which, though at one time comprising a portion of Algeria in one direction, and exercising in the other a modified jurisdiction as far as Timbuktu, is now confined to that part of north-west Africa bounded on the E. (at the Wad Kiss) by Algeria, and on the S. by Cape Nun and the Wad Draa, though both here and on the Sahara side of the Atlas the limits of the empire are rather indeterminate. Very little of the country has been even roughly surveyed; but, according to the vague knowledge possessed, it contains about 314,000 sq. m., of which the 'Tell' or fertile region west of the Atlas contains 78,000, the Steppes or flat sterile upland pastures, 27,000, and the Desert or Sahara, 209,000 sq. m. Politically, Morocco comprises at present the old kingdoms of Fez and Morocco and the territories of Taflet (Tafilalet) and Sus; but the two latter are almost independent, recognising the sultan only as the Prince of True Believers, an office which he holds as the most powerful of the Shereefs or descendants of Mohammed. These four principal governments are divided into seventeen primary provinces or 'amalats,' each presided over by a Kaid or 'Bashaw,' as the Europeans call him, who again has under him various minor officials directing the affairs of the smaller districts, until the headman of the village is reached. Many of the Arab and most of the mountain tribes are practically independent, never being troubled by the Shereefian officers, and paying taxes only when an army enters their country. Over this region, living in a few moderately-sized towns, and numerous little stationary villages of stone or clay (*dshars*) or in the tent hamlets (*douars*) of wandering tribes, is scattered a population variously estimated from 2,500,000 to 13,000,000—the actual number being perhaps between three and four millions. But there is no census, and the country-people, in order to avoid the extortion of the troops and the 'mouna,' or gift of provisions to favoured travellers, prefer to live in retired spots at a distance from the ordinary routes through the country. Morocco is, as a rule, mountainous, the Atlas (q.v.) traversing it in several chains from south-west to north-east, and by various spurs both to the coast country and to the desert. There are, however, numerous level plains, some of which are of great extent, and very rich, the soil being in many places a deep, black loam, evidently the bed of an ancient lake or of a primeval forest. There are also numerous more or less level plateaus similar to those of Algeria. But with the exception of parts of the Atlas, the forest of Mamora, the date and argan groves of the south, and a few straggling copses around the burial-places of saints, Morocco has, in the course of the last thousand years, been almost denuded of timber, the palmetto (*Chamærops humilis*) scrub being about the most common representative of woodland. Consequently the country looks bald, rolling hills and monotonous plains, green in spring, brown during summer and autumn, being the most characteristic features of the north, though some of the glens and mountain-regions are extremely picturesque. Farther south, and on the other side of the Atlas, where long droughts, followed by famines, are common calamities, and the rainfall is at the best of times scanty and uncertain, sandy wastes are the prevailing characteristic; but in western Morocco, though the soil is sometimes thin and out of the river-valleys stony, actual desert is rare, and, except where the sand has been drifted inland by the winds, not unfitted for pasturage.

The central range of the Atlas forms the watershed separating the streams which flow into the Atlantic and Mediterranean from those which run southward toward the desert, where they are often lost in marshy 'sinks' or *sebkhas*. And of the streams falling into the Atlantic and Mediterranean, many are in the hot season or after long droughts little better than a succession of pools connected by threads of water, though rolling in brown floods from bank to bank during the wet season, when they are dangerous to cross. None of them are navigable for any distance from their mouths, which are always impeded by bars and shoals. Yet before the 14th century vessels of considerable tonnage went 40 miles up the Sus to Tarudant, and stern-wheel steamers could even yet easily navigate the Sebu to within a few hours of Fez. But there are not even barges on them.

The climate of Morocco varies much, though the western slope, being tempered by the sea-breezes and protected from the hot desert-winds by the Atlas, is temperate, the thermometer seldom falling below 40° or rising above 90°. But in summer the interior valleys are very hot, and in winter snow often falls in Fez and Mequinez, where ice an inch thick is by no means uncommon. In Tangier there has been a slight snow-shower about twice in forty years, and in Mazagan even less frequently. Farther south extremes of heat and drought are more common, though as a rule the climate is equable, and, unless in swampy places during summer, extremely healthy. In the Sus country and the region of Tafilet rain is scarce and in places almost unknown. But farther north, and on the Atlantic and Mediterranean slopes, it falls with tolerable regularity every year between October and April, the amount being at times so great that the low lands are flooded, the rivers impassable, and the mountain-sides, unprotected by wood, furrowed by torrents, sweeping the soil and debris before them into the valleys below. On the upper reaches of the Atlas there is all summer a June-like atmosphere; but in winter they are capped deep with snow.

Morocco is thus fitted for growing any crops of the temperate and tropical zones, and under a better government would become, as Barbary was in Roman times, the granary of Europe. Wheat and barley are grown largely, and were they allowed to be freely exported would be produced in immense quantities. Maize forms the chief export of Mazagan. Various gums, oranges, figs, almonds, lemons, and dates are among the other vegetable products. Cotton and hemp are grown for home consumption. Tobacco cultivation is prohibited and its use forbidden by the sultan, though both it and 'keef' (Indian hemp) are used. Most European fruits grow well, and among other products sugar has been raised. Cattle (under treaty arrangement with Gibraltar) are exported; but no animals can be sent out of the country without an imperial permit. The exports (maize, beans, chick-peas, olive-oil, wool, almonds, dates, fowls, eggs, hides, bones, esparto, cattle to Gibraltar, &c.) amounted to £1,286,723 in 1887, and the imports (cotton goods, cloth, tea, coffee, sugar, candles, hardware, &c.) to £1,258,354, of which £630,245 were from Great Britain. The interior of the country is so little known, and the Atlas so entirely unexplored, except hastily in isolated places, that little can be said with certainty regarding its mineral wealth. But enough has been ascertained to enable us to assert that gold (placer and in quartz), copper, tin, argentiferous galena, nickel, antimony, iron, and manganese abound. Coal and petroleum have been indicated. Rich silver lodes exist at Gondofi near the head-waters of the Sus, and rock-

salt is mined near Fez. But these mineral deposits are scarcely touched, and no European is allowed even to visit the mines.

The flora of Morocco is essentially European, so far as the western side of the Atlas is concerned, that of the Atlas generally being a southern extension of the temperate flora of the adjoining continent, with little or no admixture of southern types.

The fauna partakes of a similar character, the Barbary fallow-deer, wild boar, Barbary monkey (found also in Gibraltar), a species of porcupine, and wild cat being the most characteristic mammals; but the lion, once common, is now very rare in the inhabited parts of the country. The birds and fishes are those of southern Europe; of the forty species of reptiles and amphibia known, twenty-two also belong to Spain; and only eight of the Moroccan species, according to Böttger, inhabit the Ethiopian region—facts all pointing to a time when the Strait of Gibraltar did not divide Europe from Africa. Ostriches are seen only in the extreme south. Locusts often devastate the country. The Barbary horses have sadly deteriorated; while in agriculture, oxen, donkeys, camels, and even women yoked with them, are commonly employed to drag the rude one-stilted plough and the harrow, which consists of a bunch of thorns.

The inhabitants consist of six principal groups. The (1) Berbers (*Braber*) or Kabyles, of whom the Amazigh, Shelluh, and Tuareg are only branches, are the aborigines. They inhabit for the most part the mountain regions, and are still only half subdued. (2) The Arabs are descendants of the invaders who came in the 7th century. (3) The Jews were very early settlers, semi-independent colonies still subsisting in the Atlas and the Sus country, though most of them in the towns are refugees driven out of Spain and Portugal. (4) A few thousands of Europeans, chiefly Spaniards, are almost entirely confined to the coast towns. (5) The 'Moors,' a term vaguely applied to all the Mohammedan inhabitants, are really Arabs with a large admixture of Spanish and other European bloods, and the name ought properly to be restricted to the inhabitants of the cities. (6) The Negroes, of whom there are large numbers, were brought from the Soudan as slaves. Most of the latter are still in this condition, though the descendants of some of them now occupy high places in the army and the government. The Jews, though sorely oppressed when not under the protection of some 'Christian' power, prosper amazingly, and are allowed a certain autonomy in their own affairs, but are confined in the cities to a 'mellah' or Jews' quarter. In spite of many indignities, some have managed to hold offices of profit in the court.

The sultan, who is the last independent sovereign in the Barbary States (of which Tripoli is now directly under the sultan of Turkey), is one of the most perfect specimens of an absolute monarch existing. He is 'the state.' His so-called ministers are simply the favourites of the hour. Everything must pass through his hands. He receives the entire revenue, believed to be about £1,800,000 per annum, and spends as little or as much of it as he pleases. Every office is directly or indirectly purchased, small salaries or none are paid, the holders recouping themselves by plunder and oppression, tempered by the fact that at any moment they may be forced to disgorge to the sultan, or in default be left to rot in the loathsome Moroccan dungeons, or be beaten or tortured to death. All justice is bought and sold. Yet, owing to the religious fanaticism of the people, and the mutual jealousies of the European powers, whose representatives reside at Tangier, the political equilibrium is

preserved, and the long-expected *débâcle* postponed. The only European nation which at present has any territory in Morocco is Spain, which maintains a fortress at Ceuta, and four convict settlements, and a fishing-station at Ifni. But independently of the sacred chiefs of Sus, the Grand Shereef of Wazan, as the nearest descendant of Mohammed, governs that city and is lord paramount or proprietor of a large territory in the neighbourhood; where he is, or was before he became a French subject and became addicted to Frankish ways, almost as powerful as the sultan himself.

Education is at a low ebb. Few of the people can read or write, a capacity to repeat by heart passages of the Koran or of Al Bekkhar's commentaries upon it, and the traditions being almost the sum of what is taught in the village schools. The so-called 'university' of Fez is nowadays merely a seminary attached to the chief mosque for the training of religious acolytes. Printing is still an unknown art, save amongst the Europeans of Tangier. There are no roads except bridle-paths, and no wheeled carriages in the interior except the sultan's state coaches. The chief industry besides the rude agriculture of the Berbers and Arabs, and the breeding of horses and mules, is the making of 'morocco' leather, harness, slippers, red 'Fez' caps, cloth for native apparel, the chiselling of brass trays, the making of rough pottery and of inlaid flint-lock muskets, and the weaving of carpets (principally in Rabat). The best mechanics and the jewellers are Jews.

The army has of late years been reorganised under European officers, a Scotsman (Kaid Maclean) taking the chief part in this task, so that at present there is a force (the Askar) of about 10,000 men, drilled, armed, and clothed after an approach to the European fashion, the rest being mainly undisciplined native levies. Altogether, the sultan is believed to be able to mobilise upwards of 100,000 men, and double that number should the Faith be in danger. There is now no navy—imperial or mercantile—a single steam-transport representing the once-dreaded 'Sallee rovers.'

Morocco is connected with Spain by telegraph, and the telephone is in use in Tangier, Casablanca, and other coast towns. The posts also are confined to the Europeans. Morocco has three capitals or imperial residences, at one of which the sultan and his army reside at uncertain intervals and for indeterminate periods. These are Fez (q.v.), Makinas or Mequinez (q.v.), and Marakesch, better known as the City of Morocco (q.v.). Beside these the principal coast towns are Tangier (20,000 to 25,000 people); Tetuan (25,000), a little way up the Martil River; Larache (El-Arish), with 10,000 people (1800 Jews and 200 Europeans); Rabat and Sallee, on opposite sides of the Bu-Ragreb River (21,000); Casablanca, or Dar-al-Baida (8000); Mazagan (5000); Saffi (8000); and Mogador (q.v.). But all of them are decaying, most of them in partial ruins, and without any exception filthy, undrained, and insanitary to the last degree. When not mere collections of flat-roofed or thatched huts, of sundried bricks, around a *kashah* or walled fortress, they are congeries of narrow intricate lanes, often covered over with vines or reeds to keep out the sun. These lanes are lined with shops which look like large packing-boxes, with the lids raised as a penthouse and padlocked at night, or else with whitewashed windowless walls, over which here and there rise the square towers of a mosque. But within these is often a pleasant courtyard shaded by oranges and palms and cooled by a fountain, into which open gaily Arabesque-painted rooms, furnished with the rich carpets that constitute the principal furniture of a strictly Moorish

house. The sole accommodation for travellers is caravanserais, with a yard for beasts and unfurnished rooms for their owners.

After being for more than four centuries a part of the Roman empire, and in the latter period of its sway veneered with a corrupt Christianity, 'Mauritania Tingitana' fell (429 A.D.) into the hands of the Vandals, who held it until 533, when Belisarius having defeated them it became subject once more to the Eastern Empire. But in the year 680 the Arab invasion began, and with little intermission the Arabs have ever since been possessors of the country, and the entire population are now the most fanatical adherents of Mohammedanism. At first, with Spain, part of the califate of Bagdad, it became divided into several independent nomarchies, and during this period the country enjoyed a prosperity to which it has ever since been a stranger. After seeing the successive dynasties of the Edrisite (789 A.D.), Mahdhiti, Zeiridi, Almora-vidi, Almohadi, Beni Marini, Uatasi, Shereefi-El-hhoseini, and Shereefi El-Fileli (or Alides), and almost unbroken civil and foreign wars and revolutions, Muley (Mulai = 'My Lord') Ismail (1692-1727) united the entire country under his sway, and as one empire it has, with occasional rebellions, continued ever since. Morocco though now more contracted than formerly, has at present, with the exception of the Spanish 'presidios,' no foreign strongholds on its coast, as there were up to the year 1769, when the Portuguese evacuated Mazagan; and since the unsuccessful war with Spain in 1859-60 the country has not been disturbed by foreign hostilities. But it is still very backward. A passive resistance is offered to every improvement, and, though Christian slavery and piracy by government vessels have been abolished since 1817-22, and foreign traders have nominally had access to all parts of the empire, the interior is not much different from what it was a thousand years ago, and many cities and districts are still dangerous or impossible to visit. The slave-trade is as brisk as ever, negroes being openly hawked about the streets of the ports, and systematically offered for sale in the markets of the larger towns of the interior. The sultan's chief complaint against the European representatives is that some of them sell 'protections' wholesale to his subjects, and that thus whole villages are passing from under his sway; while they justly insist that every obstacle, short of absolute abrogation, is offered to the carrying out of the treaty obligations, and that owing to the long distance of the court from Tangier and the almost continual absence of the sultan during his punitive and tax-collecting expeditions it is hard to transact any business with him.

The city of MOROCCO (Arab. *Marakesch*, by which name it is usually known among European residents), the southern capital of the empire of the same name, is situated in 31° 37' 28" N. lat. and 7° 36' 30" W. long., between 4 and 5 miles from the left bank of the Tensift, at the northern end of an extensive and fertile plain dotted with date-palms, 1447 feet above the sea, about three and a half days' journey from Mogador and Mazagan, and two and a half from Saffi. It is surrounded by a lime and earth ('tabia') wall, once strong, but now dilapidated, more than five miles in circumference, between 20 and 30 feet high, flanked at regular intervals by square towers, and pierced by seven gates, some of which are said to have been brought piece by piece from Spain. The town is squalid and ill-built, though it bears the marks of former grandeur, the mean, flat-roofed, windowless houses on either side of the narrow, irregular, unpaved, filthy streets, being mostly one-storied and half in decay. A large portion of the immense space within the walls is occupied by

ill-kept gardens, open areas, and 'soks,' or market-places; the eight large cemeteries are outside the walls. In the bazaar and merchants' quarter—the 'Kaiseria,' a partially-covered area—a considerable local trade is carried on with the country-people, the mountaineers from the neighbouring Atlas, and with Sus, Tafilet, Mazagan, Saffi, and Mogador, though the commercial importance of Morocco is much less than that of Fez. Morocco possesses many mosques, one of which, the Kutubia, has a tower after the model of the Hassan in Rabat and the Giralda in Seville, 230 feet high. There are several tanning and leather-dyeing establishments of considerable extent, though of late years European goods have been gradually displacing native manufactures. The population varies according to the presence or absence of the sultan, his court, and army. In ordinary times it does not exceed 60,000, of whom from 7000 to 8000 are Jews, living in a 'mellah,' or Ghetto, under the most degrading physical, political and moral conditions. But no Europeans reside permanently in the city. On the south, outside the walls, stands the imperial palace, an irregular conglomeration of gardens and buildings covering about 180 acres. But of late the sultan has resided very little here, a year or more often elapsing without his setting foot in the place.

Morocco was founded in 1072 by the Emir Jusef ben Tachefyn, and reached the summit of its prosperity in the 13th century. In those days it is affirmed to have contained more than 700,000 inhabitants. But for several centuries, owing to civil wars, during which the rebellious Berbers more than once sacked it, the city, like all the interior towns of Morocco, has been rapidly retrograding. However, owing to its excellent situation in sight of the Atlas, from which cool streams are always flowing, its genial healthy climate, and its command of the trade routes across the mountains, Marakesch is safe to have a great future when Morocco knows other masters than the Moors.

See also MOORS, BERBERS, BARBARY.

Moron, a town of Spain, on the Guadaira, 32 miles by a branch-line S.E. of Seville. Its ruined castle was once almost impregnable. Pop. 14,879.

Morpeth, a market-town of Northumberland, on the winding Wansbeck, 16 miles N. of Newcastle. The parish church dates from the 14th century; the free grammar-school, founded by Edward VI. in 1552, has an endowment of nearly £500 a year, and in 1859 was rebuilt, after a chancery suit lasting 150 years. The town-hall (restored in 1870) was erected in 1714 by Sir John Vanbrugh, and the county-hall in 1818 at a cost of £80,000. Morpeth has flannel-factories, breweries, tanneries, iron-foundries, &c., with collieries and quarries in the neighbourhood. From 1553 till 1832

it returned two members to parliament, but now only one; the parliamentary borough was extended in 1868. Pop. (1851) 10,011; (1881) 33,402; of municipal borough (1881) 4968; (1891) 5219.

Morpheus (Gr., 'moulder'), in classic mythology, the son of sleep and the god of dreams. He is so named because he shapes or moulds the dreams that visit the sleeper. He is first mentioned by Ovid, and is represented as an old man with wings, pouring somniferous vapour out of a horn.

Morphine, or MORPHIA, $C_{17}H_{19}NO_2 \cdot H_2O$, was the first alkaloid isolated in a pure state (by Sertürner, an apothecary, in Hanover in 1816). The name morphia was given to it in allusion to its crystalline form (Gr. *morphê*, 'form'). It is the most important of the alkaloids existing in opium, of which it usually constitutes from $\frac{1}{4}$ th to $\frac{1}{3}$ th by weight, and in which it is combined with meconic, sulphuric, and probably other acids. It is obtained as white, silky, translucent crystals, with a bitter taste and alkaline reaction. Morphine is soluble in about 1000 parts of cold and in 400 of boiling water; boiling alcohol dissolves it freely; but it is insoluble in pure ether and chloroform. Morphine is not so easily detected in cases of poisoning by opium as Meconic Acid (q.v.). The following are some of the ordinary tests for it: concentrated nitric acid added to morphine or any of its salts gives an orange colour; when it is mixed with iodic acid iodine is liberated; in solution it gives a blue colour with persalts of iron.

Morphine is the only opium alkaloid which is soluble in lime-water, and this property affords one of the best means of extracting it. A watery infusion of opium is boiled with milk of lime, filtered, mixed with powdered sal-ammoniac, and again boiled. By this means the lime is converted into the chloride of calcium, the ammonia is volatilised by the heat, while the morphine is precipitated in an impure form, which admits of easy purification.

Morphine combines with acids to form crystallisable salts, which are readily soluble in water and in alcohol. Of these, the hydrochlorate (muriate), the acetate, the bimeconate, and other salts are much used in medicine. Apomorphia, a white crystalline powder with physiological properties like those of morphia, is obtained by heating morphia with an excess of hydrochloric acid.

The therapeutic uses of morphine and its salts are very similar to those of Opium (q.v.), but morphine is employed largely in cases where Hypodermic Injection (q.v.) is desired. The ordinary dose of morphine, or its salts, when given to an adult to allay pain or induce sleep, ranges from an eighth of a grain to half a grain. Many persons are addicted to the habitual use of morphine. The effects are very much the same as those of opium, and it is taken for the same reasons; but morphine is more rapid in action and more efficacious, and is not accompanied by some inconveniences which attend the use of opium. The habitual abuse has its origin in the legitimate use as a medicinal agent. But when the habit is established, the evil consequences soon set in, though some constitutions suffer much more than others. As a rule, *habitués* become pale, sallow, emaciated, appetite is diminished, digestion disordered, sleeplessness sets in, and defies extra doses of the drug. If, as is usual, the morphine is subcutaneously injected, all parts of the body within reach of the syringe may become one mass of sores, so that it is hard to find a place for a new injection. The will is enfeebled: the man or woman becomes a mere paralytic. A special hospital has been equipped in Paris for victims of this self-indulgence. See Sharpey on 'Morphinomania' in the *Nineteenth Century* (1887).

Morphology (Gr. *morphē*, 'form'), the study of organic form and structure, the counterpart of physiology, which is concerned with habit and function. The term was first introduced by Goethe in 1817, and is now generally used to include 'the whole statical aspects of the organic world,' as expressed especially in anatomy, both descriptive and comparative, in histology, which is concerned with more minute structure, in palæontology or the study of extinct forms, and in so much of embryology as consists of structural investigations at different stages of development. But whether engaged with anatomical or histological, palæontological or embryological studies, the consistent morphologist always considers animals and plants at rest or dead, and analyses them into their parts; while the physiologist on the other hand studies organisms in action or life, and seeks to discover, at various levels of investigation, the physical and chemical changes associated with their activity. Thus, in short, morphology corresponds to the 'statics,' physiology to the 'dynamics' of the organism (see ANATOMY, BIOLOGY, EMBRYOLOGY, FUNCTION, PHYSIOLOGY). To the purely geometrical study of organic forms, their contour, axes, symmetry, &c.—a highly technical inquiry comparable to crystallography—Haeckel applies the special term *promorphology*.

The simplest task of the morphologist consists in describing form and structure, and the fulfilment of this with increasing thoroughness has placed taxonomy or classification on a *suré* basis. But this necessarily involves analysing the organism into its parts—organs, tissues, and cells—a method which led, for instance, to the establishment of the cell-theory (see CELL), and has been associated with a parallel deepening of physiological inquiry (see BIOLOGY). Then follows the work of comparing part with part, in a series of organisms or in the same organism, alike in living and extinct, in adult and young forms. This has led to the detection of fundamental similarities of structure or 'homologies' (see HOMOLGY)—witness Goethe's reduction of the flowering plant to an axis bearing numerous modified or 'metamorphosed' appendages or leaves (see BOTANY, FLOWER); the comparison of oral and other appendages throughout the series of arthropods (see CRUSTACEA, INSECTS); the discovery of the segmented character of the vertebrate skull and brain; the recognition of the ovum as the common starting-point in the life-history of all organisms, or of the gastrula as a predominant stage in the development of animals; the tracing of the embryonic layers to their derivatives in the adult (see EMBRYOLOGY); and so on throughout the triumphs of comparative anatomy and embryology. Finally, the facts of evolution have given the morphologists warrant for yet wider generalising, in which the results of anatomy and histology, embryology and palæontology, legitimately alloyed with physiological considerations, are welded together into the principles of differentiation.

See the Introduction to Gegenbaur's *Comparative Anatomy* (trans. by Jeffrey Bell, 1878); Haeckel, *Generelle Morphologie* (1866); Hatachek, *Lehrbuch der Zoologie*; standard text-books of Zoology and Botany, and the histories of these sciences by Carus and Sachs respectively; W. His, *Unsere Körperform* (1875), and also 'On the Principles of Animal Morphology,' *Proc. Roy. Soc. Edin.* xv. (1888); Herbert Spencer, *Principles of Biology* (1864).

Morphy, PAUL. See CHESSE.

Morris, GEORGE PERKINS, author of 'Woodman, Spare that Tree,' was born in 1802 in Philadelphia, founded the *New York Mirror* and afterwards the *Home Journal*, with both of which N. P. Willis was associated, and died in New York, 6th July 1864.

Morris, GOUVERNEUR, an American statesman, was born in Morrisania, New York, 31st January 1752, graduated at King's (now Columbia) College in 1768, and was admitted to the bar in 1771. He early showed a talent for finance, and took an active share in the political affairs of the Revolution period. In May 1780 he lost a leg through a fall from his carriage in Philadelphia. From 1781 to 1784 he was assistant to Robert Morris, superintendent of the national finance. In 1787 he took his seat as a delegate in the convention that framed the United States constitution, and the year after sailed for Paris, where for two years he devoted himself to private business. The greater part of the year 1791 he spent in England as a confidential agent of Washington's, and next served till August 1794 as United States minister to France. Returning to America in 1798, he sat for New York in the United States senate from 1800 to 1803, and was chairman of the New York canal commissioners from 1810 till his death, 6th November 1816.

See *Memoirs of Gouverneur Morris, with Selections from his Papers and Correspondence*, by Jared Sparks (3 vols. Boston, 1832), and *Gouverneur Morris*, by Theodore Roosevelt, in the 'American Statesman' series (1888), also *The Diary and Letters of Gouverneur Morris*, edited by his granddaughter, Anne Cary Morris (2 vols. 1889). The last contains many interesting glimpses of Paris in the fever of Revolution.

Morris, LEWIS, a copious writer of verse which has attained an extraordinary popularity, was born in Carmarthen in 1832, and educated at Sherborne School and at Jesus College, Oxford, where in 1855 he graduated first-class in classics, and won the Chancellor's prize. He was called six years later to the English bar, and practised till 1881, when he accepted the post of honorary secretary to the university of Wales. In 1877 he was elected an honorary fellow of Jesus College. Mr Morris's first offerings of verse appeared in 1871, when under the pen-name of 'A New Writer' he published *Songs of Two Worlds*, which at once passed into numerous editions, and which was followed in 1874 and 1875 by a second and third volume. In 1876 appeared *The Epic of Hades*, the work with which the author's name is usually associated; it has run into several series, and these series into many editions. He has since published *Gwen, a Drama*; *The Ode of Life*; *Songs Unsung*; *Gycia, a Tragedy*; and *A Vision of Saints* (1890), &c., which have shown no falling off in popularity.

Morris, WILLIAM, the poet, was born in 1834, and educated at Marlborough and at Exeter College, Oxford, where he formed an important and lasting friendship with Burne-Jones, the famous painter. He himself studied to be a painter, but without success, his artistic temperament being destined to have play in another direction. In 1858 he published a small volume entitled *The Defence of Guenevere and other Poems*, which passed almost unnoticed at the time; but in 1867 he won the attention and admiration of every true lover of poetry by a long narrative poem entitled *The Life and Death of Jason. The Earthly Paradise* (3 vols. 1868-70) confirmed his high reputation. This work is made up of twenty-four legendary and romantic poems of classic or of Gothic origin, recited by Norwegian seamen who had sailed westward to find the earthly paradise. Mr Morris has since published *Love is Enough* (1873), the *Æneid* of Virgil done into English verse (1876), and *The Fall of the Niblungs, a Poem* (1877). In collaboration with Mr Eirikr Magnusson he has translated from the Icelandic *Grettir the Strong*, *The Story of the Volsungs and Niblungs*, and *Three Northern Stories*, and in 1890 began the publication

of English versions of the *Sagas*. Of late years Mr Morris has declared himself a Socialist, and his numerous writings and speeches in support of Socialistic doctrines have left him less time and inclination for poetry. Five lectures, *Hopes and Fears for Art*, appeared in 1882. His early work is his best; indeed, his first volume is his best, and if he is to live at all it will be by reason of *The Defence of Guenevere*. These thirty lyrics, mediæval in matter—deeply mediæval in tone and colour—are instinct with life, their characters 'flesh and blood under their chain-armour, and the trappings of their tabards.' With the bulk of Mr Morris's work it is different. It were impossible to praise too highly the exquisite and sustained beauty of form, of melody, of colour. The author is the best of story-tellers; he is unsurpassed in the simple freshness of his natural descriptions and the rippling music of his verse. But the people of his later poems hardly breathe the breath of life at all. They are but beautiful shadows, and the poems, it has been well said, are fit reading for sleepy summer afternoons. For such work one cannot predict long life. Still from us who are of the present is there not due a great debt to the writer who has led us away from the doubt and mental conflict, from the hideousness and materialism, of modern life into a beautiful garden of dreams? In 1863 Mr Morris and others founded the establishment for the manufacture of wall-papers, stained glass, tiles and artistic household decorations, which has since been carried on by him, and has largely contributed to reform English taste in colour and design (the article on painted or stained glass, Vol. V. p. 246, is by him).

Morris-dance. This rustic dance, formerly an accompaniment to the May-day games and Whitsun-ales, and not yet obsolete in England, is probably of Moorish origin. Douce conjectures it was introduced into England in the reign of Edward III. by John of Gaunt on his return from Spain; but Strutt was of a different opinion, maintaining that the Morisco or Moor dance differed from the morris-dance as practised in England, having been accompanied with castanets or rattles at the end of the fingers, and not with bells attached to various parts of the dress. The principal performers of the morris-dance were Robin Hood, Maid Marian, the hobby-horse, and the Bavarian or fool, the number of actors having varied at different times. Shakespeare has several allusions to the morris-dance; the music and whimsical attire of the actors being referred to by Beaumont and Fletcher.

Morrison, ROBERT, the founder of Protestant missions in China, was born of Scottish parentage at Morpeth, in Northumberland, 5th January 1782. He studied at one of the Independent colleges, and in 1807 he was sent to Macao and Canton by the London Missionary Society. In February 1809 he was appointed translator to the East India Company's factory at Canton, and by 1814 he had completed the translation and printing of the whole of the New Testament. Four years later, by the help of William (afterwards Dr) Milne, he had done the same with the Old Testament; and in 1823 he completed and printed his great *Chinese Dictionary* in six large quarto volumes, at an expense to the East India Company of £12,000. It occupied him for sixteen years, and in connection with it he had accumulated a library of 10,000 Chinese books. It contained 40,000 words expressed by Chinese characters, and was afterwards translated into Japanese. In 1816 he acted as interpreter to Lord Amherst. In 1818 he established an Anglo-Chinese College at Malacca. When he returned to England in 1824, he brought

with him his collection of books, ultimately presented to the Council of University College, London. After visiting France, Ireland, and Scotland, he in 1826 returned to China. In 1834 he accompanied Lord Napier to Canton as interpreter, and died there 1st August. Besides the works already mentioned, he is the author of *Horæ Sinicæ* (1812), being translations from the popular literature of the Chinese, a *Chinese Grammar* (1815), and *Chinese Miscellany* (1825). In 1839 his widow published his *Memoirs*. See also Townsend's *Robert Morrison* (1888).

Morristown, capital of Morris county, New Jersey, on the Whippany River, 30 miles by rail W. of New York. It is a pleasant summer-resort, with some historic associations, and has ironworks and various mills; 3 miles to the north is a large state lunatic asylum. Pop. (1885) 8760.

Morse. See WALRUS.

Morse, SAMUEL FINLEY BREESE, American artist and inventor, was the eldest son of Rev. Dr Jedidiah Morse, geographer, and was born at Charlestown, Massachusetts, April 27, 1791. He graduated at Yale College in 1810, and visited England with the American painter Washington Allston, to study painting with him and Benjamin West. In 1813 he received the gold medal of the Adelphi Society of Arts for his first effort in sculpture, the 'Dying Hercules.' Returning to New York in 1815, he became the first president of the National Academy of Design, which was established in 1826, and filled the office till 1842, and was appointed professor of the Arts of Design in the university of the city of New York in 1835. He did not give his entire attention to art, but devoted much study to chemistry, especially to electrical and galvanic experiments; and on a voyage from Havre to New York in 1832 he conceived the idea of a magnetic telegraph, which he exhibited to congress in 1837, and vainly attempted to patent in England. His claims to priority of invention over Professor Wheatstone in England have been the subject of considerable controversy (see TELEGRAPH). He struggled on heroically against scanty means until 1843, when at length congress, at midnight, in the last moments of the session, appropriated 30,000 dollars for an experimental telegraph line between Washington and Baltimore. Morse lived to see his system of telegraphy adopted in France, Germany, Denmark, Sweden, Russia, and Australia. Honours both from home and abroad were heaped upon him, and an international present of 400,000 francs was given him in 1858, at the instance of Napoleon III. A bronze statue was erected to him in New York in 1871. He died in New York, 1872. See the *Life* by S. I. Prime (New York, 1875).

Morshansk, a town of Russia, 58 miles N. of Tamboff and 149 by rail W. by N. of Penza, has distilleries and an active trade in wheat, hempseed, and tallow. It was almost burned to the ground in 1874. Pop. 21,190.

Mortality. The subject of general tables of mortality is discussed at INSURANCE; see also VITAL STATISTICS. Weekly 'Bills of Mortality,' weekly reports as to christenings and burials, were first prepared by the parish clerks of London about 1592-93, in consequence of the frequent recurrence of the plague. The area 'within the old bills of mortality' was gradually increased, till in 1726 it extended to 21,587 acres. In 1801 the 'New Tables of Mortality' gave the registration district an area of 30,000 acres, which has also been extended till 'Registration London' had in 1871-81 an area of 75,362 acres. See LONDON.

Mortar, a short and very thick piece of artillery of large calibre, firing a heavy shell at a fixed

angle of 45° or thereabouts, so that the projectile may strike the object aimed at in a direction more or less vertical. The range is regulated by the amount of powder used, which, being placed in a chamber completely closed by the projectile, produces its maximum effect. Mortars are particularly useful at sieges, as their 'high-angle' fire enables them to search out the interior of the works, and against ships whose decks offer a vulnerable target to such fire. The common type of mortar is a muzzle-loading smooth bore of 5½, 8, 10, or 13 inch calibre, firing a spherical shell; but rifled mortars and elongated shells were used by the Germans at the siege of Strasburg in 1870; and the United States have a very powerful weapon in their 12-inch breech-loading rifled mortar or

howitzer, shown in the figure. With a charge of 35 lb. of powder and 60° elevation, this weapon will project a shell 1630 lb. in weight a distance of 5½ miles with such accuracy that five out of seven shots would injure a vessel at that distance. The Russian artillery have a so-called field-mortar weighing only 9 cwt., and firing a 46-lb. shell. This weapon is 3 feet long and of 6-inch calibre, but being fitted with elevating gear is better classed as a howitzer. It is breech-loading, effective up to 4000 yards, and as mobile as an ordinary field-gun. Very large mortars have been tried at times, as at the siege of Antwerp citadel in 1832, when the French brought one of 24-inch calibre to the attack. This monster, owing to its unwieldiness and other causes, was a failure. Larger still is Mallet's 36-inch mortar, constructed in 1855, of iron parts welded together, and now in Woolwich Arsenal. Only two or three rounds have been fired from this weapon, as it showed signs of cracking after being discharged.

Mortar. See CEMENTS.

Mortara, EDGAR, a Jewish boy who, on 23d June 1858, was forcibly carried off from his parents by the orders of the Archbishop of Bologna, on the plea that he had, when an infant, been baptised into Christianity by a Roman Catholic maid-servant. The manner of the boy's abduction, and the refusal of the Roman Catholic authorities to give him up to his parents, becoming known throughout Europe, excited great indignation, more particularly in England. But the boy remained in the hands of the Roman Catholic Church, and became an Augustinian monk.

Mortar-vessel, a class of gunboat for mounting sea-service mortars. Mortar-boats were a smaller kind. The most ancient form of mortar-vessel was the 'bomb-ketch,' convenient because of the length of deck without a mast. In the British naval service these several kinds of bomb-ships have ceased to exist.

Mortgage, in English law, is a contract whereby property is transferred to a creditor by way of

security for money advanced. A mortgage of land is, in form, an absolute conveyance, subject to a proviso that, if the money lent is repaid within a certain time, the mortgagee shall reconvey the land to the mortgager or borrower. Even when the time fixed has expired, equity will permit the mortgager to redeem his property on payment of his debt: if he proves unable to do so, the mortgagee may apply to the court for a sale of the property, or for foreclosure—i.e. for a decree which deprives the mortgager of his right to redeem and transfers the property absolutely to the mortgagee. A mortgagee may also, as a general rule, enter into possession of the land and draw the rents and profits; or he may sue the mortgager for payment of the money due. Further rights may be given him by agreement, and it was formerly usual to stipulate for large powers over the property. The Conveyancing Act of 1881 now regulates the powers exercised by mortgager and mortgagee respectively, unless in so far as its provisions are excluded by express agreement. An equitable mortgage is effected when an owner of property binds himself by memorandum or otherwise to execute a formal mortgage. A person who deposits the title-deeds of his land with a banker, as a security for money advanced, is an equitable mortgage. Mortgage deeds do not, with certain exceptions, require Registration (q.v.). An owner who has mortgaged not unfrequently obtains further advances on the security of a second or third mortgage of the same property. A third mortgagee who buys up the first and gets possession of the title-deeds is permitted to tack the first and third mortgages together: both will have to be paid off before the second. There are also cases in which a mortgagee is permitted to consolidate claims against different properties of the same debtor, requiring him to pay off all or none. No trustee is justified in advancing money on security of any but a first mortgage; and in every case a trustee is bound to see that the value of the property is amply sufficient to secure the amount advanced. See on this point the Trustee Act, 1888.

A mortgage of goods is made by means of the deed known as a Bill of Sale (q.v.). Shares, policies of insurance, and even debts, may be mortgaged by using the appropriate forms of transfer. In all cases, whatever the nature of the property, the Conveyancing Act enables the mortgagee to obtain a sale of the property, if the mortgager is unable to pay principal and interest. See Coote's *Law of Mortgage* (5th ed. 2 vols. 1884).

In Scotland mortgages are effected by means of a Bond and Disposition in Security (see BOND). Mortgages are a higher and better form of security than in England, because of the system of registration of deeds affecting land (see SASINE); and trustees have power to invest in mortgage securities, which are considered as safe as government stock, and less liable to fluctuations of interest. In Scotland it is not the practice to mortgage lands by mere deposit of title-deeds.

In the United States the form and incidents of a mortgage are regulated by the laws of each state. Except in Louisiana, the English law seems to have been accepted on the basis of American legislation. The Homestead Laws (q.v.) enacted by several states have an important influence on the law of mortgage. See L. A. Jones, *Law of Mortgages* (3d ed. Boston, 1888).

Mortification, in Scotch law, is a term used to denote lands given for charitable or public uses.

Mortification, in Medicine. See GANGRENE, INFLAMMATION.

Mortimer. See EDWARD II. and III.; and for Mortimer's Cross, see HERFORDSHIRE.

Mortlake, a parish of Surrey, on the south bank of the Thames, 2 miles ENE. of Richmond and 8 W. by S. of London. From 1619 to 1703 it was famous for its tapestry works; now malting and brewing are the leading industries. It is also a great boating-place, the Oxford and Cambridge race being rowed from Putney to Mortlake. It has associations with Archbishops Anselm and Cranmer, the astrologers Dr Dee and John Part-ridge, Cromwell, Swift and Stella, Sir Philip Francis, Sir Richard Owen, and Sir Richard Burton. Pop. (1851) 3110; (1881) 6330. See John E. Anderson's *History of Mortlake* (priv. printed, 1888).

Mortmain (Fr. *morte main*) signifies in law the dead hand of a corporation. At an early period (1279) the English parliament took note of the mischief which resulted from the transfer of land to religious corporations; statutes were passed restricting the right of corporations generally to hold land. At the present day a corporation, whether it be a college or a railway company, cannot acquire and dispose of land, except in so far as its charter or act of parliament authorises it to do so. The statutes of mortmain were directed against corporations generally; the so-called Mortmain Act of 1736 was apparently intended to guard against improvident gifts of land by will for charitable purposes. The provisions of the statutes of mortmain and the Mortmain Act have been repealed and, in substance, re-enacted by the Mortmain and Charitable Uses Act, 1888. Money given to purchase land, and moneys charged upon land, are within the provisions of these acts. Land situated in Scotland, in the colonies, or in foreign countries is not within the policy of the English statutes. In Scotland the common law put a somewhat similar check on deathbed alienations of land; but this check has been abolished by statute. In the United States the laws of several states limit the amount of real estate which may be held by religious bodies and charitable societies; and the laws of the United States impose a limit in the Territories.

Morton, JAMES DOUGLAS, EARL OF, regent of Scotland, was born in the first quarter of the 16th century, the younger son of Sir George Douglas of Pittendreech, near Edinburgh. In 1553, in right of his wife Elizabeth, daughter of the third Earl of Morton, he succeeded to the title and estates of that earldom. He joined the Reformers in 1557; in 1561 was sworn a privy-councillor; and in 1563 was made Lord High Chancellor. Having borne a foremost part in Rizzio's assassination (1566), he fled with his associates to England, but, through Bothwell's interest, in eight months obtained his pardon from the queen. He was privy to the design for Darnley's murder, but was purposely absent from Edinburgh on the night of the tragedy (1567); and, on Bothwell's abduction of Mary, he joined the confederacy of the nobles against them. He figured prominently at Carberry Hill; discovered the 'Casket Letters'; led the van at Langside (1568); and, after the brief regencies of Moray, Lennox, and Mar, in November 1572 was himself elected regent. His whole policy was directed in favour of Elizabeth, from whom in 1571 he was receiving bribes; and his high-handed treatment alike of the nobles and of the Presbyterian clergy, his attempts to restore episcopacy, and the avarice and rapacity imputed to him, daily swelled the number of his enemies, who already included all Mary's adherents. He seemed to have retrieved his temporary downfall by the seizure two months later of Stirling Castle (May 1578); but Esme Stuart in 1580 completely supplanted him in young King James's favour; and on 2d June 1581, as 'art

and part' in Darnley's murder, he was beleaded with his own 'Maiden' in the Edinburgh Grass-market. 'He died proudly, said his enemies, and Roman-like, as he had lived; constantly, humbly, and Christian-like, said the pastors who were beholders.'

See DOUGLAS, MARY QUEEN OF SCOTS, and JAMES VI., with works there cited; also Mr T. F. Henderson's article in vol. xv. of the *Dict. of Nat. Biog.* (1888).

Morton, JOHN, Cardinal, and Archbishop of Canterbury, was born at Milborne St Andrew, in Dorsetshire, about 1420, studied at Cerne Abbey and Balliol College, and practised as advocate in the Court of Arches. Holder of various ecclesiastical preferments and a member of Privy-council, he adhered with great fidelity to Henry VI., yet by Edward IV. was made Master of the Rolls and Bishop of Ely. Richard III. imprisoned him, but he escaped, and joining Henry VII. was by him made Archbishop of Canterbury and chancellor (1486). In 1493 he became a cardinal; and he died 15th September 1500. Sir Thomas More was a page in his house. See Hook's *Lives of the Archbishops* (1867), and Gairdner's *Henry VII.* (1889).

Morton, LEVI PARSONS, vice-president of the United States, was born at Shoreham, Vermont, 16th May 1824, was first a country storekeeper's assistant, then partner in a Boston firm of merchants, and in 1863 founded banking-houses in New York and London. In 1878 and 1880 he was returned to congress as a Republican; in 1881-85 he was minister to France; and in 1888 he was elected vice-president of the United States.

Morton, SAMUEL GEORGE, a distinguished American physician and naturalist, born in Philadelphia, January 26, 1799, studied medicine there and at Edinburgh, and in 1839 was appointed professor of Anatomy in the Pennsylvania Medical College. He died May 15, 1851. Morton may be regarded as the first American who endeavoured to place the doctrine of the original diversity of mankind on a scientific basis. His great works are *Crania Americana* (1839) and *Crania Egyptiaca* (1844). His museum of comparative craniology, in the Academy of Natural Sciences, Philadelphia, contains some 1500 skulls—900 of them human.

Morton, THOMAS, dramatist, was born in 1764 in the county of Durham, but, left an orphan, was brought up by an uncle in London. He entered Lincoln's Inn, but soon quitted law for play-writing, and produced *Speed the Plough* (1798, with its invisible 'Mrs Grundy'), *The Blind Girl* (1801), *Town and Country* (1807), *School for Grown Children* (1826), &c. For thirty-five years he lived at Pangbourne, near Reading, till in 1828 he removed to London, where he died, 28th March 1838.—His son, JOHN MADISON MORTON, the author of *Boz and Cox*, was born at Pangbourne, 3d January 1811, and was educated in Paris and Germany (1817-20), and then at Clapham under Dr Richardson (1820-27). From 1832 to 1840 he held a clerkship in Chelsea Hospital, and between 1835 and 1885 wrote close on a hundred farces, of which *Boz and Cox* (1847) alone is said to have brought him £7000. But the rise of burlesque was his ruin, and in 1881 he became a 'poor brother' of the Charterhouse. See an article by Clement Scott in *London Society* for January 1886.

Morula. See EMBRYOLOGY.

Morvan, LE, a barren district of France, a north-easterly extension of the central plateau (see FRANCE, Vol. IV. p. 770), is mainly in the department of Nièvre (q.v.).

Morvern, a peninsula of north-west Argyllshire, between Lochs Sunart and Linnhe. It is the 'Highland parish' of Norman Macleod.

Morwenstow, or MOORWINSTOW, a parish in the extreme north of the Cornish coast, 7 miles N. of Bude; pop. 810. Its church, dedicated to St Morwenna, is mainly of Norman date; R. S. Hawker (q.v.) was its vicar.

Mosaics. Mosaic work (Lat. *opus musivum*) consists of small pieces of diversely coloured marble, glass, or other substances set together so as to produce a geometrical or artistic design. Mosaics are principally used for ornamental floors and pavements, and for the permanent artistic decoration of the walls of churches and other public buildings. The art is of ancient origin; by the book of Esther we may infer that it was practised in the days of Ahasuerus; but among the Romans it was very common, for scarcely have the remains of any ancient Roman villa been discovered without finding in it a mosaic pavement. These ancient pavements being composed of small tesserae or dice of coloured marble, and rarely also of glass, are known as tessellated mosaics. The pieces used consist of irregular cubes varying from a quarter to half an inch in size, and they are carefully bedded in a cement surface set over a prepared concrete foundation. The designs, pictorial or otherwise, are produced by selecting and setting together, in proper position and relation, tesserae of the required colour and size. The most famous tessellated mosaic of ancient Rome now existing is that obtained from Hadrian's villa at Tivoli, preserved in the Capitoline Museum at Rome, and known as 'Pliny's pigeons' from the subject it depicts. Under the Byzantine empire mosaic became a distinctively Christian art, employed for decorating the walls of churches with figures of the Saviour, apostles, saints, &c., and the remains of such Byzantine art form a link of great importance between classical and mediæval periods. The art was revived in Italy about the beginning of the 13th century, when it was employed with great effect for the decoration of churches; and since that time it has remained, with many fluctuations, a distinctively Italian pursuit. Modern mosaics are also made in Russia, forming a department of the imperial glass manufactory at St Petersburg; and in Paris some excellent work has been done. The cubes of opaque glass for mosaic pictures, technically called *smalto* (Ital. *smalto*), are of all possible varieties of colour, as many as 25,000 shades being prepared. With these the finest gradations in tone may be produced, and copies of any painting may be made, but mosaics of real artistic significance are simple in composition, and broad and sober in treatment. Italian mosaics are of two distinct classes—Florentine and Roman, the former being composed of pieces of stones or shells of natural colours shaped and inlaid in marble slabs according to the design to be produced; but it is limited in its application chiefly to floral scrolls and Arabesque designs. This variety of mosaic is extensively produced in India, having been there introduced by the Frenchman Austin de Bordeaux in the decoration of the famous Taj Mahal at Agra, whence it is distinguished as Agra work. Roman mosaic is made up of the small cubes above mentioned, and, while the larger wall decorations are composed of pieces which may be half an inch in size and upwards, small mosaics are composed of almost microscopical squares, these being used by jewellers for the ornamentation of brooches, small boxes, and miscellaneous bijoux. Mosaic pavements are extensively made of small cubes or tesserae of coloured marbles, and baked clay or terra-cotta similar to the ancient Roman tessellated pavements.

See Thomas Morgan, *Romano-British Mosaic Pavements* (1886); Parker's *Church Decorations and Mosaic*

Pictures (*Archæol. of Rome*, vol. xi. 1876); and Gerspach, *La Mosaïque* (1883).

Mosasauros, a huge fossil reptile, belonging to the remarkable group of Pythonomorphs or 'sea-serpents,' which suggest both lizards and snakes. The remains of three species have been disinterred from Cretaceous strata. They were aquatic animals, furnished with paddles, and are estimated to have attained a length of as much as 75 feet (see REPTILES).

Mosaylima, or MOSEILEMA ('Little Moslem'), one of the most important rivals of Mohammed, belonged to the clan Dûl, a division of the tribe of the Beni Hanifah, of Yamâma in Nejd. The traditions about his life and age are extremely contradictory and legendary. It appears, however, tolerably certain that he had risen to some eminence in his tribe, probably as a religious teacher only at first, before Mohammed assumed his prophetic office. It was in the ninth year of the Hegira that Mosaylima, at the head of an embassy sent by his tribe, appeared before Mohammed, in order to settle certain points of dispute. Shortly after this event Mosaylima openly professed himself to be a prophet as well as Mohammed. The latter sent a messenger to him, as soon as he heard of this, to request him to reiterate publicly his profession of Islam. Mosaylima's answer was a request that Mohammed should share his power with him. 'From Mosaylima, the Apostle of God,' he is said to have written, 'to Mohammed, the Apostle of God. Now let the earth be half mine, and half thine.' Mohammed replied: 'From Mohammed, the Apostle of God, to Mosaylima, the liar. The earth is God's: He giveth the same for inheritance unto such of his servants as He pleases, and the happy issue shall attend those who fear Him.' Yet notwithstanding these testimonies, of probably late dates, it seems, on the other hand, perfectly certain that Mohammed made very great concessions to his rival—concessions that point to his having secretly nominated Mosaylima his successor, and that he by this means bought Mosaylima's open allegiance during his lifetime. It was not a question of dogmas, though they each had special revelations, but a question of supremacy which was thus settled amicably.

After Mohammed's death, in the 11th year of the Hegira, it at last came to an open breach between the two rival powers. Abu Bekr, the calif, sent Khalid, 'the Sword of the Faith,' with a number of choice troops, to compel Mosaylima to submission. Mosaylima awaited the enemy at Rowdah, a village in the Wadi Hanifah. So formidable indeed was Mosaylima's force that Khalid is said to have hesitated for a whole day and night. On the second morning, however, he advanced, and in a battle which lasted until the evening, contrived, with fearful losses of his own, to gain the victory, in which Mosaylima fell, and his heresy was practically stamped out. It is extremely difficult to come to any clear notion of Mosaylima's real doctrines, as all the accounts that have survived of them come from victorious adversaries. See Sir W. Muir, *Annals of the Early Caliphate* (1883).

Mosch'eles, IGNAZ, pianist and musical composer, born at Prague, 30th May 1794, of Jewish parents, was between 1808 and 1816 the favourite musician and music-master of Vienna. Settling in London in 1825, he taught at the Academy of Music and directed at the Philharmonic Concerts. From 1844 he laboured at the conservatory in Leipzig until his death, 10th March 1870. A brilliant performer on the piano and an able composer, Moscheles ranks high amongst modern writers for the pianoforte. He also edited, in English,

Schindler's *Life of Beethoven* (1841). See the *Life* by his wife (Eng. trans. 1873), and his Correspondence with Mendelssohn (Eng. trans. 1888).

Moschus, Greek bucolic poet, usually designated of Syracuse in Sicily; he flourished circa 150 B.C., and wrote in a style of almost painfully finished elegance an epitaph on Bion, a couple of short epics, and minor poems. His works are generally printed along with those of Theocritus and Bion; and there is a fine prose translation of the three, with an introduction, by Andrew Lang (1889).

Moscow, formerly the capital of Russia, and still venerated as such by the Russian peasantry, stands on the little river Moskwa, a sub-tributary of the Volga, 403 miles by rail S.E. of St Petersburg, 768 E.N.E. of Warsaw, and 967 N.N.E. of Odessa. The city, a rude rhomboid in shape, measures 7 miles by 9 along its diameters, and covers some 40 sq. m. of area. Its centre is the enclosure called the Kreml or Krémliu ('Citadel'), which is surrounded by walls, crowned by eighteen towers and pierced by five gates. This enclosure is the most sacred spot in all the vast Russian empire. The stranger equally with the native pilgrim, on entering its Saviour gate (1491), must doff his cap to the holy icon of the Saviour that surmounts it. The most notable of the religious buildings inside the Kremlin are the cathedral of the Assumption, built originally in 1326 and rebuilt in 1475-79; its interior is encrusted with mosaics and jewelled ornaments, adorned with venerated pictures, and sanctified by numerous relics of saints; within its walls the early czars and all the Russian metropolitans and patriarchs have been consecrated, and the metropolitans buried. The cathedral of the Archangel was originally built in 1333, but restored in 1505; here were buried the Russian czars down to Ivan Alexievitch, brother of Peter the Great. The cathedral of the Annunciation (1489; rebuilt 1554) was formerly the private chapel of the czars; it shelters some remarkable paintings by Rubleff (1405). There are numerous churches of minor rank, and several monasteries; in the Voznesenski monastery (1393) the czarinas and female relatives of the czars are buried. In 1600 Boris Godunoff built in the Kremlin the Ivan Veliki tower, 270 feet high, the summit of which commands a magnificent view of Moscow, with her gilded cupolas and fantastic towers, her half Asiatic, half European architecture. Close by, at its foot, stands the gigantic bell, Czar Kolokol ('king of bells'; see BELL). The more important secular buildings within this sanctuary of Moscow are the imperial palace (1849); the palace built in the reign of Ivan III.; the new palace Orushenaya, which serves as a museum of the most valuable Russian antiquities; the palace of the patriarchs, with archaeological treasures and 1500 rare Russian and Greek MSS.; the arsenal (1701-36), before which is the trophy of 1812, a pile of 800 or 900 French cannon; and the Hall of the Synod, with a valuable library and ecclesiastical collections. Outside the Kreml the chief objects of interest are the colossal 'Temple of the Saviour' (1838-81), a building commemorative of 1812; the cathedral of St Basil (1554), a 'nightmare in stone,' with fantastic towers; the gigantic bazaar (Gostinói Dvor); the historical museum; the library (10,000 vols. of old printed books and 600 MSS.) of the synod and its typographical museum; the university (1755), with scientific collections and a library of 170,000 vols.—it is frequented by 3350 students; the public museum (1861), containing a library of 300,000 vols. and 5000 MSS., a first-rate ethnological museum, a gallery of pictures, and scientific collections; the Golitzyn Museum (1865), with 20,000

vols. and a collection of paintings; an observatory; a large founding hospital (1764); and numerous monasteries and special educational institutions. Moscow is celebrated for its excellent scientific societies. The suburbs of the city are thickly

Cathedral of St Basil, Moscow.

sprinkled with palaces, parks, and monasteries, some of the first and last being of great historic significance.

Next to St Petersburg, Moscow is the busiest industrial city in the empire, manufacturing cotton and woollen goods, silks, leather, tobacco, candles, metallic articles, machinery, paper, chemicals, bricks, carriages, pottery, and watches, all on an extensive scale. But the city occupies an even higher position as a commercial mart. Situated nearly in the centre of European Russia, midway between the Baltic, the Black Sea, and the Caspian, it is one of the principal meeting-places of the streams of Asiatic and European commerce. In the 14th, and more especially the 15th century, it was of even greater importance than it is to-day as a commercial mart. An enormous trade is done in grain, collected from the provinces and exported through the Baltic ports; in timber, from the northern governments; in furs, hides, tallow, and cattle; in the mineral products of the Ural region; in tea, sugar, and other groceries; in cotton, silk, and woollen goods, and in all the various manufactured wares of Russia. The Moscow customs office levies annually £6,000,000 to £7,000,000 on merchandise entering the city bounds. Pop. (1864) 365,000; (1884) 753,469, nearly all Great Russians of the Orthodox Greek Church. As a general rule the temperature ranges from a winter mean of 14° F. to a summer mean of 66°, the annual mean being 40°.

Previous to its settlement by Great Russians in the 12th century, the site had been occupied by Finnish races. The young state was greatly imperilled in its first years by the Mongols, who sacked the town in 1237 and 1293. But by the beginning of the 14th century its princes had secured their position, and began to make conquests and annexations on all sides. In 1325 the metropolitan of central Russia moved his seat to Moscow; a few years later the principality of

Vladimir was united to that of Moscow; the Kremlin, built in 1300, was in 1367 encircled with stone walls. Moscow continued to grow in area and in political influence, and Ivan III. (1462-1505) assumed the title Czar of all Russia. Its prosperity received serious checks in the next century: it was nearly wholly burned to the ground in 1547, was taken and burned by the Khan of the Crimea in 1571, was hard pressed by the Mongols in 1591, and was the scene of riots arising out of the behaviour of the large Polish retinue who accompanied the bride of the Czar Demetrius early in the 17th century. During the whole of that century the people frequently rose against the czars and their unworthy favourites. In 1713 Peter the Great founded St Petersburg and made it his capital; but the old merchant families, the old conservative nobles, and the common peasantry still continue to look upon 'Moscow the Holy' as the real capital of the empire. The city again suffered greatly from fires in 1739, 1748, and 1753, and the cup of misfortune was filled to the brim when the city was set on fire and burned in 1812, according to the traditional belief the patriotic act of its own inhabitants to save it from Napoleon and the French (see NAPOLEON). Since then the city has been in great part rebuilt.—The government of Moscow has an area of 12,855 sq. m., and a pop. (1887) of 2,210,791.

Moselle (Ger. *Mosel*), a left-hand affluent of the Rhine, rises at the south-west extremity of the Vosges Mountains in France, at an elevation of about 2412 feet. Its course is north-westerly as far as Toul, passing Épinal on the way; thence it proceeds in a north-easterly direction (latterly, with many zigzag picturesque windings) through Luxembourg and Rhenish Prussia, and joins the Rhine at Coblenz, flowing on its way through Metz, Thionville, and Treves. Its entire length is 315 miles, and it is navigable up to Frouard, 214 miles from Coblenz. Its principal tributaries are the Meurthe, Seille, and Saar on the right, and the Orne, Sure, and Kyll on the left. The wines grown in the basin of the Moselle are noted for their lightness and their delicate aromatic flavour.

Moselle was formerly a frontier department in the north-east of France, but the greater part of it was taken by Germany after the war of 1870-1871, and became as of old part of Lorraine. The small portion left to France was joined to the department of Meurthe. Pop. of Moselle in 1866, 452,157. See MEURTHE-ET-MOSELLE.

Moser, MARY, flower-painter, was the only woman, besides Angelica Kauffmann, ever elected an Academician. Her father, a Swiss, George Michael Moser (1704-83), was an enameller and gold-chaser, the first keeper of the Royal Academy; and she herself died Mrs Lloyd, at a great age in 1819.

Moses (Heb. *Mōsheh*; LXX. and Vulgate, *Mōyses*), the great lawgiver and judge, under whose leadership Israel first began to be a nation. The whole subsequent course of Hebrew history and literature bears witness to the greatness of his fame and influence; but the details of his life preserved in that literature, though sometimes very minute, are not, as a whole, very full or satisfying. This was felt to be the case even when it was believed that the so-called 'Books of Moses' were written by him, and, therefore, so far autobiographical; and now that the Pentateuch (q.v.), or rather Hexateuch, is held not to have taken its present form till at least 800 years after his death, and the historical traditions which it embodies are seen to be of various dates and to represent various phases of growth, the outline of his life and character has become dimmer than ever. He

still remains, nevertheless, a great historical figure. If we adopt the now very generally accepted belief that Meneptah or Meriempthah was the Pharaoh of the Exodus (see EGYPT, Vol. IV. p. 240), Moses was born in the first half of the 14th century B.C. At the time of his birth the 'children of Israel' (*B'ne Israel*) were a pastoral people who had long dwelt on the eastern fringe of the Nile delta, where it begins to merge into the Arabian desert. His name—for which a Hebrew interpretation ('drawn'; the verb is the same as in Psalms, xviii. 16) is offered in Exodus, ii. 10—is now generally supposed to be really of Egyptian origin (perhaps *mes* or *messu*, 'son,' 'child'). His life divides itself into three periods of forty years each (a definite for an indefinite number), during two of which he had long and intimate experience, first of the civilised life of Egypt, and afterwards of the simple nomadic life of the desert. Ultimately he became the acknowledged leader of Israel in the movement for civil and religious freedom which led to the Exodus. Thenceforward the scenes of his activity were principally Sinai, 'the Olympus of the Hebrew peoples,' En-Mishpat or Kadesh (Gen. xiv. 7), a locality of which the site is not certainly known, and the plains of Moab to the east of Jordan. The greater part of the time was no doubt passed at Kadesh, which seems to have long been the national headquarters. Here his energy and force of character, combined with a conciliatory meekness (Numb. xii. 3) which has become proverbial, enabled him to establish the beginnings of the national organisation on an enduring basis. At the foundation of the commonwealth as outlined by him lay the theocratic idea, and the faith which had for its formula 'Jehovah is the God of Israel, and Israel is the people of Jehovah.' Although there is evidence that the name Jehovah was not unknown in pre-Mosaic times, it was not until now that it became a national watchword. Among the religious institutions possessed by Israel were some which their forefathers had carried with them in their early migrations from Chaldaea, and others that had been more recently acquired in Egypt. To the former class belonged the fundamental institution of sacrifice, and also, possibly, that of the Sabbath; on the other hand it seems probable that the ideas connected with an ark and a separate priesthood had the later origin. The practices resting on these Moses, as a 'prophet,' extended, regulated, and reformed. It was as a member of the priestly caste (he belonged to the tribe of Levi) that at the sanctuary and oracle of Jehovah at the 'Well of Judgment' (En-Mishpat) he exercised the functions of law-maker and judge, and so laid the foundations of that 'Torah'—i.e. 'instruction' or 'law'—which, handed on by oral tradition and enriched by ever-broadening precedents, ultimately passed into writing in more than one form as the 'Mosaic legislation.' It does not appear that writing was much used in these early days; and most modern critics are agreed that the historical portions, as well as almost all the legislative documents, of the Pentateuch belong to a much later time. The poetical compositions which are attributed to Moses—the so-called 'Song of Moses' (Deut. xxxii.) and Psalm xc.—also give internal evidence of more recent authorship.

After the close of the Old Testament canon Jewish tradition still busied itself about the story of Moses; some of its later additions have been preserved in the writings of Philo and Josephus (cf. Acts, vii. 22), and many more in the Palestinian Targum on Exodus. For a good popular study of the life of Moses, see Rawlinson's *Moses: his Life and Times* (1887). A more critical point of view is represented in Wellhausen's *History of Israel* (1885), pp. 429-440; Reuss's *Geschichte des Alten Testaments* (2d ed. 1890); Renan's *Histoire du Peuple*

d'Israël (vol. i. 1887; Eng. trans. 1887); and Kittel's *Geschichte der Hebräer* (1888). Ample references to the literature of the subject are given by Reuss.

Mosheim, JOHANN LORENZ VON, a distinguished church historian of Germany, was born at Lübeck on 9th October 1694, studied at Kiel, became in 1723 professor of Theology at Helmstedt, in 1747 at Göttingen, as well as Chancellor of the University. Here he died, 9th September 1755. His theological works are numerous, amongst which are a work on Bible morality and *Heilige Reden*. But his most important work belonged to the department of church history, his *Institutiones Historiæ Ecclesiasticæ* (1726; improved ed. 1755) being familiar to every student as a work of great learning and accuracy. Its author is, in Gibbon's phrase, 'full, rational, correct, and moderate.' It has been translated from the original very elegant Latin into English and other languages. The best English translation is that by Dr James Murdock (3 vols. New York, 1832). Other works were *Institutiones Historiæ Christianæ Majores* (1763); *De Rebus Christianorum ante Constantinum Commentarii* (1753); *Dissertationes ad Historiam Ecclesiasticam pertinentes* (2 vols. new ed. 1767); and a *Ketzergeschichte* (2 vols. 1746-48). Mosheim's standpoint is that of liberal orthodoxy; and his greatest work remains a monument of erudition and insight from the point of view of the impartial observer.

Moskwa, a branch of the Volga's tributary, the Oka, rises in a marsh in the east of Smolensk, flows east to the city of Moscow, and thence 112 miles south-east to the Oka. Its total course is 305 miles. It is navigable from its mouth to Moscow, except between November and April, when it is generally frozen, and is connected directly with the Volga by the Moskwa Canal.

Mosque, a Mohammedan house of prayer. The word is derived, through the Italian *moschea*, from the Arabic *mesjid*, 'a place of prayer.' The form of the oldest mosques is evidently from that of the Christian basilica (see ARABIAN ARCHITECTURE). The original forms became, however, entirely obliterated in the progress of Mohammedan architecture, and the mosques, with their arcaded courts, gateways, domes, and minarets, became the most characteristic edifices of Saracenic art. Wherever the Mohammedan faith prevailed, from Spain to India, beautiful examples of these buildings exist. They vary considerably in style in different countries, the Saracens generally borrowing much from the architecture of the various nations who adopted their faith. In India the mosques have many features in common with the temples of the Jains (see the section on architecture in INDIA, and the illustration at AGRA), while in Turkey they resemble the Byzantine architecture of Constantinople. Everywhere the dome is one of the leading and most beautiful features of the mosques, which commonly consist of porticoes surrounding an open square, in the centre of which is a tank or fountain for ablution. Arabesques and sentences of the Koran inscribed upon the walls, which are generally whitewashed, and never bear any device representing a living thing, are the only ornaments of the interior. The floor is generally covered with mats or carpets; there are no seats. In the south-east is a kind of pulpit (*mimbar*) for the imâm; and in the direction in which Mecca lies (the Kibleh), there is a niche (*mihrab*) towards which the faithful are required to look when they pray. Opposite the pulpit there is generally a platform (*dikka*), surrounded by a parapet, with a desk bearing the Koran, from which portions are read to the congregation. The five daily prayers, which are

generally said at home on week-days, are said in the mosque by the whole congregation on Fridays and certain other days, together with some additional prayers, and at times a sermon is superadded to the service. It is not customary for women to visit the mosques, and if they do, they are separated from the male worshippers. On entering the mosque, the Moslem takes off his shoes, performs the necessary ablutions, and finishes by putting his shoes and any arms he may have with him upon the matting before him. The chief officer of a mosque is the nazir, under whom are two imâms, a kind of religious official, in no way to be compared with what we understand by a clergyman of a creed, but who performs a certain number of religious rites, and, being very badly remunerated, generally has to find some other occupation besides. There are further many persons attached to a mosque in a lower capacity, as Muezzins (q.v.), door-keepers, &c., all of whom are paid from the funds of the mosque itself—generally derived from lands. With many of the larger mosques there are schools, academies (medressels), and hospitals connected, and public kitchens, in which food is prepared for the poor.

Mosquito (dim. of Span. *mosca*, 'a fly'), a name applied to various troublesome gnats, for the most part belonging to the genus *Culex*, though sometimes members of the adjacent family Simuliidæ. They are very widely distributed, especially in tropical countries, but also in the far north, as in Arctic America, Lapland, and Siberia. The numerous species to which the popular title mosquito is justifiably applied are not yet known with sufficient precision. Yet the entomologists catalogue 150 species of *Culex* alone, of which 35 occur in Europe, and most of these bite sorely enough to be ranked as mosquitoes. In hot summers the cry is sometimes heard that mosquitoes have appeared in Britain from the Continent or even from America. Importations no doubt occur; but the fact is that mosquitoes are always with us under the name of gnats. In hot weather they often appear in great swarms, especially in low countries, and the temperature seems to exaggerate their venomous voracity and our sensibility too. In places where they abound complete protection from their notoriously intense bites is almost impossible, but 'mosquito-curtains' of very fine gauze are most useful safeguards at night. The natives of various countries smear themselves with oil or grease, and sometimes sleep with their bodies almost buried in sand. It is noteworthy, however, that some people are much less susceptible and sensitive to mosquito-bites than is the case with the great majority. In some countries an additional terror is associated with mosquitoes, since they seem to be the host of the embryonic stage of *Filaria sanguinis hominis*, a parasite of man associated with the loathsome disease of Elephantiasis (q.v.). For the structure and life-history of most mosquitoes, see GNAT.

Mosquito Coast, or MOSQUITIA, formerly an independent state under the protectorate of Britain, lies on the east side of Nicaragua (q.v.), to which it has belonged since 1860. The coast-lands are low and swampy, but the interior rises into mountains, and is healthy. The characteristic products of the West Indies are grown. The inhabitants are a mixed race, of Indian and African blood, and number about 15,000. The chief town is Bluefields (pop. 500). The Mosquito Coast was discovered in 1502 by Columbus, and, though never conquered, was claimed by Spain. During the 17th century it was the rendezvous of the Buccaneers (q.v.), and was subjected to Britain in 1655, who only abandoned it in 1850.

Mossamedes, a seaport on Little Fish Bay, in Angola, the Portuguese territory on the West Coast of Africa. Pop. 2000.

Mosses (*Musci*). The mosses are a class of small flowerless plants, important in the economy of nature, and of great interest in their life-history. They are found in all climates, but are most abundant in temperate regions and in damp places. They are included with the Liverworts in the division Muscineae, which is sharply separated from the higher division of Vascular Cryptogams (Ferns, &c.) by the absence of vessels; while the lower members of the group consist of a mere flat thallus, and are thus related to the Thallophytes. This, with other characters, indicates that the Muscineae form an independent branch of the tree of evolution, and are not an intermediate type.

The uses of mosses in medicine and the arts are few and unimportant, but in mountain-regions the thick felts of moss and deep beds of peat soak up the rain, and so prevent floods from sudden storms, and in dry weather supply the streams through weeks of drought. With favouring surroundings the life of a moss-plant seems to be endless; the mosses (*Sphagnum*) we see growing to-day in a bog are the tips of plants which began life perhaps thousands of years ago, and which have formed a great bed of peat, which may be 20 feet thick. This social habit of moss is a peculiarity. In some species cushions of marvellous regularity are formed; it enables individual plants to stand erect, and is of great importance in the process of fertilisation. The capsules of many mosses must be familiar to every one as small sacs at the ends of their hair-like stalks, which rise in great numbers from a moss-cushion. These contain the spores, from each of which when sown there grows in a few days a tiny thread-like plant, the protonema. Buds of young moss-plants soon appear on this, and then, as a rule, the thread-plant dies. A moss-plant consists of a stem with leaves and roots. The roots will grow out from any part of the plant that is kept dark and damp; they are very like the

Diagram of the Life-history of a Moss:

a, spore; b, spore producing the thread-like underground protonema; c, bud from protonema which will rise into moss-plant; d, a leaf-bearing portion of moss-plant; e, apex of moss-plant with club-shaped male organs (antheridia) producing male cells, one of which lies between e and f; f, apex of moss-plant with bottle-shaped female organs (archegonia) within which is the female cell; g, g', spore-producing generation which grows from division of fertilised egg-cell and upon the female plant.

protonema, indeed buds of new plants may arise on them. Even from a detached leaf roots and new plants will grow; this is a sign of the simple nature of the tissues. By their branching habit, and by the death of the older parts, which leave the branches as separate plants, and in many species by the growth of special buds which are easily separated from the parent, mosses are rapidly pro-

pagated, indeed in many species the production of spores is rare. The sexual mode of reproduction is as follows. At the apex of a plant about mid-summer may often be seen what are popularly known as moss flowers. These consist of a rosette of numerous leaves, smaller than ordinary, a sort of bud in fact. In the centre are male and female organs (antheridia and archegonia), but in some species the male are on one plant, the female on another; within the 'flowers' are also barren leaves known as paraphyses. The antheridia are club-shaped bodies; when ripe, if they are wetted, they burst; the contained cells are squeezed out as a gelatinous mass; within each cell is a small motile 'antherozoid'; this, owing to the nearness of the plants to one another, is able to swim away if the moss is thoroughly wet. The archegonia are flask-shaped; within them lies, in the bottom of the flask, the large egg-cell; in the neck a row of 'canal cells'; these, when the egg-cell is ready, swell up and form a jelly. If an antherozoid is near, it enters the jelly, and working down to the egg-cell fertilises it. The ovum now grows within the flask, which for a time grows with it, forming the 'calyptra'; but after a time the flask is split, and the growing embryo forces its way down into the parent plant, and is *nourished by it*. When fully grown it is the capsule containing spores, of which we have already spoken, and thus the life-cycle of the moss is completed. This cycle consists of two generations, the moss-plant which produces an egg; from the egg grows a plant which produces spores, but itself remains attached to the parent plant. This is called an alternation of generations. The fern has a similar story, but in this case the spore-bearing generation is the conspicuous plant. Fossil remains have been found in rocks of Palaeozoic age.

Classification.—There are some 3000 species; these are divided into four orders. (1) *Bryaceae*, which include the vast majority of genera. The sporangium always has a cap, 'calyptra,' which, when ripe, is blown away by the wind; beneath this is a lid, 'operculum,' which splits off from the capsule, exposing the spores. The capsule has a long stalk, 'seta.' The commonest forms are *Funaria*, *Polytrichum*, &c. (2) *Phascaceae*, a small order; the spores are set free by the rotting of the sporangium; the protonema persists until the maturity of the sporangium. (3) *Andreaeeae*, a single genus; no operculum; the sporangium opens by 4-8 longitudinal slits. (4) *Sphagnaceae*, bog mosses; some of the cells of the leaves grow larger than the rest, lose their contents while their walls become spirally thickened; these cells open one to the other; the smaller cells are filled with chlorophyll, and form a network round the large empty ones. The tissue of the stem is in the centre a sort of pith; outside this a layer of long cells with thick walls; outside this an epidermal layer of large empty cells. The male and female organs are either on separate branches or separate plants.

See articles LIVERWORTS, FERNS, GENERATIONS (ALTERNATION OF). Also Ruskin, *Proserpina*; Goebel, *Outlines of Classification and special Morphology* (Oxford); Bennett and Murray, *Handbook of Cryptogamic Botany*; and works on British mosses by Stark, Holmes and Gray, Bagnall, and Hobkirk.—The so-called Irish moss (see CARRAGEEN) is a seaweed. Corsican moss and Ceylon moss are names of algae (of the genus *Plocaria*) used for producing an edible mucilage. Iceland Moss (*q.v.*) is a lichen.

Mostaganem, a town of Algeria, on the coast, 45 miles N.E. of Oran, manufactures pottery and has corn-mills and tanneries. Pop. (1886) 12,395, more than one-third being Europeans. It was a place of 40,000 inhabitants in the 16th century; and has again grown up from its decayed state since the French took possession in 1833.

Mostar, formerly the chief town of Herzegovina, on the Narenta, about 35 miles from the Adriatic and the terminus of a railway running 27 miles down the valley. It takes its name (= 'old bridge') from a Roman bridge of one arch, 95 feet in span, has numerous mosques, and is the seat of a Roman Catholic and a Greek bishop. Wine is produced, and swords and tobacco manufactured. Pop. (1885) 12,655.

Mosul, a decayed town of Asiatic Turkey, in the province of Al-Jezireh (ancient Mesopotamia), is situated on the right bank of the Tigris, opposite the ruins of ancient Nineveh (q.v.), 200 miles up the river from Bagdad. It is partly surrounded by crumbling walls. During the middle ages it was a very prosperous city, with much industry—*muslin* takes name from this town; now its bazaars are filled with the manufactures of the West, and almost the only export is gall-nuts, from the Kurdish mountains. Mosul was formerly the metropolis of the Mesopotamian Christians (the Nestorians, the United Chaldeans, the Jacobites, &c.), and still contains many Catholic Christians. Pop. estimated at 30,000. The town, which existed in 636, enjoyed its greatest prosperity in the 9th century, and onwards, until the desolating inroads of the Mongols in the 12th. Then came the Seljuks; and they were followed by the Turks, and since then Mosul has steadily declined.

Motacillidæ. See WAGTAIL.

Motazilites, a 'heretical' Mohammedan sect, founded by Wasil b. Ata in the 2d century after Mohammed. They denied predestination, and recognised in man a power over his own actions.

Mote-hill. See FOLKMOOT.

Motett, a name applied to two different forms of musical composition—(1) a sacred cantata, consisting of several unconnected movements, as a solo, trio, chorus, fugue, &c.; (2) a choral composition, generally also of a sacred character, beginning with an introduction in the form of a song, perhaps with figurative accompaniment; after which follow several fugue subjects, with their expositions, the whole ending either with the exposition of the last subject, a repetition of the introduction, or a special final subject. A motett differs from a double or triple fugue in that the subjects never appear simultaneously, but are introduced one after the other. In one form of the motett the successive phrases of an entire chorale are treated as so many fugue subjects.

Mother Carey's Chicken, a name (a corruption of *Mater cara*) familiarly given by sailors to the Stormy Petrel and other small oceanic species of Petrel.—The name MOTHER CAREY'S GOOSE is, in like manner, given to the Great Black Petrel or Gigantic Fulmar (*Procellaria gigantea*) of the Pacific Ocean (see articles on PETREL and FULMAR).

Mother of Pearl. See PEARL.

Motherwell, a town of Lanarkshire, 12 miles SE. of Glasgow. Owing its rapid growth to the amazing extension of its mineral industries, it has a good water-supply (1877), municipal buildings (1887), a public park (1887), large iron and steel works, &c. Pop. (1841) 726; (1861) 2925; (1871) 6943; (1881) 12,904; (1891) 18,662.

Motherwell, WILLIAM, a Scottish poet and antiquary, was born in Glasgow, 13th October 1797, and educated in Edinburgh and at the grammar-school of Paisley, where, in his fifteenth year, he entered the office of the sheriff-clerk. At the age of twenty-one he was appointed sheriff-clerk depute of the county of Renfrew. In 1819 he published his first work, the *Harp of Renfrew-*

shire, containing biographical notices of the poets of that district from the 16th to the 19th century. This work was but the prelude to one of far greater importance—his *Minstrelsy, Ancient and Modern* (1827). In 1828 he commenced the *Paisley Magazine*, in which some of his finest original pieces first saw the light, and in the same year accepted the editorship of the *Paisley Advertiser*, a Conservative journal. In 1830 he became editor of the *Glasgow Courier*. In 1832 he published a collection of his best poems, entitled *Poems Narrative and Lyrical*. He died in Glasgow, November 1, 1835, at the early age of thirty-eight. Motherwell displays in his best moods (but only then) a rich, beautiful, and strong imagination, great warmth and tenderness of feeling, and a thorough knowledge of the technique of a poet. His *Jeanie Morrison* is unsurpassed for the mingled pathos and picturesque beauty of its reminiscences of boyish love; and the little piece beginning, 'My heid is like to rend, Willie, has seldom been read without tears. An enlarged edition of his poetical remains, with a memoir, was published in London in 1849.

Motherwort (*Leonurus cardiaca*), a plant of the natural order Labiatae, found about hedges and in waste places in Europe, and now abundantly naturalised in some parts of North America. It is not very common in Britain, and probably has been introduced. It is perennial, has a branched stem about 3 feet high, stalked leaves, the lower ones 3-lobed, and crowded whorls of reddish-white flowers. The plant was formerly in much use as a domestic pectoral medicine, but is now comparatively little employed. It has a strong, but not agreeable smell.—Other species of the same genus are found in Europe and the north of Asia.

Motherwort
(*Leonurus cardiaca*).

Moths, a sub-order of Lepidopterous insects, which in twilight and darkness take the place of the light-loving butterflies. Technically known as Heterocera, they are distinguished from the butterflies or Rhopalocera by the antennæ, which are variable in form instead of being constantly club-tipped, and by the fact that the wings are usually expanded, and not elevated, when the insect is at rest. Like the parallel series of butterflies, the moths differ greatly from one another in size and colour, habit and diet. The giant owl-moth of Brazil (*Thysania agrippina*) measures nearly a foot across from tip to tip of expanded wings, while the smallest are hardly visible to unaided eyes. They are represented in most parts of the world, and are usually very prolific. The larvæ or caterpillars feed mostly on living plants, and in this connection are very familiar; others of these ravaging forms ruin clothes, furs, and the like. Most of the latter belong to the family Tineidæ, especially to the genus *Tinea*. They are the 'moths' *par excellence*, against whose ravages housewives carefully guard. Clothes should be kept perfectly dry, and the

wardrobe, chest, &c. containing them should have no cracks or crevices. Pieces of camphor, sprinkled pepper, and strongly odoriferous 'moth-powder' of some sort will help to keep the adult moths away; but when a host of larvæ have possessed the garment it may be immersed in boiling water, carbolic acid, &c., or burned as hopelessly spoilt. Almost the only directly useful form is the Silk-moth (q.v.). There are separate articles on the Hawk Moth, Death's-head Moth, Gooseberry Caterpillar, &c.; see also BUTTERFLY, CATERPILLAR, INSECTS.

Motif, in a musical composition, means the principal subject on which the movement is constructed, and which, during the movement, is constantly appearing in one or other of the parts, either complete or modified. In elaborate and long compositions there are also secondary motifs.

Motion, LAWS OF. In developing the subject of Dynamics (q.v.) it is convenient to lay down in the form of postulates axioms or the fundamental principles on which the science is based. These axioms are generally referred to as the laws of motion. They rest ultimately, as do the axioms of geometry, upon our experience; and once the terms in which they are expressed are sufficiently understood, the laws themselves are admitted without further question. We owe to Newton what still remains the most serviceable, because the most concise and at the same time complete, expression of these dynamical axioms. Newton's predecessors, particularly Galileo, had already formulated some of the fundamental principles of abstract dynamics; but in the Three Laws of Motion, which form the basis of the *Principia*, we have for the first time all the necessary and sufficient principles laid down in a manner easy to understand and easy to apply. These three laws are given both under DYNAMICS and under FORCE, and need not be reproduced here.

Newton's method of presenting his definitions and axioms has been made the subject of much criticism. And doubtless a logician, confining his attention to the eight definitions of mass, momentum, inertia, force, acceleration, &c., and the three laws of motion, could easily discover faults of logical arrangement. Nevertheless, taking this preliminary section of the *Principia*, with its masterly scholia, as a whole, and bearing in mind that the aim is to establish a theory of dynamics that shall harmonise with the facts of experience, we shall find no difficulty in admitting the soundness of Newton's principles. There is absolutely no confusion of thought. The demands on our intellectual faith, whether explicitly stated or implicitly involved in other statements, are essentially rational. The treatment is luminous as it is profound. Attempts have been made to substitute a more logical procedure; but all such attempts lead to intricate phraseology and a corresponding intricacy of dynamic conception quite beyond the powers of apprehension of the tyro. And even when all is done it is doubtful if the strict canons of logic are quite satisfied. It may be safely said that, as an introduction to the study of dynamics, Newton's laws of motion, along with the definitions of the physical quantities involved, have not as yet been surpassed.

The train of thought running through Newton's method may be thus described. Everything dynamical that happens in nature consists of changes of position and motion of the parts of a material system. Fixing our attention on one body or particle in the system, we soon perceive by experience that its changes of motion or (more strictly) momentum relatively to the other parts of the system must depend on the mechanism connecting it with these parts. With this mechanism, how-

ever, we do not at first explicitly concern ourselves. For it we substitute the conception of force, or its time-accumulation, impulse, which we regard as the external something causing the observed change in momentum and measured by that change. This force may be constant or variable in space, or it may depend on the velocity of the body. On these conceptions and definitions we base the simplest department of abstract dynamics—that known as the dynamics of a particle. Many of its theorems are found to be very approximately realised in the falling of bodies, in the flight of projectiles, in the motions of planets and comets round the sun. But before we can pass to the dynamics of material systems we must restore the bonds we severed when we introduced the idea of force acting on a single particle. This Newton completely effected by his third law, in which every force is recognised as being only the half of a whole, the other half being the equal but oppositely directed reaction. This means that whatever change of momentum may be observed to be taking place in one particle must be balanced by an equal and opposite change of momentum occurring elsewhere. Thus, the momentum of a material system as a whole can never change, however much its configuration may alter, in virtue of the mutual actions of its parts. And in this statement we may readily recognise the generalisation of the first law of motion—commonly called the Law of Inertia—in its application to any complex material system, dynamically isolated, and considered as a unity. Newton's very remarkable second interpretation of the third law, given at the end of the scholium attached, implicitly contains, as was first pointed out by Thomson and Tait, nearly the whole of the modern doctrine of energy. It is discussed under that heading. See also FORCE for the discussion of the Second Law.—For Motion in Plants, see IRRITABILITY, PLANTS, SENSITIVE PLANTS, SPORE; for animal locomotion, see FLYING, HORSE, &c.

Motley, JOHN LOTHROP, historian and diplomatist, was born in Dorchester, Massachusetts, April 15, 1814. He had an inheritance of wit and literary taste as well as of fortune, and had all timely advantages of education and travel to make him the 'picked man of countries' which he became. He attended the school at Northampton, Massachusetts, kept by Dr Cogswell and Bancroft the historian, and at the age of thirteen entered Harvard College, graduating in 1831. He next studied in German universities, and at Göttingen was the intimate friend of Bismarck. His reading was various and enormous, especially in poetry and fiction, and in modern languages. He 'toiled terribly' afterwards, when he made the studies for his history, but his early assiduity was like that of a bee in a flower-garden. He was naturally a favourite in society, as he was tall and exceedingly handsome, with a captivating manner. His resemblance to Lord Byron was striking. He was married in 1837 to Miss Benjamin, a lady of beauty and accomplishments. In 1839 he published his first work, an historical novel, entitled *Morton's Hope*. Its brilliant pictures were admired, but it was not successful. His second novel, *Merrymount*, was partly a protest against the gloom of Puritanism, and was more favourably received; yet it was evident that the genius of the author was not to be displayed in fiction. When, afterwards, the splendour of Motley's style lighted up the great scenes of history, as, for instance, the abdication of Charles V. in the town-hall of Brussels, it was seen that his ardent and imaginative nature had found its predestined place. His studies early turned in this direction, but

Copyright 1891 in U.S.

Company.

fully ten years were consumed in his preparations, and in completing his *History of the Dutch Republic*. This work, published in 1856, established his fame, and was translated into many languages, the French version being supervised by Guizot. The labours which were the indispensable foundation of the work can be comprehended best from the author's own account, which will be found in a letter printed in Dr Holmes' *Memoir of Motley* (1878). This letter is furthermore valuable as a sketch of his intended work, which was to be continued to 1648, the peace of Westphalia—a vast design which he did not live to accomplish. In 1857 he was once more in Boston, and contributed to the *Atlantic Monthly* a paper on Florence. But he soon returned to Europe, as the materials for European history were not accessible in the United States. The first part of his *History of the United Netherlands* appeared in 1860. The capacity for research and the power of pictorial representation were combined in this as in the preceding work.

The civil war in the United States aroused the deepest feeling in Motley, and his letters to the *London Times* upon the policy of the British government were probably the most important and decisive of all the efforts made by patriotic Americans to enlighten the British public upon the momentous issues involved. In 1861 he was appointed minister to Austria, and remained until 1867, when he resigned in consequence of a foolish attack made upon him. In 1868 the second part of the *History of the United Netherlands* appeared. In 1869 he was appointed minister to Great Britain, but was summarily recalled the following year, under circumstances which made the recall an indignity. There had grown up a deadly feud between Charles Sumner, senator from Massachusetts, and President Grant; and, as Motley and Sumner were intimate friends, the recall of the minister was designed as a blow at the senator. The pretext was that Motley had disregarded his instructions, but it is evident that his dismissal had been determined upon. Motley was cut to the heart, and brooded over his unmerited disgrace to the day of his death.

His next and final work was *The Life and Death of John Barneveldt*, a biography which is virtually history, and a part of his main theme, though not a distinct continuation. After the death of his wife in 1874 Motley paid another visit to the United States. His severe labours and trials had impaired his strength, and he had had some slight attacks of apoplexy. After his return to England in 1876 he gradually sank, and died at Kingston Russell, the Dorsetshire residence of his daughter, Sir William Vernon Harcourt's wife, May 29, 1877. He was buried at Kensal Green.

The character of Motley is strongly impressed upon his works, and they are as far removed from annals as possible. His long studies, aided by his creative imagination, enabled him to make past ages live again, and to present historical personages with their own traits and manners. Few historians have given such illumination and stereoscopic reality to people and scenes described; and the same eager nature makes it impossible for him to attain to judicial impartiality. He glories in being a partisan—a partisan of progress, liberty, and humanity. Criticism has touched his narrations only in some minor details; of their general faithfulness there is no question.

Two large volumes of his correspondence were edited by George William Curtis in 1888. His own letters are picturesque, eloquent, and weighty by turns. Many of them are addressed to Dr Holmes, his most intimate friend. Bismarck's letters are naive and charming, giving a most unexpected and pleasing insight into the

life and character of the great chancellor. The Memoir by Dr Holmes (1878) is an affectionate tribute. The appreciation of his works in Holland was most gratifying. Visitors to the Hague are shown the room in the Queen's Palace in the Wood where, by royal invitation, Motley lived and worked during his last visit.

Motril, a town of Spain, 31 miles S. by E. of Granada and nearly 3 miles from the sea, with sugar and cotton factories, and lead mines and works. Esparto grass is exported. The port is at Calahonda, 6½ miles SE. Pop. 16,665.

Motto, in Heraldry, a word or short sentence which forms an accompaniment to a coat-of-arms, crest, or household badge; it was called in Scotland the 'ditton.' In France and Scotland it was frequently placed above the crest, in England almost invariably below the escutcheon. A motto is sometimes a religious or moral sentiment, as 'Gardez la foi,' 'Humanitate,' 'Et decus et pretium recti' (Grafton); it is not unfrequently a heroic exclamation or war-cry, 'Courage sans peur,' 'Forward.' Sometimes it alludes to a peculiar tenure, as 'Free for a blast' (Clerk of Penicuik); while in a great many cases it bears reference to the crest, badge, or some bearing of the escutcheon. Thus, Stuart, Earl of Moray, has for crest a pelican wounding herself, and for motto, 'Salus per Christum Redemptorem.' Not a few mottoes are 'canting' or punning allusions to the family name—as 'Scuto amoris Divini,' for Scudamore; 'Ver non semper viret,' for Vernon; 'Fare, fac,' for Fairfax; 'Time Deum, cole regem,' for Coleridge; and 'Teneo quia teneor,' for Holden. Two mottoes are sometimes used by the same family—one above the crest, the other below the shield. The motto, 'Dieu et mon Droit,' which accompanies the royal arms of Great Britain, is supposed to have been a war-cry, and was used in England at least as early as the time of Henry VI. Its origin has been assigned to a saying of Richard I., 'Not we, but God and our right have vanquished France.' See Seton's *Law and Practice of Heraldry* (1863).

Mouflon (*Ovis Musimon*), the wild sheep of Corsica, Sardinia, central Asia, &c. See ARGALI, and SHEEP.

Moukden. See MUKDEN.

Mould, or MOULDINESS, the common name of many minute fungi which make their appearance, often in crowded multitudes, on decaying or diseased plants and animals and animal and vegetable substances. To the naked eye they often seem like patches of fine cobweb, which are shown by the microscope to consist of cellular threads. Their structure and history are described in the article FUNGI, from the systematic part of which it will be seen that the popular name is applied to many very different forms—e.g. the common White Mould (*Mucor mucedo*), the Bread Mould (*Eurotium Aspergillus-glaucus*), the mould of fruit and jam (*Penicillium glaucum*), &c. See also DRY ROT.

Mouldings, the curved and plane surfaces used as ornaments in cornices, panels, arches, &c., and in all enriched apertures in buildings. In classic architecture the mouldings are few in number, and definitely fixed in their forms.

Classic Mouldings.

The illustration

shows (1) the Echinus, (2) Cyma Recta, (3) Cyma Reversa, (4) Scotia, (5) Torus; another is the Fillet (q.v.); and each of these mouldings has its proper place assigned to it in each order (see COLUMN). In Gothic architecture, and all other styles, the mouldings are not reduced to a system as in the Greek and Roman styles, but may be used in every variety of form at the pleasure of the artist. Certain forms generally prevail at one period in any style. Thus, in Gothic architecture the date of a building may in many instances be determined by the form of the mouldings. The Norman mouldings were very simple in outline, and frequently enriched with the zigzag and billet ornaments. Fig. 6 is a common Norman form.

In the English style the mouldings are also simple in outline, and are usually arranged in rectangular divisions, as in fig. 7, and consist of

Various Mouldings.

alternate rounds and hollows. In late examples of this style the fillet was introduced (fig. 8) and led to the more elaborate form of mouldings during the Decorated period (fig. 9). The mouldings of the Perpendicular style are generally flatter and thinner than the preceding, and have large hollows separated by narrow fillets.

Moulins, the capital of the French department of Allier, on the right bank of the river Allier, here crossed by a handsome stone bridge of thirteen arches, lies 196 miles by rail SSE. of Paris and 124 NW. of Lyons. A clean, well-built town, with pretty promenades, it has a cathedral (1468-1871), the choir old; a square tower of the old castle of the dukes of Bourbon; a 15th-century belfry; and the chapel of a former convent. Marshals Villars and Berwick were natives, and Clarendon wrote here great part of his History. Nor must Sterne's Maria be forgotten. Pop. (1872) 19,774; (1886) 21,213.

Moulmein. See MAULMAIN.

Moultan. See MULTAN.

Moulting, a general name for the process by which birds lose some of their feathers, or crustaceans cast their cuticular shells, or young insects get rid of their outer husk in metamorphosis. The shedding of the hair in mammals and the sloughing of snakes, &c. are also analogous. See BIRD, CRAB, CRUSTACEA, HAIR, INSECTS, SNAKE, &c.

Moulton, LOUISE CHANDLER, writer, was born in Pomfret, Connecticut, 5th April 1835, married at twenty W. U. Moulton, a Boston publisher, and has published children's stories, novels, essays, and poems. Her stories are unaffected and well constructed, full of grace and tenderness; her verse reveals the rarer gift of lyrical music. Here may be named *Bedtime Stories* (1873; followed by a second series in 1875, and a third in 1880); *Some Women's Hearts* (1874); *Miss Eyre from Boston*, &c. (1889); and *In the Garden of Dreams* (1890), a volume of charmingly tender and pathetic verse.

Moultrie, FORT, a fortress on Sullivan's Island, at the mouth of Charleston Harbour, South Carolina, celebrated for the repulse of a British squadron commanded by Sir Peter Parker, 28th January 1776.

The fort, which had 26 guns and 435 men, and was commanded by Colonel William Moultrie (1731-1805), had been hastily built of palmetto logs, in two rows 16 feet apart, with the space between filled with sand. The spongy wood of the palmetto was found to resist the cannon balls perfectly.

Moultrie, JOHN, minor poet, born in London in 1799, educated at Eton and Trinity College, Cambridge, took orders, and was presented in 1828 to the rectory of Rugby, where he enjoyed the friendship of Arnold. He died in 1874. Some little poems of deep tenderness in *My Brother's Grave* (1837), and *The Dream of Life* (1843), have kept his name from being quite forgotten; neither the praises of Wordsworth nor Præd could keep *Godiva* alive. There is a Memoir by Derwent Coleridge prefixed to an edition of his *Poems* (1876).

Mound-birds (*Megapodidae*), a family of gallinaceous birds remarkable for the large mounds which they build as incubators for the eggs. They are natives of Australasia and of the islands in the Eastern Archipelago and Pacific. The Australian *Megapodes* (*Megapodius tumulus*), about the size of common fowls, build mounds of leaves, vegetable refuse, and soil, and add to them year after year until they become immense structures. The largest on record measured 150 feet in circumference. Both sexes work at the nest, in which the eggs are laid in separate holes at a depth of 5 or 6 feet, and left to be hatched by the warmth of the decomposing vegetable matter. The mound of the Nicobar species (*M. nicobariensis*) seems to be used not only by the original pair, but by their descendants as well. In a related genus, *Leipoa*, the eggs are laid separately in a circle in the centre of the mound, and then deeply covered up with compost. In the genus *Tallegallus*—represented by the large Brush-turkey (*Tallegallus lathami*) of Australia—the mounds are used socially by a number of birds.

Mound Builders, the name given to a vanished race of North America, by whose labour the remarkable earth mounds found in the United States were raised. These mounds exist in extraordinary numbers over all the country between the Alleghany and Rocky Mountains, but chiefly in Ohio, Illinois, Indiana, and Missouri; they are abundant in all the Gulf States, and even farther south, and they extend at least as far north as the Great Lakes. Their usual height is from 6 to 30 feet, with a diameter of 40 to 100 feet. The majority are simply conical burial mounds, mostly rising from 15 to 25 feet, though one in West Virginia is 70 feet high and over 300 feet in diameter at the base. But very many others of these mounds are defensive, and others again have a religious origin. The fortifications, usually earthworks raised on heights near some water-course, embrace walls, trenches, watch-towers, and are too skilfully constructed to have been temporary defences: many archaeologists believe that there was a connected line of defensive works from New York to Ohio. In the Mississippi Valley, where the largest mounds are, these forts disappear; and it is supposed that the principal enemies of the Mound Builders had their home in the east—perhaps in the Alleghanies. Some of the Ohio fortresses enclose over 100 acres, the walls of earth, winding in and out, in each case being several miles long. In the alluvial valleys other enclosures have been found, regular—circular, square, &c.—in shape; these have been called 'sacred enclosures,' but on very problematical grounds; and the same criticism applies to the identification of the smaller low mounds, from a few inches square to 50 by 15 feet, which have been called 'altars.' Of the 'temple' mounds, however, there are numerous examples, some very large: one in

Illinois reaches a height of 90 feet, and measures 700 by 500 feet at the base; and another in Mississippi is 600 by 400 feet, and its topmost mound is 80 feet above the base. To these must be added the curious mounds constructed in the shape of animals, and sometimes extending to a length of 400 feet. They are most numerous in Wisconsin, but one of the most interesting is the serpent mound near Bush Creek, Ohio (figured and described in *The Century*, April 1890).

As to the identity of the Mound Builders' opinions, of course, differ. The general tendency is to recognise their descendants in the Natchez and other kindred tribes whom the Spaniards found on the Mississippi, partly because their chief was both king and deity—he was regarded as the child of the sun—and so we find evidences of the religious feeling and the despotic power necessary to secure the accomplishment of such enormous works. The race may perhaps also have survived in the more highly civilised tribes whom De Soto and his followers met with in Florida and the other southern states. But a comparison of the Mound Builders' civilisation with that which prevailed in Mexico when Cortes landed, supplies very strong arguments for connecting these northern Indians, driven south by their nomadic enemies, with the tribes who came from the north and in turn expelled successively the Toltecs and one another, blending their more savage customs with the higher civilisation which they found there (see MEXICO). The contents of the mounds support this view. It is evident that the Mound Builders, like the later Mexican tribes, were in the transition stage between the stone and metal age; copper they had obtained in the same primitive manner as it was obtained in Mexico, but the weapons and tools were stone implements, and knives of obsidian especially—the well-known sacrificial knives of the Aztecs—were common. Their art and manufactures were both of a low standard; but it is well known that the invaders of the Mexican tableland partly absorbed the civilisation they found there, partly degraded it. Finally, it may be mentioned that the sepulchral mounds yield many evidences of the cruel rites of their builders; and the pyramidal form of the 'temple' mounds is reproduced in the *teocalli* of Mexico. See Squier and Davis, *Ancient Monuments of the Mississippi Valley* (1848); Conant's *Footprints of Vanished Races in the Mississippi Valley*; Thruston, *Antiquities of Tennessee* (1890); Shepherd, *Antiquities of Ohio* (1890); and Moorehead, *Fort Ancient, Ohio* (1890).

Mountain-leather, &c. See AMPHIBOLE.

Mountain Meadow. See DANITES.

Mountains. Every one knows what a mountain is, and yet it is hard to give an adequate definition of the term. We may say vaguely that any region the surface of which rises with a more or less steep gradient to a height of 1000 feet or more is a mountain. Mountains differ vastly in form—some assuming pyramidal or conical shapes, others forming ridges, others occurring as irregular amorphous masses. Some again stand in more or less isolated positions, whilst in other cases very many crowd together, forming a billowy mass of elevated ground; and yet others, amongst which are the most prominent mountains of the globe, extend continuously in definite directions as long ranges and chains for hundreds or thousands of miles. Notwithstanding this diversity of form and of grouping, all mountains may be classified as—(a) mountains of accumulation, (b) mountains of elevation, (c) mountains of circumdenudation.

(a) *Mountains of Accumulation.*—Volcanoes may

be taken as the type of this class of mountains (fig. 1). These are of course formed by the accumulation of igneous materials around the focus or foci of

Fig. 1.—Volcano; Mountain of Accumulation.

eruption. Most volcanoes are more or less conical in shape; but in the case of those which have been long extinct the form has often been greatly modified by the denuding action of the subaerial agents. Some very ancient ones have been so demolished that frequently all that remains of them are mere stumps, formed of the hard crystalline rocks that plug up the pipes or flues through which the igneous materials found a passage to the surface. In former times lava seems often to have welled up along the lines of extensive fissures and flooded surrounding regions. This happening again and again, vast plateaus have been built up. These are called *plateaus of accumulation*. Many of these, however, have since been highly denuded, so that they have now quite a mountainous appearance (fig. 2). As examples

Fig. 2.—Plateau of Accumulation, A—B; showing Mountains of Circumdenudation (m, m).

may be mentioned the denuded plateaus of Iceland, the Faroes, Antrim and Mull, Abyssinia, and the Deccan. Of course plateaus of accumulation are not always formed of igneous rocks. Any area of approximately horizontal aqueous strata, were it to be elevated to a height of a thousand feet or so, would form a plateau of the kind, such as the plateau of the Colorado. That plateau is geologically of recent origin, and yet sufficient time has elapsed to allow of profound erosion of its surface. Thus, mountains and plateaus of accumulation often owe many of their present features to the action of denuding agents.

(b) *Mountains of Elevation* owe their origin to the folding, crumpling, and fracturing of strata that accompany certain great movements of the earth's crust. They are lines of weakness along which the rocks have yielded to excessive lateral compression by folding and doubling up, during the sinking down of the cool outer shell of the globe upon the more rapidly contracting hot nucleus. The simplest structure presented by such mountains is shown in the Uinta Mountains of Wyoming and Utah. This is a flattened arch of strata, having a breadth of 50 miles and a length of 150 miles, which bulges up to a height of 5000 or 6000 feet above the plains on either side. It shows a broad plateau-like surface which has been deeply eroded. Powell believes that a thickness of $3\frac{1}{2}$ miles of strata has been denuded from its surface. In the Jura Mountains we have a series of parallel ridges, each ridge coinciding with a symmetrical anticlinal or saddle-backed arrangement of strata, while the intervening hollows occupy symmetrical synclinal troughs (fig. 3). The tops of the anticlines are all more or less denuded. In the western part of the same range of mountains the flexures of the strata are mostly

unsymmetrical (fig. 4). In the Alps and mountain-ranges of similar character the flexures of the strata

Fig. 3.—Symmetrical Flexures of Swiss Jura (Mountains of Elevation).

are frequently reversed—the beds being doubled back so that older strata are inverted and overturned upon younger beds. The accompanying

section exhibits the principal features in what is known as the Alpine type of mountain structure

Fig. 4.—Unsymmetrical Flexures of Swiss Jura (Mountains of Elevation).

(fig. 5). A glance at the diagram will show that the greater features of the surface coincide approximately with the larger flexures of the strata, but

Fig. 5.—Section across a Mountain-chain (Elevation Mountains): *a-a*, Isoclinal Folds (showing inversion of strata); *b-b*, Symmetrical Folds.

that these features have been greatly modified by denudation. In such mountain-regions the highly flexed and contorted strata are frequently dislocated; but for the sake of clearness such dislocations are not represented in the diagram. Occasionally we find that the prominent features in a mountain-region have been determined by profound dislocations of the rocks, as is well shown in the parallel ranges of the Great Basin, of western Arizona, and of northern Mexico. That region has been divided into a series of long narrow blocks by a system of parallel dislocations—the prominent mountain-ridges corresponding to the blocks on the high or upcast side of the fractures. Although the direction and general form of those mountains are thus the result of earth-movements, the evidence of subsequent erosion and denudation is everywhere conspicuous.

(c) *Mountains of Circumdenudation.*—In countries composed of undulating and highly-folded strata which have been for long ages exposed to the action of eroding agents the ultimate form assumed by the ground is directly dependent on the character of the rocks and the mode of their arrangement (fig. 6). Plateaus in course of time come to be

Fig. 6.—Escarpments (*e, e*) and Hills of Circumdenudation (*h, h*).

deeply trenched in different directions and eventually lose their plateau character. The remaining portions of high ground then form groups of mountains and hills. In regions of horizontal or approximately horizontal strata the mountains assume the form of pyramids or flat-topped *mesas* and *buttes*, excellent examples of which are seen in the western territories of North America, and in the much-denuded basaltic plateaus of Iceland and the Faroe Islands (fig. 2). In regions of folded and contorted strata, composed of diverse kinds of rock, the orographic features are more variable. A highly-denuded plateau of folded strata seen from a height presents the appearance of a tumbled and billowy sea—the Scottish Highlands and the high grounds of Scandinavia being examples of mountains of circumdenudation which have been carved out of elevated plateaus of denudation (fig. 7). The origin of a plateau formed of such folded and contorted strata requires a word of

explanation. Mountains of elevation are in the course of time denuded and degraded, and should the land of which they form a part remain long enough above the sea, the whole surface must

Fig. 7.—Plateau of Denudation, A-B; showing Mountains of Circumdenudation (*m, m*).

eventually be reduced to the condition of a low gently undulating plain. Should elevation now ensue, this plain becomes a plateau—the surface of which by-and-by is trenched and furrowed by running water, &c., as is the case with the ancient plateaus of Scotland and Scandinavia.

Age of Mountains.—As might have been expected, mountains are of all geological dates, and the age of a large number has been determined. But this has reference chiefly to those that owe their origin to accumulation (volcanic cones) or to compression and folding of strata during great earth-movements (mountains of elevation). Many of the latter are the result, not of one, but of several successive periods of uplift. It can often be shown that between those periods of movement the mountains have been subjected to long-continued erosion, and partially or even wholly submerged, while newer accumulations of sediment were gradually piled up over their denuded surfaces. The Pyrenees, the Alps, the Jura, the Himalayas, the Andes, and many other conspicuous ranges have been formed by successive upthrusts, separated by longer or shorter periods of degradation and sedimentation. Some mountains of elevation, which originated in very early geological times, appear to have been denuded down to their very roots—reduced to the condition of low-lying plains. Such plains have subsequently been pushed up bodily and converted into plateaus, which in the course of time have been profoundly modified by denudation, so as now to present the appearance of a rolling mountainous country—the mountains being mountains of circumdenudation (fig. 7). The greatest and loftiest mountains of elevation have all received their latest uplift in comparatively recent geological times. Amongst such young ranges we find that the larger orographic features coincide more or less closely with the greater convolutions, folds, and fractures of the strata. In ranges belonging to much older dates denudation has profoundly

modified the original configuration of the surface—the present orographic features being the result of denudation, determined by the character of the rocks and the geological structure of the ground. Hence in such regions anticlinal mountains, which are weak structures, are almost unknown, while synclinal troughs, which are strong structures, in place of coinciding with valleys (as in the Jura Mountains, fig. 3), have often come to form mountainous ridges (figs. 6, 7).

Mountain-systems.—Some attempts have been made to group the various mountain-ranges of the world into systems, more particularly by E. de Beaumont, who maintained the synchronism of ranges situated on lines parallel to one another. The parallelism does not consist in having the same relations to the points of the compass—for these as regards north and south would be far from parallel—but is estimated in its relation to some imaginary great circle, which being drawn round the globe would divide it into equal hemispheres. Such circles were called Great Circles of Reference. But De Beaumont went beyond this, and proposed a more refined classification, depending on a principle of geometrical symmetry, which he believed he had discovered among his great circles of reference. These geometrical speculations have never commended themselves much to geologists. It has been demonstrated indeed that certain mountain-chains in widely separated regions belong approximately to the same geological age, and may really be strictly synchronous. But much more has yet to be known of the geological structure of the various ranges of the earth before any general grouping of these into systems can be considered reliable. See ALPS, GREAT BRITAIN (*Physical Geography*), HIMALAYA.

The following table shows the heights of some of the principal peaks in the several continents :

ASIA.		NORTH AMERICA.

Mountmellick, a town in Queen's County, Ireland, on the Grand Canal, 7 miles N. of Maryborough by rail. It has a brewery, a tannery, and manufactures woollens and tobacco. Pop. 3126.

Mount Morgan, a gold-mining township in Queensland, 28 miles SSW. of Rockhampton. The gold-mine at the summit of the mount, said to be the richest deposit in Australia, was originally sold for £640 to a copartnership, including the brothers Morgan, and after changing hands several times became a limited liability company, with a capital of £1,000,000. The gold is described as of unusual fineness and purity. An estimate made in 1887 was to the effect that there were 1,000,000 tons of ore available, from which gold to the value of £20,000,000 was expected. The yield in 1887 was 83,705 ounces. Pop. (1890) about 2000.

Mount Vernon, memorable as the residence and the burial-place of General Washington, is on the right bank of the Potomac, in Virginia, 15 miles below Washington. In 1856 the mansion and surrounding property were saved from the auctioneer's hammer, and secured as a national possession by the Ladies' Mount Vernon Association, assisted principally by

Edward Everett.—Mount Vernon has given its name to a number of places in the United States, the most important of which is a city, the capital of Knox county, Ohio, on the Vernon River, 44 miles by rail NNE. of Columbus. It contains many handsome residences, and the river affords ample water-power for a number of mills and manufacturing of doors and sashes, furniture, machinery, &c. Pop. (1890) 6016.

Mourne Mountains. See DOWN.

Mousa. See BROCHS.

Mouse (*Mus musculus*), a familiar rodent, representative of a large genus to which rats also belong. It is not necessary to describe the soft 'mouse-coloured' fur occasionally varying to white; the scaly tail so useful in climbing; the bright, conspicuous eyes; and the well-hidden cosy nest. Not less familiar is the way in which this tiny mammal has followed man everywhere over the earth; breeding all the year round, and bringing forth four or five young at a birth, its extraordinary fecundity sometimes causes a plague in a district (as in the wheat-fields of South Australia in 1890). It may be well, however, in the face of continually recurrent discussion, to note the power that at least some of the common mice have of making musical sounds, 'not squeaking, but singing, musically and rhythmically, in a high key, with a thin and wiry, but not displeasing quality—something like a weak-voiced canary bird.' Mice are occasionally cannibals, and have been known to eat painters' putty with red lead in it. Larger than the above is the beautiful Wood-mouse (*M. sylvaticus*), an abundant pest in the fields and gardens of Europe, notable for the stores of grain and other food which it accumulates among the grass or just under the surface of the ground. Smaller than either, and smallest of British mammals, is the Harvest-mouse

(*M. minutus*), which makes a neat globular nest of woven leaves among the grasses and reeds. The white-footed mouse (*Hesperomys leucopus*), which is exceedingly common in N. America, has small cheek-pouches, structures best developed in the related family of Cricetinae or hamsters. Corresponding to the European harvest-mice are the American species of Och-

1, Harvest-mouse (*Mus minutus*);
2, Long-tailed Field-mouse (*Mus sylvaticus*).

otonodon, of which *O. humilis* measures only about 2 inches in length, not including the tail. Finally, the Water-mice (*Hydromys*) of Australia may be noted as remarkably divergent. The name is sometimes extended, as we have seen, to include the smaller species of other genera than *Mus*, rat being an equally wide title for the larger forms. But, while the wide application of the name is naturally justified, care must be taken to keep the shrews (*Sorex*) in their entirely distinct, though somewhat analogous, position among Insectivora. See RAT, SHREW, VOLE.

Mousquetaires, the mounted body-guard of the kings of France, all of noble birth, were organised by Louis XIII. in 1622. They rode gray horses, and were disbanded in 1815.

Mouth. See the articles dealing with Palate, Digestion, Teeth, Tongue, Cancrum Oris, Salivation, Scurvy, &c.

Movables. See HERITABLE AND MOVABLE.

Moville, a seaside resort in County Donegal, on Lough Foyle, 19 miles NNE. of Londonderry. It is a calling-station of the Transatlantic steam-packets of the Anchor line. Pop. 1129.

Moving Plant (*Desmodium gyrans*), a plant of the natural order Leguminosæ, sub-order Papilionaceæ, a native of India, remarkable, as are also some other species of the same genus, for the spontaneous movement of the leaves. See PLANTS (MOVEMENT OF).

Mowing-machine, a machine for mowing lawns and bowling-greens, instead of the scythe. The mowing-machine differs from the reaping-machine in principle, chiefly in having revolving instead of horizontal cutters. The first successful mowing-machines in use in Britain were those invented by Shanks of Arbroath and by Green of Leeds about 1850, whose improved machines are yet the best where the wear and tear are heavy. There are now many rivals to these, chiefly of American manufacture, which are preferable to them on the score of lightness of draught, and consequently ease and speed in the performance of the work.

Moxa is a peculiar form of counter-irritation which was early practised in the East, particularly by the Chinese and Japanese, from whom it was learned by the Portuguese. One or more small cones, formed of the downy covering of the leaves of *Artemisia Moxa* (as used by the Chinese), or of the pith of various plants (as of the common sun-flower), or of linen steeped in nitre, are placed on the skin over the affected part, and the ends remote from the skin are ignited. The combustion gradually proceeds through the cone and forms a superficial eschar on the skin. The surrounding parts must be protected by a pad of wet rag, with a hole in it for the moxa. It is not much used in Europe in consequence of the somewhat severe pain attending it.

Mozambique, the collective name for the territories of Portugal on the east coast of Africa, extends from Cape Delgado to Delagoa Bay, a distance of 1300 miles. The northern boundary is the Rovuma, the southern (in part), the Maputa, and the western frontiers are formed by Lake Tanganyika, the river Ruvo, the Zambesi up to Zumbo, Mashona and Matabele Lands (British South Africa Company's Territories), and the Transvaal. The principal rivers, besides those already mentioned, are the Limpopo and Sabi, towards the south. The coast belt is low and swampy; but the interior rises into well-wooded plateaus, which furnish valuable timber. The soil is naturally fertile, and yields, in addition to maize, rice, manioc, &c., an abundance of natural products, such as cotton, sesame, cocoa-nut, medicinal plants, and india-rubber, but very little is done to cultivate them, owing to lack of capital and of means of communication. The imports (cotton goods, beads, hardware, arms and gunpowder, coals, spirits, and provisions) average about £508,000 annually; the exports (ivory, ground nuts, india-rubber, wax, copal, and oil seeds) about £765,000. The shipping is mostly (seven-tenths) in the hands of British firms. Customs duties are exceptionally heavy; agriculture does not flourish; mining is little prosecuted, although the country is rich in minerals,

in gold, silver, iron, coal, and copper; pearls abound on the reefs off the coast, but are not gathered to any extent; and there is annually a deficit equal to 43 per cent. of the expenditure—some £60,000, which is made good by the home country. The pop. of the province is estimated at one million. There is a railway (1887) of 52 miles from Delagoa Bay to the Transvaal frontier. Chief towns: Mozambique, Quilimane, and Lourenço Marques, for which see the separate articles. The Mozambique territories are administered by a governor-general, assisted by a governing and a provincial council, and are divided into nine districts, each under a district governor.

MOZAMBIQUE, the capital, stands on a small coral island lying close to the mainland, and has a fine government house, a cathedral, an arsenal, &c. A fort, built by Albuquerque in 1508, two years after he occupied the island for Portugal, still stands at the north end of the island. Pop. 7380, of whom 6800 are natives, 280 Banyans, and about 100 Europeans. The city was formerly a great place for the slave-trade, but seems now hardly able to hold its own against Quilimane and Lourenço Marques. Its total trade ranges annually between £250,000 and £320,000.

Mozambique Channel, between Madagascar and the east coast of Africa, is about 1000 miles in length and 400 in average breadth. At its northern extremity lie the Comoro Islands.

Mozarabes. See MORISCOS; and for Mozarabian Liturgy, see LITURGY.

Mozart, WOLFGANG AMADEUS CHRYSOSTOM, was the younger child of Leopold Mozart, Kapellmeister to the Archbishop of Salzburg, and was born in Salzburg on 27th January 1756. Numerous anecdotes are related of his childhood, illustrating an almost incredible precocity of genius, whose early promise, however, was amply fulfilled in his after-life. On his first professional tour through Europe when he was six years old, he was accompanied by his sister Marianne, and under their father's care the children visited Vienna, Paris, Belgium, and London. The greatest triumphs of Mozart were won in Bologna, then the musical centre of Italy. The Philharmonic Academy there suspended the rule by which no one under twenty was eligible for membership, in order to elect this young prodigy of barely fifteen. The wonderful power of his memory was illustrated by a famous feat performed in this Italian tour. The Easter music in the Sistine chapel was jealously kept from the eyes of outsiders, and no copy of it was permitted to be made. After one hearing, Mozart wrote from memory a full and minutely correct vocal score. During all the years of childhood and boyhood Mozart had been ever under the immediate care of his father, until his twenty-first year, when, stung by the indignities heaped upon him at the archiepiscopal court, he asked permission to leave it. In September 1777 he left Salzburg for Paris, with his mother as companion and adviser; and from this date began that struggle with the world in which he was to be so soon overthrown. In Mannheim, which he visited on the way, he made the acquaintance of a new instrument, the clarionette, which he was the first to incorporate in the modern orchestra, and fell in love with Aloysia Weber, the second daughter of a poor man with a considerable family. For many obvious reasons Leopold Mozart was greatly disturbed, and the correspondence between the anxious loving father and the disappointed but always dutiful son throws a flood of light on the relation, as beautiful as it is rare, in which they stood to each other.

In Paris mother and son had to practise the strictest economy, for the mature musician no

longer commanded the limitless admiration and interest so readily accorded to the prodigy fifteen years before. In poor lodgings and amid depressing surroundings the mother's health gave way; she died in her son's arms; and Mozart returned to the paternal roof in Salzburg.

In 1781, having re-entered the service of the archbishop, he followed him with the rest of the prelate's household to Vienna. Although the archbishop was proud to have such a famous artist in his suite, he hated Mozart, and even the compliments so easily won on all hands by the young man were made so many occasions to wound his proud spirit. At last, stung by the studied and systematic insult to which he was subjected by his patron, Mozart retorted in language more caustic than prudent, which procured him an instant and ignominious dismissal.

Mozart took lodgings with his Mannheim friends, the Webers, who had now settled in Vienna. The father, his firm friend, was now dead, and Aloysia was married; but her place in Mozart's heart was taken by her younger sister Constance, a very gentle and attractive girl. Constance made a loving and devoted wife, but a wretched manager. She kept her husband up to his engagements, and amused him by her powers as a story-teller; but debts and difficulties increased. Just a month previous to his marriage he produced the charming little opera, *Die Entführung aus dem Serail*, which paved the way for the next, *The Marriage of Figaro*, the most delightful of lyric comedies. With his magic wand he touched the somewhat coarse or at least questionable elements in Beaumarchais' play, and these assumed an ideal form in a supernatural atmosphere of pretty piquancy where naughtiness is unknown. The opera was more than a success, it created a furore; yet jealousy and court intrigue prevented any reward, any acknowledgment that the greatest living musician was labouring and hungering in their midst. More generous appreciation was offered him in Prague, and, being commissioned to write an opera for the theatre there, he set to work on *Don Giovanni*. The summer-house and the little stone table on which most of the charming music was written are still shown in the gardens, where, amid the noise of conversation and skittles, he worked apparently undisturbed. The extraordinary success of *Don Giovanni* made it impossible for the court still to overlook the composer, and he was appointed 'Kammer-Musicus' to Joseph II., his duties being to supply dance-music for the imperial balls at a salary of £80 a year.

Pecuniary embarrassments pressed heavily on his heart once so light, and he writes of gloomy thoughts, which he has to repress with all his might. He had great hopes that a journey to Berlin, *via* Dresden and Leipzig, in company with his friend and pupil, Prince Lichnowski, might give some chance of bettering his condition; and indeed Frederick-William II. of Prussia was so delighted with him that he offered him the post of Kapellmeister with about £450 a year. But a sentimental loyalty prevented him from accepting it. Ever-increasing difficulties induced him to inform the emperor of the king of Prussia's offer, and when Joseph seemed painfully surprised, Mozart, confirmed in an unreasoning affection for a monarch who did so little for him, exclaimed: 'I throw myself upon your kindness and remain.' Joseph II. ordered a new opera, *Così fan Tutti*, but owing to his death, and the indifference to art of his successor Leopold II., the composer reaped no pecuniary benefit. He made one more desperate application for a regular post, and was rewarded by being appointed assistant and successor (without pay for the present) to the Cathedral Kapellmeister, who

outlived him many years. His carelessness and improvidence beset him with endless petty embarrassments, and Constance's frequent illnesses, which necessitated prolonged visits to health-resorts, were an additional and serious drain on the precarious income. He was hastened towards financial ruin too by his heedless and overpowering generosity, often casting his pearls before swine—'false friends,' his sister-in-law terms them, 'secret blood-suckers and worthless people, intercourse with whom ruined his reputation.' In 1791, Mozart's health even then breaking down, an adventurer, a brother freemason, applied to him for help. This was Schikaneder, a theatre manager, who found himself in difficulties, from which he said only a new opera by Mozart could save him. He suggested the subject himself, *The Magic Flute*, and, seeing Mozart's failing health and uncertain powers of work, he took care to keep him under his own eye, giving him working accommodation in his own house, and keeping him in good humour with copious supplies of wine and frequent invitations to dinner. For a short time Mozart, harassed and ailing, sought to forget himself in a continual fever of excitement, and the lapses of these few sad weeks, multiplied and magnified, gave rise to the judgments which upon those who so hastily condemn reflect double the dishonour they would impute. As the struggle with the world became more unequal, as the iron entered deeper into his soul, his vision became clearer to read the mystery of life. In six weeks he wrote his three greatest symphonies, in which first throbs that intense expression of passion and 'Weltschmerz' which was to raise Beethoven, his stronger successor, to the highest place of honour in Music's temple.

In March 1791 he began the *Magic Flute*, which was produced on the 30th September; and, though it was at first coldly received, it rapidly conquered public opinion, and in the end made the fortune of the lucky Schikaneder. While he was at work on the opera Mozart received the famous visit about which so much mystery has been made. One night a stranger, now known to have been the steward of a nobleman, Count Walsegg, appeared and commissioned him to write a Requiem Mass to be finished in a month. He enjoined the strictest secrecy, and departed as mysteriously as he had come. The month passed, and Mozart was just stepping into the travelling-carriage which was to take him to Prague for the production of a new opera, when the stranger again appeared and reminded him of his promise. The incident made a deep impression on him; and the idea that it was a summons from the other world grew upon the fevered brain and broken heart of the composer. He was really dying, and, as he worked hard at the Requiem, he felt, as he said, that he was writing it for himself. On the 4th of December a few friends met in his room to rehearse the part of the work which was finished, but the dying composer was unequal to the effort. During the evening he seemed, even in unconsciousness, to be occupied with his work until at midnight came the last summons.

He was buried in the common ground of St Mark's Churchyard, and no friendly eye saw his remains laid in their last resting-place. When the bereaved wife made inquiries a few days afterwards, she found that the gravedigger had been changed, and her search for the grave proved fruitless; thus no one knows where Mozart was buried. It was many years after his death that Vienna awoke to sense of her shame and erected a beautiful monument to the memory of her adopted son.

Mozart wrote 824 compositions; he left no branch of the art unenriched by his genius; and he takes a

high place in all. Indeed, in opera and symphony, in spite of the more advanced writings of Wagner and Beethoven, he may be said to be second to none. Gifted with an inexhaustible vein of the richest, purest melody, he is at once the glory and the reproach of the Italian school (see OPERA); for, while he surpasses all Italians on their own chosen ground, his strict training in the German school placed at his service those wonderful resources of harmony and instrumentation in which the southerners have always been deficient. His most important operas are those already mentioned, *Don Giovanni*, *The Magic Flute*, and *Figaro*. The first stands upon a pinnacle of its own in the history of opera. It has no rival, and commands the unlimited admiration of every true musician; the great deficiencies of the libretto are forgotten in the charm of the music, in the masterly combinations of effect shown in the finales and concerted pieces, and in the triumph of sustained dramatic power in the last scene. The greatest compliment that could be paid the *Magic Flute* is that it still holds its place as a classic on the opera-stage, in spite of the most incoherent and incomprehensible plot. The importance of the orchestration gives the work a place only second to *Don Giovanni*, and it has been a favourite study with all great opera-composers. *Figaro* is perhaps the most perfect opera of the three, for in it the plot is slight, and the time required for its development very short.

Of forty-one symphonies there are three which will occupy an honoured place so long as music exists. These are the C major (called the 'Jupiter'), G-minor, and Eb. The first deserves its name from the proud and noble rhythm of the first part, and the absolute ease with which the last movement sets forth a triumph of the most complicated counterpoint. In the G minor beat the first distinct pulses of that great wave of romanticism and passion which was to flood with its influence all future musical development.

The Eb is very lively and good-humoured and tender withal. It might almost be called a 'Carnaval,' written before Schumann had shown the way to such titles. The quartets are very beautiful and exceedingly original; but they are not associated with Mozart's name as they are with that of Haydn, nor is the fame of the earlier creator overshadowed in this branch of the art as is the case in the realm of orchestral writing. His pianoforte sonatas, and those for the violin and piano, are of no great importance except in the development of musical form; but an exception must be made in the case of the *Fantasia in C minor*, which, like the G minor symphony, foreshadows much of the new school, and reaches even so far as the influence of Schubert. His Masses are all youthful works, with the faults of youth easily recognisable, and the marks of the haste with which they were supplied as occasion required. The *Ave Verum*, a late church composition, though simple, is very expressive and touching. The unfinished *Requiem* remains a noble monument of his genius.

The great authority on Mozart's life is Otto Jahn (1856-59; 2d ed. 1867; Eng. trans. by Townsend, 1882); see also the *Life* by Nohl (Eng. trans. by Lady Wallace, 1877), that by Meinardus (1882), and the English one by Holmes (1845; 2d ed. 1878). Nohl edited the Correspondence (2d ed. 1877). See also the *Life* by Fischer (1888) of Mozart's second son, Wolfgang Amadeus (1791-1844), who wrote a few compositions of slight importance.

Mozdok, a town of Russian Caucasus, on the Terek, 58 miles N. of Vladikavkaz, with three large annual fairs for horses, sheep, cattle, &c. It grows excellent melons and wine. Pop. 11,008.

Mozley, JAMES BOWLING, an able theological writer and High Church divine, was born in Lincoln-

shire in 1813. Educated at Oriel College, Oxford, he became a fellow of Magdalen, vicar of Old Shoreham, canon of Worcester, and in 1871 regius professor of Divinity at Oxford. His chief books are: *The Augustinian Doctrine of Predestination* (1855); *The Primitive Doctrine of Baptismal Regeneration* (1856); *Review of the Baptismal Controversy* (1863); his admirable Bampton Lectures on *Miracles* (1865); *Oxford University Sermons* (1876); *Ruling Ideas in Early Ages* (1877); *Theory of Development*, in answer to Newman (1878); *Essays, Historical and Theological* (2 vols. 1878), containing among other papers admirable essays on Laud and Luther, an over-eulogistic study of Strafford, and a still less successful depreciation of Cromwell and Dr Arnold; and *Sermons, Parochial and Occasional* (1879). Mozley had great intellectual force, subtlety of analysis, and imaginative versatility, but he wrote without facility, and his style is not commensurate in quality with his thought. He died 4th January 1878. See his *Letters* (1884).—His elder brother Thomas, rector of Plymtree, Devon, is well known as the author of *Reminiscences chiefly of Oriel College and the Oxford Movement* (1882), and *Reminiscences, chiefly of Towns, Villages, and Schools* (1885).

Mozuffernugger. See MUZAFFARNAGAR.

Msket, also written MTSCKETHA and otherwise, probably the most ancient town of the Caucasus, and down to the 5th century the capital of the old Georgian kings, stands on the south side of the Caucasus, 10 miles NNW. of Tiflis. It contains a cathedral, already existing in the 4th century, in which the Georgian kings were crowned and buried. When the Poti-Tiflis Railway was constructed, an ancient necropolis was laid bare; the graves were those of a cannibal race, and furnished proof that the modern Georgians are the direct descendants of the ancient Iberi.

Mtzensk, a town of Russia, 31 miles by rail NE. of Orel. Pop. 15,067.

Much Woolton (i.e. 'Great Woolton'), a town of Lancashire, 6 miles SE. of Liverpool. Near it are large quarries. Pop. 4541.

Mucilage is the term applied to the solution of a gum in water—thus, mucilage of acacia, mucilage of tragacanth. The term is also sometimes applied to the natural solution of gummy substances found in plants. See GUM.

Muckers, the popular name of a sect which sprung up at Königsberg in 1835. The movement seems to have originated in the dualistic and theosophic views of John Henry Schönherr (1771-1826) concerning the origination of the universe by the combination of a spiritual and a sensual principle. The most notable of his followers were two clergymen, J. W. Ebel (1784-1861) and Diestel, both of whom were in 1839-42 degraded from their office. Hepworth Dixon (in his *Spiritual Wives*, 1868) pointed out the resemblance of the Mucker sect to the Agapemone (q.v.) and the Perfectionists (q.v.). In 1874, at Porto Alegre in Brazil, a band of German Muckers, under a propheteess, were nearly all killed in conflicts with the military.

Mucous Membrane. Under the term mucous system anatomists include the skin, mucous membranes, and true glands, all of which are continuous with one another, and are essentially composed of similar parts (see SKIN, GLANDS). The mucous membrane is divided into the alimentary mucous membrane (for which see DIGESTION, Vol. III. p. 813), the respiratory (see NOSE, RESPIRATION), and the genito-urinary (see KIDNEYS, &c.).

Mudar (*Calotropis*), a genus of Asclepiadaceae found in India, Persia, &c. The inspissated juice is used as a purgative and sudorific medicine.

Mudejares. See MORISCOS.

Mud-fishes (*Dipnoi*), a small but very important order of fresh-water fishes, a connecting-link towards Amphibians. There are only two genera, widely separated in geographical distribution—*Ceratodus* from Queensland and *Protopterus* from tropical Africa. Of an alleged third genus, 'Lepidosiren' from Brazil, we know extremely little, not enough to warrant its separation from *Protopterus*. The wide range of distribution, and the discovery in Mesozoic rocks of fossil teeth resembling those of *Ceratodus*, confirm the impression of ancient origin which is suggested by not a few facts of Dipnoan anatomy, such as the persistent notochord without distinct vertebrae, the intestinal spiral valve, the cloaca, the abdominal pores, &c. (see FISHES). On the other hand the mud-fishes are in other respects almost amphibians, for the swim-bladder functions as a single (*Ceratodus*) or double (*Protopterus*) 'lung,' along with which gills also persist. The Dipnoi are thus important connecting-links. The limbs are peculiar in the possession of a central axis, which in *Ceratodus* bears rays on each side. The body is covered with flat scales, is from four to six feet in length, and bears a symmetrical tail. *Ceratodus* seems to feed on decaying leaves and the like, *Protopterus* on fish, frogs, insects, &c.,

Head of *Protopterus* (after Wiedersheim):
Showing fore-limb (a), entrance to gill-cavity (b), external gills (c).

while 'Lepidosiren,' though described by the natives as feeding on roots, is said to have teeth suited to carnivorous diet. The nostrils open posteriorly into the mouth, a condition occurring in no other fish, unless *Myxine* be reckoned as such. Air is taken into the lungs at the surface of the water, and this mode of respiration becomes more emphatic when the fishes venture to wriggle ashore, as *Ceratodus* is said to do, or get into thick muddy water, or when the dry season begins to desiccate the pools. It is then in fact that *Protopterus* most deserves its popular name, descending into the mud, rounding off a nest for itself, and becoming more or less dormant. 'The mud around one of these nests becomes very hard, and the balls thus formed have been dug out, and, without breaking, have been brought to Europe or North America. A short immersion in water serves to release the fish, which will live for some time in confinement.' Both *Ceratodus* and *Protopterus* are esteemed as food. The development of all the forms is still quite unknown. The term 'mud-fish' is also applied to a Ganoid (*Amia calva*) not uncommon in some of the fresh waters of the United States. It attains a length of two feet, is carnivorous in diet, and gulps air at the surface of water, the air-bladder having truly pulmonary functions.

See CERATODUS, FISHES, LEPIDOSIREN; also Günther's *Study of Fishes* (Edin. 1880); Howard Ayers, *Jenaische Zeitschr. f. Naturwiss.* xviii. 1885, with literature.

Mudie, CHARLES EDWARD, founder of the celebrated library which bears his name, was

born at Chelsea in 1818. Having started as a bookseller, he established his library in 1842, which became a limited company in 1864, and had 25,000 members in 1890, the annual receipts being £100,000. He published poetical *Stray Leaves* (1873), and died 28th Oct. 1890. See BOOK-TRADE.

Mudki, often spelt MOODKEE, a village of the Punjab, India, 26 miles S. of the Sutlej, and on the old road from Ferozpur to Karnal. Here the first battle in the Sikh war of 1845-46 was fought (18th December 1845), when the British under Sir Hugh Gough repulsed the Sikhs, and Sir Robert Henry Sale, 'Fighting Bob,' was killed.

Mud Volcanoes. See VOLCANOES.

Muezzin (Arab. *Mu-zin* or *Mu-azzin*; sometimes *Mueddin*), the official attached to a Mohammedan mosque, who announces the different times of prayer. See MOHAMMED, p. 249.

Mufti. The Turkish Grand Mufti or Sheikh-ul-Islam is the head of the great corporation of Ulema (q.v.), the interpreters of the Koran, by whose decisions (when written down, *Fetwas*) the Cadi's have to judge. The chief of the Ulema is little less powerful than the Grand Vizier.

Muggletonians, a sect that arose in England about the year 1651, and of which the founders were John Reeve and Lodowick Muggleton (1607-97), obscure men, but who claimed to have the spirit of prophecy. Muggleton was a journeyman tailor. He professed to be the 'mouth' of Reeve, as Aaron was of Moses. They affirmed themselves to be the *two witnesses* of Rev. xi. They asserted a right to curse all who opposed them, and did not hesitate to declare eternal damnation against their adversaries. They favoured the world with a number of publications, one of which—particularly directed to the Parliament and Commonwealth of England, and to his Excellency the Lord General Cromwell—was entitled a *Remonstrance from the Eternal God*. The prophets were at that time imprisoned as nuisances in Old Bridewell. Another publication was a *General Epistle from the Holy Spirit* in 1756; Muggleton's writings were collected again in 1832. He had assailed the Quakers, and was answered effectively by Penn and George Fox. He denied the doctrine of the Trinity, held anthropomorphist opinions, with many strange doctrines over and above, as that the devil became incarnate in Eve, &c. A few Muggletonians lingered in England well into the 19th century. See Jessopp's *Coming of the Friars, and other Essays* (1888).

Mugwumps, a title conferred, during the United States presidential election of 1884 (New York *Sun*, June 15), on such Republicans as threw over the nominee of their party for Cleveland, the Democratic candidate, in the interests of civil service reform. The title implied a belief that these Independents set themselves up as superior to their former associates.—The word means 'big chief' in the Algonquin Indian dialects, and John Eliot, who spelled it 'Mugquomp,' employed it to translate 'leader' and 'duke' (as in Gen. xxxvi. 15) in his Indian version of the Bible.

Mühlberg, a town of Prussian Saxony, on the Elbe, 36 miles SE. of Wittenberg. Pop. 3441. Here, on 24th April 1547, the Emperor Charles V. defeated John Frederick the Magnanimous, Elector of Saxony. See SCHMALKALD.

Mühlhausen, a town of Prussian Saxony, on the Unstrut, 25 miles by rail NNW. of Gotha. An important imperial free city in the 13th century, it came to Prussia in 1802, to Westphalia in 1807, and again to Prussia in 1815; and it is still an active centre of commerce, with manufactures of woollen and cotton goods, hosiery, &c. Pop. (1875)

21,054; (1885) 25,141. See works by Herquet (1874), Pfaff (1874), and Stephan (1886).

Muir, JOHN, a distinguished Sanskrit scholar, was born in Glasgow in 1810, studied at the university there and at Haileybury, and at eighteen went out to Bengal to join the East India Company's Civil Service, in which he remained for twenty-five years. His last years were spent in Edinburgh, where he died, March 7, 1882. Muir was a munificent patron of learning, and himself a scholar of unusually wide intellectual and spiritual sympathies. He founded and endowed a chair of Sanskrit in Edinburgh, as well as prizes for high attainments in that language, and also provided the funds for a lectureship in comparative religion. His great work was his *Original Sanskrit Texts on the Origin and History of the People of India, their Religion and Institutions* (5 vols. 1858-70; 2d ed. 1868-73). Another book is *Metrical Translations from Sanskrit Writers* (1878).

SIR WILLIAM MUIR, his brother, was born in 1819, and at eighteen joined the Bengal Civil Service after having attended lectures at both the universities of Edinburgh and Glasgow. He rose rapidly in rank, was made K.C.S.I. in 1867, and was lieutenant-governor of the North-west Provinces, 1868-74, and Financial Minister to the government of India, 1874-76. After his return to England he sat on the Council of India, 1876-85, when he was elected Principal of the university of Edinburgh. Sir William Muir is an eminent Arabic scholar, and his *Life of Mahomet* (4 vols. 1858-61; abridged ed. 1877) and *Annals of the Early Caliphate* (1883) are works of solid and enduring value. Other books are *The Corân, its Composition and Teaching, and the Testimony it bears to the Holy Scriptures* (1878); *Extracts from the Corân* (1880); and *The Early Caliphate and Rise of Islam, the Rede Lecture* for 1881.

Muirkirk, a town of Ayrshire, 26 miles E. by N. of Ayr, bleakly situated, 720 feet above sea-level. It is the seat of great ironworks, dating from 1787. Pop. (1871) 2376; (1881) 3470.

Mukaddasi, an Arab geographer, born at Jerusalem, voyaged extensively for twenty years, and described Moslem lands in a work published in 985 A.D. It was edited by De Goeje in 1877; and the part relating to Syria and Palestine was translated from the Arabic for the Palestine Pilgrim's Text Society in 1887, by Guy Le Strange.

Mukden, or **MOUKDEN**, capital of Manchuria, is situated in the southern part of the country, on a branch of the river Liao, 425 miles N.E. of Peking. Mukden is the Manchu name; the Chinese call it Shingking, its present official title. The town is surrounded by a good masonry wall, a parallelogram in shape. Outside this the suburbs extend for one to two miles and are protected by a mud wall. The imperial palace stands in the centre of the city, enclosed within a third separate wall. Previous to 1625 the town was called Shenyang; in that year Nurbachu, the founder of the present reigning family in China, made it his capital and called it Mukden. The Irish and Scotch Presbyterians are very active in the place; they conduct also a medical mission which is very successful. There is, too, a Roman Catholic mission. Numerous temples adorn the city. About four miles to the east is the tomb of Nurbachu. Mukden contains other imperial tombs of the reigning family. Good coal exists in the vicinity. Its port is Newchwang (q.v.), a railway between the two places being in contemplation in 1891. Pop. (1887) 250,000.

Mulatto. See **NEGRO**.

Mulberry (*Morus*), a genus of trees of the natural order Moraceæ, natives of temperate and

warm climates, with deciduous leaves, unisexual flowers in short, thick spikes, a 4-parted perianth, containing either four stamens or one pistil with two styles, the perianth of the female flowers becoming succulent and closing over the small pericarp, the whole spike coalescing into an aggregate fruit.—The Common Mulberry, or Black Mulberry (*M. nigra*), is a native of the middle parts of Asia, but was introduced into the south of Europe more than a thousand years ago, and is now almost naturalised there. It is a low tree, much branched, with thick rough bark, and broad heart-shaped leaves, which are unequally serrated, and very rough. It is cultivated in the middle parts of Europe, and succeeds well in the south of

Common Mulberry (*Morus nigra*).

England, but in the northern parts of Britain it requires a wall. The perianth and stigmas are roughly ciliated, and the fruit is of a purplish-black colour, with dark red juice, fine aromatic flavour, and subacid sweet taste. The fruit is much esteemed for dessert; an excellent preserve and a pleasant light wine are made of it. The tree often produces its fruit in prodigious quantity. The wood is employed in cabinet-work, but is not of much value. The leaves are sometimes used for feeding silkworms. The Black Mulberry lives long; trees still existing in England are known to be more than 300 years old. It is propagated by seed, by suckers, by layers, or by cuttings. It succeeds best in a rich light soil.—The White Mulberry (*M. alba*) is a native of China, and has been there planted from time immemorial for the sake of its leaves, which are the best food for silkworms; on this account also it has been cultivated in the south of Europe since about 1540. In North America it does not succeed farther north than 43° lat., being somewhat more impatient of frost than the Black Mulberry. The perianth and stigmas are smooth; the fruit is almost white, and is much less palatable than that of the Black Mulberry, although in this respect there is great difference among the many varieties. A rob made of it is useful in sore throat. The best variety for feeding silkworms, on account of its rapid growth and abundant leaves, is that called the Philippine Mulberry. In India the White Mulberry is treated as a bush, and cut down twice a year; the shoots, stripped of their leaves, being thrown away, although the bark has long been used in China and Japan for making paper. It grows readily from cuttings. The root has a considerable reputation as a vermifuge.—The Red Mulberry (*M. rubra*), a native of North America, abounding

particularly on the lower parts of the Missouri, endures severe frosts much better than either of the preceding, and is therefore preferred for cultivation in some parts of Europe. Its fruit is deep red, and almost as pleasant as the Black Mulberry. It forms a tree 60 to 70 feet high, with a circumference of about six feet; the wood is fine grained, strong, and adapted even for shipbuilding, but cannot be procured in any quantity for that purpose.—The Indian Mulberry (*M. Indica*) has black fruit of a delicate flavour, and the leaves are extensively used for feeding silkworms in China, Cochinchina, and Bengal.—*M. atro-purpurea* has been introduced into India from China for feeding silkworms. *M. Mauritiana*, a native of Madagascar and Mauritius; *M. celtidifolia* and *M. corylifolia*, Peruvian species; *M. Tatarica*, a native of central Asia; *M. laevigata*, the species most common in the north of India; and *M. Cashmeriana*, a native of Cashmere, produce pleasant fruit. *M. dulcis*, a native of the north of India, is said to be superior in flavour to all others.

The Paper Mulberry (*Broussonetia papyrifera*) differs from the true mulberries in having the female flowers collected in a globular mass. The tree is of moderate size, or, in cultivation, a bush of 6 to 12 feet high, with leaves either simple or lobed, a native of India, Japan, and the islands of the Pacific Ocean, but now not uncommon in pleasure-grounds in Europe and North America. The islanders of the Pacific cultivate the Paper Mulberry with great care. They make a kind of clothing from the bark, using for this purpose the bark of small branches about an inch in diameter, which they macerate in water, and then, scraping off the epidermis, they press and beat the moist slips together. The paper also which is used in Japan and many parts of the East is in great part made from the bark of the young shoots of this plant, which for this purpose is boiled to a pulp, and treated somewhat in the same way as the pulp of rags in Europe. When the shoots are cut, new ones spring up very rapidly. Silkworms eat the leaves of the Paper Mulberry. The fruit is oblong, of a dark-scarlet colour, sweetish, but insipid.

Mulcaster, RICHARD, philologist (died 1611), was a scholar of King's College, Cambridge, in 1548, but attracted no notice till 1555, when he removed to Oxford, and was chosen student of Christ Church, quickly becoming eminent for his knowledge of eastern literature. In 1561 he was appointed master of Merchant Taylors' School, and in 1596 master of St Paul's School. He enjoyed great reputation as a Greek and oriental scholar and successful schoolmaster. His English and Latin works were celebrated in their day, the principal being *Positions, &c. necessarie for the Training up of Children* (Lond. 1581) and *Elementarie on the Right Writing of our English Tung* (1582). He was early addicted to dramatic composition, and assisted in the performance of plays before Queen Elizabeth.

Mulder, GERARD JOHANNES (1802–80), was professor of Chemistry at Utrecht, and was best known from his investigations on protein and vegetable physiology.

Mule, the hybrid offspring of the male ass and the mare, much used and valued in many parts of the world as a beast of burden. The head, ears, croup, and tail show very distinctly the 'prepotency' of the ass; but in bulk and stature the mule is nearer the horse, and seems to excel both its parents in sagacity, muscular endurance, sure-footedness, and length of life. Though never much used in Britain (save in some places for tram-cars), it has been common from ancient times in many parts of the East, and is a very important animal

in most of the countries round the Mediterranean, and in the mountainous parts of South America. The best European breeds are found in France, Spain, and Italy; those of Kentucky, Missouri, Minnesota, and Mexico are also renowned. The carrier-mules of South America and elsewhere are driven in troops, each led by a bell-bearing old mare. Her they follow with such docility and affection that when the troops mingle in their halting-places they are readily separated by securing the leader. In ancient times mules were often reserved as the peculiar steeds of princes, and they are still used to draw the carriages of Italian cardinals and other ecclesiastical dignitaries. Mules are very surefooted, strong of limb and firm of hoof, clever at passing steep places and sharp turns, easy to please with food. They may be ridden, driven, or used for pack purposes. Their flesh is edible.

The fact that mules are generally sterile has given rise to the common mistake of supposing that sterility is a necessary consequence of hybridisation. Even as regards mules, the females may be successfully crossed by horse or ass, though the more numerous males seem to be constantly sterile. The hinny or companion hybrid of the mule, the offspring of a female ass and a stallion, is not common, and is decidedly inferior in size, strength, and beauty. See ASS, HORSE, HYBRID, CANARY; and for the Spinning-mule, see SPINNING.

Mulgrave Islands, a name given to some of the Marshall Islands (q.v.) from their discoverer, the navigator Lord Mulgrave (1744–92).

Mülhausen (Fr. *Mulhouse*), a town of Alsace-Lorraine, on the Ill and the Rhine and Rhine Canal, 68 miles by rail SSW. of Strasburg and 20 NW. of Basel. It consists of three parts, the old town, the new town, and the artisans' town, and is a place of first-rate industrial importance. The cotton manufacture employs 16,000 workpeople in the town and 60,000 in the adjacent villages. Besides this, it has printing and dye works for cotton, linen, calico, wool, and silk fabrics, chemical factories, iron and other metal works, and shops for making machinery, railway plant, &c. Pop. (1821) 13,027; (1861) 45,887; (1885) 69,759; (1890) 76,413. Mülhausen, which existed as early as 717, was made a free imperial city by Rudolf of Hapsburg in 1273. By siding with some of the Swiss cantons in the 14th century, it was enabled to maintain a certain degree of neutrality in the feuds between the empire and France. In 1515 it joined the Swiss Confederation, and in 1528 adopted the Reformed faith. But in 1798 it was incorporated with France, and began to come to the front as an industrial place after 1829. It is noted for the excellent arrangements made for the housing, &c. of the working-classes. It became a town of the German empire after the war of 1870–71. See *Histories of the town* by De Sablière (1856) and Metzger (Lyons, 1883).

Mülheim, a manufacturing town of Rhenish Prussia, on the river Ruhr, 16 miles N. of Düsseldorf. It has great ironworks and an extensive trade in coal. Pop. (1875) 15,445; (1890) 27,702.—**MÜLHEIM-AM RHEIN**, 3 miles above Cologne, carries on extensive manufactures of silk, velvet, thread, leather, &c. Pop. (1875) 17,350; (1885) 24,975.

Mull, an Argyllshire island, the largest of the Hebrides after Lewis and Skye, is separated from the mainland by the Sound of Mull (19 miles long and $1\frac{1}{2}$ to $3\frac{1}{2}$ miles wide), and is engirt by a number of smaller islands—Gometra, Ulva, Staffa, Iona, &c. It is 347 sq. m. in area, and has a maximum length and breadth of 30 and 29 miles, but is so deeply indented, especially towards the

Atlantic, by a dozen sea-lochs and bays—the chief, Loch-na-Keal and Loch Scridain—that the coastline cannot be less than 300 miles. The rocks are chiefly volcanic, with a quarry of fine red granite in the south-west; and the surface is mountainous. Benmore (3185 feet) is the loftiest summit, Bentalloch the most beautiful, where there is much that is beautiful—these misty heights, the stretching moors, the sea-cliffs at Carsaig, the terraced basaltic plateaus, the glens, streams, and lakes, and the patches of wood and green pasture. The climate is good for the Highlands, and the soil of fair fertility, but grazing answers much better than corn-crops. Tobermory, in the north, 28 miles WNW. of Oban, is the only town. It was founded in 1788 at the head of its sheltered harbour, and has a pier (1864), a telegraph, a new water-supply (1882), and 1200 inhabitants. Aros and Duart Castles are interesting ruins; and MacKinnon's Cave was pronounced by Dr Johnson 'the greatest natural curiosity he had ever seen.' Pop. (1851) 7485; (1881) 5229, of whom 4591 were Gaelic-speaking. See GALLOWAY (MULL OF), KINTYRE.

Mullein, the common English name of the genus *Verbascum*, belonging to the Scrophulariaceae, and containing some eighty species, of which some six (Great Mullein, White, Dark, Moth, &c.) are natives of England, and have been naturalised in the United States. The leaves and stem (2 to 4 feet high), of the common and larger species, are covered with a dense, woolly growth; the flowers form a dense spike a foot long. A mucilaginous decoction of the leaves is used to allay coughs and as an emollient application.

Müller, F. MAX. See MAX-MÜLLER.

Müller, GEORGE, founder of the Orphan Homes, Ashleydown, Bristol, was born near Halberstadt, Prussia, September 27, 1805. While in training for the ministry he was dissipated in his habits, and at sixteen he was sent to prison for defrauding an hotelkeeper. He went to Halle as a student of divinity, and a visit to a private meeting for praise and prayer proved the turning-point in his career, and in 1826 he began to preach and teach, and took up his abode in free lodgings provided for poor divinity students. Through Tholuck's advice he came to London in 1829, and studied Hebrew and Chaldee with the view of becoming a missionary to the Jews. He settled at Teignmouth as minister of Ebenezer Chapel, and in the conduct of his church abolished collections and depended on voluntary gifts. In 1835 he printed proposals for the establishment of an Orphan House, which took shape in 1836 at Bristol. As the result only of 'prayer to God' he announced that he had received £84,441 up to 1856 on behalf of the orphans, who then numbered 297. By 1875 upwards of 2000 children were lodged, fed, and educated. In 1889 it was announced that the Orphan Homes and associated enterprises cost about £36,000, which sum was the result of faith and prayer and voluntary subscriptions on the part of the public. Müller visited the East on an evangelistic tour in 1889. He has published *A Narrative of some of the Lord's Dealings with George Müller* (1837). Other three portions were published, 1841-56.

Müller, JOHANNES, one of the most eminent physiologists of the 19th century, was born at Coblenz on 14th July 1801, studied at Bonn and Berlin, chiefly anatomy and zoology, and in 1826 was appointed professor of Physiology and Anatomy at Bonn; in 1833 he succeeded Rudolphi as professor of Anatomy and Physiology at Berlin, and held that post until his death, 28th April 1858. He is regarded as the founder of modern physiology, on the ground that he summed up the work of his predecessors, instituted the methods of ex-

perimental and microscopic investigation of physiological properties, himself carried out and recorded most valuable observations in connection with the mechanism of sight, hearing, and voice, and the chemical and physical properties of chyle, lymph, and bile, and studied in an original and fruitful way the phenomena of reflex action and the glands. Moreover, his *Handbuch der Physiologie des Menschen* (2 vols. 1833-40; Eng. trans. 1840-49) exercised a great influence as a text-book of the science, and Müller counted amongst his pupils several men who now stand in the front rank of German science, such as Helmholtz, Vierordt, Du Bois Reymond, &c. Müller was scarcely less eminent as a student of comparative anatomy; he observed rapidly and accurately, and possessed a remarkable insight into the interrelations of structural parts. In this department of work his most famous memoirs were those on the Amphioxus, on Fishes, the Echinoderms, and the Cæcilians. Several of his works were translated into English between 1839 and 1849.

Müller, JOHANNES VON, historian of Switzerland, was born 3d January 1752, at Schaffhausen, studied at Göttingen under Heyne, Schlözer, and others, and in 1772 was appointed professor of Greek at Schaffhausen. Already he had commenced the investigation of Swiss chronicles and documents. From 1774 to 1780 he lived in Geneva, taught there, and wrote his *Allgemeine Geschichte* (3 vols. 1810), and published the first volume of his great work, *Geschichte der Schweizer*. Shortly afterwards he was given the professorship of History and a librarianship at Cassel, but resigned both posts in 1783. In 1786 he became librarian and councillor of state to the Elector of Mainz, and began the publication of his larger *Geschichte der schweizerischen Eidgenossenschaft* (5 vols. 1786-1808; improved ed. 1826). In support of the confederation of the German princes he wrote a *Darstellung des Fürstenbundes* (1787). In 1792, when Mainz was taken by the French, he went to Vienna, where the Emperor Leopold nominated him a member of the privy-council; but, a Protestant at a Roman Catholic court, he did not see much prospect of advancement, and in 1804 left Vienna for Berlin, where he was appointed historiographer of the Hohenzollern family, and wrote *Ueber die Geschichte Friedrich's I., Ueber den Untergang der Freiheit der Alten Völker, und Versuch über die Zeitrechnungen der Vorwelt*. Introduced to Napoleon after the battle of Jena, he was appointed by him (1807) secretary of state in the new kingdom of Westphalia; but died at Cassel, 29th May 1809. His *Sämmtliche Werke* were published, 27 vols. Tübingen, 1800-17; new ed. 40 vols. Stuttgart, 1831-35. See Lives by Heeren (1820), Döring (1835), Monnard, in French (1839), and Thiersch (1881).

Müller, JULIUS, a German theologian, was born at Brieg, April 10, 1801, brother of Karl Otfried Müller, the antiquary. He studied at Breslau and Göttingen, at first law, next theology, and after a severe mental struggle adopted opinions in religion opposed to those of the Rationalists. In 1825 he was appointed pastor at Schönbrunn, south of Breslau, in 1831 second university preacher in Göttingen, in 1834 extra-ordinary professor of Theology there, next year ordinary professor in Marburg, and in 1839 in Halle. Here he died, 27th September 1878. His reputation as a theologian chiefly rests upon his great work on sin, *Die Christliche Lehre von der Sünde* (Bresl. 1839; 6th ed. 1878). It was translated into English by W. Urwick (2 vols. 1868). Another work was *Dogmatische Abhandlungen* (1870). Müller, together with Neander and Nitzsch, edited from 1850 to

1861 the *Deutsche Zeitschrift für Christliche Wissenschaft und Christliches Leben*. There is a Life by Kähler (1878) and a study by Schultz (1879).

Müller, KARL OTFRIED, classical archaeologist, was born 28th August 1797, at Brieg, in Silesia, studied at Breslau and Berlin, and in 1819 was appointed professor of Archaeology and director of the Philological Seminary at Göttingen. He died at Athens, 1st August 1840, whilst on a tour through Italy and Greece. His great design was to embrace the whole life of ancient Greece, its art, politics, industry, religion, in one warm and vivid conception—in a word, to cover the skeletons of antiquity with flesh, and to make the dry bones live. Thus his activity ranged over the whole field of Greek antiquity. We are indebted to him for many new and striking elucidations of the geography and topography, literature, grammar, mythology, manners and customs of the ancients. His work on the Dorians (*Die Dorier*; Eng. trans. 1839) forms the 2d vol. of his *Geschichte Hellenischer Stämme und Städte* (new and improved ed. 1844), his principal production; the first vol. deals with Orchomenos and the Minyans. The treatises on the ancient Macedonians (1825) and on the Etruscans (2 vols. 1828; new ed. 1877–78) continue the same line of investigations. Other valuable works from his pen are *Ancient Art* (1830; new ed. 1878; Eng. trans. 1847); *System of Mythology* (1825; Eng. trans. 1844); and *History of the Literature of Ancient Greece* (1846), undertaken at the request of the British 'Society for the Diffusion of Useful Knowledge,' translated into English by Sir George Cornewall Lewis and Dr Donaldson, the latter of whom continued the work down to the taking of Constantinople. The German original was published by Müller's brother (2 vols. 1841; new ed. 1882–84). Müller issued useful critical editions of Varro, *De Lingua Latina* (1833); Festus, *De Significatione Verborum* (1839); and Æschylus, *Eumenides* (1833–35). See *Memoirs* by Lücke (1841) and F. Ranke (1870).

Mullet (*Mugil*), a genus of acanthopterous bony fishes, type of the family Mugilidæ. The members are common coast fishes, often frequenting brackish water. They eat mud, which they crush and sift within a filtering pharynx, rejecting the useless stuff, swallowing the rest for the sake of the organic debris it contains. The mouth has at most feeble teeth; the gill-rakers form an effective sieve; the stomach is rather like a bird's

Common Gray Mullet (*Mugil capito*).

gizzard; the intestines are exceedingly long. There are about seventy species, some of which attain a weight of 10 or 12 pounds. As they are edible and sometimes highly esteemed, the mullets ought to be more cultivated. Among British species *M. octo-radiatus*, *M. capito*, *M. auratus* may be noted. A species from the fresh waters of Central America (*M. proboscideus*) has a pointed fleshy snout. The Mediterranean mullet formed a

favourite Roman dish, and their roes preserved are made into a delicacy.

The so-called 'red mullets' (*Mullus*) are quite different from the above, and not far removed from perches. The body is slightly compressed, and covered with large, thin scales. There are two long, erectile barbels and feeble teeth. About forty species, mostly from tropical seas, are divided among a number of sub-genera. There is only one European species (*M. barbatus*), of which the so-called 'surmullet' is probably the female form. It occurs on the southern coasts of Britain, and is much esteemed as a delicacy. The male seems to be smaller than the female, which in British waters rarely exceeds two pounds in weight. The colour

Surmullet.

of the surmullet is pale pink, with three or four yellow longitudinal stripes; but where any of the scales have been rubbed off beautiful tints of purple and bright red appear. This takes place also during the struggles of the fish when dying, and the Romans were therefore accustomed to bring surmullets alive into their banquetting-rooms that the guests might see them die, and enjoy the brilliant display of colour before eating the fish. 'The fishermen of our times,' Günther says, 'attain the same object by scaling the fish immediately after its capture, thus causing a permanent contraction of the chromatophores (colour-cells) containing the red pigment.' See Günther's *Study of Fishes* (Edin. 1880).

Mullet. See HERALDRY.

Mullingar, the chief town of Westmeath, in Ireland, 50 miles WNW. of Dublin by rail, on the Royal Canal and the river Brosna. It is an important trading town, has large infantry barracks, and is a centre for anglers visiting the Westmeath lakes. Pop. (1861) 5426; (1881) 4787.

Mullion, the upright division between the lights of windows, screens, &c. in Gothic architecture. Mullions are rarely met with in Norman architecture, but they become more frequent in the Early English style, and in the Decorated and Perpendicular are very common. They have sometimes small shafts attached to them, which carry the tracery of the upper part of the windows. In late domestic architecture they are usually plain. See WINDOW.

Mulock, MISS. See CRAIK.

Mulready, WILLIAM, genre-painter, was born at Ennis, in Ireland, 1st April 1786. When a boy he went to London with his parents, and at the age of fifteen entered as a student in the Royal Academy. Having tried classical subjects and landscape, he soon found his true sphere in genre-painting—painting subjects such as 'A Roadside Inn,' 'Horses Baiting,' the 'Barber's Shop,' and 'Punch' (1812), 'Boys Fishing' (1813), 'Idle Boys' (1815). He was elected an Associate of the Royal Academy in November 1815, and an Academician in February 1816. He also worked indefatigably at portrait-painting and the illustration of children's books; designed the famous

'Mulready envelope' for Sir Rowland Hill; and was throughout conscientious, careful in drawing, and rich in colouring. 'The Truant' (1835), 'The Seven Ages' (1838), 'The Sonnet' (1839), 'First Love' (1840) are famous works of his middle period; and his illustrations to the *Vicar of Wakefield* are well known. His later works, 'Women Bathing' (1849), 'Blackheath Park' (1849), 'The Toy Seller' (1862), showed failing powers. He died in London, 7th July 1863. See Stephens, *Memorials of Mulready* ('Great Artists' series, 1890).

Multan, or MOOLTAN, an ancient city of India, in the Punjab, stands on a mound formed by the ruins of ancient cities that occupied the same site, 4 miles from the left bank of the Chenab, the inundations of which sometimes reach Multan. It is surrounded on all sides except the south by a wall 10 to 20 feet high. The European quarter lies to the north and west of the city, whilst to the south is the citadel, which contains two Mohammedan shrines, the ruins of an ancient Hindu temple, and a massive obelisk (70 feet) to the memory of Vans Agnew and Anderson, murdered here in 1848. The vicinity abounds in mosques, tombs, shrines, &c. Manufactures of silks, cottons, and carpets are carried on; and the glazed pottery and enamel work enjoy a high reputation. Multan is an important centre of trade: it collects all the products of the Punjab, chiefly cotton, wheat, wool, sugar, indigo, and oil-seeds, sends them by the Indus Valley Railway to Hyderabad and Karachi, and imports European piece-goods and other manufactured articles. From Afghanistan it receives fruits, drugs, spices, and raw silk, and sends back indigo, cotton, and other textiles, sugar, and coarse shoes (of its own manufacture). In 1849 Multan was taken by the British troops and annexed. Pop. (1868) 54,652; (1881) 68,674.—The area of the division is 20,295 sq. m., and its pop. (1881) 1,712,394; the area of the district, 5880 sq. m., and pop. (1881) 551,964.

Multiple-poiniding is a well-known form of legal process in Scotland, by which competing claims to one and the same fund are set at rest. A person who has funds in his possession, to which there are more claimants than one, is liable to be harassed by double distress; and hence he commences a suit called the action of multiple-poiniding, by which he alleges that he ought not to be made to pay the sum more than once; and as he does not know who is really entitled to payment, he cites all the parties claiming it, that they may fight out their claims among themselves. The corresponding process in England is Interpleader (q.v.).

Multiple Proportions. See CHEMISTRY.

Mum, a peculiar kind of beer made of wheat-malt, to which some brewers add oat and bean meal. See *Notes and Queries* for November 1881, p. 376.

Mummius. See CORINTH.

Mummy. See EMBALMING.

Mumps, a popular name of a specific inflammation of the salivary glands described by nosologists as *Cynanche Parotidæ*, or *Parotitis*. In Scotland it is frequently termed *The Branks*. The disorder usually begins with a feeling of stiffness about the jaws, which is followed by pains, heat, and swelling beneath the ear. The swelling begins in the parotid, but the other Salivary Glands (q.v.) usually soon become implicated, so that the swelling extends along the neck towards the chin, thus giving the patient a deformed and somewhat grotesque appearance. One or both sides may be affected, and in general the disease appears first on one side and then on the other. There is seldom much fever. The inflammation is usually at its highest point in three or four days, after which it

begins to decline, suppuration of the glands scarcely ever occurring. In most cases no treatment further than antiphlogistic regimen, due attention to the bowels, and protection of the parts from cold, by the application of flannel or cotton-wool is required, and the patient completely recovers in a week or a fortnight. The disease is infectious; and the infection probably remains for at least a fortnight after apparent recovery. Like most infectious diseases, it seldom affects the same person twice. It chiefly attacks children and young persons. A singular circumstance connected with the disease is that in many cases the subsidence of the swelling is immediately followed by swelling and pain in the *testes* in the male sex, and in the *mammæ* in the female. The inflammation in these glands is seldom very painful or long continued, but is apt in the male to lead to permanent atrophy of the organ.

München. See MUNICH.

Münchhausen, KARL FRIEDRICH HIERONYMUS, BARON VON, a member of an ancient, noble family of Hanover, whose name has become proverbial as the narrator of false and ridiculously exaggerated exploits and adventures, was born 11th May 1720, at Bodenwerder, in Hanover, served as a cavalry officer in Russian campaigns against the Turks, and died at his birthplace, 22d February 1797. A collection of his marvellous stories, or stories attributed to him, was first published in English under the title of *Baron Münchhausen's Narrative of his Marvellous Travels and Campaigns in Russia* (Lond. 1785). The compiler was Rudolf Erich Raspe, an expatriated countryman of the baron's. The book went rapidly through several editions; and in 1786 appeared the first German version, edited by the poet Bürger. Ellisen's edition, *Des Freiherrn von Münchhausen wunderbare Reisen und Abenteuer* (11th ed. 1873), is enriched by an admirable introduction on the origin and sources of the book, and on the kind of literary fiction to which it belongs. Several of the adventures ascribed to the baron occur in Bebel's *Facetie* (1508); others in Lange's *Delicæ Academicæ* (1765). See Müller-Fraureuth, *Deutsche Lügendichtungen* (1881).—A Freiherr von Münchhausen (1813-86) became in 1850 head of the government of Hanover; and after the annexation of Hanover by Prussia (1866) he made himself a champion of the national party.

Muncie, capital of Delaware county, Indiana, 54 miles by rail ENE. of Indianapolis, is an important railway junction, and has manufactures of furniture, castings, &c. Pop. (1890) 11,345.

Münden, a town of Hanover, at the influx of the Werra and Fulda to the Weser, 15 miles NE. of Cassel. Engirt by wooded hills, it has a school of forestry (1868), an old castle, and manufactures of india-rubber, glass, sugar, &c. Pop. (1875) 5679; (1885) 7053. See also MINDEN.

Mungo, St. See KENTIGERN.

Mongoose. See ICHNEUMON.

Munich (Ger. *München*), the capital of Bavaria, is situated in a flat, barren plain, 1700 feet above the sea-level, chiefly on the left or west bank of the impetuous Isar, a tributary of the Danube. By rail it is 440 miles SSW. of Berlin, 272 W. of Vienna, and 867 SE. of London. Seven bridges, including a railway bridge, span the river to the suburbs on the right bank. The elevated site of the city and the neighbourhood of the Alps render it liable to sudden changes of temperature, sometimes ranging over 20° in twenty-four hours. The population in 1885 was 261,981, of whom about 84 per cent. were Roman Catholics; by 1890 it had increased to 334,710; in 1880 it was 230,023;

in 1801 only 48,885. Munich is one of the handsomest cities in Germany, and perhaps the richest in treasures of art, while itself famous for its school of painting. Within the last two generations, and especially under King Ludwig I. (1825-48), who spent nearly 7,000,000 thalers in beautifying the city, it has been decorated with buildings of almost every style of architecture, many of them ornamented with frescoes and sculpture; wide and handsome streets have been constructed; and the squares and gardens adorned with statues and other monuments. Among the imposing edifices raised for the accommodation of the public collections are the Glyptothek (1816-30), with its magnificent collection of ancient and modern sculpture, including the famous *Eginetan* marbles, discovered in 1811; the Old Pinakothek (1826-36), containing paintings by the old masters, besides 168,000 engravings and 22,000 drawings, and a priceless collection of 1500 antique vases; the New Pinakothek (1846-53), devoted to the works of modern painters; the Royal and National Library, with over 1,000,000 volumes and 30,000 MSS.; and the Bavarian National Museum, illustrating the history of civilisation and art. The New Palace includes an older palace and chapel, the *Königsbau* (1826-35), in the style of the Pitti Palace at Florence, with Schnorr's frescoes of the *Nibelungenlied*, and the sumptuously-adorned Banqueting Hall building. Other public structures are the Court Theatre, one of the largest in Germany, with room for 2600 spectators; the old and the new town-house; the Temple of Fame, a Doric colonnaded building containing busts of eighty illustrious Bavarians, in front of which rises the colossal statue of Bavaria, 65 feet high; the Generals' Portico (1844), a copy of the *Loggia dei Lanzi* at Florence; the conspicuous Maximilianeum, on its terrace on the right bank of the Isar, a college for civil servants, containing a gallery of modern historical paintings; and various palaces and administrative buildings. Among the gates of Munich the most beautiful are the Gate of Victory, designed after Constantine's triumphal arch in the Forum; the old Isar gate, with its elaborate frescoes; and the Propylæa (1862), commemorating the Greek war of independence. The numerous churches are all, except two or three, Roman Catholic. The oldest is St Peter's (1294). The huge brick church of Our Lady (1468-88), the cathedral of the archbishopric of Munich-Freising, is remarkable for its two unfinished towers (325 feet), now capped with cupolas; in the interior is the elaborate tomb of the Emperor Louis the Bavarian. St Michael's, or the Jesuits' church (1583-91), contains a monument by Thorwaldsen to Eugène Beauharnais; the Theatine Church (1767) contains the royal burial-vault; the Louis Church (1830-44) is embellished with Cornelius's fresco of the 'Last Judgment'; the beautiful church of St Marienhilf (1831-39) is noted for its gorgeous painted glass and fine wood-carvings; and the basilica of St Boniface (1835-50) for its sixty-six monoliths of gray Tyrolean marble and resplendent interior decoration. The Court Chapel of All Saints is a perfect casket of art-treasures. Munich is admirably endowed with scholastic, literary, scientific, and benevolent institutions, including Royal Academies of Art and Science, a Polytechnic School, &c. The university, removed from Landshut to Munich in 1826, has 171 professors and teachers, and over 3000 students; its library contains over 300,000 volumes; and its subsidiary institutions are numerous and well equipped. Adjoining the palace is the Court Garden, bounded on two sides by arcades adorned with frescoes; farther north is the English Garden, a park 600 acres in area; and on the right bank of the Isar are the attractive Gasteig promenades.

The industrial development of Munich lags behind its æsthetic development. Its stained-glass works, iron, brass, and bell foundries, lithographing and engraving works, and manufactories of optical and mathematical instruments, and various artistic articles are, however, deservedly noted. Still more famous are the enormous breweries of Bavarian beer, which annually produce about 49,000,000 gallons, of which 37,000,000 are consumed in the city itself. Munich carries on a large trade in grain and in objects of art.

In 1158 Henry the Lion raised the *Villa Munichen* from its previous obscurity by establishing a mint and a salt-emporium within its precincts, the name (also appearing as *Forum ad Monachos*) being derived from the monks who owned the site. In the 13th century the dukes of the Wittelsbach dynasty selected Munich for their residence and fortified the town. In 1327 the old town was nearly destroyed by fire, and was rebuilt by the Emperor Louis the Bavarian very much on the plan which it still exhibits; but it was not until the fortifications were razed at the close of the 18th century that the limits of the town were enlarged to any extent. The true history of modern Munich is the account of its artistic development in the 19th century, with which the artists most closely identified are Klenze and Gärtner the architects, Schwanthaler the sculptor, and Cornelius and Kaulbach the painters. The modern Munich school of painting, headed by K. von Piloty and W. Diez, is characterised by marked realism in colour and detail, in contrast to the romanticism of the older masters.

See works by Söhl (1854), Reber (1876), Maillinger (3 vols. 1876), Regnet (1878), and Trautwein (13th ed. 1887); also Mrs Howitt-Watts' *Art-student in Munich* (2d ed. 1879).

Municipal Architecture is shown in the buildings used for municipal purposes, such as town-halls, guildhalls, &c. These were first built when the towns of the middle ages rose in importance, and asserted their freedom. Those of North Italy and Belgium were the first to move, and consequently we find in these countries the earliest and most important specimens of municipal architecture during the middle ages. Municipal buildings always partake of the character of the architecture of the period when they were erected. In Italy, for instance, they are of the Italian-Gothic style in Vicenza, Venice, Florence, &c. during the 13th, 14th, and 15th centuries. In Belgium, during the same period, they are of the northern Gothic style, and are almost the only really fine specimens of the civil architecture of the middle ages now extant. The Cloth-hall at Ypres, and the town-halls of Brussels, Louvain, Bruges (see BELFRY), Oudenarde, the Exchange at Antwerp, and many other markets, lodges, halls, &c. testify to the early importance of the municipal institutions in Belgium. We look for town-halls in vain in France or England till the development of industry and knowledge had made the citizens of the large towns so wealthy and important as to enable them to raise the municipal power into an institution. But from the 15th and 16th centuries there exist in Britain abundant instances of buildings erected for the use of the guilds and corporations and the municipal courts. Many of the corporation halls in London have recently been rebuilt by the wealthy bodies they belong to, such as the Fishmongers, Merchant Taylors, Goldsmiths, and other companies (see also GUILDHALL). Municipal buildings on a large scale for the use of the town-councils and magistrates have also been recently erected in many large towns in Britain; and now no town of importance is complete without a great town-hall for the use of the inhabitants.

It is a curious fact that in France, where the

towns became of considerable importance during the middle ages, so few municipal buildings remain. This arises from the circumstance that the resources of the early municipalities of France were devoted to aid the bishops in the erection of the great French cathedrals, and the townspeople used these cathedrals as their halls of assembly, and even for such purposes as masques and amusements.

Municipality (from Lat. *municipes*, from *munus* and *capio*, 'one who enjoys the rights of a free citizen'), a town or city possessed of certain privileges of local self-government, the governing body in such a town. Municipal institutions originated in the times of the Roman empire. The provincial towns of Italy, which were from the first Roman colonies, as also those which, after having an independent existence, became members of the Roman state, though subjected to the rule of an imperial governor, were allowed to enjoy a right of regulating their internal affairs. A class of the inhabitants called the *curia*, or *decuriones*, elected two officers, called *duumviri*, whose functions were supposed to be analogous to those of the consuls of the imperial city, and who exercised a limited jurisdiction, civil and criminal. There was an important functionary in every municipality called the *defensor civitatis*, or advocate for the city, the protector of the citizens against arbitrary acts on the part of the imperial governor. The municipal system declined with the decline of the empire, yet it retained vitality enough to be afterwards resuscitated in union with feudalism, and with the Saxon institutions of Britain. Some cities of Italy, France, and Germany have indeed derived their present magistracy by direct succession from imperial Rome. For British Municipalities, see BOROUGH, CITY; see also FREE IMPERIAL CITIES.

Munjeet. See MADDER.

Munkacs, a market-town of Hungary, situated at the foot of the Carpathians, 101 miles by rail NE. of Debreczin, has mines of iron and rock-crystals, called Hungarian diamonds. The citadel, built on an isolated height, resisted the imperial arms for three years (1685-88); and, having fallen in 1848 into the hands of the Hungarians, was captured by the Russians in the following year. It is now a state-prison. Pop. 9691.

Munkacsy, MICHAEL, painter, whose real surname is LIEB, was born at Munkacs, 10th October 1846. He went a turner's apprentice to Vienna, and studied painting there, at Munich, and at Düsseldorf, and in 1872 settled in Paris. Except a few portraits, his works are nearly all genre-pictures. Three classes may be distinguished—those depicting Hungarian life, mostly very dark in colouring, as 'The Condemned,' 'War-time,' 'Night-roamers,' 'Village Hero,' and others; those illustrative of the social life of Paris, much lighter and brighter in tone, as 'Munkacsy in his Studio,' 'Father's Birthday,' 'Two Families,' &c.; historical pieces, of which the best-known examples are 'Milton dictating *Paradise Lost* to his Daughters,' 'Christ before Pilate,' 'Crucifixion,' and 'Mozart's Last Moments.' Vigorous characterisation, dramatic power, and pictorial breadth are perhaps his most conspicuous traits.

Munnipore. See MANIPUR.

Munro, HUGH ANDREW JOHNSTONE, Latin scholar, born at Elgin in Scotland in 1819, was educated at Shrewsbury and Trinity College, Cambridge, elected fellow of his college in 1843, and professor of Latin in his university in 1869 (he resigned the chair in 1872), and died at Rome, 30th March 1885. His greatest achievement was an edition of *Lucretius* (1864; 4th ed. 1885), text, translation, and notes, one of the finest and most

brilliant works of British scholarship. His reputation stands high moreover as a writer of Greek and Latin verse; the best pieces were published along with a Latin translation of Gray's *Elegy* in 1884. The edition of *Horace* (1869), *Criticisms and Elucidations of Catullus* (1878), several papers in the *Journal of Philology*, and a *Syllabus of Latin Pronunciation*, in co-operation with Prof. E. Palmer, constitute the remaining published work of this consummate scholar. See *Journ. of Phil.* (1885).

Munster, the largest of the four provinces of Ireland, occupies the south-west, and is bounded on the N. by Connaught, on the E. by Leinster, and on the W. and S. by the Atlantic. It contains the six counties of Clare, Cork, Kerry, Limerick, Tipperary, and Waterford, and the country is described under these heads; see also IRELAND. Area, 6,064,579 statute acres. Pop. (1841) 2,396,161; (1861) 1,513,558; (1881) 1,331,115; and (1891) 1,168,994. Of the total nearly 94 per cent. are Roman Catholics.

Münster, capital of Westphalia, stands on a small stream, by rail 101 miles N. by E. of Cologne and 106 S.W. of Bremen. It retains numerous remains of mediæval architecture, including the mixed Romanesque and Gothic cathedral, built between the 12th and 14th centuries, and despoiled of its internal decorations by the Anabaptists; Our Lady's Church, Gothic, built about 1340; the Gothic church of St Lambert, of the 14th century, from the original tower of which were suspended the three iron cages with the bodies of the Anabaptist leaders, John of Leyden, Knipperdolling, and Krechting, after they had been executed; the church of St Ludgerus, also Gothic, dating from 1330; the Gothic town-hall, in which, in 1648, the peace of Westphalia was signed (also signed simultaneously at Osnabrück, q.v.); the castle, built in 1767, and surrounded by fine pleasure-grounds, including botanical gardens; and the 16th-century town wine-cellar, in which are preserved some rare pictures of the old German school. The old Catholic university of Münster was dissolved in 1818; there is now an academy, with a Catholic theological and a philosophical faculty, and about 470 pupils. Attached to it are a library of 123,000 volumes, a natural history museum, and collections of art and antiquity. The industrial products of Münster include woollen, cotton, and silk fabrics, and paper, besides dyeing, printing, and enamelling. The trade is limited to linens, woollens, thread, cattle, corn, &c. Pop. (1875) 35,705; (1885) 44,060, of whom 36,751 were Catholics; (1890) 48,613. Münster was known under the name of Mimigardesvord in the time of Charlemagne, who in 791 made it the see of the new bishop of the Saxons, St Ludgerus. Towards the middle of the 11th century a monastery (whence Münster) was founded on the spot, and by 1186 it had grown into a town. In the 12th century the bishopric was elevated into a principality of the empire. In the 13th century the city became a member of the Hanseatic League; and in 1532 it declared its adhesion to the Reformed faith, notwithstanding the violent opposition of the chapter. During 1535 Münster was the scene of the violent politico-religious movement of the Anabaptists (q.v.). The bishop repossessed himself of the city, and in 1661 Bishop Bernhard built a strong citadel within the walls, and deprived the citizens of nearly all their liberties. In both the Thirty Years' War and the Seven Years' War Münster suffered severely. The bishopric, which since 1719 had been held by the Archbishop of Cologne, although it retained a special form of government, was secularised in 1803, and divided among various reigning houses. The Congress of Vienna gave the greater part of the principality to Prussia, a

small portion being apportioned to Oldenburg, while Hanover acquired the territories of the mediatised Dukes of Arenberg. The bishopric was reconstituted in 1821. See works by Erhard (1837), Cornelius (1855-60), Keller (1880), and Detten (1887).—There is another Münster in Alsace, 12 miles SW. of Colmar by rails; pop. 3390.

Münster. SEBASTIAN, scholar, was born at Ingelheim in the Palatinate in 1489, studied at Heidelberg and Tübingen, and became a Franciscan monk, but at the Reformation he embraced the new doctrines (1529). He then taught Hebrew and theology at Heidelberg, and from 1536 mathematics at Basel, in which city he died on 23d May 1552. He brought out the first Hebrew Bible (1534-35) edited by a German; wrote *Cosmographia* (1544), a work on geography that kept its ground for more than a century; and published a Hebrew grammar, a Chaldaic grammar (1527), and lexicon (1527), and a Latin-Greek-Hebrew dictionary (1530).

Muntjak (*Cervulus muntjac*). These small deer, of which there are several species, appear to connect the true deer with the Chevrotains (q.v.); they inhabit the forest tracts of the oriental region—i.e. India, China, Java, Sumatra, Formosa, and the Philippines. The males have large canine teeth as in the Chevrotains; the horns are borne upon a long pedicel covered with hair, which seems to resemble the 'horn' of the giraffe.

Muntz's Metal. See BRASS.

Münzer, THOMAS, one of the leaders of the Anabaptists (q.v.), was born at Stolberg, in the Harz, about 1489, studied theology, and in 1520 began to preach at Zwickau. His Christian socialism and his mystical doctrines soon brought him into collision with the Reformers and the town authorities. He thereupon made a preaching tour through Bohemia, Silesia, and Brandenburg, and settled in Thuringia (1523). Again deprived of his office, he visited Nuremberg, Basel, and other south German cities, and was finally in 1525 elected pastor of the Anabaptists of Mühlhausen, where he won the common people, notwithstanding Luther's denunciations of him, introduced his communistic ideas, and soon had the whole country in insurrection. But on 15th May 1525 he and his men were totally routed at Frankenhausen by Philip of Hesse. Münzer himself was captured in flight and executed on 30th May at Mühlhausen.

See Lives by Melancthon (1525), Strobel (1795), and Seidemann (1842); also Ranke, *Zeitalter der Reformation* (vol. ii.), and Jörg, *Geschichte des grossen Bauernkriegs* (1850).

Muræna. See EEL.

Mural Circle, an astronomical instrument for the observation of celestial bodies at their meridian passage. It consists of a large metal circle, turning on an axis the end of which projects from a solid stone pier or wall (whence the name), close to which the circle moves. The plane of the circle is set as nearly

Mural Circle.

as possible in the meridian. Fixed immovably to the circle is a telescope, which by turning the circle is made to point to the star to be observed, at the time of its meridian passage. Two wires, one fixed and one movable, similar to those in the

Transit Circle (q.v.), enables the altitude, or zenith distance, of the star to be noted, if the instrument has been properly adjusted, and if the zenith or horizontal point on the circle be known. On the rim of the circle are divisions in degrees, &c., so that the angle through which it is turned can be noted by means of several microscopes, as in the transit circle. The mural circles once in use at Greenwich were six feet in diameter, and each degree of the division on the edge measured more than six-tenths of an inch in length. The manner of support allowed of a large circle, which gave this advantage. The mural circle is now almost obsolete, modern improvements enabling all its work to be much better done by the transit circle.

Mural Crown. See CROWN.

Mural Decoration dates from very ancient times. The Egyptian and Etruscan monuments form an integral and important part of the history of Painting (q.v.), and have helped to mould the development of certain styles of art (see ARABESQUE). Incised work and reliefs have been largely employed. The Greeks tinted their temples and 'picked out' their sculptured friezes and pediments with colour; coloured bricks were used in Assyrian, and wall tiles (see POTTERY) in Moslem, architecture. Some of the Roman walls were built of tufa and red brick, coloured brick, terra-cotta, and variegated arrangements of marble were largely used in Italy. The plaster-work known as Sgraffito (q.v.) is especially adapted for this use. Many English churches of the mediæval period have been built of flint and stone, and much Tudor work of parti-coloured brick. Distemper and Fresco are described in separate articles; water glass is a silicate process of which there is an example in the Houses of Parliament. Mosaic-work is extensively used in floors and ceilings, but also occasionally employed in mural decoration. The dado of the Albert Memorial Chapel at Windsor is composed of slabs of inlaid marble hatched with coloured gold cement. See also TAPESTRY, WALL-PAPER.

Another system is that known as Encaustic Painting (Gr. *encaustike*, 'fixed by fire'), a manner of mural painting with a medium composed principally of wax, practised by the ancients. As the name implied that fire was used in the execution, some have been led to suppose that encaustic painting was the same as enamel painting; but notices by Pliny and other writers show clearly that it was a species of painting in which the chief ingredient used for uniting and fixing the colours was wax dissolved by heat. Various attempts have been made in modern times to revive it. About the middle of the 18th century Count Caylus and Bachelier, and in 1792 Mrs Hooker of Rottingdean, under the name of Emma Jane Greenland, made various successful experiments with this view. Encaustic painting was again taken up in Germany under the patronage of Louis I. of Bavaria, who commissioned Louis Schnorr to execute a series of historical subjects on the walls of the royal palace, Munich. For preparing her medium Mrs Hooker dissolved gum-arabic in water, afterwards adding gum-mastic, which was dissolved by stirring and boiling, and when the mixture had reached the boiling-point she put in the wax. After painting the picture, she passed a thin coating of melted wax over it with a hard brush, and then drew over the surface an iron—for ironing linen—moderately heated. After the picture cooled it was rubbed with a fine linen cloth. The German method is somewhat similar, but some other ingredients are used; among these, potash with the wax; and, in place of an iron being passed over the surface, the wax is brought to the surface by a vessel containing fire being held at a

little distance from the picture. It is also possible to employ a medium made of a mixture of turpentine and beeswax sufficiently plastic to be worked like oil. A modification of the system was also devised by Mr Gambier-Parry, and is known as Spirit Fresco. By his method the walls are coated with wax and gum compounded with spirit of lavender. The colours are ground with the same medium.

Murano, famous as the seat of the Venetian glass manufacture, is an island and town a little more than a mile north of Venice, with 3600 inhabitants. It possesses a fine 12th-century cathedral, and another church with some valuable pictures, including Paul Veronese's 'St Jerome in the Desert.' But the chief interest centres in the glass-factories—an industry established in the 13th century, and revived in 1860 by Antonio Salviati (1816-90).

Murat, JOACHIM, king of Naples, was the son of an innkeeper at La Bastide-Fortunière, near Cahors, in France, and was born 25th March 1771. He was at first intended for the priesthood, but the outbreak of the Revolution fired his enthusiasm; he entered the army, and soon rose to the rank of colonel. Attaching himself closely to Bonaparte, he served under him in Italy and in Egypt, distinguishing himself in many battles; rose to the rank of a general of division (1799); returned with Bonaparte to France, and rendered him most important assistance on the 18th Brumaire, by dispersing the Council of Five Hundred at St Cloud. Bonaparte now entrusted him with the command of the Consular Guard, and gave him his youngest sister, Caroline, in marriage. Murat held his usual post, the command of the cavalry, at Marengo, where he covered himself with glory, and in 1801 was nominated governor of the Cisalpine Republic. On the establishment of the French empire he was loaded with honours. He continued to command the cavalry in the armies led by the emperor, and contributed not a little to the victory at Austerlitz (1805), at Jena, at Eylau, and to many other victories. In 1806 the newly-erected grand-duchy of Berg (q.v.) was bestowed upon him, and on 1st August 1808 he was proclaimed king of the Two Sicilies by the style of Joachim I. Napoleon. He took possession of Naples, but the Bourbons, supported by the fleet of Britain, retained Sicily. By the moderation of his government he won the hearts of his subjects. In the expedition against Russia he commanded the cavalry, and indeed the army after Napoleon left it. After crushing the Austrians at Dresden (1813), and helping to fight the disastrous battle of Leipzig, he concluded a treaty with Austria, and a truce with the British admiral, and promised the allies an auxiliary corps; but, as soon as he learned of Napoleon's escape from Elba and return to France, he commenced a hasty war against Austria. He was, however, defeated at Ferrara (12th April 1815), and again at Tolentino (2d May). With a few horsemen he fled to Naples, where all was insurrection and commotion; thence he found his way to France. After Napoleon's final overthrow, he took refuge in Corsica, from which he proceeded with a few followers to the coast of Calabria, and proclaimed himself king and liberator, but, being presently taken prisoner, was tried by court-martial, and shot at Pizzo, on 13th October 1815. See biographical accounts by Gallois (Paris, 1828), Coletta (Paris, 1821), and Helfert (Vienna, 1878).—His widow (1782-1839) assumed the title of Countess of Lipona, and resided in the neighbourhood of Trieste till her death. His two sons went to the United States, where the elder, NAPOLÉON ACHILLE (1801-47), settled in Florida, married a niece of Washington, and published *Exposition des Principes du Gouvernement Republicain en Amérique* (1833). The younger,

NAPOLÉON LUCIEN CHARLES (1803-78), suffered reverses in fortune; but, returning to France after the revolution of 1848, he attached himself closely to Louis Napoleon, who in 1849 sent him as ambassador extra-ordinary to Turin, and in 1852 made him a senator.

Muratori, LODOVICO ANTONIO, Italian antiquary and historian, was born at Vignola, in the duchy of Modena, 21st October 1672. His life was devoted mainly to researches in history, especially the history of his native country. In 1695 he was appointed a librarian of the Ambrosian Library at Milan. His first work was to issue collections of inedited Latin fragments, *Anecdota Latina*, followed later by *Anecdota Græca*. In 1700 he was recalled by the Duke of Modena to take charge of the D'Este Library and the ducal archives at Modena. In 1723 the first folio volume of his great collection, *Rerum Italicarum Scriptores*, was published, and between that date and 1751 twenty-eight more. This work contains all the chronicles of Italy from the 5th to the 16th century, illustrated with commentaries and critical notices. It was accompanied by a collection of dissertations illustrative of the religious, literary, social, political, military, and commercial relations of the several states of Italy during the same period, in 6 vols. folio, 1738-42, a work which, although far from being free from errors, is still regarded as a treasure-house of mediæval antiquities. Muratori likewise undertook a general history of Italy (*Annali d'Italia*, 12 vols. 4to, 1744-49); compiled in two vols. *Antichità Estensi* (1717); and published *Antiquitates Italicae Medii Ævi* (6 vols. 1738-42), and a collection of Ancient Inscriptions (6 vols. 1739-42). In his later years he was attacked by the Jesuits on the ground of teaching heresies; but he found a protector in Pope Benedict XIV. He died at Modena, 23d January 1750. The *Antiquitates Italicae* (vol. iii.) contains a catalogue or canon of the New Testament Scriptures, a fragment (the 'Muratorian Fragment'), apparently drawn up by a contemporary of Irenæus; see BIBLE, Vol. II. p. 126. Lightfoot assigned it to Hippolytus; see his *Clement of Rome* (vol. ii. 1890). Muratori's *Collected Works* fill 36 volumes (Arezzo, 1767-80), and 48 volumes in another edition (Venice, 1790-1810). See the Life by his nephew (1756).

Murchison, SIR RODERICK IMPEY, geologist and geographer, was born at Tarradale, Ross-shire, 19th February 1792. He was educated at the grammar-school of Durham and the Military College, Great Marlow. He entered the army at an early age, served as an officer in Spain and Portugal, and was present at Vimiero and the retreat to Corunna. Quitting the army in 1816, he devoted himself to science, especially geology, and travelled in various parts of the globe. He found the same sedimentary strata lying in the earth's crust beneath the old red sandstone in the mountainous regions of Norway and Sweden, in the vast and distant provinces of the Russian empire, and also in America. The result of his investigations was the discovery and establishment of the Silurian system, which won for him the Copley Medal of the Royal Society, and European reputation as a geologist. His subsequent exposition of the Devonian, Permian, and Laurentian systems increased and confirmed his reputation. He explored several parts of Germany, Poland, and the Carpathians; and in 1840-45, with De Verneuil and others, carried out a geological survey of the Russian empire. Struck with the resemblance in geological structure between the Ural Mountains and the Australian chain, Murchison in 1844 first predicted the discovery of gold in Australia. He was president of the British Association in 1846,

and of the Royal Geographical Society in 1844-45, was re-elected in 1857, and continued to hold that post till 1870, when he was compelled to resign it by paralysis. Perhaps no contemporary did more to promote geographical science at home, and kindle the spirit of adventure among those engaged in Arctic exploration on the one hand and African discovery on the other. In 1855 he was made director-general of the Geological Survey and director of the Royal School of Mines. His investigations into the crystalline schists of the Highlands established a striking instance of regional metamorphism on a large scale. He was a vice-president of the Royal Society, and a foreign member of the French Academy, was knighted in 1846, and made a baronet in 1863. In 1870 he founded the chair of Geology in Edinburgh University. He died 22d October 1871. Most of his contributions to science appeared in the *Transactions* of the Geological and other Societies. His principal works were *The Silurian System* (1839); *The Geology of Russia in Europe and the Ural Mountains* (1845; 2d ed. 1853). See Life by Professor Arch. Geikie (1875).

Murcia, an ancient town of Spain, on the left bank of the Segura, by rail 46 miles SW. of Alicante and 50 N. by W. of Cartagena. It stands in the productive vale of Murcia, an old-fashioned Moorish town, embosomed in gardens of mulberry, orange, fig, palm, and other fruit trees. Almost the only notable buildings are the bishop's palace and the cathedral, this last begun in 1353, but reconstructed in 1521, and surmounted by a fine bell-tower. Silks, saltpetre, soda, gunpowder, musical instruments, and glass are manufactured; fruit-growing, the preparation of olive-oil, and the weaving of esparto also flourish. Pop. (1877) 91,805; (1887) 98,538. Alfonso X. of Castile took the city from the Moors in 1263; an earthquake almost destroyed it in 1829; and it was captured by the insurgents in 1843.—The province of Murcia has an area of 4478 sq. m. and pop. (1887) of 491,438. Along with the present province of Albacete it was an independent Arab kingdom for 27 years in the 13th century.

Murder is the unlawful and intentional killing of a human being by a human being. The most compendious statement of the distinctions drawn by the law of England between murder and manslaughter is given by Sir James Fitzjames Stephen in article 223 of his *Digest of the Criminal Law*. He says: 'Manslaughter is unlawful homicide without malice aforethought. Murder is unlawful homicide with malice aforethought. Malice aforethought means any one or more of the following states of mind preceding or co-existing with the act or omission by which death is caused, and it may exist when that act is unpremeditated: (a) an intention to cause the death of, or grievous bodily harm to, any person, whether such person is the person actually killed or not; (b) knowledge that the act which causes death will probably cause the death of, or grievous bodily harm to, some person, whether such person is the person actually killed or not, although such knowledge is accompanied by indifference whether death or grievous bodily harm is caused or not, or by a wish that it may not be caused; (c) an intent to commit any felony whatever; or (d) an intent to oppose by force any officer of justice on his way to, in, or returning from the execution of the duty of arresting, keeping in custody, or imprisoning any person whom he is lawfully entitled to arrest, keep in custody or imprison, or the duty of keeping the peace, or dispersing an unlawful assembly, provided that the offender has notice that the person killed is such an officer so employed.' If the act of killing is done in the heat of passion caused by provocation, it is not murder, but manslaughter.

The law presumes that every one who has killed another has murdered him, unless there are circumstances in the case to raise a contrary presumption. Murder is punished by death, manslaughter by penal servitude for life, or by a fine, according to the degree of culpability involved in the crime. The law of Scotland does not substantially differ from that laid down by Sir James Stephen, the chief distinction being that what in England is called manslaughter is in Scotland called culpable homicide. In the United States the only noteworthy distinction from the law of England is the recognition of different degrees of murder. An early act of the legislature of Pennsylvania distinguishes murder by poison or waylaying, or any other deliberate and premeditated killing, or murder committed in the furtherance of any arson, rape, robbery, or burglary, as murder of the first degree, and murder of all other kinds as murder of the second degree. The statute law of other states has similar provisions. In England and Wales during 1856-88 the maximum number of murders (as returned by coroner's inquests) in any one year was 272 in 1866, the minimum 153 in 1879. During that same period the minimum number of executions was 4 in 1871, the maximum 23 in 1875 and 1877. According to a paper in the *Journal of the Statistical Society* for 1885, the proportion of homicides of all kinds to population was in England and Wales 1 to 63,000, and in the United States 1 to 43,000. From differences in legal classification and administration, it is notoriously difficult to compare the frequency of murder in different countries. But an estimate has been made that, whereas in England there are 7.1 murders per 10,000 deaths, in Germany the proportion is 6.4 murders to 10,000, in France 8, in Austria 8.8, in Switzerland 13.8, in Spain 23.8, in Italy as many as 29.4 per 10,000 deaths. The arguments for and against the abolition of Capital Punishment (q.v.) have been discussed in a separate article; see also EXECUTION, BIRTH (CONCEALMENT OF), SUICIDE; and Holtzendorff, *Die Psychologie des Mordes* (1875).

Murdock, or MURDOCH, WILLIAM, inventor of gas for illuminating purposes, was born 25th August 1754, near Auchinleck, Ayrshire. His family traced their descent from some Flemish architects or engineers; and his father, a millwright and miller near Old Cumnock, designed the first iron-toothed gearing in Great Britain. Murdock worked under his father till he was twenty-three, then entered the employment of Boulton & Watt, Birmingham, and showed such marked ability that he was sent to Cornwall to superintend the erection of mining engines there. At Redruth he constructed in 1784 the model of a high-pressure engine to run on wheels. Watt showed some jealousy at these efforts; but Boulton offered him a reward for an engine capable of carrying two persons and the driver. His labours in Cornwall were arduous, though he had not more than £1 per week up till his forty-fourth year; and, a request for an increase of salary not being promptly acceded to, he made up his mind to change. The mining companies at last realising the value of his services, offered him £1000 a year as chief engineer at the mines. But he declined, returning to Boulton & Watt, who gave him a like salary as general manager of Soho Works. Murdock's inventive brain was never idle; he introduced labour-saving machinery, a new method of wheel rotation, and an oscillating engine (1785) of a pattern still in use. He also improved Watt's engine; introduced a method of casting steam cases for cylinders in one piece, instead of in segments; a rotatory and compressed-air engine; a steam gun; cast-iron cement; a method of heating

by circulating water through pipes; a method of sending messages through an exhausted air tube; and many other inventions. His investigations in the distillation of coal-gas began at Redruth in 1792, when he lighted his offices and cottages by its agency. He publicly showed the results in 1797 and in 1798, the premises at Soho being lighted with gas. But he did not reap due profit from this useful invention. Murdock read a paper on the *Economical Uses of the Gas from Coal* before the Royal Society in 1808. He died in 1839.

Mure, SIR WILLIAM, of Rowallan in Ayrshire, Scottish poet, was born in 1594, a nephew of the author of *The Cherrie and the Slae*. He was wounded at Marston Moor, and died about the end of 1657. He translated into English sapphics Boyd of Trochrig's Latin poem, *Hecatombe Christiana*, but his principal work is his *True Crucifixe for True Catholics* (Edin. 1629). His fine version of the Psalms dates from 1639. See Lyle's *Ancient Ballads and Songs* (1827).

Mure, WILLIAM, was born at Caldwell in Ayrshire in 1799, educated at Westminster and the universities of Edinburgh and Bonn, represented Renfrewshire 1846-55, was Lord Rector of Glasgow University 1847-48, and died in London, 1st April 1860. Colonel Mure was for many years commandant of the Renfrewshire militia. He was the author of *A Critical Account of the Language and Literature of Ancient Greece* (5 vols. 1850-57), a work of sound scholarship and great learning; he maintains the unity of the Homeric poems. Mure also wrote *Journal of a Tour in Greece* (1842) and a couple of treatises on Egyptian chronology.

Muret (MURETUS), MARC ANTOINE, a celebrated humanist, was born at Muret, near Limoges, 12th April 1526. In early life in France he read lectures on civil law with great success, but subsequently in Italy he seems to have devoted himself entirely to literature till 1576, when he took orders. He afterwards resided in Rome till his death, 4th June 1585. His well-known *Orations*, though shallow, are remarkable examples of elocution in the style of Cicero. His poems, Latin and French, though graceful and fluent, are now considered worthless; but his learned criticisms and commentaries, *Variae Lectiones*, in 5 books, are held in great estimation. There are editions of his works by Ruhnken (1789) and Frotscher (1834-41), and 2 vols. of *Scripta Selecta* (1871-73) by Frey. See also the monograph by Dejob (Paris, 1881).

Murex, a genus of marine Gasteropods in the same set as buckies, cone-shells, and cowries. The members prey upon other molluscs, boring by means of the usual rasper. The shells are fringed

Woodcock-shell (*Murex tenuispina*).

with numerous spines in a very quaint and beautiful fashion, to which some names, as 'Venus Comb,' obviously refer. Several species, especially *M. trunculus* and *M. brandaris*, used to be crushed to furnish the famous dye of Tyrian purple. A few species occur on British coasts.—For *Murexide* (Purpurate of Ammonia, or Roman Purple), see DYEING, Vol. IV. p. 139.

Murfreesborough, capital of Rutherford county, Tennessee, and from 1819 to 1826 capital of the state, is 33 miles by rail S.E. of Nashville, and has several mills and factories. Close by the bloody battle of Stone River was fought, 31st December 1862 and 2d January 1863, between Generals Rosecrans and Bragg; the Confederate army was compelled to retreat, but the losses on both sides were nearly equal—National forces, 9511; Confederates, 9236. Pop 3800.

Mürger, HENRI, novelist and poet, was born in Paris on March 24, 1822. He began life as a notary's clerk, and afterwards acted as secretary to Count Tolstoi, at a salary of about a pound a week. He gave himself to literature, and for several years led the life of privation and adventure which he has described in his *Scènes de la Vie de Bohème* (1845). At last his genius was recognised by Arsène Houssaye, the editor of the *Artiste*, and during his later years his popularity was secure. Every journal was open to him, but he wrote slowly and fitfully in the intervals of dissipation, and was never in easy circumstances. He died in the hospital in Paris on January 28, 1861. His first and best novel, *Scènes de la Vie de Bohème*, is, says Mr Saintsbury, a work final and perfect, which deserves a place in the literature of humanity. A vivid transcript from the scenes, alternately sombre and jovial, of the writer's years of struggle, it is in parts infinitely pathetic, in parts irresistibly amusing. Mürger had a rich gift of humour, but his predominant tone is one of poignant melancholy. *Le Manchon de Francine* is one of the saddest, as it is one of the most beautiful, short stories ever penned. He had uncommon literary skill, and could portray certain types of character admirably. But he had only one subject which he could handle successfully—the Bohemia of literary Paris. Next to the *Scènes de la Vie de Bohème*, his best prose works are *Scènes de la Vie de Jeunesse*, *Les Buveurs d'Eau*, and the short tales included in the volume entitled *Madame Olympe*. His poems, *Les Nuits d'Hiver*, are graceful, sincere, and often deeply pathetic, bearing strong traces of the influence of Musset. One of them, *La Chanson de Musette*, is a lyric masterpiece—'a tear,' said Gautier, 'which has become a pearl of poetry.' Several of Mürger's pieces have been translated with rare felicity by Mr Andrew Lang in his *Lays of Old France*. Mürger was likewise the author of *Le Dernier Rendezvous*, *Scènes de Campagne*, *Le Pays Latin*, *Le Sabot Rouge*, *Les Vacances de Camille*, &c.

See the notices of Mürger by Gautier, Houssaye, Janin, and Saint-Victor in *Les Nuits d'Hiver* (1862).

Murghab, a river that rises in the mountains north-east of Herat in Afghanistan, flows north-west, and loses itself in the desert of Turkestan beyond Merv.

Muriatic Acid. See HYDROCHLORIC ACID.

Muridae, a family of rodent quadrupeds, containing many genera and a very large number of species, distributed over all parts of the world, and of which rats and mice may be regarded as typical examples. To this family belong also voles, lemmings, dormice, jerboas, marmots, &c.

Murillo, BARTOLOMÉ ESTEBAN, was born of humble parentage at Seville, and baptised January 1, 1618; and, after receiving some education, was placed with his relative, Juan del Castillo, to study painting. Having saved a little money, which he made by painting somewhat stiff and rough religious pictures for the fairs of Seville and for exportation to South America, he went to Madrid in 1641, being then in his twenty-fourth year; was favourably noticed by his celebrated townsman Velasquez; and through his influence was enabled to study the *chefs-d'œuvre* of Italian

and Flemish art in the royal collections. In 1645 he determined to return to Seville, though advised to proceed to Rome by Velasquez, who offered him letters from the king. After settling in Seville, he painted eleven large and remarkable pictures for the convent of San Francisco. He at once became famous, and, receiving numerous important commissions, was soon acknowledged as the head of the school there. In 1648 Murillo married a lady of fortune; he now maintained a handsome establishment, and his house was the resort of people of taste and fashion. About this time he passed from his first or 'cold' style—dark with decided outlines—to his second or 'warm' style, in which the drawing is softer and the colour improved. Of the second style good examples are 'St Leander,' the 'Nativity of the Virgin,' and 'St Antony of Padua.' In 1656 he was engaged on four great semicircular pictures, which are the first examples of his third or 'vaporous' manner, the outlines vanishing in a misty blending of light and shade. The three styles, it should be said, are not strictly chronological, the warm style constantly reappearing. The Academy of Seville was founded by him in 1660, but he filled the office of president only during the first year. After this came Murillo's most brilliant period; eight of the eleven pictures painted in 1661-74 for the almshouse of St Jorge, including 'Moses striking the Rock,' 'Abraham and the Angels,' 'The Miracle of the Loaves and Fishes,' 'St Peter released from Prison,' and 'St Elizabeth,' are accounted his masterpieces. He executed some twenty pieces for the Capuchin Convent after 1675. He frequently chose the Immaculate Conception or Assumption of the Virgin as a subject, and treated them much alike; the famous 'Conception' now in the Louvre was sold in 1852 at the sale of Marshal Soult's pictures for £24,000. In 1681 he went to Cadiz, and while there fell from a scaffold when painting an altarpiece in the church of the Capuchins, returned to Seville, and soon after died from the injury he received, April 3, 1682. Murillo's pictures naturally fall into two great groups—scenes from low life, Gypsies and beggar children (mostly executed early in his life), and scripture and religious works. Of the former, by which he is largely known abroad, very few are to be seen in Spain. Though his best pictures show much technical skill, truth to nature, and sentiment of a kind, they seldom show ideal beauty or sublimity of feeling.

See Miss E. E. Minor's *Murillo* ('Great Artists' series, 1882), and C. B. Curtis' *Velasquez and Murillo* (1883), the latter giving a list of 481 pictures by Murillo—105 in London, 99 elsewhere in England, 61 in Madrid, 59 in Seville, 21 in Paris, 24 in Russia, &c.

Murphy, ARTHUR, dramatic and miscellaneous writer, was born in Roscommon, Ireland, in 1727. Intended by his father for business, he was placed in a London bank, but having, during his education at the college at St Omer, in France, made extraordinary proficiency in Greek and Latin, he contracted literary and dramatic tastes. In 1752-74 he published the *Gray's Inn Journal*, a weekly paper which obtained him the acquaintance of Dr Johnson. Being disappointed of some expectations and already in debt, he went on the stage, and made his first appearance as Othello. In one season he paid his debts, and then left the stage with £400 in his pocket; and, determining to study law, he entered Lincoln's Inn in 1757. In 1758 he produced his first play, *The Upholsterer*, a successful farce; in 1762 he was called to the bar, but with so poor a result that in 1788 he retired. He continued to write comedies and other plays for the stage, and is said to have produced more stock pieces than any man of his time. His translation of Tacitus (1793) is excellent; but his *Essay on*

Johnson and Life of Garrick did not add to his fame. His dramatic works fill 8 vols. Late in life he became a Commissioner of Bankrupts, and enjoyed a pension of £200 a year. He died in 1805. See his *Life* by Jesse Foot (1811).

Murrain is the generic term loosely used to designate a variety of diseases of domestic animals, but more generally restricted to the vesicular epizootic, popularly known as the foot-and-mouth disease. It is a contagious, infectious eruptive fever, affecting cattle, sheep, pigs, and poultry; but is rarely communicable to horses or men. It is characterised by the appearance of little bladders or vesicles in the mouth, on the lips, gums, and tongue, on the coronets and interdigital spaces of the feet, causing inability to eat, drivelling of saliva, sometimes heat and swelling of the udder, and lameness. The disorder runs a fixed and definite course usually in eight or ten days. Good nursing, comfortable lodgings, and a liberal supply of soft, easily digestible food, are the chief requisites for speedy recovery. A laxative may be given if needed. The mouth may be washed out twice daily with a mild astringent solution, which may be made with half an ounce of alum, oxide of zinc, or sugar of lead, to the quart of water. When the udder in milch cows, in which the complaint is usually most serious, is affected, it should be bathed with tepid water before and after milking, which must be attended to very regularly, the feet kept clean, loose horn removed, and washed occasionally with the lotion used for the mouth. See also ANTHRAX, CATTLE-PLAGUE, PLEURO-PNEUMONIA.

Murray, ALEXANDER, philologist, was born the son of a shepherd at Dunkitterick in Urr parish, Kirkcudbright, 22d October 1775, and had hardly any education save what his father could impart, till 1788, when he was at school for a short time. Yet by diligent and omnivorous reading of all such books as fell in his way or could be borrowed, he, when engaged as a shepherd, acquired, besides a scholarly knowledge of English literature, a mastery of the classics, all the principal European tongues, and Hebrew. The fame of the learned shepherd led to an invitation to Edinburgh, where he obtained a bursary, gave private lessons, and continued his linguistic labours, which were extended to oriental tongues and ancient and modern Abyssinian. In 1806 he became minister of Urr, in 1812 professor of Oriental Languages in Edinburgh University; but he died 15th April 1813. His *History of the European Languages* was published in 1823.

Murray, DAVID CHRISTIE, novelist, was born 13th April 1847, at West Bromwich, in Staffordshire, and had served as reporter and then as war-correspondent (1877-78) for several newspapers, when in 1879 he published *A Life's Atonement* in 'Chambers's Journal.' In the same journal appeared *Val Strange* and *John Vale's Guardian*. Other works are *By the Gate of the Sea*, *The Way of the World*, *Aunt Rachel*, *Old Blazer's Hero*, *The Weaker Vessel*, *A Dangerous Catpaw*, &c. In 1889 he visited Australia and went on the stage.

Murray, EUSTACE CLARE GRENVILLE, the 'Roving Englishman,' was born 2d October 1819, the natural son of the second Duke of Buckingham. After studying at Oxford, he served till 1849 in the Austrian army; in 1851 joined the British embassy at Vienna as attaché; in 1853-54 went on a special mission to the islands in the Ægean Sea; in 1857 was attaché at Teheran; and in the next year consul-general at Odessa. For exposing in the public press in 1866 certain abuses connected with the foreign office he was dismissed the service. He spent the rest of his life in Paris, and died at Passy, on 20th December 1881. As a journalist he is best known for his

brilliant papers in the *Daily News* and *Pall Mall Gazette*, and as an author by *The Roving Englishman* (1854-55), *Embassies and Foreign Courts* (1855), *History of the French Press* (1874), *Men of the Second Empire, &c.* (1872-74), and a few brilliant novels. Of the last, *The Member for Paris* (1871) is the cleverest, but *Young Brown* (1874), from the circumstances of its hero's birth, has the most interest.

Murray, JAMES A. H., philologist, was born at Denholm, Roxburghshire, in 1837, received his elementary education at Minto school, removed to Hawick, and was appointed assistant-teacher in the parish school there, and afterwards master of a subscription academy. He next removed to London, filling the post of foreign correspondent in the Oriental Bank for some years; he afterwards became senior assistant-master at Mill Hill school. Dr Murray has been twice president of the Philological Society (1879-80), is a graduate of London University, and LL.D. of Edinburgh University. His work on the *Dialects of the Southern Counties of Scotland* (1873) established his reputation as a philologist. He is familiar with almost all the European languages and a large number of oriental tongues. The great work of his life, the editorship of the Philological Society's New English Dictionary, issued by the Clarendon Press, was begun while at Mill Hill (1879), an iron building in his garden there being utilised for the assortment of the two tons of material to which he fell heir from his predecessors in the editorship, Herbert Coleridge and Dr Furnivall. This work has been continued at Oxford, where Dr Murray has, with a staff of assistants, devoted his whole attention to the task. Dr Murray has fought his way to the front rank as an authority in the history and derivation of words, and his great English Dictionary is the most thorough and important work of the kind ever undertaken in Britain. A civil list pension of £270 per annum was conferred upon him in 1884.

Murray, JOHN, the name of four generations of English publishers, will for ever remain associated with the palmiest days of English literature in the 18th and 19th centuries. The founder of the house, John M'Murray, was born in Edinburgh in 1745. He obtained a commission in the Royal Marines in 1762, and in 1768 was still second-lieutenant, when, disgusted with the slowness of promotion, he purchased the bookselling business of Paul Sandby, 32 Fleet Street, London, and, dropping the Scottish prefix, became a bookseller and publisher. He brought out the *English Review*, and published the first two volumes of the elder Disraeli's *Curiosities of Literature, &c.* He died November 16, 1793, and was succeeded in due time by his son JOHN (born November 27, 1778), a minor of fifteen at his father's death, who was for a short time associated as partner with his father's shopman, Mr Highley. One of the earliest hits of John the second was Mrs Rundell's *Cookery-book*, of which over 300,000 copies were sold. He became connected with Mr Stratford Canning, afterwards Lord Stratford de Redcliffe, through the assistance he lent him and other Etonians with their publication of *The Miniature*. In 1808-9 he projected the *Quarterly Review*, a Tory organ, in opposition to the Whig *Edinburgh Review*; his first step being to obtain Canning's countenance. A severe criticism of Scott's *Marmion* in the *Edinburgh Review* suggested to Murray a visit to Scott; he secured his co-operation, as also that of Heber, Canning, George Ellis, and Sir John Barrow. The first number was published February 1, 1809, under the editorship of William Gifford. The new periodical was completely successful, attaining a

circulation of 18,000 copies, and brought Murray into communication not only with the chief literati, but also with the Conservative statesmen of the time. A still more fortunate connection was that with Lord Byron (1810), whom he offered £600 for the first two cantos of *Childe Harold* (published 1812). Murray now removed from Fleet Street to Albemarle Street, where the business is still carried on. Here Byron and Scott first met, and here Southey made the acquaintance of Crabbe. Almost all the literary magnates of the day were 'four o'clock visitors' in Albemarle Street—wits and bards; Crabbes, Campbells, Crokers, Freres, and Wards. Murray paid Byron nearly £20,000 for his works, and his dealings with Crabbe, Moore, Campbell, and Irving were princely. He had at one time dealings with Constable and Ballantyne, but never approved of their methods of business. Hearing that Byron was in difficulties in 1815, he sent him a cheque for £1500, promised another for the same amount, and even offered to sell the copyright of his works on his behalf if necessary. (As to Byron's autobiography, see BYRON, Vol. II. p. 598). Perhaps his only unsuccessful venture was the *Representative* (1826) newspaper; his 'Family Library' was begun in 1829, and he issued the travels of Mungo Park, Belzoni, Parry, Franklin, and others. The second John Murray died in his sixty-fifth year, June 27, 1843, and was succeeded by his son, JOHN MURRAY the third, born in 1808, and educated at the Charterhouse and at Edinburgh University. A more practical and realistic age had succeeded that of Byron, and the 'Home and Colonial Library' was the precursor of much of the cheap railway and other literature of the present day. Many of the greatest works in history, biography, travel, art, and science have been issued by the third Murray. Among his successes may be mentioned Dr Livingstone's *Travels and Last Journals*, Smiles's *Life of George Stephenson*, *Self-help*, of which more than 150,000 have been sold, Darwin's works, Dr Smith's dictionaries, and the well-known *Handbooks for Travellers* (begun 1836; see GUIDEBOOKS), of the first five of which he was author, and all of which owe much to his superintendence. His son, the fourth JOHN MURRAY, is now a member of the firm. See S. Smiles, *A Publisher and His Friends* (1891).

Murray, JOHN (1741-1815), was the founder of Universalism (q.v.) in America.

Murray, LINDLEY, grammarian, was born at Svetara, Lancaster county, Pennsylvania, in 1745, the eldest of twelve children, and was educated at a school in Philadelphia belonging to the Society of Friends. On his father's removal to New York he was placed in a counting-house, but his thirst for study was so ardent that he escaped to a school in New Jersey. He then studied law, and was admitted to the bar at the age of twenty-one, and commenced a good practice. During the revolutionary war he engaged in mercantile pursuits with such success as to accumulate a handsome fortune. In 1767, his health failing, he came to England and purchased the estate of Holdgate, near York, where he devoted himself to literary pursuits. In 1787 he published his *Power of Religion on the Mind*, which passed through nineteen editions, and was translated into French. His *Grammar of the English Language* was issued in 1795, and was followed by *English Exercises*, the *Key*, the *English Reader*, *Introduction and Sequel* (both translated into French), a *Spelling Book*, *A First Book for Children*, *A Compendium of Faith and Practice*, and *The Duty and Benefit of a Daily Perusal of the Scriptures*. The lesson-books all passed through numerous large editions, and there can be no stronger indication of how entirely the

systematic study of the English language had been, until recent years, neglected by scholars than the fact that Murray's Grammar was for half a century the standard text-book throughout Britain and America. Murray wrote an autobiography to the year 1809, which was published after his death, February 16, 1826.

Murray, THE REGENT. See MORAY.

Murray River, the principal river of Australia. It rises in the Australian Alps, flows north-west along the frontiers of New South Wales and Victoria, and in South Australia passes southward through the shallow Lake Alexandrina towards the sea at Encounter Bay. In its 1120 miles' length it drains 270,000 sq. m.; it is navigable for small steamers as far as Albury, 190 miles N.E. of Melbourne, but its mouth cannot be entered by ships of any size. The chief tributaries are the Lachlan and Murrumbidgee and the Darling (q.v.), themselves large rivers. See also AUSTRALIA, NEW SOUTH WALES, VICTORIA.

Murshidabad, a town of India, situated on the left bank of the Bhagirathi, a branch of the Ganges, 124 miles N. of Calcutta. During the 18th century it was the capital of Bengal and a very populous city; but about the time (1790) the British made Calcutta their headquarters Murshidabad began to decline. In 1881 its population was only 39,231. The chief buildings of note are the palace of the Nawab (1837), the miāmbara, and a Mohammedan mosque. Two miles south of the city is Motijhil or Pearl Lake; on its bank stood the palace of Suraj-ud-Dowlah, in which Clive enthroned Mir Jafar, and the English Residents—Warren Hastings the first—dwelt. On the opposite side of the river is the old cemetery of the Nawabs, containing a mausoleum, mosque, &c. The city is noted for its ivory-carving, its embroidery in gold and silver lace, silk-weaving, and the manufacture of hookah pipes and musical instruments. It is moreover a busy centre of trade. The district has an area of 2144 sq. m. and a pop. of 1,226,790.

Murten, battle. See MORAT.

Murviedro, a town of Spain, 18 miles NNE. of Valencia, stands on the site of the ancient Saguntum, a Greek colony, the siege of which by Hannibal (q.v.) was the beginning of the second Punic war. Pop. 6287.

Murzuk. See FEZZAN.

Musaceæ, a natural order comprising the largest of herbaceous plants, generally destitute or almost destitute of true stems, yet resembling trees in appearance, and sometimes rivalling palms in stateliness, the long sheathing bases of the leaf-stalks combining to form a false stem. The blade of the leaf has many fine parallel veins proceeding from the mid-rib to the margin. The flowers are congregated on spadices, which are protected by spathe. The fruit is either a 3-valved capsule or fleshy. The species are not numerous; they are natives of warm climates, in which they are widely distributed, and are of great value to the inhabitants of tropical countries; the fruit of some, particularly of the genus *Musa*, being much used for food, whilst the fibres of the leaves are employed for cordage and for textile purposes (see BANANA, ABACA, FIBROUS SUBSTANCES). A very interesting plant of the order Musaceæ is the Traveller's Tree (q.v.) of Madagascar.

Musæus, one of the ancient mythical poets, seers, and priests of the Greeks, is said to have been the son of Eumolpus and Selene, or, according to others, the son and pupil of Orpheus. He was the reputed author of a number of poems, oracles, purificatory verses, hymns, &c., of which

we possess but a few fragments, and those of doubtful authenticity.—A later Musæus, who flourished about the end of the 5th century, was the author of a beautiful little poem in Greek, entitled *Hero and Leander* (ed. by Aldus Manutius c. 1494; by Diltley, Bonn, 1874). See HERO.

Musa Ibn Nosair (born 640), the Arab conqueror of northern Africa (699-709) and of Spain (712), fell under the displeasure of the Calif of Damascus, and died in poverty in Hedjaz in 717.

Musæus, JOHANN KARL AUGUST, a German writer, born on 29th March 1735, at Jena, where he studied theology. In 1763 he was appointed tutor to the pages at the ducal court of Weimar, and in 1770 became professor at the gymnasium. His first production in 1760 was a parody of Richardson's *Sir Charles Grandison*, a book at that time extravagantly admired in Germany. Eighteen years later he satirised Lavater in *Physiognomische Reisen*. But his literary fame rests upon his version of *Volkmärchen der Deutschen*, which professed to be a collection of popular tales noted down from the lips of old people; but such is not exactly the case: their chief note is an artificial naïveté. Nevertheless, they are tinged with such a blending of satirical humour, quaint fancy, and graceful writing that they have become a classic of their kind. He continued to work the satirical vein in *Freund Heins Erscheinungen in Holbeins Manier* (1785), and began a course of tales, *Straussfedern* (1787), which he did not live to complete, dying at Weimar, 28th October 1787. See Life by M. Müller (1867) and Ad. Stern in *Allgemeine Zeitung* (1887).

Muscæ Volitantes is the term applied to ocular spectra, which appear like flies on the wing, or floating black spots before the eyes. There are two kinds of muscæ volitantes—the one a perfectly harmless kind, while the other is symptomatic of serious disease of the eyes. Whoever will look through a minute pin-hole in a card at the clear sky may see floating before his sight a number of translucent tubes or fibres, and many little beads, of which some are separate, some attached to the tubes, and some apparently within them. Some of the tubes or fibres are straight, others looped or twisted, and others again forked. All these objects are bright in the middle, and bounded by fine black lines, beyond and parallel to which may be seen an appearance of coloured lines or fringes. The doublings and crossings of the loops or knots in the twisted fibres appear as black points. Though the eye be fixed, these bodies change their position with greater or less rapidity. These appearances are produced by the shadows of minute corpuscles and fibres present in the vitreous humour. They are not generally noticed under ordinary conditions; but some persons, especially those who have small pupils or who are short-sighted, readily see them, especially on looking at a bright surface, such as a white cloud or a brightly-illuminated sheet of paper. If attended to and watched they become more prominent, and may cause a good deal of annoyance. When they become visible and troublesome under ordinary conditions they generally indicate some defective state of health, particularly of the digestive organs. The appearance of dark spots before the eyes not answering to the above description generally points to the existence of a diseased condition of the deeper parts of the eye, vitreous humour, retina or choroid: and as these, or the morbid conditions causing them, are almost always visible with the ophthalmoscope, the eyes should be thoroughly examined in any doubtful case (see EYE, OPHTHALMOSCOPE). For further information on the differences between the innocent and the dangerous

forms of muscæ volitantes, the reader is referred to an article by Sir David Brewster in the *North British Review* for November 1856.

Muscardine, or SILKWORM ROT (*Botrytis Bassiana*), so called from the Italian physician Bassi, who first proved its true nature in 1836, is a mould doubtless belonging to the Discomycetes (since its congener *B. cinerea* has been shown to be the spore-bearing phase of *Peziza Fückeliana*). It was first observed on the silkworm in Piedmont and France in the later part of the 18th century, and was frequently epidemic during the first half of the 19th, but has since been practically stamped out. De Bary has shown that it occurs not unfrequently upon a variety of insects.

Muscat, or more correctly MASKAT, capital of the independent state of Oman or Muscat, which occupies the eastern continuation of Arabia. It stands in a narrow rocky cove that opens out to the Indian Ocean on the one side and on the other forms the exit of a pass leading from the interior of Arabia. It is surrounded by a wall, and defended by forts planted on the rocky heights above. Its streets are narrow and not over clean; in summer the heat is intense; hence Muscat is not a healthy place. Yet the advantages of its situation make it of great importance for the commerce between eastern Arabia, Persia, India, the west coast of Africa, and the Red Sea. Its total trade reaches the value of £1,100,000 annually, the chief exports being pearls and fish, in which its coastal waters are extraordinarily rich, and salt, dates, drugs, dyestuff, horses, and the imports chiefly coffee, rice, sugar, piece-goods, oil, &c. Pop. about 20,000. Although a very ancient place, Muscat remained small and of little importance until the Portuguese took possession of it in 1508. Under their rule, lasting exactly a century and a half, it developed into a prosperous commercial centre. It was subsequently governed by native rulers (*imams*), who in the 17th century succeeded the Portuguese also as masters of Zanzibar and some places on the east coast of Africa. These African possessions were, however, wrested from the reigning imam of Muscat by an illegitimate son in 1856.

Muscateel (Ital. *moscado*, 'musk'), the name given to many sweet, strong French and Italian wines, whether white or red. Amongst the finest are the white Rivesaltes and red Bagnol from Ronsillon, and the Lunel from the Pyrenees, the Lacrymæ Christi of Naples, &c. Fine varieties are yielded by Syracuse, Sardinia, the Cape, Canary Islands, Corfu, Crete, and Cyprus.

Muscatine, capital of Muscatine county, Iowa, is on the west bank of the Mississippi, built mostly on rocky bluffs, where the river makes a great bend to the south, 211 miles by rail WSW. of Chicago. It has a large trade by river and rail, and contains great pork-packing establishments, as well as flour and lumber mills, and plough and furniture factories. Pop. (1885) 10,389; (1890) 11,454.

Muschelkalk (Ger., 'shell-lime'), the middle member of the Triassic system as developed in Germany. It is wanting in Britain. The muschelkalk consists chiefly of limestone—the series attaining a thickness of 550 to 1100 feet. The upper portion is more or less pure limestone and highly fossiliferous; the middle and lower portions consist mostly of dolomitic limestone, with which are associated rock-salt, gypsum, and anhydrite. One of the most abundant and characteristic fossils of the muschelkalk is the lily encrinure (*Encrinurus liliiformis*). See TRIASSIC SYSTEM.

Muscle, the fleshy parts of an animal. Muscular tissue is specially distinguished by its power of contracting in one direction, and is

the instrument by which all the sensible movements of the animal body are performed. When examined under a high magnifying power the fibres of which it is composed are found to exist under two forms, which can be distinguished from one another by the presence or absence of very close and minute transverse bars or stripes. The fibres of the *voluntary* muscles—those whose movements can be influenced by nerve impulses originated by the will—as well as the fibres of the heart, are *striped*; while those of the *involuntary* muscles, such as the muscular fibres of the intestinal canal, of Blood-vessels (q.v.), and in skin, are *unstriped*.

On examining an ordinary voluntary muscle with the naked eye, we observe that it presents a fibrous appearance, and that the fibres are arranged with great regularity in the direction in which the muscle is to act or contract. On closer examination

Fig. 1.—Attachment of Tendon to Muscular Fibre in the Skate.

it is found that these fibres are arranged in *fasciculi*, or bundles of various sizes, enclosed in sheaths of areolar tissue, by which they are at the same time connected with and isolated from those adjoining them; and when the smallest *fasciculus* visible to the naked eye is examined

with the microscope it is seen to consist of a number of cylindrical fibres lying in a parallel direction, and closely bound together. These fibres may end in blunt extremities or be forked as in the lips, or branched as in the tongue. Each fibre consists of an elastic homogeneous sheath—the *sarcolemma* (Gr. *sarz*, 'flesh,' and *lemma*, 'a skin or husk'), which contains a contractile semi-fluid material. This substance shows transverse striæ at regular intervals, as well as longitudinal striæ. Dilute mineral acids cause the fibre to cleave crosswise into discs. When

Fig. 2.—Sarcolemma of Mammalian Muscle.

Fig. 3.—Muscular Fibre of Frog's Tongue—mag. 200 diameters (after Kölliker).

Fig. 4.—Portion of Human Muscular Fibre—mag. 600 diameters.

highly magnified the transverse striæ resolve them-

selves into (1) a thin dim disc whose edges appear to adhere to the sarcolemma, (2) a clear space, (3) a broad dim disc, (4) a clear space like 2, (5) another disc like 1, &c.

Nerve fibres pierce the sarcolemma, and end upon the contractile substance (see NERVOUS SYSTEM). No blood-vessels penetrate the sarcolemma; they merely lie in the intervals between the fibres. Through the medium of tendon or aponeurosis the muscular fibres are attached to the parts which they are intended to move. Aggregated in parallel series, of greater or lesser size, and associated with nerves, vessels, tendinous structures, &c., they form the various muscles, which are for the most part solid and elongated, but are sometimes expanded (as in the diaphragm) into a membranous shape. In the human subject voluntary muscles are red, and although pale fibres are scattered through many of them, still nothing is ever seen to correspond with what may be found in the muscles of the rabbit. The colour is due to a substance closely akin to the blood-pigment. Each muscle has a middle portion or *belly* and two extremities which are attached. When the belly contracts it acts in a straight line, and drags equally on both extremities; but, as one is more fixed than the other, the force is spent in bringing the movable attachment nearer to the fixed one, and thus the fixed end is named the *origin*, the movable end the *insertion*. Muscles are usually grouped around joints, and attached to bone.

The *involuntary* or *unstriated* muscular tissue most commonly occurs in the shape of flattened bands of considerable length, but of a width not exceeding $\frac{1}{1000}$ th or $\frac{1}{2000}$ th of an inch. Their substance presents fine longitudinal markings, and each cell possesses an elongated nucleus, towards each end of which a few fine granules are found. Kölliker has shown that every one of these bands or fibres is either a single elongated cell (a fibre-cell) or is a fasciculus of such cells (see CELL). These fibres have not usually fixed points of attachment like the striated fibres, but form continuous investments around cavities within the body, such as the intestinal canal, the blood-vessels; or are dispersed through the substance of tissues, such as the skin, to which they impart a contractile property.

Cardiac muscle, although involuntary, differs in a remarkable manner from the fibres just described. It consists of quadrangular cells, which are often branched at their ends. Each cell has a clear oval nucleus near its centre, and the cells present transverse striae not so distinct and less regular than those of voluntary muscle. Hitherto these cardiac fibres have not been shown to possess a sarcolemma.

The chemical composition of ordinary or voluntary muscle is described at FLESH. The fibrillæ, or the sarcous elements of which they are composed, consist of a substance termed Syntonin (q.v.), which closely resembles the fibrine or coagulating constituent of the blood; and the same syntonin is also the main constituent of the unstriated muscles, or at all events of their fibre-cells. Like the blood-fibrine, it exists in a fluid form in the living tissue, and only coagulates or solidifies after death.

Muscles vary extremely in their form. In the limbs they are usually of considerable length, surrounding the bones and forming an important protection to the joints; while in the trunk they are flattened and broad, and contribute very essentially to form the walls of the cavities which they enclose. Muscles derive their names variously (1) from their situation—as the temporal, pectorals, glutæals; or (2) from their direction—as the rectus, obliquus, &c., of which there may be several pairs—as, for example, rectus femoris, rectus capitis; or (3) from their uses—as the masseter, the various flexors, extensors; or (4) from their shape—as the deltoid, trapezius, rhomboid; or (5) from the number of their divisions—as the biceps and triceps; or (6) from their points of attachment—as the sterno-cleido-mastoid, the sterno-thyroid.

The skeleton, which may be termed the locomotive framework, may be regarded as a series of levers, of which the fulcrum is, for the most part, in a joint—viz. at one extremity of a bone—the resistance (or weight) at the further end, and the force (or muscle) in the intermediate portion. In most cases, in order to preserve the necessary form of the body, muscles are applied at a great mechanical disadvantage as regards the exercise of their power; that is to say, a much larger force is employed than would suffice, if differently applied, to overcome the resistance. The two main sources of this disadvantage

lie in the obliquity of the insertion, and consequently of the action of most muscles, and in the muscles being usually inserted very near the fulcrum. The first of these disadvantages is in many cases diminished by the enlargements of the bones at the joints. See fig. 8, A.

The tendons (*t*) of the muscles (*m*) situated above the joint are usually inserted immediately below the bony enlargement, and thus reach the bone that is to be moved (*o*) in a direction somewhat approaching the perpendicular. If this enlargement did not exist (as in fig. 8, B), the contraction of the muscle, instead of causing the lower bone to turn upon the upper one with comparatively little loss of power, would do little more than cause the two ends of the bones to press upon each other. The second mechanical disadvantage is compensated for by gain in the extent and velocity of movement, and by the avoidance of the great inconvenience of having the muscles extended in straight lines between the ends of jointed continuous levers. Thus, the bones of the forearm (fig. 9, *b*, *c*) are bent upon the bone of the arm (*a*) by the biceps muscle (*d*), which arises close to the head of the latter, and is inserted at *e*, at a short distance from the elbow-joint, which acts as the fulcrum of the lever (*c*). By

Fig. 5. — Muscular Fibre-cells from the coat of the Small Intestine (after Quain): a, complete cell showing nucleus, intranuclear network and longitudinal fibrillation; b, cell broken in process of isolation.

Fig. 6. — Muscular Fibre-cells from Human Artery (after Kölliker): a, nucleus; c, cell treated with acetic acid.

Fig. 7. — Muscular Fibres from the Heart.

Fig. 8.

this arrangement a contraction of a single inch in the muscle moves the hand (*f*), in the same time, through the extent of about 12 inches, but then the hand moves through every inch with only about the twelfth part of the power exerted by the muscle. By the junction of two or more levers in one direction, as in the different segments of the extremities, the extent and velocity of their united actions are communicated to the extreme one.

Fig. 9.

Thus, a blow of the fist may be made to include the force of all the muscles engaged in extending the shoulder, elbow, and wrist.

The great and characteristic property of muscular tissue—that of shortening itself in a particular direction when stimulated—is called *contractility*. The stimulus may be direct irritation by mechanical means, or by galvanism, or by some chemical substance, but in the living body the muscular fibres are, in most cases, made to contract by the immediate influence of the nerves distributed among them, which are consequently termed *motor nerves* (see NERVOUS SYSTEM), and are under the influence of the will. By an exertion of volition, we can contract more or fewer muscles at once, and to any degree, within certain limits; and, as a matter of fact, there is hardly any ordinary movement performed in which several muscles are not called into play. But every voluntary muscle is also subject to other influences more powerful in their operation than the will. The movement of the features under the impulses of passion and emotion are more or less involuntary, as is shown by the very partial power the will has of restraining them, and the extreme difficulty of imitating them. Many movements ensue involuntarily when certain impressions, which need not necessarily be attended with consciousness, are made on the surface of the body, or on any part of its interior, either by external or internal causes. Such movements are termed *reflex*, and are noticed in the article NERVOUS SYSTEM. For various important groups of muscles, see ARM, EYE, FOOT, HAND, KNEE, LEG, &c.; and for the source of muscular force, see DIET, DIGESTION.

Muscovite. See MICA.

Muscovy. See RUSSIA.

Muses, in the Greek Mythology, divinities originally included amongst the Nymphs, but afterwards regarded as quite distinct from them. To them was ascribed the power of inspiring song, and poets and musicians were therefore regarded as their pupils and favourites. They were first honoured amongst the Thracians, and, as Pieria around Olympus was the original seat of that people, it came to be considered as the native country of the Muses, who were therefore called *Pierides*. In the earliest period their number was three, though Homer sometimes speaks of a single muse, and once, at least, alludes to nine. This last is the number given by Hesiod in his *Theogony*, who

also mentions their names—Clio, the muse of history; Euterpe, of lyric poetry; Thalia, of comedy; Melpomene, of tragedy; Terpsichore, of choral dance and song; Erato, of erotic poetry; Polyhymnia, of the sublime hymn; Urania, of astronomy; and Calliope, of epic poetry. Their origin is differently given, but the most widely-spread account represented them as the daughters of Zeus and Mnemosyne. Homer speaks of them as the goddesses of song, and as dwelling on the summit of Olympus. They are also often represented as the companions of Apollo, and as singing while he played upon the lyre at the banquets of the Immortals. Various legends ascribed to them victories in musical competitions, particularly over the Sirens. In the later classic times particular provinces were assigned to them in connection with different departments of literature, science, and the fine arts; but the invocations addressed to them appear to have been, as in the case of modern writers, merely formal imitations of the early poets. Their worship amongst the Romans was a mere imitation of the Greeks, and never became truly national or popular. Among the places sacred to them were the fountains of Aganippe and Hippocrene on Mount Helicon, and the Castalian spring on Mount Parnassus.

Museum (Gr. *mousetion*), originally the name given by the ancients to a temple of the Muses, and afterwards to a building devoted to science, learning, and the fine arts. The first museum of this kind was the celebrated Alexandrian Museum—a meeting-place for learned men and a library, founded about 280 B.C. in the palace. After the revival of learning in Europe the term museum came to be applied to collections of antiquities, and sculptures, and paintings. Collections illustrative of natural history and other sciences now form a chief part of the treasures of many of the greatest museums, and there are museums devoted to particular branches of science, and to illustrating the industrial arts. Of the museums of Britain, the British Museum (q.v.) and that of South Kensington (see KENSINGTON) are the most important. The museums of the Vatican in Rome, of the Louvre in Paris, of St Petersburg, Dresden, Vienna, Munich, and Berlin, and the National Museum at Washington also are among the greatest in the world. See the Address of the President of the British Association, 1889.

Musha Islands. See OBOK.

Mushroom, or AGARIC, the popular name of a somewhat diverse group of genera and species of fungi belonging to the sub-order Hymenomycetes, of the great class Cryptogams. The best known of the true mushrooms to English readers is the Common Mushroom (*Agaricus campestris*), and it is the type of the sub-order named. In Britain it is the most esteemed of its tribe, though little valued in countries where fungi more generally form an article of diet of the people; in Italy it is disapproved. It should be noted that some of the forms common to Europe and North America are esteemed in England, but found unpalatable in the United States. The Common Mushroom varies considerably in appearance according to soil and locality, but presents in all its variations the same essential characters. It has a fleshy head or *pileus*, smooth or scaly on the upper surface, varying in colour from white to different shades of tawny or fuliginous brown. The gills (*hymenium*) on the under side of the head are free, at first pallid, changing by gradations in age to pink, purple, and brown-black. The stem is white, varied in shape, full, firm, furnished towards the top with a white persistent ring. The Common Mushroom is widely

distributed in most of the temperate regions of both the northern and the southern hemispheres. In Britain it is abundant chiefly in autumn in pastures and orchards.—The Horse Mushroom (*A. arvensis*) is very frequently found growing in company with the Common Mushroom. It is altogether

Fig. 1.

1. Parasol Agaric (*Agaricus procerus*); a, young. 2. Orange-milked Agaric (*A. deliciosus*); b, young. 3. White Field Agaric (*A. virgineus*); c, young.

a coarser and larger form, and is less favoured for culinary purposes except in the making of ketchup. It often attains enormous dimensions; the top is generally smooth and snow-white, gills brownish white, ultimately with age becoming brown-black, stem pithy or hollow, with a ragged or floccose ring. This is the 'White-caps' Mushroom of some parts of England.—The true St George's Mushroom (*A. gambosus* of some, or *primulosus* of others), so called from appearing about St George's day (April 23), is sometimes confounded with the Common Mushroom. The head is thick and fleshy, at first convex, becoming undulated and irregular in outline, light yellow in colour in the centre, fading to opaque white at the edges, gills yellowish white, irregularly interposed, smaller and larger, overlying each other like the plaits of a frill; the stem is solid, white, when young bulging at the base, but in age either equal throughout or tapering to greater thickness above. The skin of this mushroom is soft and firm to the touch, and in appearance has been aptly described by Berkeley as resembling a cracknel biscuit. It is one of the most prized of the Agarics on the Continent, so much so in Rome that a dish of it is considered the most fitting present to any one whose good offices are to be propitiated.—The Fairy-ring Mushroom (*A. oreades*; *Marasmius oreades* of some), also the Champignon of the French, is common in pastures and in lawns in Britain, and in most parts of Europe. The head is small, smooth, fleshy, convex, having a boss (*umbo*) in the centre, tough, leathery, elastic, wrinkled; when soaked with water brown, when dry buff. The gills are free, distant, somewhat paler than the head; the stem equal in thickness, twisted, tough, fibrous, of a pale silky-white colour. This species is much esteemed by all who know it. Its flavour is extremely fine, and it is employed in the making of the best kinds of ketchup. On the Continent it is dried and used in the form of a powder to flavour various made dishes. Its peculiar mode of growing in circular patches or in rings, which procured for it its popular name, leads to the risk of an

allied but poisonous species which sometimes grows in the same manner being confounded with it. This is the False Champignon (*A.* or *Marasmius urens*), which is readily distinguished from the true Fairy-ring Mushroom by its having a flat top without any boss, and by its narrow gills being closely crowded together. The foregoing are the most commonly esteemed of edible British mushrooms. But there are a number of others which are not only wholesome but extremely delicate in flavour and nutritious. There is the Parasol Mushroom (*A. procerus*); the Maned Mushroom (*Coprinus comatus*), of which young specimens only should be used; the Red-fleshed Mushroom (*A. rubescens*); the Clouded Mushroom (*A. nebularis*), appearing late in autumn in moist places on the borders of woods; and the Orange-milk Mushroom (*Lactarius* or *A. deliciosus*). This last is much prized by connoisseurs in edible fungi on the Continent and in Britain. It has, as the name implies, orange-coloured milky sap in the head, and when broken or bruised both the flesh and the milk become green by exposure to the air. This is an

Fig. 2.

4. St George's Agaric (*Agaricus georgii*); d, young. 5. Common Mushroom (*A. campestris*); e, young. 6. Fairy-ring Mushroom (*A. oreades*); f, young. 7. *Clavaria phalloides*; g, young.

excellent test when there is any doubt as to the identity of this and an allied but virulently poisonous species—*L. torminosus*—in which both the flesh and the milk are white, and do not change colour when broken or bruised. Although many of the British fungi are wholesome and nutritious food, yet it is proper that the inexperienced in diagnosing them should be cautioned strongly against eating any species of the wholesome qualities of which they are not absolutely assured. In many continental cities inspectors are appointed to examine all fungi that are brought to market, lest deleterious species should perchance be sold to the people. Those who desire to acquire an accurate knowledge of edible British species of fungi may refer to Dr Badman's *Esulent Funguses* (1863), M. J. Berkeley's *Outlines of British Fungology* (1860), and other works cited at FUNGI.

The culture of the common mushroom for profit in Britain has since 1875 become an important branch of gardening industry. About London in particular it is entered into by market-gardeners and even by specialists who live and thrive solely by the production of mushrooms for the million. To a lesser extent the industry is also

being taken up in the vicinity of the larger provincial towns. In Paris the catacombs are utilised for the growing of mushrooms, as are caves in all parts of France; and in Edinburgh the disused Scotland Street tunnel was acquired in 1886 for the same purpose. The principles of the culture of mushrooms are very simple, though considerable attention and skill are required in working out the practical details. For these, see W. Robinson's *Mushroom Culture* (1880).

Music. European music is by no means a spontaneous expression of ideas and sentiments, and it is only in a poetical sense that we can talk of the 'music' or 'melody' made, for example, by birds. Music is an art, and in order to make an impression on our minds it must take as its foundation the succession of sounds embodied in the scales we have chosen, and to which we are accustomed; it must also conform to the rules which have become the canon of music. We must look for its birth in Egypt, but it would serve no purpose here to occupy any space with the little that is known of Egyptian, or its offspring Greek music.

It is not improbable that the Israelites took with them to Palestine some songs they had learned in Egypt; and that many of the hymns of the early Christian church were identical with Temple melodies. As from these hymns was formulated the first authoritative musical system, we may say that in a double sense we are indebted to Egypt for the beginning of the modern art. It was St Ambrose towards the close of the 4th century, and Gregory the Great two centuries afterwards,

Neume Notation of the Tenth Century.

who selected eight scales or 'modes' (the 'Gregorian') as proper for use in church music (see HARMONY), and till about 1600 A.D. the legitimate development of music was in the hands of the clergy. At first a rude system of dots and scratches (*neumes*) above the syllables in the Rubric served to indicate approximately when and how far the voice should be raised or lowered in pitch. This could only have been an aid to memory. The relative pitch of the notes was more definitely shown when a line of normal pitch was drawn through these neumes; and to this line was added three others in order to attain a more exact definition of intervals. The key or clef (*clavis*) was given to this stave of lines by a sign—usually C or F on the line which represented that note (C); sometimes F (f). Later the G (G) clef came into use, of which our treble or violin Clef (q.v.) is a corruption. With the idea of singing in parts instead of unison came the necessity for indicating the relative *duration* of notes as well as their pitch, and for this purpose different shapes were given to the [*Nota*] *Longa* (2)—the *Maxima*

(1) being twice as long—and to the *Brevis* (3) with its supplementary *Semibrevis* (4). A very short note was added—the *Minima* (5). When music came to be printed these signs were made open, and convenience in writing substituted the round form for the square or diamond. The semibreve (C) is now our longest note, although the breve is still to be met in church music, and in

the indication of the measure 'two semibreves to the bar' (*Alla Breve*). In order to avoid a certain false relation of sound called the *tritonus*, which the pious old theorists called 'the very devil' ('*Mi contra fa diabolus est in musica*'), some of the church modes used $\text{B}\flat$ instead of B. This was the only 'license' allowed, and was indicated by the 'B rotundum' (b) instead of the 'B quadratum' (b). These signs are the origin of our 'accidentals'—the flat (b), which lowers the pitch of a note one semitone, and the natural (♮), which restores it. The sharp (\sharp), which raises the pitch, is also a development of the 'B quadratum.' See also GUIDO ARETINUS.

Counterpoint (1400–1600 A.D.).—Such were the materials with which Johannes Ockenheim or Okeghem (c. 1420–1513) and Josquin des Prés (c. 1450–1521) laid the foundation of Counterpoint (*punctus contra punctum*, 'note against note'), the art of combining one or more melodic parts with a principal melody called the 'Canto Fermo,' or fixed song. Counterpoint was the workshop in which were made many of the best tools used by great musicians of modern times. The art attained its perfection under Orlando di Lasso and Palestrina at the end of the 16th century, just when a new departure by Monteverde became the inauguration of the new school of harmony which was to supersede the old contrapuntal school by assimilating all that was good therein. Other influences which helped to break the monopoly of church counterpoint were the growing popularity and secularity of Madrigals (q.v.), at first distinguishable only by their words from church music; the improvement in organ-building and organ-playing, which encouraged freer part-writing and bolder melodic progressions than the limitations of unsupported human voices allowed; and doubtless also the natural warmth of musical feeling which had found expression among the troubadours of France and the minnesingers of Germany, and in the rude popular songs of these early ages.

Florence Academy.—Most potent factor of all in this new birth of music was the invention (in 1594–1600) of recitative music and the introduction of the dramatic principle by the Florence Academy—a group of literati and artists who met in the house of Count Bardi, a Florentine nobleman. Their aim and ambition was to restore the ancient accompanied Greek play; and by making use of all the slender resources which harmony could then put at their disposal they stumbled, as it were by accident, on the form of recitative, or, as they called it, 'Stilo rappresentativo.' The development of opera and oratorio, with all the various forms of aria, &c., was a natural consequent, a particular account of which will be found under their proper headings.

Monteverde.—The great landmark which separates the old school of counterpoint from the new is the compositions of Monteverde, whose importance is explained in the article on Harmony. It was only gradually that the new heaven spread through the schools of Europe, and nearly one hundred years elapsed between the setting of Palestrina's sun and the appearance of the twin morning-stars of modern music—Bach and Handel. The time, however, was well occupied. In vocal music greater freedom in the use of established forms was gradually attained, and new forms were invented, chief among which was the Aria introduced by Alessandro Scarlatti (1659–1725). He first used the 'second part,' which, followed by a *da capo* or repetition of the first strain, summarised for vocal music the tendency which was dominating all musical development.

The French Grand Opera school, founded by the Florentine Lully (1633–87), studied the art of

expressing in sound the most fleeting emotions to be found even in the ever-varying turns of thought in an operatic recitative.

Of still more importance was the progress made during the century in instrumental music. A great impetus to solo-playing in particular, and execution in general, was given by the improvement in the manufacture of violins. The centre of this industry was Cremona, where the three famous families of Stradivarius, Guarnerius, and Amati worked for three generations. Some of their instruments are to-day literally worth more than their weight in gold.

Handel and Bach.—In 1685, on the 23d of February and 18th of March respectively, were born Handel in Halle and Bach in Eisenach. From 1710 till 1722 Handel devoted all his energies and genius to writing operas after the Italian school, and most of his works have shared the fate of their contemporaries and rivals. He was then led into the path of oratorio, and a brilliant succession of well-known compositions sheds an undying radiance on the last twenty years of his active life (see ORATORIO). Bach's influence has been wider and more far-reaching even than that of his great contemporary. Indeed, no less a critical authority than Schumann has declared that music owes as much to Bach as Christianity does to its founder. By virtue of his complete and easy command of all the resources of harmony and counterpoint, his boundless originality and fertility, the invariably high level of his compositions—even when judged by his own high standard—he takes a place above all ancient and modern composers. Under his influence also the German school of composition chose the path of instrumental music, in which the voice is only one of a large orchestra of instruments, entitled to no more consideration than its limits demand. The attempt in Gluck's operas to reconcile the requirements of expressive instrumentation and the demands of the vocal school was more successful in theory than in reality (see GLUCK), and the true central column of progress has moved up till now in Germany along instrumental lines in the hands of Bach, Mozart, Beethoven, Schumann, Wagner, and their contemporaries.

Sonata.—The most important form of instrumental music had hitherto been the Fugue (q.v.), and in its strait and heavy harness these giants of old moved with ease, grace, and dignity. But the age of monothematic work was already past, and the old dance forms (allemande, courante, sarabande, gavotte, gigue) did not readily lend themselves to the requirements of thematic development, so necessary to instrumental music as a conception distinct from music, to which words at once give inspiration and impose limitation. Corelli, A. and D. Scarlatti, Bach, and others each strove to solve the problem in his own way, and the sum of their influences was handed from Emmanuel Bach to the 'formulator of the modern sonata,' Joseph Haydn (1732-1809).

The name 'sonata' was first used in Italy for music which was only to be played or 'sounded,' contrasted with 'cantata,' which was to be sung. The particular form, however, gradually separated itself from all other instrumental music, and when generations of earnest musicians had lavished care, thought, and experience on its development it was accepted, and is accepted, as the form *par excellence*. In its mould are cast sonatas, symphonies, quartets, concertos, &c., and even the most romantic and daring of fantasias find it necessary to recognise its broad and accommodating principles. Haydn's sonatas are still very formal; so also are Mozart's, though he had more in common with the Romantic school of the next century than the elder composer. This is shown by a comparison of their symphonies.

Haydn's are beautiful and graceful, but the themes and subjects he chooses are never very deep, nor can they move the depths of the heart. He is most successful in his airy and humorous quick movements. In Mozart's symphonies a nobler and more romantic spirit breathes—sometimes with most intense passion, sometimes with a dignified melancholy. And so the way was prepared for the most powerful and the most widely honoured of all rulers in the realms of sound. In the works which are classed as his 'first period' Beethoven showed how he had studied and mastered the work of his great predecessors. In his second period he proceeded to build on the solid foundation that wonderful structure to which the vast conceptions of his third period form a fitting and glorious crown. Nothing important has been added to sonata form since Beethoven wrote the works between the *Eroica* and the Choral Symphonies (1803-23); and although much has since been written, much that is new, much that is original—although a ready appreciation is granted to the passion of Schumann, the romantic power of Schubert, the poetry of Chopin, the refined elegance of Mendelssohn, the successful use of new colour shown in later works by Brahms, Dvorák, Liszt, &c.—Beethoven's sonatas and symphonies still stand unrivalled, unchallenged.

Fantasia.—A desire for some more direct, more unfettered expression of feeling not unnaturally succeeded this long striving after adequate form. But, while all great composers devoted most of their genius to its development of perfect form, the growth of the fantasia was much neglected. Only when the greatest minds turned their attention for a moment from the more important aim was anything of lasting importance produced; and that because it is only the mind trained in the strict school of form to use all available resources which can wisely enjoy a liberty so easily converted into license. The earliest attempts in fantasia form were called 'toccatas' during the 17th century; and, notwithstanding excellent modern toccatas by Schumann, Rheinberger, and others, we may say that the history of the toccata was brought to a close by the magnificent specimens written early in the 18th century by J. S. Bach. The same composer left a freer model than the somewhat formal toccata in one of the most famous and successful fantasias in existence, and instrumental music has never attained nearer to the definiteness of articulate speech than in the great *Chromatic Fantasia*.

The strong romantic movement which naturally ensued after the perfecting of the classical school in Beethoven's hands eagerly followed out the path he so often and with such effect indicated in his works; and, although the name fantasia has lately fallen into much disrepute by reason of many unworthy and worthless compositions, it may recover its fair fame when Schumann's and Schubert's fantasias have survived their contemporaries. In any case the endless varieties of fantasia (i.e. unfettered) form, and their adoption in rhapsodies, symphonic poems, and the like, have proved as valuable and as potent a factor in modern romantic music as the various modifications they have effected in the classical sonata form (e.g. Liszt's concertos and sonatas). Schumann adopted some very curious whimsical or poetical names for his smaller compositions—nolette, humoreske, carnaval, &c.—and the idea has found great favour with many modern writers. The nocturne invented by the Irish pianist Field is more identified with Chopin's dreamy genius. The latter composer also transfused the waltz and the polonaise and mazurka of his own unhappy country with such an intensity of passion, such a chivalrous

nobility, and surrounded them with such a halo of poetry and romance that they are an important addition to the resources of a modern composer, and Chopin's name overshadows that of Schubert and Weber, earlier workers in the same field (*Deutsche Tänze, L'Invitation à la Valse*). The latest developments in instrumental music are intense nationality in colour and thought, as shown in the works of Grieg, Dvorák, Liszt, Mackenzie, and a new striving after more definiteness which was inaugurated by Berlioz.

Vocal Music.—The progress of vocal music from its first great triumph in 16th-century counterpoint was much slower and varied than that of instrumental. The reason of this is not hard to find; for the conception of vocal writing in the contrapuntal school was sound and artistic, and it reached a point of absolute perfection in that epoch called the 'Golden Age.' Thus there was not the necessity for that advance which ever improving instruments and the feeling for instrumental effects demanded. Indeed, in choral music exactly the same principles which formulated the rules of counterpoint in the 16th century, must be recognised by composers of to-day who wish to produce the purest and grandest effects; and the rules themselves have been rather extended in scope than relaxed in meaning by Bach, the most daring choral writer, and his successors. Where the letter of the law has been modified it has been so from within, and the spirit remains the same. It will be convenient here to treat of choral and solo vocal music, leaving the other obvious subdivisions of sacred and secular to be treated in the articles ORATORIO and OPERA.

Monody.—From the invention of part-singing till the end of the 16th century (i.e. during the course of its legitimate development in the church) vocal music was entirely choral. When a solo was required, the most melodious part was selected from a choral movement, with what must have been a most unsatisfactory and incomplete result. The first example of a piece conceived and written for one voice seems to have been *Ugolino*, a dramatic scena with viola accompaniment, written (1584) by Galilei (father of the philosopher), one of the Florence Academy. It was this invention of Monody which prepared the way for opera and made it possible. Unfortunately, the first writers in this new school, which aimed after expressive melody, were little proficient in the more solid art of counterpoint which they affected to despise; and this tendency consistently followed out has procured for Italian music its unenviable reputation of being gracefully melodious at the expense of depth and meaning. The rude recitatives of earlier composers became more and more melodious till A. Scarlatti formulated the first *Aria*—i.e. a regular strain of melody, followed by a second in contrast and complement, and thereafter repeated (*Da Capo*). Almost any of Handel's well-known songs will furnish an advanced specimen of this form, which was brought to perfection by Mozart. The more serious style required for sacred works, as well as the greater skill in the *science* of music which was at the disposal of composers like Handel, Bach, and Mozart, saved the *Aria* from its friends, and in northern Europe it chose a slower development but a worthier end. In the schools of Bach, Gluck, Beethoven, Schumann, Wagner, and Liszt the voice is treated as only one instrument, to which indeed the important part is assigned of giving the words intended for illustration—the expression, however, being entrusted to the whole mass of instruments employed. The claims of any settled form to absolute consideration are likewise disregarded where these seem to clash with the higher demands of expression and

dramatic truth. Hence the opposition offered and the accusations brought against all these composers in succession by the professional and amateur melodists of each day. None of their styles may be entirely exonerated, but their ideal is certainly the true one, and their work shows a progressive development along at least closely related lines.

Ballads.—Alongside this scientific progress there has always been the popular love of melody which has found expression in folk-song and ballads. Each nation has its characteristics strongly reflected in these, and where they have been recognised and accepted as a veritable and refreshing fount of inspiration—as in Germany, Hungary, and Norway—the gain has been great. They are of course the origin of the simple strophic song or ballad (e.g. Mendelssohn's *Es ist bestimmt*), however skillfully modern composers adorn it with graceful accompaniment (e.g. the same composer's *Auf Flügeln des Gesanges*). The Ballade, which aims at a dramatic setting of some romantic story, is the offspring of the same influence which inspired Weber's operas. In this style Loewe showed Schubert the way (*Erl König*), and following composers have used the device very successfully (Villiers Stanford's *La Belle Dame*). A later form is the art song which tries to reflect the most delicate turn of meaning and the deepest subjectivity to be found in the words. It was to a great extent the result of Heine's poetry, and its first great exponent was Schumann.

Choral Music.—The chosen home of modern choral music has been Germany and England. In the beginning of the 17th century H. Schütz left his home in Dresden to study the 'new music' of the Florentine school in Italy, and he took the weakling back with him to be reared among the great instrumental masters of Germany. The noble German chorale was chosen as a foundation, and in the effort to illustrate the text no device of counterpoint, no resource of the ever-improving science of harmony, was left unused. Graun, Bach, Haydn, Handel, Mozart, Beethoven, Mendelssohn have enriched the church with innumerable and inestimable treasures in their Passions, Oratorios, Masses, and Psalms; and it is surprising how well fitted the strict writing of all these masters has proved in their hands to convey the most elevated, the most dramatic, the most touching emotions. More modern works are such as Dvorák's *Stabat Mater*, Liszt's Masses, &c. But the same principle has always commanded the same success; whatever modern development in modern instrumentation, harmony, &c. may be added to a composer's resources, there is only one foundation, that on which the great masters have ever built when rearing their great choral works.

Formal choruses have never been an important part of operatic writing since the first rude beginnings. In plays the single characters will be rather brought together, as it were, than introduced with a distinct intention of giving each an equal part. This feeling for dramatic truth is the origin of the concerted writing in operas—duets, ensembles, finales—the treatment of which is indebted partly to solo vocal writing, partly to choral. The handling of crowds, again, and the best expression in music of their feelings requires different treatment, and it is interesting to compare how each great reformer has approached the problem. Curiously enough, it is the composers who have shown the greatest capacity for many-part writing who have most successfully given the correct impression. No two works are wider asunder than Bach's *Matthew Passion* (1729) and Wagner's *Meistersinger* (1867); and yet it is impossible to deny that the single terrible

shout of the multitude 'Barabbas!' and the complicated chorus 'Let Him come down from the cross,' show that a genius in no way inferior to Wagner's, but with comparatively very limited resources, could grapple with the same problem which is so marvellously solved in the street riot scene (*Meistersinger*, act ii.). Gluck's correct feeling saw the difficulty, but his powers were not great enough to overcome it. Mozart's greater, and in this matter somewhat irresponsible, genius never troubled itself on the subject.

Orchestra.—It only remains to describe shortly the growth of the orchestra before closing with an account of the latest development in European music. Monteverde laid the foundation of the modern orchestra when he multiplied the stringed instruments and relegated the pianoforte (or rather its precursor the harpsichord) to a somewhat subordinate position. The latter, however, maintained its place in the orchestra till after Handel's day. Between Monteverde and Haydn many experiments were made in the arrangement and combinations of instruments; also in the manufacture of the instruments themselves. By-and-by the various forms of 'Viol' (Viol di Gamba, di Braccia, &c.) resolved themselves into the viola or tenor violin, and the violoncello (i.e. 'the little violone' or smaller double bass). The violin is of course the little viol. And these remain the foundation of our orchestra. The wind-instruments were the flute and the oboe (a compromise among various forms—Oboi d'Amore, di Caccia, &c.), to which the bassoon gave the bass. To these were added trumpets and drums for special effects. Such was the orchestra with which Haydn laid the corner-stone of modern instrumentation. Mozart added the expressive clarinet, which was at once incorporated in the band. The piccolo, or little flute, and the double bassoon (Contra Fagotto) can hardly be called additions in the sense of novelty; and from Mozart's time to Wagner's the improvement, with one important exception, has been in the direction of improvement in mechanism, and in power of variety in combinations and tone colours. The exception is the trombone, first used with its full effect by Mozart in *Don Giovanni*, and ever becoming more important in the hands of Beethoven, Schubert, Schumann, and Wagner. Berlioz, the greatest master of instrumentation the world has seen, embodied the result of his experience in a 'Treatise' which will ever remain one of the greatest monuments of his extraordinary genius. He has been worthily followed by the scarcely less successful Wagner, and an enumeration of the instruments at his masterly disposal will show what limitless combinations and permutations are now possible. In *Tannhäuser*, the orchestra for which he writes comprises, besides the usual stringed band (about 12 first violins, 12 second violins, 8 violas, 8 violoncellos, and 6 double basses), 3 flutes, 1 piccolo, 2 oboes, 2 clarinets, 1 bass clarinet, 2 bassoons, 2 horns, 2 valve horns, 3 trumpets, 3 trombones, and 1 bass tuba, with 1 pair of kettledrums, bass drum, cymbals, triangle, tambourine, and harp; and, on the stage, 4 flutes, 2 piccolos, 4 oboes, 6 corni Inglesi, 6 clarinets, 6 bassoons, 12 trumpets, 12 horns, 4 trombones, cymbals, triangle, and tambourine.

Programme Music.—Many attempts of a more or less legitimate kind have been made to illustrate by abstract music a certain story, set of scenes, or progress of emotions. Probably the earliest examples which can be pronounced artistically successful are the famous Pastoral Symphony and the sonata *Les Adieux, l'Absence, et le Retour*, by Beethoven. To criticise this tendency would lead us far beyond the limits of this article, and a mere enumeration of names

and compositions will suffice to show what an attraction the idea has had for almost all modern composers. Mendelssohn has tried to paint Fingal's Cave in his *Hebrides* overture, and in his Scotch Symphony he seeks to convey the impressions made on him during his visit to Scotland. Schumann has painted a whole set of figures and characters in his *Carneval*, and in his great *Fantasia in C* he has set out with a very definite intention to convey the meaning of a verse by the poet Schlegel. Berlioz has gone further and proposed to tell the *Episodes in the Life of an Artist* in a symphony. Unfortunately, his morbid and rather gruesome genius has chosen very repulsive pictures to paint; and he also makes the mistake of entrusting a certain character or sentiment to a certain phrase—evidently impossible without words set to the music or a previous explanation. Raff's *Lenore* Symphony, Mackenzie's *La Belle Dame*, and Liszt's *Mazeppa* are good examples of well-known poems set forth in music alone. MacCunn's *Land of the Mountain and the Flood* is a descriptive overture; and Liszt's and Saint-Saëns' *Symphonic Poems* are very beautiful and expressive.

Of course, descriptive music which occurs in the course of a cantata (e.g. in David's *Le Désert* or Berlioz's *Faust*) has the advantage of a definite starting-point in the words which surround and explain it, and therefore is distinct from these works mentioned which aim at dispensing with words except as an inspiration. The success which has attended the attempts is certainly unequal, but an immense new field of effort has been opened to composers which will doubtless yield a rich harvest.

Whither music is tending in the 19th century it is difficult to say; but so long as the treasures left us by the great composers are as reverently and as earnestly studied and accepted as they are at present: so long as composers recognise that their genius is a call to labour and not to enjoyment: so long as criticism is honest and based upon sound knowledge, there is no fear that the heritage of the ages will be lost. And one delightful feature all over Europe just now is the intense nationality which lovingly studies the national treasures, and, with a skill and a breadth of conception only to be gained in the cosmopolitan school, proudly holds up both them and the æsthetic truths they tell for the admiration of musical Europe.

Musical Box, a case containing a mechanism which, when the spring is wound up, plays tunes automatically. Teeth projecting from a barrel (as in a barrel-organ or a mechanical peal of chimes) impinge on and set vibrating the tongues cut out

in *comb* or steel plate; the difference of tone being due to the greater length and breadth of the teeth. The larger and better boxes, some of which play many tunes after one winding up, can be regulated in pace by a fly regulator, with flat wings, which catch the air. The invention dates from about the middle of the 18th century. Switzerland (especially Geneva) is the headquarters of the manufacture.

Musical Glasses. See HARMONICA.

Musk. The musk of commerce, which is an important element in very many compounded perfumes, is mainly obtained from the Musk-deer (q.v.), the best kind being that known as Chinese musk, and imported from Tonquin. Other kinds are the Indian (from the Himalayas) and the Siberian. Musk is often adulterated with dried blood, bits of leather, &c. In 1890 Bauer of Erfurt produced an artificial musk by treating butyl-toluol with a mixture of sulphuric and nitric acids, the resulting nitro-compound being purified by crystallisation from alcohol.

Musk-deer (*Moschus moschiferus*) is a ruminant Ungulate forming a special family of the Artiodactyla. According to Flower, it represents an ancestral type of the Pecora (Bovidae, Cervidae, Giraffidae), but with nearest affinities to the Deer (Cervidae). As in the Cervidae, the young is spotted, but it has no horns, and the canine teeth of the male project in the form of longish tusks; this latter fact has led to the association of *Moschus* with the Tragulidae (Chevrotains, q.v.), which is, however, not justified by its other characters. The musk-deer is an inhabitant of the mountainous regions of central Asia from the extreme north to as far south as Cochin-China and Nepal. There is only one species, with perhaps four well-marked varieties. The musk-deer is much hunted on account of the odoriferous secretion which is found in a special gland upon the hinder-part of the abdomen of the males. This substance was first introduced into the west by the Arabs. It is spoken of in the pharmacologies of Serapion and Avicenna and by the traveller Marco Polo. The value of the substance used to be very great, as it figures among the costly objects presented by Saladin to the Greek emperor in 1189. It was used in the embalming of bodies as early as the 14th century. For an interesting account of the musk-deer (and the Chevrotains), see Milne-Edwards, *Annales des Sciences Naturelles* (1864); and for the anatomy, Flower, *Proc. Zool. Soc.* 1875.

Muskegon, capital of Muskegon county, Michigan, is on the Muskegon River, which here (4 miles from its mouth in Lake Michigan) widens into Muskegon Lake, the best harbour on the east side of Lake Michigan. Muskegon is 40 miles by rail NW. of Grand Rapids, has daily steamboat communication with Chicago, and saws and ships enormous quantities of lumber. It has also a number of foundries, machine-shops, boiler-works, &c. Pop. (1890) 22,702.

Musket. See FIREARMS.

Musk-glands, skin-pits in mammals producing a secretion with a musky odour. They belong to a series of skin-glands, which occur in various parts of the body and with various secretions (see ANAL GLANDS). The most notable musk-glands are those of the male musk-deer and the male beaver. See BEAVER, CASTOREUM, CIVET, &c.

Musk or Muscovy Duck. See DUCK.

Musk-ox (*Oribos moschatus*) is a member of the family Bovidae. It inhabits at present the most northern parts of the American continent north of lat. 60°. Its remains, which have been

found in Quaternary deposits of England, Europe, and Siberia, indicate that it had formerly a much wider range. The hair is long, serving of course to protect the animal from the rigour of the climate which prevails in its habitat, and of a brownish colour. The creature measures above 5½ feet from the tip of the nose to the root of the tail, and so approaches in size the smallest Highland cattle. It is gregarious, there being only one or two males to a herd of eighty or a hundred. They browse on grass, reindeer moss, willow shoots, the Labrador tea-plant, and crowberry bushes. The flesh of the calves and cows, when in condition, is very palatable. Unlike many purely Arctic

Musk-ox (*Oribos moschatus*).

animals—e.g. the Arctic fox—the hair does not become white at the approach of winter. But it has been suggested that this protective change in coloration is not necessary, since it is an animal which lives in herds; hence it is better for an individual, which has got accidentally separated from its fellows, to regain a position of safety by being able to readily detect the whereabouts of the herd than to trust to escape from carnivorous foes by a resemblance in colour to the surrounding snow.

Musk-plants. Various parts of a number of plants smell more or less strongly of musk. Among these are the common little Musk-plant (see MIMULUS) and the Musk-seed (see HIBISCUS). The musk-tree of Jamaica (*Moschoxylum Swartzii*), belonging to the natural order Meliaceae, emits from all parts a smell of musk. All parts of *Guarea grandifolia*, another tree of the same order, a native of the West Indies, sometimes called musk-wood, also smells strongly of musk.—The drug called Musk-root or Sambul is the root of a plant of the natural order Umbelliferae, and is brought from Persia or central Asia; it has a pure musky odour, and is used as a substitute for musk.

Musk-rat, a name applied to several distinct animals. (1) The Desman (*Myogale*), a genus of insectivorous quadrupeds of the Shrew (q.v.) family (Soricidae), differing from the true Shrews (*Sorex*) in having two very small teeth between the two large incisors of the lower jaw, and the upper incisors flattened and triangular. Behind these incisors are six or seven small teeth (lateral incisors or false canine teeth) and four jagged molars. The muzzle is elongated into a small flexible proboscis, which is constantly in motion. The eyes are very small; there are no external ears; the fur is long, straight, and divergent; the tail long, scaly, and flattened at the sides. All the feet have five toes, fully webbed; and the animals are entirely aquatic, inhabiting lakes and rivers, and making holes in the banks with the entrance from beneath the surface of the water. Only two species are known, one (*M. pyrenaica*), about 8 inches long, with tail as long as the body, a native of the streams of the

Pyrenees; another larger species (*M. moschata*), very plentiful in the Volga and other rivers and

Musk-rat, or Desman (*Myogale pyrenaica*).

lakes of the south of Russia, nearly equal in size to the common hedgehog, with tail about three-fourths of the length of the body. The Russian desman is blackish above, whitish beneath; it has long silky hair, with a softer felt beneath, and its fur is held in some esteem. Desman skins, however, are chiefly valued on account of the musky odour which they long exhale, and which is derived from a fatty secretion produced by small follicles under the tail of the animal. The desman feeds on leeches, aquatic larvae, &c., searching for them in the mud by means of its flexible proboscis. It seldom, if ever, voluntarily leaves the water, except in the interior of its burrows, which are sometimes 20 feet long. (2) The name of Musk-rat is also a common name for an Indian species of Shrew (*Sorex murinus*), in size about equal to the common brown rat, in form and colour much resembling the common shrew of Britain, but remarkable for the powerful musky odour of a secretion which proceeds from glands on its belly and flanks. (3) The name is also given to the Musquash (q.v.).

Muslin, a fine cotton fabric somewhat resembling Gauze (q.v.) in appearance, but it is woven plain without any looping of the warp threads on the weft. A piece of the finest muslin at one time manufactured at Dacca in India, measuring 3 yards in length by 1 in breadth, weighed only the fifth part of an ounce, and cost £40; but none approaching to this in fineness is made in India now. Very fine muslin has been woven from yarn spun by machinery at Manchester, but it wanted the delicate softness of the finest Dacca. Printed muslins are made in France and England for female summer attire. In India some muslins are woven with coloured patterns; others are embroidered with silk or beetles' wings; others again are printed with gold and silver leaf. Such names as 'woven air' and 'evening dew' are given in that country to those of exquisitely fine texture.

Musquash, also called MUSK-RAT, or ONDATRA (*Fiber zibethicus*), a rodent quadruped, a native of North America, from the Rio Grande to the Arctic regions. The genus to which it belongs contains only one other species, *F. alleni*, from Florida. They belong to the family Muridae. The musquash is in shape nearly similar to the brown rat; the head and body are about 15 inches in length, the tail 10 inches. The whole body is covered with a short, downy, dark-brown fur, intermixed with longer and coarser hairs. It is a very aquatic animal, seldom wandering from the rivers, lakes, or marshes in which it makes its abode. It is chiefly a vegetable feeder, but like other Muridae will occasionally take to animal food—the mollusc *Unio* is a favourite delicacy. The fur is in demand, and forms an article of commerce—skins in large numbers being still exported from America to Britain and other European countries. The

musquash burrows in the banks of streams and ponds, the entrances of its burrows being always under water. In marshes the musquash builds a kind of hut, collecting coarse grasses and mud, and raising the fabric from 2 to 4 feet above the water. The flesh of the musquash, at those seasons

Musquash (*Fiber zibethicus*).

when it is fat, is in some request among the American Indians, and is said to be not unpalatable.

Mussel, a name applied to several common bivalves or Lamellibranch molluscs. (1) The Common Sea-mussel (*Mytilus edulis*), very important for bait and not unfrequently used as food, is widely distributed in crowded 'beds' between high and low water marks. It is usually sedentary and firmly anchored by yellowish silken 'byssus,' but it is also able to shift its quarters and even to climb by slowly extending the range of the byssal thread exuded from the 'foot.' (2) The Horse-mussel (*Modiolus modiola*) is nearly twice as large as the above, and lives a more active burrowing life below the low-water mark. It is never used for food, and is not available for bait. Both these sea-mussels are representative of large genera, and are included in one family—Mytilidae. (3) Quite different from the above are the fresh-water mussels, Unionidae, widely distributed in lakes and rivers, where they plough their way slowly along the bottom from one resting-place to another. As good representatives of the Unionidae, the Pond-mussel, *Anodon cygnea*, the Painter's Mussel, *Unio pictorum*, whose shells were once used for holding water-colour paints, and the Pearl-mussel, *Margaritana margaritifera* (see PEARL), may be noted. For the structure and general characters, see BIVALVES.

The common edible mussel abounds on the Atlantic seaboard of the United States, but is used neither as food nor as bait. In England it is largely used as human food; in Scotland it is not so used, but enormous quantities are required for bait, especially by haddock fishers. The chief objection to mussels as food is that they are occasionally poisonous. Mussels especially which are unhealthy or dead are very apt to contain dangerously poisonous waste-products; care should accordingly be taken that those used for food are thoroughly fresh. A French Commission reported in 1889 that the poison is due to the presence in the mussel of a volatile alkaloid developed under the influence of a particular microbe, which is only found in mussels growing in stagnant and polluted water. Sewage fairly free from the pollution of manufactories is distinctly

beneficial to mussel culture. It is said on good authority that mussels lose any poisonous properties they may have if cooked for ten minutes with carbonate of soda. The wasteful and unregulated consumption of mussels from the scalps on the British coasts, the reckless destruction of immature mussels, and the wholly inadequate efforts at artificial mussel culture have caused in some parts of Britain a mussel famine, and necessitated large importations from abroad. Great natural scalps on the British coasts are those of the Wash, Morecambe Bay, and the estuary of the Clyde. The last, from which it is computed that since 1840 one hundred thousand tons of mussels have been taken, is now exhausted and unproductive. The cultivation is practised in the Thames estuary and the Medway, in the Teign and Exe, at Montrose, and elsewhere; but large supplies are imported from Holland. Scotland imports from England, the north of Ireland, and Hamburg. In one year the Eyemouth fishermen have used nine hundred and twenty tons of mussels, mainly imported, and costing £1800. Yet in Lancashire and Norfolk mussels are wastefully used as manure. Mussels may be cultivated either on natural beds—especially where clean gravelly bottoms are exposed at low-water, and where salt and fresh water mix—by transplanting spat and protecting young mussels; or in deep water, where transplantation may also be practised. In north Germany and north France mussels are successfully cultivated on wicker-work attached to palisades. The Dutch artificial beds are mainly provided with spat from the coasts of Essex and Kent.

Musselburgh, an old-fashioned town of Midlothian, near the mouth of the Esk in the Firth of Forth, 6 miles E. of Edinburgh by a branch-line (1847). Since 1832 it has united with Leith and Portobello to return one member, the parliamentary burgh including the large fishing-suburb of Fisherrow, with a small tidal harbour, and the pretty village of Inveresk, whose conspicuous spired church was rebuilt in 1805 by 'Jupiter' Carlyle, and occupies a Roman prætorium. Musselburgh's chief features are its celebrated golf-links (since 1817 also the Edinburgh racecourse), Loretto school (marking the site of a famed place of pilgrimage), Pinkie House (1613), the 'Roman' bridge, the quaint tolbooth, and a statue of David Moir. The manufactures include paper, nets, leather, &c. Pop. (1841) 6366; (1881) 7566; (1891) 8885. See Paterson's *History of Musselburgh* (1857).

Musset, ALFRED DE, one of the most striking figures in the literature of modern France, was born in Paris, 11th December 1810, the son of an official who rose high in the War Office. He was unusually impulsive from his childhood, and precocious alike in sensibility and in genius, and grew up handsome in person and fascinating in manners, though he retained something of the spoilt child all his life. He thought first of law, next of medicine, then of art, but at eighteen discovered himself to be a poet, and scarcely a year after published his *Contes d'Espagne et d'Italie*, a collection of unequal poems, of which *Portia*, *Mardoche*, and *Don Paez* at least are still remembered. A splendid and brilliant youth, of equal grace and assurance, he was warmly received into Victor Hugo's *Cénacle*, the inner shrine of militant Romanticism; was crowned with seductive flatteries by the wider world of society; and in his hunger for premature experience at once flung himself recklessly into the eager pursuit of pleasure in every form. He was eager to feel, and feeling brought suffering in its train, but gave him the impulse out of which came his verse—ever a part of himself, the answering echo of his own emotions. His piece

La Nuit Venitienne failed at the Odéon in 1830, and thus turned him from a career in which he was yet to gain triumphs without seeking for them. In 1832 he published *Un Spectacle dans un Fauteuil*, comprising two short plays—*La Coupe et les Lèvres* and *À quoi rêvent les Jeunes Filles*, as well as the poem of *Namouna*, written hastily to eke out a slender volume. Next year followed in the pages of the *Revue des Deux Mondes* two of his very greatest works, the tragical comedies *André del Sarto* and *Les Caprices de Marianne*. It was of Marianne that her creator replied, when asked where he had found her character, 'Nowhere and everywhere; she is not a woman, she is woman.' Next followed the famous poem of *Rolla*, which has not sustained the applause with which it was received. Then came the fatal journey to Italy with George Sand. He first met her in the summer of 1833, and the intimacy quickly blossomed into love. The projected tour was at first opposed by De Musset's mother, but George Sand took the extraordinary step of calling upon her one evening, and in a moment of emotion gained her consent. They set out for Venice at the beginning of winter. About the middle of February his letters to his mother and brother ceased; for six weeks there was silence, then on the 10th April he reappeared alone, broken in health and sunk in the deepest depression of spirits. A quarter of a century later, and soon after his death, she gave the world, in the guise of a novel, *Elle et Lui*, her version of the events which led to the catastrophe. Paul de Musset at once retorted with *Lui et Elle* (1859), a book poor as fiction, but which rings like truth. His account was that she had been grossly unfaithful to him, and that his discovery of this in a state of weak health had brought on an almost fatal attack of brain-fever; she, on the other hand, explained the infidelity as but a delusion of the fever itself. It is at anyrate suspicious that but one of the pair suffered deeply, while the other went on calmly writing romances, and utilising the experience at once as impulse and material. The Jacques Laurent of her story bears many a trait of the true De Musset. Despite, or, more probably, in consequence of his sufferings, the five years that followed his return were his best years of production. Another love quickly followed, only to end as unhappily; and that again was succeeded by a series of unworthy and often sordid entanglements, which distracted his heart and were followed by periods of deep depression which alcohol did little to allay. The patronage of the Duc d'Orléans, the warm friendship of a small circle of devoted friends, and his appointment in 1838 to be librarian at the Home Office did something to take him out of himself, but he was ever as capricious in character as in genius, and the feverish activity that sometimes seized him soon exhausted itself in splendid projects and unfinished poems. Even his famous *Confession d'un Enfant du Siècle* (1835), like most of his works, was begun, laid aside, and then finished under a cloud of sorrow. It is not an autobiography, though it owes its sombre colour to its author's personal experience. It is a striking study of moral pathology, full of admirable expression of cynical contempt for the world and of the misery of hopeless doubt; but, as a work of art, it breaks down pitifully at the close into weakness and platitude. When De Musset's health gave way about 1840 his literary activity began to decline also. He was already, in Heine's phrase, 'a young man who has had a splendid past'; he felt himself an old man at thirty, and to the end he was never blessed with anything of the serenity of the Olympians, nor was he even one of those artists who find consolation in their art. The success of *Un Caprice* at the Théâtre Français in 1847 recalled

him for some time to life and hope, but during his last half-dozen years he wrote nothing of importance. He was elected to the Academy, but not without difficulty, in 1852, and Sainte-Beuve has told us of his coming tipsy to its sittings. 'Musset s'absente trop,' said a member on one occasion; 'Il s'absente trop,' was the response. He died of heart disease, May 1, 1857.

Of De Musset's poetry the four pieces entitled *Nuits* mark the highest reach of his lyrical talent. The *Nuit de Mai* and that of *d'Octobre* are perfect and immortal poems, like Milton's *Il Penseroso* with passion added, says Sainte-Beuve. The *Nuit de Décembre* is a subtle realisation of that other self that had shadowed all his life. These poems quiver with the quick pulse of life and the throb of suffering, yet the poet's eyes are open throughout to all the innumerable beauties of the universe. The *Ode à la Malibran* is a splendid tribute of admiration to a great actress; the *Lettre à Lamartine*, to a master in his own art; *L'Espoir en Dieu*, a noble expression of the longing of the human soul for certainty; the famous *Rhin Allemand*, a spirited retort to Nikolaus Becker's too patriotic German poem, which brought him a crop of challenges from foolish German officers. The greatest merit of these poems is that they thrill with real, not simulated passion. 'Mon verre n'est pas grand, mais je bois dans mon verre' was his own judgment of himself, and so far as regards his genuineness it is true. He is the poet of a certain range of personal emotions, of youthfulness, and, above all, of passion, in which respect he follows close upon Byron in power, while far surpassing him in unaffectedness and reality, if not always in finish and exquisiteness of art.

His dramatic work is unique in 19th-century literature of its kind for originality, intensity, and variety, linked to brilliant wit and real dramatic genius. It consisted of *comédies*, or regular dramas, full of tragic quality and ending with tragic abruptness, and *proverbes*, the latter short dramatic illustrations of some common saying. Of the former class are *André del Sarto*, perhaps his greatest work; *Lorenzaccio*; *Les Caprices de Marianne*; and *On ne badine pas avec l'Amour*. To the class of *proverbes* belong *Fantasio* and *Barberine*, both bright and graceful, if fantastic; *Le Chandelier*, slight in structure, but absolutely perfect in art; *Il ne faut jurer de Rien*, more serious, but no less successful; *Un Caprice*, graceful and brilliant; *Il faut qu'une Porte soit ouverte ou fermée*, bright and charming; *Louison*, in verse, less interesting; *On ne saurait penser à tout*, an extravaganza; *Carmosine*, a charming little masterpiece of romance in miniature; and *Bettine*, a lively little drama.

Of his largest although not greatest prose work we have already spoken. It remains only to speak of his brilliant and inimitable *Nouvelles* or short stories and his *Contes*. To the former belong *Les Deux Maîtresses*, in which Valentin is said to have been a study of his own character; *Emmeline*; *Le Fils du Titien*, perhaps his finest work in prose; *Frédéric et Bernerette*, which grew out of an unworthy *liaison* of his own; *Croisilles*; and *Margot*. The *Contes* are *Pierre et Camille*; *Mademoiselle Mimi Pinson*, a charming study of the best aspect of that peculiar Parisian product, the *grisette*, as a work of art an absolute masterpiece; *Le Secret de Javotte*; *Le Merle Blanc*; and *Lettres de Dupuis et Cotonet*. His *Mélanges* and *Œuvres Posthumes* are less valuable. De Musset's whole work fills but ten small volumes (Lemerre, 1876), but it is not too much to say that these include some of the noblest poetry, greatest plays, and best short stories French literature has yet produced.

See the *Life* by his brother Paul de Musset (3d ed. 1877), and a good and exhaustive study by Paul Lindau (Berlin, 1876). See also *French Poets and Novelists* (1884), by Henry James, and the excellent study by the late Cyril Francis Oliphant (1890) in the series of 'Foreign Classics for English Readers.' A monograph by Jules Lemaitre is promised in 'Les Grands Écrivains Français,' and a translation of four of the *Comédies* was published, with an introduction by S. L. Gwynn, in the 'Camelot' series (1890).

Mustang. See HORSE.

Mustapha, a suburb of Algiers (q.v.).

Mustard (*Sinapis*), a genus of plants of the natural order Cruciferae, now generally included as a sub-genus of Brassica. Three species, all annuals, of *Sinapis* contribute their seeds to the manufacture of mustard. (1) Black Mustard (*S. nigra*), a native of the middle and the south of Europe, also of Britain, but rare in Scotland; a rather coarse plant, two or more feet high, having the lower leaves lyrate and usually hispid, the upper leaves linear-lanceolate, entire, and hairless. The flowers are yellow, in slender racemes. The pods rarely exceed half an inch in length, closely pressed to the stem. The seeds are deep brown. (2) White Mustard (*S. alba*), a native of southern Europe and western Asia, naturalised in the southern parts of Britain and in Ireland, and in the United States. The whole plant is more or less hairy, the leaves pinnately lobed. The flowers are large compared with those of the preceding species; the pods nearly twice as long, with a long flattened beak, and five prominent nerves; and the seeds are pale yellow. (3) The Wild Mustard (*S. arvensis*), in nearly all parts of the country better known as *Charlock*, is a weed of cultivation only too common throughout Britain and Ireland in cornfields, and in some parts of the United States. It is from the ground seeds of the two first named that mustard is chiefly obtained, but those of the last named are also used in the manufacture of that condiment. The wild mustard is reputed to have yielded the original Durham Mustard, but its seeds are now only gathered for mixing with those of the two preceding species. The black mustard is the most pungent, and is almost exclusively used in the manufacture of mustard on the Continent. White mustard is most favoured in Britain, chiefly because the skin is more easily separated from the seed. The greatest bulk of it is grown in the fens of Lincolnshire and Cambridgeshire, also in Kent and Essex. White mustard is sown in gardens, and used as a small salad. Much of the mustard seed imported from India is *Sarepta Mustard* (*S. juncea*). Mustard is often adulterated (see ADULTERATION); but 'mustard condiment,' made of mustard flour and wheat flour or starch flour, is less bitter and stinging than pure mustard, and keeps better. Both black and white mustard seed yield by expression a non-drying fixed oil, which is known as *oil of mustard*, and is free from pungency. When the residual cake, possessing in itself little pungent odour, is treated with water it immediately becomes powerfully irritating to the skin. This is due to a chemical action between an albuminous body, myrosin, and complex bodies differing in the two varieties of seed which are present in the cells. These in presence of water react, giving, in the case of black mustard, a *volatile oil*, having the composition of isosulphocyanate of allyl, C_3H_5SCN , while in the white seed the non-volatile sulphocyanate of acrinyl, C_7H_7SCNO , is produced. This action is similar to that of oil of bitter almonds (see ALMONDS). It is to the formation of these vesicating substances that the pungency and activity of a mustard plaster are due. As the white seed contains more myrosin than the black,

it is usual to mix the two, so as to fully develop the action of the latter. The use of boiling water is of course inadmissible in forming such a poultice, as it rapidly dissipates the volatile oil, on which the virtues partly depend (see **BLISTER**). 'Mustard papers,' used as vesicants, are made of mustard flour deprived of its fixed oil. The cake that remains after the oil is extracted may be given to cattle as a condiment. The Mustard-tree of Scripture has been supposed to be *Salvadora persica*, a small tree of the natural order Salvadoraceæ, a small order allied to Myrsinaceæ; but other interpreters insist that the ordinary black mustard is meant in the proverb.

Mustelidæ, a family in the bear section of Carnivores (q.v.), somewhat arbitrarily divided into otter-like (*Lutrine*), badger-like (*Meline*), and weasel-like (*Musteline*) sub-families. See the articles on these and related types.

Musulmān (Persian form of Arabic *Muslim*), a Moslem or Mohammedan. We need hardly add that the termination 'ān' has nothing to do with our word *man*, and that a further English plural *Musulmen*, instead of *Musulmans*, is both barbarous and absurd.

Muta Nzige, a lake of Equatorial Africa discovered by Stanley in 1876, and again seen by him in 1889, and renamed the Albert Edward Nyanza. It occupies the southern end of a vast natural depression, of which the Albert Nyanza (q.v.) fills the northern extremity.

Mute, a small instrument used to modify the sound of the violin or violoncello. It is made of hard wood, ivory, or brass, and is attached to the bridge by means of a slit, its three legs standing between, but clear of, the strings. The use of the mute both softens the tone and imparts to it a peculiar muffled and tremulous quality, which is sometimes very effective. Its application is indicated by the letters *c. s.*, or *con sordino*, and its discontinuance by *s. s.*, or *senza sordino*. A mute, consisting of a pear-shaped leather pad, is sometimes used for the horn and trumpet. It is inserted into the bell of the instrument, thereby subduing the sound and producing the effect of great distance.

Mutiny, as defined by British military law, is 'collective insubordination,' or the combination of two or more persons to resist or induce others to resist lawful military authority. The punishment laid down in the Army Act of 1881 for this crime and for failing when present to use the utmost effort to suppress it, or, when knowing of a mutiny or intended mutiny, failing to give notice of it to the commanding officer, is death or such less punishment as a court-martial shall award. It may be pointed out that, in view of the above legal definition, one man alone cannot be guilty of mutiny, but may be charged with 'insubordination,' a crime which, in its worst forms, is also punishable by death. On board ship the mutiny of the *Bounty* (see **PITCAIRN ISLAND**) in 1789 is memorable, and of that on board the *Danaë* frigate in 1800; the great naval mutiny at the Nore (q.v.) in 1797 is dealt with specially. The Indian Mutiny is a common name of the Sepoy rebellion of 1857. See **INDIA**.

Mutiny Act was an act passed by the British parliament from year to year, to regulate the government of the army. The navy and marines, when serving on a ship in commission, are under Naval Discipline Acts, 1861 and 1866, the successors of Articles of War first enacted under Charles II., which, unlike the Mutiny Act, remained in force for an indefinite time. By the Bill of Rights the maintenance of a standing army in time of peace, unless by consent of parliament, was declared illegal, and

from that time the number of troops to be maintained, and the cost of the different branches of the service, have been regulated by an annual vote of the House of Commons. Soldiers, in time of war or rebellion, were always subject to military law; but the occurrence of a mutiny in certain Scottish regiments soon after the Revolution raised the question whether the same law could be enforced in time of peace; and it was decided that, in the absence of any statute to the contrary, a soldier in time of peace was only amenable to the common law: if he deserted, he was only liable for breach of contract; or if he struck his officer, to an indictment for assault. The authority of the legislature became indispensable to the maintenance of discipline; and parliament, from 1689 till 1879, conferred this and other powers in the Mutiny Act, limited in its duration at one time to six months, but latterly to a year. Although it was greatly changed from the form in which it first passed, the annual alterations were slight, and substantially it had a fixed form. The preamble quoting the above declaration from the Bill of Rights added that it was judged necessary that a force of specified strength should be continued, while it gave authority to the sovereign to enact Articles of War for the government of that force. The act specified the persons liable to its provisions, treated of courts-martial crimes and punishments, and of military prisons, furlough, Enlistment (q.v.), stoppages, billets, and the conveyance and entertainment of troops. For years prior to 1878 attention had been drawn in parliament and elsewhere to the shortcomings of the act, as well as to those of the Articles of War (q.v.) by which it was accompanied, explained, and amplified. These representations culminated in the appointment of a Parliamentary Committee, which in 1879 presented a Bill to supersede the Mutiny Act, and, like it, to be passed annually as the 'Army Discipline and Regulation Act.' The Marine Forces when serving on shore were under the Marine Mutiny Act up to 1879; then they were brought under the 'Army Discipline and Regulation Act.' In 1881 this act was slightly modified and called the 'Army Act of 1881.' It is brought into force annually by a short act called the Army Annual Act, which lays down the number of troops to be kept up for the ensuing twelve months, the prices to be paid in billets, and any amendments found to be necessary in the Army Act itself. The latter is accompanied by Rules of Procedure for its administration, and contains the whole military law of Great Britain.

Muttra, or **MATHURA**, a town of India, in the North-west Provinces, is situated on the right bank of the Jumna, 30 miles above Agra. For centuries it has been a centre of the Buddhist faith; the surrounding country swarms with associations of Krishna and Balarama (see **VISHNU**). There are numerous temples and mosques; the river is lined with magnificent flights of stairs, leading down to the bathing-places in the sacred river; large numbers of pilgrims resort to the city on the occasion of its religious festivals; and troops of monkeys and turtles are supported by the charity of the gentle-hearted people. The city has passed through a long series of misfortunes: it was sacked by Mahmud of Ghazni in 1017; its temples were destroyed by a native sultan in 1500, and by Aurungzebe in 1669; and it was plundered by the Afghans in 1756. In 1803 it passed into the hands of the British. Pop. (1881) 57,724.—The *district* has an area of 1453 sq. m., and a pop. (1881) of 671,690.

Muyscas. See **COLOMBIA**.

Muzaffarnagar, a municipality in the North-west Provinces of India and capital of a district (area, 1656 sq. m.; pop. in 1881, 758,444), 80 miles NE. of Delhi by rail. Pop. 15,080.

Muzaffarpur, capital of a district (area, 3003 sq. m.; pop. in 1881, 2,582,060) in Bengal, on the Little Gandak, 140 miles N. by rail of the Ganges at Patna. Pop. 42,460.

Myall Wood, the hard violet-scented wood of the Australian *Acacia homalophylla*, much used for making whip-handles and tobacco-pipes.

Mycalæ, a wooded promontory of ancient Ionia, over against Samos; in the channel between them, Leotychides the Spartan and Xanthippos the Athenian defeated the Persian fleet, 479 B.C.

Mycellium, the vegetative part of fungi which is not concerned in spore-bearing. It may consist simply of a much-elongated cell growing from the spore, or of a chain of cells, but in the majority it is a tissue of interlaced branched filaments or hyphæ, loosely united in many moulds, membranous in dry-rot, compact and tuberous in mushrooms. See FUNGI.

Mycenæ, a very ancient city in the north-eastern part of Argolis, in the Peloponnesus, built upon a craggy height, and said to have been founded by Perseus. It was the capital of Agamemnon's kingdom, and was at that time the principal city in Greece. About 468 B.C. it was destroyed by the inhabitants of Argos, and never rose again to anything like its former prosperity. In Strabo's time its ruins alone remained; these are still to be seen in the neighbourhood of Kharvati, and are noble specimens of Cyclopean architecture. The most celebrated are the 'Gate of Lions,' chief entrance to the ancient Acropolis, and the 'Treasury of Atreus.' Excavations prosecuted at Mycenæ by Dr Henry Schliemann brought to light in 1876 another subterranean treasury and several ancient tombs, containing, with architectural fragments, terra-cottas, vases, weapons, gold death-masks (see MASKS), and other ornaments of thin hammered gold. Good authorities say these objects show a type of art derived from Mesopotamia through Phœnicia and Asia Minor, with little or no trace of Greek tastes, beliefs, or usages. Their date seems to be about that of the Doric invasion (see GREECE, Vol. V. p. 386). See Schliemann's *Mycenæ and Tiryns* (Eng. trans. 1877). In 1889 Tsoundas discovered at Mycenæ a series of tombs of the Achaian period.

Mycetozoa. See MYXOMYCETES.

Myelitis (*myelos*, 'marrow') is the term employed to signify inflammation of the substance of the spinal cord. It may be either acute or chronic, but the latter is by far the most common affection. The *chronic* form begins with a little uneasiness in the spine, somewhat disordered sensations in the extremities, and unusual fatigue after any slight exertion. After a short time paralytic symptoms appear, and slowly increase. The gait becomes uncertain and tottering, and at length the limbs fail to support the body. The paralysis finally attacks the bladder and rectum, and the evacuations are discharged involuntarily; and death takes place as the result of exhaustion, or occasionally of asphyxia if the paralysis involves the chest. In the *acute* form the symptoms are the same as those of the chronic form, but they occur more rapidly and with greater severity, and death sometimes takes place in a few days. Pain may be present in the spine, or in the parts of the body whose nerves proceed from the diseased area of the spinal cord; but it is not usually a prominent symptom when the morbid process begins in the cord itself.

The most common causes of this disease are falls, blows, and strains from over-exertion; but sexual abuses and intemperate habits occasionally induce it. It may also result from other diseases of the spine (as caries), or may be propagated from inflammation of the corresponding tissue of the brain. The treatment, which is much the same as that of inflammation elsewhere, must be confided entirely to the medical practitioner; and it is therefore unnecessary to enter into any details regarding it. When confirmed paralysis has set in there is little to hope for, but in the early stage the disease is often checked by judicious remedies.

Mygale. See BIRD-CATCHING SPIDER.

Myllitta, a Babylonian goddess of fruitfulness, procreation, and birth, in whose honour, according to Herodotus, every girl had once in her life to give herself up to the embraces of a stranger.

Myiodon (Gr., 'grinder-teeth'), a genus of huge fossil sloths, whose remains are found in the Pleistocene deposits of America, associated with the *Megatherium* and other allied genera. A complete skeleton of the best-known species (*M. robustus*), dug up at Buenos Ayres, measured 11 feet from the forepart of the skull to the end of the tail. Another species from the same region was considerably larger. The genus ranged into North America, the remains of one species (*M. Harlani*) having been found in Kentucky. Although like the modern sloth in general structure and dentition, the immense size of *Myiodon* forbids us to suppose that it could have had the same arboreal habits, and the modifications of its structure seem to have fitted it for the uprooting and prostrating of the trees, the foliage of which supplied it with food.

Myna (*Acridotheres*, or *Gracula* of Cuvier), a genus of birds of the family Sturnidæ, of which there are seven species ranging over the whole oriental region and Celebes. The head is more or less crested, and some have a naked space behind and under the eye; the bill is rather short, stout, and compressed; the tail is rounded; the feet are strong, the toes long, and the claws moderately curved. The Common Myna (*A. tristis*), which is found throughout India and extends into Assam and Burma, measures about 10 inches in length, and is of a glossy black colour on the head, neck, and breast; the rest of the plumage is snuff-brown, darkest on the back and wing-coverts, and lightest beneath; the wing-quills are black, with a white spot at their base, forming a conspicuous wing-spot; the tail is black, with a white tip; the bill is deep yellow; and the legs are dull yellow. It is one of the commonest birds of India, where it is found in large numbers, being eminently sociable in its habits. It feeds chiefly on insects, grain, and fruit. It makes its nest in nooks and eaves of houses and in holes in the walls of houses and ruins. The eggs, which usually number four or five, are pale bluish green in colour. It has a variety of notes, some musical and pleasing, others harsh. It is often domesticated, when it becomes pert and familiar, and a good imitator of the human voice, in this respect excelling parrots. This bird was introduced into Mauritius to destroy the grasshoppers, which it did very effectively; but in its turn, when naturalised there, it became a pest through its ravages among fruit trees.—The name Hill Mynas or Grakles (q.v.) is given to four distinct races of birds belonging to the genus *Eulabes* of Cuvier, or *Gracula* of Linneus, one from Southern India, another from Ceylon, a third from the Himalayas and Burma, and the last from Malaysia. They are birds of fine glossy plumage with prominent yellow wattles behind the ears. This genus comprises thirteen species found in the oriental region as far as south-west China, Hainan, and Java, and

in the Australian region in Flores, New Guinea, and the Solomon Islands.

Myopia. See EYE.

Myosin. See GLOBULIN.

Myosotis. See FORGET-ME-NOT.

Myrcia, a genus of trees of the natural order Myrtaceæ, to which belongs the Wild Clove or Wild Cinnamon of the West Indies (*M. acris*), a handsome tree of 20 or 30 feet high. Its timber is very hard, red, and heavy, capable of receiving a fine polish, and much used for cogs of wheels. Its leaves have an aromatic cinnamon-like smell, and an agreeable astringency, and are used in sauces. Its berries are round, and as large as peas, have an aromatic smell and taste, and are used for culinary purposes.—The leaves, berries, and flower-buds of *M. pimentoides* have a hot taste and fragrant smell, and are also used for culinary purposes.

Myrica. See CANDLEBERRY.

Myriopoda (Gr., 'myriad-footed'), a class of terrestrial Arthropods with numerous and very uniform segments. The head is distinct and bears a pair of antennæ, while mandibles and maxillæ form the true mouth-appendages. The legs themselves have six or seven joints, and end in a claw. Respiration is discharged by air-tubes or tracheæ. The class includes two orders, which differ considerably: the Centipedes (Chilopoda), with flattened body, a pair of legs on each ring, the second pair behind the mouth with powerful poison-claws; and the Millipedes (Chilognatha), with cylindrical body, and two pairs of legs on most of the rings. The Centipedes are carnivorous, and their venomous 'bite' is sometimes dangerous; the Millipedes are destructively vegetarian, but otherwise harmless. Generally they avoid the light, and live in the ground, under stones, among moss, under bark, or in similar hidden habitats. A few have a quite ancestral-like simplicity of structure. Fossil forms appear in Carboniferous strata. See CENTIPEDE.

Myristicaceæ. See NUTMEG.

Myrmecophaga. See ANT-EATER.

Myrmidons, the followers of Achilles in the Trojan war. They were an old Thessalian race who colonised the island of Ægina. According to Greek legend, Zeus peopled Thessaly by transforming the ants into men; hence myrmidons (*murmeæ* = 'an ant').

Myrobalans, the astringent fruit of certain species of Terminalia, trees of the natural order Combretaceæ, natives of the mountains of India. *T. Belerica* produces great part of the myrobalans of commerce of that name; the fruit is about the size of a nutmeg, very astringent, with bitter kernels, to which intoxicating qualities have been ascribed. It is also said to be tonic, but is now scarcely used in medicine. The bark of the tree abounds in a gum, resembling gum-arabic, which is soluble in water and burns away in the flame of a candle. The kernel of the fruit is said to yield an oil which encourages the growth of the hair. Other forms of myrobalans are the Chebulic, the fruit of *T. chebulica*; the Citrine, the fruit of *T. citrina*; and the Indian, which are the small unripe fruits of either or all of the preceding. They are all chiefly in request by tanners, dyers, and the manufacturers of ink. Emblic myrobalans, the fruit of *Embolia officinalis*, of the natural order Euphorbiaceæ, are used in India as tonics and astringents, in tanning, and in the making of ink. For Myrobalan Plum, see PLUM.

Myron, Greek sculptor, a native of Eleutheræ, flourished about 450 B.C. He was a fellow-pupil of Phidias, and excelled in modelling athletes, animals, and figures in motion. His most cele-

brated works were the 'Discobolos,' 'Ladas the Runner,' 'A Cow,' and 'Athene and the Satyr.' Copies have survived of the first and last only. Myron worked principally in bronze.

Myrrh (Heb. *mur*), a gum-resin produced by *Balsamodendron* (q.v.) *myrrha*, a tree of the natural order Amyridaceæ, growing in Arabia, and also in Somali Land. The myrrh-tree is small and scrubby, spiny, with whitish-gray bark, thinly-scattered small leaves, each consisting of three obovate leaflets with obtuse toothlets, and the fruit a smooth brown ovate drupe, somewhat larger than a pea. Myrrh exudes from the bark in oily yellowish drops, which gradually thicken and finally become hard, the colour at the same time becoming darker. Myrrh has been known and valued from the most ancient times; and was amongst the presents which the wise men from the East brought to the infant Jesus. (The 'myrrh' of Gen. xxxvii. 25, Heb. *lôt*, was probably Ladanum, q.v.) Myrrh appears in commerce either in tears and grains, or in pieces of irregular form and various sizes, yellow, red, or reddish brown. It is brittle, and has a waxy fracture, often exhibiting whitish veins. Its smell is balsamic, its taste aromatic and bitter. It is used in medicine as a tonic and stimulant, in disorders of the digestive organs, excessive secretions from the mucous membranes, &c., also to cleanse ulcers and promote their healing, and as a dentifrice, particularly in a spongy or ulcerated condition of the gums. It was much used by the ancient Egyptians in embalming. The best myrrh is known in commerce as *Turkey Myrrh*, but practically all myrrh comes either from Aden or from Bombay.

Myrrh
(*Balsamodendron myrrha*).

Myrtaceæ, a natural order of exogenous plants, consisting of trees and shrubs, natives chiefly of warm, but partly also of temperate, countries. The order, as defined by the greater number of botanists, includes several sub-orders, which are regarded by some as distinct orders, particularly Chamelauciaceæ (in which are contained about fifty known species, mostly beautiful little bushes, often with fragrant leaves, natives of Australia and Tasmania), Barringtoniaceæ, and Lecythidaceæ. Even as restricted, by the separation of these, the order contains about 1300 known species. The leaves are entire, usually with pellucid dots, and a vein running parallel to and near their margin.—Some of the species are gigantic trees, as the *Eucalypti* or Gum Trees of Australia, and different species of *Metrosideros*, of which one is found as far south as the Auckland Islands, in 50½° lat. The timber is generally compact.—Astringency seems to be rather a prevalent property in the order, and the leaves or other parts of some species are used in medicine as astringents and tonics. A fragrant or pungent volatile oil is often present in considerable quantity, of which

Oil of Cajeput and Oil of Cloves are examples. Cloves and Pimento are amongst the best-known products of the order. The berries of several species are occasionally used as spices in the same way as the true Pimento. A considerable number yield pleasant edible fruits, among which are the Pomegranate, the Guava, species of the genus *Eugenia*, and some species of myrtle.

Myrtle (*Myrtus*), a genus of Myrtaceæ, the characteristics of which are well illustrated in the accompanying figure. The Common Myrtle (*M. communis*) is well known as a beautiful evergreen shrub, or a tree of moderate size, with white flowers. It is a native of all the countries around the Mediterranean Sea, and of the temperate parts of Asia, often forming thickets, which sometimes occur even within the reach of the sea-spray. The leaves are ovate or lanceolate, varying much in breadth. They are astringent and aromatic, contain a volatile oil, and were used in medicine by the ancients as a stimulant. The berries are also

Myrtle (*Myrtus communis*):
a, branch in flower; b, vertical section
of flower.

aromatic, and are used in medicine in Greece and India. A myrtle wine is also made. Myrtle-bark is used for tanning in many parts of the south of Europe. Among the ancient Greeks the myrtle was sacred to Venus, as the symbol of youth and beauty, was much used in festivals, and was, as it still is, often mentioned in poetry. The myrtle endures the winters of Britain only in the mildest situations in the south. The Small-leaved Myrtle of Peru (*M. microphylla*) has red berries of the size of a pea, of a pleasant flavour and sugary sweetness. Those of the Luma (*M. luma*) are also palatable, and are eaten in Chili, as are those of the Downy Myrtle (*M. tomentosa*) on the Neilgherry (Nilgiri) Hills, and those of the White-berried Myrtle (*M. leucocarpa*) in Greece and Syria. The berries of this species or variety are larger than those of the common myrtle. A very humble species of myrtle (*M. nummularia*) spreads over the ground in the Falkland Islands, as thyme does in Britain. *M. Ugni*, a native of Chili, was about 1865 highly extolled as a fruit-bearing shrub adapted to the warmest districts of Britain; but it proved unfit for open-air culture, though it fruits freely in an unheated greenhouse. The fruit emits an aromatic fragrance which permeates the atmosphere around the plant continually, and the juicy pulp of the berries possesses a rare mixture of sweetness and spiciness which is very agreeable.

Myrtle-wax. See CANDLEBERRY.

Mysia, a district of ancient Asia Minor, having the Propontis (Sea of Marmora) on the N., the Ægean on the W., Lydia on the S., and Bithynia and Phrygia on the E. The Troad (see TROY) was one of its subdivisions.

Mysis, a genus of podophtalmous (stalk-eyed) crustaceans, of the order Stomapoda, much resembling the common shrimps in form.

Mysore, or MAISUR, a native state of Southern India, is surrounded entirely by districts of the Madras Presidency. The area is 24,700 sq. m. Pop. (1871) 5,055,412; (1881) 4,186,188. Mysore is an extensive tableland much broken by hill-ranges and deep ravines, and is divided into two portions, a little north of 13° N. lat., by the watershed between the Kistna and the Kaveri rivers. Numerous isolated rocks (*drugs*), rising to 4000 or 5000 feet, are a peculiarity of the country, and have been mostly converted into hill-fortresses. The rivers are used for irrigation purposes, but are not navigable. The climate of the higher districts is during a great portion of the year healthy and pleasant. The annual value of the exports, chiefly betel nut and leaves, coffee, ragi, gram, cotton, piece-goods, cardamoms, rice, silk, and sugar, is above £1,200,000. The imports, consisting mainly of piece-goods, cloth, wheat, silver, gold, cotton, rice, silk, betel-leaves, and pepper, are over £1,500,000. The ruinous misgovernment of the native prince led the British to assume the administration in 1831; but in 1881 Mysore was restored to the native dynasty. The famine years (1876-78) told with great severity on that state. Chief town, Mysore; but the British headquarters were at Bangalore. For the history of Mysore, see HYDER ALI, TIPPOO SAIB, and INDIA.

The capital of the state, **MYSCORE**, is situated amid picturesque scenery on a declivity formed by two parallel ranges running north and south, 245 miles WSW. of Madras. A prosperous, well-built town, it has broad, regular streets, and substantial houses and public buildings. On the south side stands the fort, which encloses the rajah's palace; its chief object of interest is a magnificent chair or throne of fig-wood, overlaid with ivory and gold. Pop. (1881) 60,292. The gold obtained by the various companies working at Kolar in the east of Mysore amounted in 1877 to 15,403 ounces, in 1888 to 35,073 ounces, in 1889 to about 72,000 ounces.

Mystagogue (Gr. *mystēs*, 'an initiated person,' and *ago*, 'I lead'), the name in the Greek religious system of the priest whose duty it was to direct the preparations of the candidates for initiation in the several mysteries, as well as to conduct the ceremonial of initiation. The same name is applied in the Christian church as early as the 4th and 5th centuries to the catechists or other clergy who prepared candidates for the Christian *mysteries*, or sacraments, of baptism, confirmation, and the eucharist, especially the last.

Mysteries (Gr. from *μύω*, 'I close the lips or eyes'), also called *Teletai*, *Orgia*, or, in Latin, *Initia*, designates certain rites and ceremonies in ancient, chiefly Greek and Roman, religions, only known to, and practised by, congregations of certain initiated men and women, at appointed seasons, and in strict seclusion. The origin, as well as the real purport of these mysteries, which take no unimportant place among the religious festivals of the classical period, and which, in their ever-changing nature, designate various phases of religious development in the antique world, is all but unknown. It does seem, indeed, as if the vague speculations of modern times on the subject were an echo of the manifold interpretations of the various acts of the mysteries given by the priests to the inquiring disciple—according to the lights of the former or the latter. Some investigators, themselves not entirely free from certain mystic influences (like Creuzer and others), have held them to have been a kind of misty orb around a kernel of pure light, the bright rays of which were too strong for the eyes of the multitude;

that, in fact, they hid under an outward garb of mummery a certain portion of the real and eternal truth of religion, the knowledge of which had been derived from some primeval or, perhaps, the Mosaic revelation; if it could not be traced to certain (or uncertain) Egyptian, Indian, or generally eastern sources. To this kind of hazy talk, however (which we only mention because it is still repeated every now and then), the real and thorough investigations begun by Lobeck, and still pursued by many competent scholars in our own day, have, or ought to have, put an end. There cannot be anything more alien to the whole spirit of Greek and Roman antiquity than a hiding of abstract truths and occult wisdom under rites and formulas, songs and dances; and, in fact, the mysteries were anything but exclusive, either with respect to sex, age, or rank, in point of initiation. It was only the speculative tendency of later times, when Polytheism was on the wane, that tried to symbolize and allegorize these obscure ceremonies. The very fact of their having to be put down in later days as public nuisances in Rome herself speaks volumes against the occult wisdom inculcated in secret assemblies of men and women.

How it was that in the best times of Greece these mysteries had such a hold on such large numbers of people is a point about which there need be no mystery. It is perfectly plain. God has at no time left himself without a witness. The Greeks were men; and being men found it impossible to believe that with the death of the body man's life was at an end, or that the sufferings of the innocent met with no reward, the triumph of the wicked with no requital. But the Greeks had no revealed religion, no authoritative teaching on this point. Yet the religious sentiment required some external support for this aspiration, craved some confirmation of this hope. And at the celebration of the mysteries the man or woman whose thoughts were fixed upon the next world found his or her faltering hope strengthened by the sympathy of thousands who were present from the same motives and in the same faith. That this is the secret of the mysteries is indicated partly by the fact that it was the resurrection of various gods which was most prominently set before the eyes of the initiated; and still more by such expressions as that of Pindar (fr. 137), 'Blessed is he who has seen them before he goes below ground;' or of Sophocles (fr. 719), 'Thrice happy they who have been initiated before they die, for theirs is the lot of life, and evil is it with the others;' or of the chorus of the initiated in Aristophanes (*Ran.* 455), 'We alone enjoy the holy light, we, who were initiated and led a life of godliness toward both kin and stranger;' or of the stone record (*Ephem. arch.* 1883), 'To the initiated death is not an evil: it is a gain.'

The mysteries, as such, consisted of purifications, sacrificial offerings, processions, songs, dances, dramatic performances, and the like. The mystic formulas (*Deiknumena*, *Dromena*, *Legomena*, the latter including the Liturgies, &c.) were held deep secrets, and could only be communicated to those who had passed the last stage of preparation at the mystagogue's hand. The hold which the nightly secrecy of these meetings, together with their extraordinary worship, must naturally have taken upon minds more fresh and childlike than our advanced ages can boast of was increased by all the mechanical contrivances of the effects of light and sound which the priests could command. Mysterious voices were heard singing, whispering, and sighing all around, lights gleamed in manifold colours from above and below, figures appeared and disappeared; the mimic, the tonic, the plastic—all the arts, in fact, were taxed to their very utmost to

make these performances (the nearest approach to which, in this country, is furnished by transformation-scenes, or sensation-dramas in general) as attractive and profitable (to the priests) as could be. As far as we have any knowledge of the plots of these Mysteries as scenic representations, they generally brought the stories of the special gods or goddesses before the spectator—their births, sufferings, deaths, and specially their resurrections. Many were the outward symbols used, of which such as the Phallus, the Thyrsus, Flower Baskets, Mystic Boxes, in connection with special deities, told more or less their own tale, although the meanings supplied by later ages, from the Neoplatonists to our own day, are various, and often very amazing. The most important Mysteries were, in historical times, those of Eleusis and the Thesmophorian, both representing—each from a different point of view—the rape of Proserpina, and Ceres' search for her: the Thesmophorian mysteries being also in a manner connected with the Dionysian worship. There were further those of Zeus of Crete (derived from a very remote period), of Bacchus himself, of Cybele, and Aphrodite—the two latter with reference to the Mystery of Procreation, but celebrated in diametrically opposed ways, the former culminating in the self-mutilation of the worshipper, the latter in prostitution. Further, there were the Mysteries of Orpheus, who in a certain degree was considered the founder of all mysteries. Nor were the other gods and goddesses forgotten: Hera, Minerva, Diana, Hecate, nay, foreign gods like Mithras (q.v.) and the like, had their due secret solemnities all over the classical soil, and whithersoever Greek (and partly Roman) colonists took their Lares and Penates all over the antique world. The Eleusinian mysteries can be traced back to the 7th century B.C. (cf. *Homeric Hymn to Demeter*, l. 473 ff.) In the time of Herodotus as many as 30,000 people attended them (viii. 65); and between 490–430 B.C., the period of Athens' highest power and of the Eleusinian mysteries' greatest fame, the number must have been much greater. When, towards the end of the classical periods, the mysteries were no longer secret, but public orgies of the most shameless kind, their days were numbered. The most subtle metaphysicians, allegorise and symbolise as they might, failed in reviving them, and in restoring them to whatever primeval dignity there might have once been inherent in them.

See Lobeck, *Aglaophamus* (1829); Preller, in *Pauly's Encyc.* s. v.; Chr. Petersen, *Der geheime Gottesdienst* (1848); Lehrs, *Populäre Aufsätze*; Baumeister, *Denkmäler*, s. v. *Eleusinia*; and P. Stengel, in *Müller's Handbuch der Klassischen Altertums-wissenschaft*, vol. v. pt. 3.

Mysteries and Miracle-plays were dramas founded on the historical parts of the Old and New Testaments, and the lives of the saints, performed during the middle ages, first in churches, and afterwards in the streets on fixed or movable stages. Mysteries were properly taken from biblical and miracle-plays from legendary subjects, but this distinction in nomenclature was not always strictly adhered to. We have an extant specimen of the religious play of a date prior to the beginning of the middle ages in the *Christos Paschōn*, assigned, somewhat questionably, to Gregory Nazianzen, and written in 4th-century Greek. Next come six Latin plays on subjects connected with the lives of the saints, by Hroswitha (c. 920–968), a nun of Gandersheim, in Saxony, which, though not very artistically constructed, possess considerable dramatic power and interest; they were discovered by Konrad Celtes and by him first published in 1501 at Nuremberg. The performers were at first the clergy and choristers; afterwards any layman

might participate. The earliest record of the performance of a miracle-play in England is found in Matthew Paris, who relates that Geoffrey, afterwards Abbot of St Albans, while a secular, exhibited at Dunstable in 1110 the miracle-play of *St Catherine*, and borrowed copes from St Albans to dress his characters. Fitzstephen, in his *Life of Thomas à Becket* (1183), describes with approval the representation in London of the sufferings of the saints and miracles of the confessors. On the establishment of the Corpus Christi festival by Pope Urban IV. in 1264, miracle-plays became one of its adjuncts, and every considerable town had a fraternity for their performance. Throughout the 15th and following centuries they continued in full force in England, and are mentioned, sometimes approvingly, sometimes disapprovingly, by contemporary writers. Designed at first as a means of religious instruction for the people, they had long before the Reformation so far departed from their original character as to be mixed up in many instances with buffoonery and irreverence, intentional or unintentional, and to be the means of inducing contempt rather than respect for the church and religion. An example of the degradation of the Mysteries may be seen in the folk-book of Till Eulenspiegel (q.v.). They lingered on after the Reformation, the mystery-play of *The Three Kings of Cologne* being performed at Newcastle so late even as 1599. Remarkable collections exist of English mysteries and miracles of the 15th century, known as the Towneley Mysteries (Surtees Soc. 1836), the Coventry Mysteries (Shakespeare Soc. 1841), the Chester Plays (Shakespeare Soc. 1843), and the York Plays (Clar. Press, 1885).

Out of the mysteries and miracle-plays sprang a third class of religious plays, called *Moralities*, in which allegorical personifications of the Virtues and Vices were introduced as *dramatis personæ*. These personages at first took part in the play along with the scriptural or legendary characters, but afterwards entirely superseded them. The oldest known English compositions of this kind are of the time of Henry VI.; they are more elaborate and less interesting than the miracle-plays. Moralities continued in fashion till Elizabeth's time, and were the immediate precursors of the regular drama.

Miracle-plays and mysteries were as popular in France, Germany, Spain, and Italy as in England; and indeed some of the *pastorales* still acted among the Basques (q.v.) are mere survivals. A piece of the kind yet extant, composed in France in the 11th century, is entitled the *Mystery of the Wise and Foolish Virgins*, written partly in Provençal, partly in Latin. A celebrated fraternity, the *Confrérie de la Passion*, founded in Paris in 1350, had a monopoly for the performance of mysteries and miracle-plays, the exhibition of each of which took several days. Many of these are still extant.

It is a mistake to suppose that the hostility of the Reformers was what suppressed these exhibitions. The fathers of the Reformation showed no unfriendly feeling towards them. Luther is reported to have said that they often did more good and produced more impression than sermons; and Bishop Bale's *Breve Comedy of Johan Baptyste* (1538) is an onslaught on the friars. The most direct encouragement was given to such plays by the founders of the Swedish Protestant Church, and by the earlier Lutheran bishops, Swedish and Danish. The authorship of one drama of the kind is assigned to Grotius. In England the greatest check they received was from the rise of the secular drama; yet they continued to be occasionally performed in the times of James I. and Charles I., and it is well known that the first sketch of Milton's *Paradise Lost* was a sacred drama, where the opening speech was Satan's Address to the Sun.

A degenerate relic of the miracle-play may yet be traced in some remote districts of England, where the story of St George, the dragon, and Beelzebub is rudely represented by the peasantry. Strange to say, it was in the Catholic south of Germany, where these miracle-plays and mysteries had preserved most of their old religious character, that the severest blow was levelled against them. In 1779 a manifesto was issued by the Prince-archbishop of Salzburg, condemning them, and prohibiting their performance, on the ground of their ludicrous mixture of the sacred and the profane, the frequent bad acting in the serious parts, the distraction of the lower orders from more edifying modes of instruction, and the scandal arising from the exposure of sacred subjects to the ridicule of freethinkers. This ecclesiastical denunciation was followed by vigorous measures on the part of the civil authorities in Austria and Bavaria. One exception was made to the general suppression. In 1633 the villagers of Oberammergau (q.v.), in the Bavarian highlands, on the cessation of a plague which desolated the surrounding country, had vowed to perform every tenth year the Passion of Our Saviour, out of gratitude, and as a means of religious instruction; a vow which had ever since been regularly observed. The pleading of a deputation of Ammergau peasants with Maximilian of Bavaria saved their mystery from the general condemnation, on condition of everything that could offend good taste being expunged. It was then and afterwards somewhat remodelled, and is perhaps the only mystery or miracle-play which has survived to the present day—taking place every ten years (1870, 1880, 1890, &c.). The inhabitants of this secluded village, long noted for their skill in carving in wood and ivory, have a rare union of artistic cultivation with perfect simplicity. Their familiarity with sacred subjects is even beyond what is usual in the alpine part of Germany, and the spectacle seems still to be looked on with feelings much like those with which it was originally conceived. What would elsewhere appear impious, is to the alpine peasants devout and edifying. The personator of Christ considers his part an act of religious worship; he and the other principal performers are said to be selected for their holy life, and consecrated to their work with prayer. The players, about 500 in number, are exclusively the villagers, who, though they have no artistic instruction except from the parish priest, act their parts with no little dramatic power, and a delicate appreciation of character. The New Testament narrative is strictly adhered to, the only legendary addition to it being the St Veronica handkerchief. The acts alternate with *tableaux* from the Old Testament and choral odes. Many thousands of the peasantry are attracted by the spectacle from all parts of the Tyrol and Bavaria, among whom the same devout demeanour prevails as among the performers. Plays of a humbler description, from subjects in legendary or sacred history, are not unfrequently got up by the villagers around Innsbruck, which show a certain rude dramatic talent.

See Leroy's *Études sur les Mystères* (1837); Monmerqué and Michel, *Théâtre Français au moyen âge, 12^e-16^e Siècles* (1839); Mone, *Schauspiele des Mittelalters* (1846); A. d'Ancona, *Sacre rappresentazione dei Secoli 14-16* (Flor. 3 vols. 1872); Sepet, *Le Drame Chrétien au moyen âge* (1878); Petit de Julleville, *Histoire du Théâtre en France* (2 vols. 1880); *Miracle-plays*, by K. Hase, trans. by Jackson (1880); A. W. Pollard, *English Miracle-plays, Moralities, and Interludes* (1890); the classified list of *References for Students of Miracle-plays and Mysteries*, by Francis H. Stoddard (Berkeley, U.S. 1887); and, for the passion-play at Oberammergau, works by Seguin, Tweedie, Farrar, and others.

Mysticism is not so much a definite system of thought as a tendency of religious feeling, cher-

ished more or less at different periods in most religions by individuals or groups: the essential element being the effort to attain to direct and immediate communion with God or the divine. The tendency appears in the Mysteries (q.v.) of the Greeks, but is more marked in Buddhism, in various Hindu sects, in Sufism, and is the most prominent feature in Neoplatonism and some of the Gnostic systems. But it is more especially to Christian writers of the middle ages that the name of mystics is wont to be given, one of the earliest being Dionysius the Areopagite, followed by Scotus Erigena; and this mode of thought or mood of mind developed itself specially in opposition to the dry, cold, rationalistic formalism of scholastic theology. Among the great Catholic mystics are Bernard of Clairvaux; his contemporaries the Victorines—Hugo, Richard, and Walter of St Victor near Paris; Bonaventura; John of Chur (died 1380); and Thomas à Kempis. The German mystics are specially Meister Eckhart, Suso, Tauler, Ruysbroeck. Aberrant or fanatical forms are found amongst the Fraticelli, Beghards, Beguines, the Brethren of the Free Spirit, the Brethren of the Common Life (to whom Thomas à Kempis belonged), and the Anabaptists. Less theological and more philosophical are Paracelsus, Bruno, Campanella, Jacob Boehme, Schelling, and Swedenborg. In England William Law is a conspicuous example; and some of the Cambridge Platonists like Henry More were to some extent mystical in their religious teaching. Millenarianism has produced several types; from Jansenism sprang the Convulsionaries. In modern Catholicism St Theresa, Fénelon, Madame Guyon, Molinos, the Quietists, and Bourignon may be specially mentioned. Most of them are discussed in separate articles.

See BOEHME, ECKHART, &c., in this work; also ILLUMINATI, ROSICRUCIANS, THEOSOPHY; Vaughan, *Hours with the Mystics* (1856; 3d ed. 1880); Du Prel, *The Philosophy of Mysticism* (trans. by Massey, 1889); and German works on the subject by Görres (1846), Helfferich (1842), Noack (1853), Preger (1881).

Mythology. A myth is a story told about gods or heroes. Mythology is a term sometimes applied to the collected myths of a nation, sometimes to the scientific study of myths. Mythology in the latter sense of the term has for its object not to ascertain why men believe in gods—that is rather the business of the science of religion—but, granted the belief, why men tell these (sometimes extraordinary) stories about them. The first nation to busy itself with this enquiry was the nation whose mythology had the most luxuriant development, the Greeks. From very early times they started their enquiry with the assumption that there must be something behind the myths as known to them—that there was some meaning in a myth. Thus far, they were as regards most myths quite right. The mistake, however, which the Greek philosophers who undertook to recover the original meaning of various myths made was that they imagined the authors of these myths to be, like themselves, philosophers. In other words, they imagined that not only was there a meaning concealed behind myths, but that that meaning had been intentionally concealed, and that myths were the vehicles by which philosophical teaching had been originally conveyed, and in which it might still be detected. Myth was identified with allegory. The particular branch of philosophy supposed to be veiled by mythology depended on the taste of the particular mythologist. Anaxagoras discovered psychological teaching behind the veil; Empedocles found his own theory of the four elements capable of being stated in terms of mythology (see EMPEDOCLES), and he thus effected the first reconciliation between science and religion.

And speaking generally, we may say that from that day to this the magic mirror of mythology has never failed to show to every enquirer that which he wished to see in it. The next attempt at interpretation, which also proceeded from Greece, was to strip myth of all that was supernatural and affirm the residuum to be history (see EUHEMERISM, to which article it is only necessary here to add that in the opinion of Gruppe, in *Die griechischen Culte und Mythen* (vol. i. 1887), the work of Euhemerus was not intended as an explanation of mythology, though it was subsequently regarded as such, but was a romance of much the same character as some of Lucian's work or *Gulliver's Travels*). It is interesting to note that in India an independent attempt was made by the Aitihasika school to explain the mythology of the Vedas as history clothed in the garb of the supernatural. The two modes of interpretation already described—the allegorical and the Euhemeristic—continued to be the only methods applied throughout Roman and Christian times to the present century, nor can they be said to be wholly extinct even now. At Rome the Stoics, developing systematically what had been rather suggested than definitely formulated by Empedocles, endeavoured to explain all myths as but allegorical descriptions of physical facts. They failed, however, to explain just those myths which most required explanation, the immortal, brutal, and bestial myths, for examples of which we may refer to Vol. V. p. 385 of this work. Their failure was the more remarkable inasmuch as in India the same key had been applied by the native grammarians with considerable apparent success: but we must remember that the science of grammar had been already carried to great perfection in India, and that some of the mythological figures in the Vedas have names which are much more obviously names of nature-powers than is the case in Greek mythology. For instances of native Indian interpretations we may refer to Max-Müller's *History of Ancient Sanskrit Literature*, p. 529. Inadequate as was the allegorical interpretation of myth, it continued to enjoy an undisputed mastery of the field of investigation in Europe for many centuries. But, as it was sterile to the end, we need here only mention the fact that the latest and most learned form in which it appeared was the *Symbolik und Mythologie der alten Völker* of Creuzer (q.v.), published 1810-12. The effect of the publication of this work was to overthrow the mode of interpretation which it was designed to prove and illustrate. It led to a thorough investigation of the assumptions on which the allegory theory was based; and an era in the history of mythology as a science is marked by the demonstration given by Lobeck in his *Aglaophamus* (1829), of the utter untenability of these assumptions. What is implied in any theory which explains myths as truths conveyed in the form of allegories is the existence of a caste or class of priests or philosophers, possessing a recondite knowledge and teaching it by means of parables. Now the existence of such a class or caste is a matter which requires to be proved, and of which the proof must satisfy the canons of historical criticism. And it may safely be said that there is absolutely no evidence whatever to show that such a class ever existed amongst the Greeks or any other Indo-Germanic nation.

The establishment of this negative conclusion by Lobeck paved the way for the next step forward in the science of mythology. Scholars had hitherto assumed that the authors of myths were men of learning, philosophers. After the exposure of this error, the next step was to recognise the necessity not only of throwing aside our modern, civilised, artificial ideas, but also of

endeavouring to see the myths in 'the light in which they presented themselves to the Homeric or Hesiodic audience.' The conviction of this necessity manifests itself, after the time of Lobeck, in Grote, from whom the quotation in the last sentence is made, Lehrs (*Gott, Götter, und Dämonen*), and Renan (*Études de l'Histoire Religieuse*). Now, if we try to see myths as primitive man saw them, we can hardly doubt that to the Greek of Homer's time or Hesiod's Aphrodite must have presented herself as the ideal of female beauty, Demeter as the perfect type of motherhood, and so on. Thus far it was thought, by Grote and others, possible to go in the way of interpretation: the Greek was at all times characteristically given to anthropomorphism. But to go further and try to explain not only the individual figures of the gods, but the relations in which those figures are represented by myth as standing to each other, was, by a natural reaction against the exploded system of allegorical interpretation, considered to be futile. Primitive man is but a child; he lives in a world of dreams and fancies which are to him as real as the waking world of facts. As for coherence or meaning in what he chose to dream about his gods, you may as well undertake to decide what shapes the clouds have or what words the bells say. The imagination knows no law, or at the most is subject only to the laws of poetical and æsthetic consistency. It is vain to endeavour to go beyond the myth, or behind it. It is like the curtain of Zeuxis, which was itself the picture. There is nothing behind it. This, as we have said, was a natural reaction, but the pendulum swung too far. No one at the present day would think of denying that in many cases there is something behind the veil—that most myths have a meaning of some kind. Nor would any one now admit that myths possess poetic or æsthetic consistency; on the contrary, one of the problems of scientific mythology is to explain the inconsistency of feeling which is to be found in myths relating to the same subject, to explain, for instance, the repulsive origin attributed by mythology to Aphrodite, the type of feminine beauty, or the amour carried on by Demeter, the ideal of motherhood, in the shape of a mare, with Poseidon.

A partial solution of this problem was afforded by the brothers Grimm (q.v.), whose labours mark a new era in mythology. While collecting their famous fairy tales from the mouths of the people, they were forced to the conclusion that many a tale which had hitherto only been known in a literary form had existed orally long before it had been put on paper or shaped into verse, and the further inference from this became the wide-reaching conclusion that mythology was not, as the allegory theory had falsely taught, the work of the superior few, but the production of the people. It was the way in which the many expressed their religious feeling. It was their only mode of expression, and it was theirs exclusively. The current of mythology, on this theory, flows from the lower strata of society to the upper. Here we have an explanation of the incongruity existing in the myths told of Aphrodite or Demeter, for instance; for myths could not be perpetually retold in one generation after another without being reshaped to suit the changing modes of thought of different generations. But it will be also noticed that, granting that the current of mythology is upwards from below, we are no nearer an answer to the question, Why do men tell the extraordinary stories they do tell about their gods? The quarter, however, in which an answer to this question might be looked for was indicated by Grimm.

One and the same myth may be found, in different forms, amongst different Aryan peoples (see

Vol. I. p. 471), and although some such myths may have been borrowed by one people from another, just as one language may borrow words from another, still the resemblances between the myths of different Aryan peoples could, like the resemblance between their languages, be only properly accounted for on the supposition that they had been handed down by each separate people from a time when the forefathers of all were united in one home, one tongue, one faith. In fine, the solution of the problem was to be sought in the application of the comparative method to the study of mythology, and in the creation of a comparative mythology of the Aryan peoples. The verification of this hypothesis was supposed to have been effected when it was discovered that the literature of Sanskrit threw the same light on the structure of myths as the language of Sanskrit had thrown on the structure of the Aryan tongues. Comparative mythology may fairly be said to be the creation of two scholars—in Germany Adalbert Kuhn (1812–81), and in England Max-Müller (q.v.). The object of the school founded by them is to trace myths back to Aryan times, to determine their original forms, and, having done this, to show what was their original meaning, and any changes that may have subsequently come over that meaning. Their guiding principle is that in the Vedas (q.v.) we see Aryan myths in their earliest form—indeed, that we see them in process of making. The conclusion to which they come is that, owing to the defects of language in its earliest stage, the primitive Aryan could only speak of natural objects as living things, and that in consequence he came to believe that all nature was possessed of life. Again, as in language we can only predicate of a subject something which the subject is not, so in myth, primitive man could only express a phenomenon of nature by comparing it with something which it was not—in fact, could only express it by a simile. When in course of time, and owing to the 'disease of language,' the meaning of the simile came to be forgotten, what had originally been a very innocent comparison might become a very repulsive myth. For instance, the sun's relation to the dawn may be likened to that of a husband to his wife, or of a son to his mother; and a myth of incest may be the result.

The reaction against the allegory theory, which was strongest in the time of Grote, has, we observe, ceased by the time of Max-Müller, and the pendulum once more approaches more nearly to the true mean. According to the comparative mythologists, there is, after all, something behind myth; not, however, an intentionally veiled meaning, but an unintentionally forgotten substratum, a simile originally descriptive of some natural phenomenon. But though this school is right in maintaining that myths have a meaning, and that in some cases the meaning is to be found in a metaphorical description of the sun, the dawn, the wind, &c., the extremes to which this mode of interpretation has been pushed have caused a revolt amongst recent mythologists. The earliest insurgent, Mannhardt (1831–89), was content to turn from the Vedas to popular beliefs and folk-tales as the earliest stratum accessible to the comparative mythologist; but the latest revolter, and we may say the greatest, that is Gruppe, rejects the comparative method altogether, and undertakes to demonstrate in his second and following volumes that myths have been borrowed by one nation from another, not handed down from the common ancestors of the separate peoples. It seems indeed impossible to deny that, with regard to the importance of Sanskrit, the same mistake has been made by comparative mythologists as was at first made by comparative philologists. The conviction is spreading that the myths of the Vedas

form a literary mythology which is nothing like so near to the myth-making stage in the history of a people as are many of the popular traditions of the peasantry of Europe. On the other hand, although Max-Müller and his school have been guilty of many offences against the canons of comparative philology in their desire to identify the names of mythological figures, Gruppe undoubtedly has gone too far in asserting that comparative philology lends no support whatever to the belief that the Aryans possessed any gods at all. Zeus, Aurora, and Agni may safely be said to have been known to the Aryans, and to have been worshipped as deities.

Another series of attacks has been made upon the Kuhn and Müller school on the ground that, if the comparative method is to be applied, it should be applied to the whole of the facts, and not to one particular section of them. In other words, we must not confine ourselves to Aryan myths, but must open our eyes to the fact that nearly every Aryan myth can be paralleled by similar tales from the remotest quarters of the globe. No explanation which explains only a part of the phenomena and leaves other exactly similar phenomena unexplained can possibly be the right explanation. Obviously, therefore, it is impossible to find the key to all the mythologies in any peculiarity of language, for such peculiarity or 'disease' would only affect the mythology of the nations speaking that language or family of languages. The mythologist has not only to answer the question why men tell their extraordinary tales about the gods, but also the question why do they all tell the same sort of story, no matter what race or clime they belong to. The theory that all myths are derived from a common centre, from which they spread in all directions over the face of the earth by borrowing, would explain the similarity in the myths; but, until that theory is more fully elaborated than it is at present, the field is held by a theory of mythology of which the most distinguished champion in England is Mr Andrew Lang (q.v.). It is, briefly, that myths are survivals from a primitive stage of culture through which all races pass, and in which they much resemble each other. *Ex eisdem eadem*. Primitive man, whether of the stone age on this side of the world or on the other, chipped his flint implements in much the same way; and no one thinks of accounting for the resemblance between the implements thus manufactured by any theory of borrowing or of common descent. It is obvious that the same causes acting on the same organisms produce similar results, and this is as true of mental and moral culture as of material culture. Here, too, we have the explanation of the strange nature of many myths; what seems brutal to us does not seem brutal to the savage. There is therefore nothing surprising in the fact that the gods and heroes of the savage are, like himself, savages. Above all, the same problems presented themselves to primitive peoples in all parts of the world, and were solved by the aid of the same analogies. What was the origin of man? of the world? What causes rain? Why does the wind blow? Why does the sun behave as he does? Why are certain customs observed? The answers which commended themselves to primitive man constitute mythology. At the same time there is no reason to believe that primitive man was not as fond of hearing and telling stories as civilised man is of reading novels. And though most myths may be the explanations which

were invented to explain what seemed to primitive man to need explanation, some myths probably were from the beginning designed solely for the gratification of the imagination.

In addition to the works of Creuzer, Lobeck, Grote, Lehra, Renan, Grimm, and Gruppe already referred to, see Max-Müller's various works, and particularly his *Biographies of Words*; Mannhardt, *Wald und Feldkulte*; Schrader, *Prehistoric Antiquities of the Aryan Peoples*; E. B. Tylor, *Early History of Mankind and Primitive Culture*; A. Lang, *Custom and Myth and La Mythologie* (Paris, 1886); Canon Taylor, *Origin of the Aryans*; Chantepie de la Saussaye, *Religions-geschichte*; C. Petersen, article *Mythologie* in Ersch and Gruber; L. Preller, *Griechische Mythologie*; P. Decharme, *Mythologie de la Grèce antique*; and Roscher's *Lexikon der Mythologie*. Myxœdema is the name generally accepted for a diseased condition first described by Sir William Gull in 1873. It occurs in adults, generally females, and is characterised by a thickening of the subcutaneous tissue, most noticeable in the face (which becomes enlarged, swollen-looking, and expressionless) and the hands, with a simultaneous dulling of all the faculties and slowing of the movements of the body. A precisely similar condition occurs in many cases where the thyroid gland has been removed for disease. Myxœdema is very slow in its progress, but undoubtedly tends to shorten life. It greatly resembles cretinism, except that the mental condition is much less affected, and that the deformities resulting from arrested development are not present. See Horsley in *Brit. Med. Journal*, January 1885.

Myxomycetes, or MYCETOZOA, a class of very simple organisms, often claimed by botanists as fungi, generally regarded by zoologists as primitive Protozoa, the fact being that they have not taken any very definite step along either of the lines which lead to plants or to animals. One of the most familiar is *Fuligo* or *Æthelium septicum*—the 'flowers of tan'—which spreads in summer on the bark of the tan-yard. They live on damp surfaces exposed to air, especially on rotting wood, and feed on organic debris. They form composite masses or *plasmodia*, in which numerous units are fused, or in rare cases simply combined in close contact. On the margins of such a mass amoeboid processes of living matter flow in and out, with streaming internal movement, and the plasmodium spreads towards moisture, food, and warmth, or away from the light. Drought, cold, or scarcity of food produce a dormant encysted stage. At other times part of the plasmodium divides into spores, each enclosed in a coat, which bursts and liberates a swarm spore, sometimes flagellate, always eventually like a little amoeba. A number of these minute amoebæ unite to form the plasmodium from which we started. About two hundred species have been described. See FUNGI, PROTOZOA; De Bary, *Die Mycetozoen* (1864); Zoph, *Die Schleimpilze*, in Schenk's *Botanik*, iii. (1887).

Mzensk, a town in the Russian government of Orel, 200 miles SSW. of Moscow. Pop. 15,067.

N

the fourteenth letter in our alphabet, is derived from the hieroglyphic sign for water (see ALPHABET). When taken over by the Phœnicians it was called *nun*, 'the fish.' The earliest Greek form was *Ν*, which afterwards became *N*. Our script form, *n*, is derived from the old Roman cursive. The sound of *n* is defined as a nasal dental. It is produced when the organs are in the position for pronouncing *d*, and the breath is allowed to pass into the nose. Hence *n* attracts *d*, as in *expond* from *expono*, *sound* from *sonus*, or in *thunder* and *hind* from Old English *thunor* and *hine*. Our two nasals *m* and *n* also interchange according to the nature of the following consonant. If it is a labial *n* changes to *m*, as in *hemp* from Old English *hancp*, or *comfort* from *confortare*; but if it is a dental *m* changes to *n*, as in *ant* from Old English *amete*, or *count* from *computare*. We also find an intrusive *n* before gutturals and dentals, as in *nightingale* from Old English *nihtegale*, *messenger* from *messenger*, *passenger* from *passager*, or *lantern* from *laterna*.

Naas, a garrison town of Kildare county, Ireland, 20 miles SW. of Dublin by rail; pop. 3808. Once the capital of Leinster, Naas obtained charters from Henry V., Elizabeth, and James I., but was disfranchised at the Union.

Nabateans, a people of northern Arabia, generally considered to have been of pure Arab blood, though some authorities, identifying them with the Ishmaelite tribe of Nebaioth, regard them as having been closely akin to the Edomites. They took possession of the country once occupied by the Edomites; and in the beginning of the 3d century B.C. they were one of the most powerful amongst the Arab tribes, warlike, with a force of 10,000 fighting men, nomadic, and busy carriers of merchandise between the East and the West. In 312 B.C. Antigonus, the general of Alexander, made an attack, unsuccessful, upon their desert fastness of Sela or Petra (q.v.). By the 1st century B.C. they had shaped their power into a kingdom; in the time of St Paul their king Aretas, who died in 40 A.D. after a reign of forty-eight years, was master of Damascus and Coele-Syria. They were in antagonism successively to the Syrian monarchs, the Maccabean rulers of Judea, and the Romans, but eventually acknowledged the supremacy of these last. Nevertheless Trajan, in 105, captured their stronghold and put an end to their kingdom. They possessed a certain measure of culture, derived from the Syrians. The language of their coins and inscriptions is Aramaic. See Charles Doughty, *Documents Epigraphiques recueillis dans le Nord de l'Arabie* (1884), and books cited at EDM.

Nabha, a Sikh principality under the political control of the Punjab, cis-Sutlej, to the E. of Patiala and S. of Ludiana; area, 928 sq. m. Pop. 261,824.

Nablus, corrupted from the Greek *Neapolis*, the ancient *Shechem*, a town of Palestine, stands

on the highest part of the pass, between Mounts Ebal and Gerizim, that leads from the Mediterranean to the Jordan. In the same valley or gap are Jacob's Well, the Tree of the Sanctuary, and Joseph's grave. At first a Canaanite city, it was destroyed by Abimelech, a son of Gideon the Judge. Here Rehoboam was crowned king of Israel. The place became the religious centre of the Samaritans (q.v.). The Greek city gave birth to Justin Martyr, and suffered much during the Crusades. See *Memoirs of Palestine Exploration Fund*, vol. iii.

Nabob, an Anglo-Indian corruption of the word *Nawab* ('deputy'), was the title belonging to the administrators of provinces under the Mogul empire. The title was continued under the British rule, but it gradually came to be applied generally to natives who were men of wealth and consideration. In Europe it is applied more or less sarcastically to those who, having made great fortunes in the Indies or in foreign parts generally, return to their native country, and live there in oriental splendour.

Nabonassar. See BABYLONIA.

Nachtigal, GUSTAV, German traveller, was born 23d February 1834, at Eichstedt, between Magdeburg and Wittenberg, studied medicine, and served as army surgeon until 1863. In that year he went to North Africa, suffering from a chest disease. In 1868, through the influence of Rohlf, he was selected to carry presents from the king of Prussia to the sultan of Bornu. Starting from Tripoli in 1869, he travelled by way of Fezzan and Tibesti to Bornu, made excursions into the states of Borgu and Bagirmi, and returned home by way of Wadai, Dar-Fur, Kordofan, and Cairo, where he arrived on 22d November 1874. This long and successful journey, in the course of which he visited, the first of Europeans, the native states of Tibesti, Borgu, and Wadai, put him in the forefront of modern travellers. His vast collection of most valuable information was written down in the three vols. of *Sahara und Sudan* (1879-89). In 1884 Nachtigal was commissioned to annex for Germany Togoland, Cameroons, and Lüderitzland (Angra Pequena) on the west coast of Africa. He died on the return journey off Cape Palmas, 19th April 1885, and was buried on that rocky promontory; but in 1887 his bones were removed to German soil in the Cameroons. See Dorothea Berlin's *Erinnerungen an Nachtigal* (1887).

Nacre. See PEARL (MOTHER OF).

Nadir (Arabic *nazir*), that point in the heavens which is diametrically opposite to the Zenith (q.v.), so that the zenith, nadir, and centre of the earth are in one straight line. The zenith and nadir form the poles of the Horizon (q.v.).

Nadir Shah of Persia, the Conqueror, belonged to a Turkish tribe, and was born in Khorassan in 1688. He entered the service of the governor of Khorassan, and soon obtained high promotion; but, having been degraded for some offence, he betook himself to a lawless life, and for several years was the daring leader of a band

of 3000 robbers, and gradually extended his territorial authority. Persia was at this time ruled by Ashraf, an Afghan, whose grinding tyranny and cruelty produced in the mind of every Persian a deadly hatred of the very name Afghan. Nadir having avowed his intention of expelling the hated race from the country and restoring the old dynasty, numbers flocked to his standard, and Meshed, Herat, and all Khorassan were speedily reduced. Ashraf, signally defeated in several engagements, fled before the avenger, who, with a celerity only equalled by its thoroughness, purged Persia of even the semblance of Afghan domination. The rightful heir, Tamaasp, then ascended the throne, and Nadir received for his services the government of the provinces of Khorassan, Mazanderan, Seistan, and Kerman. He was sent against the Turks in 1731, and defeated them at Hamadan; but his sovereign having engaged unsuccessfully the same enemy, Nadir caused him to be put in prison, and elevated his infant son, Abbas III., to the throne in 1732. The death of this puppet, in 1736, opened the way for the elevation of Nadir himself, who was crowned as *Nadir Shah*. He resumed the war with the Turks, and, though totally defeated in the first two battles, turned the tide of fortune in the subsequent campaign. He also conquered Afghanistan, and drove back the invading Uzbeks. Difficulties arose with the Great Mogul, and his envoy having been murdered at Jelalabad, Nadir ravaged the North-west Provinces, and took Delhi, which he pillaged. With booty to the amount, it was said, of £20,000,000, including the Koh-i-nûr (see DIAMOND), he returned to the west bank of the Indus. He next reduced Bokhara and Khwarezm, restoring to Persia her limits under the golden reign of the Sassanides. From this period his character underwent a sudden change; he became suspicious, avaricious, and tyrannical, and was assassinated 20th June 1747. See H. Maynard's *Nadir Shah* (Stanhope Essay, 1885).

Nadiya, capital of a district in Bengal, on the Bhagirathi River, 63 miles N. of Calcutta; pop. 14,105. It was the residence of the last independent Hindu king of Bengal (till 1203).

Nævius, GNEUS, with the exception of Livius Andronicus, the earliest of the creators of Latin literature, was born, probably in Campania, about 265 B.C. In his youth he served in the first Punic war, made his first appearance at Rome as a dramatic writer in 235, and continued his activity for thirty years. Of his life we know little, save that he was very decidedly attached to the plebeian party, and in his plays satirised and lampooned the Roman nobles with all the virulence and indiscretion of a hot-blooded impetuous Campanian—that Gascon of ancient Italy. He incurred the especial hostility of the Metelli, and was imprisoned at their instance, as we learn from a passage in the *Miles Gloriosus* of Plautus. He was ultimately obliged to retire to Utica in Africa, where he died after 204. Besides his dramatic writings, comprising both tragedies and comedies, he wrote an epic poem, *De Bello Punico*, in the old Saturnian metre. His work bore the stamp of the national genius, and its vigour and invention gave pleasure to Cicero and to Horace. Only a few very unimportant fragments are extant, which may be found in editions more or less complete by Vahlen (1854) and Ribbeck, *Scenicae Poësis Romanorum Fragmenta* (2d ed. 1871–73). See also Sellar's *Poets of the Roman Republic*, and Ribbeck, *Die Römische Tragödie* (1875).

Nævus (Lat., 'a mole;') known popularly as *mother-spot* or *birth-mark*) is a congenital mark or growth strictly on a part of the skin. The most

frequent form is the *pigmentary nævus*, or *mole*. This may be simply a darker pigmentation of a circumscribed portion of skin; or the pigmented skin may be thickened and rough as well, and is often thickly covered with hair. Moles do not tend to increase, and do not need to be treated unless for the sake of appearance. In that case, removal by knife or destruction by caustics must be resorted to.

When the name is used without qualification, a *vascular nævus* or overgrowth of capillary blood-vessels is generally meant, and the term is used of such abnormal growths in whatever organ or tissue they occur. The slightest form is sometimes called *port-wine stain*, and is sufficiently described by the name: there is just so much overgrowth as to produce a deep red discoloration, without appreciable swelling of the part affected. Frequently the abnormal tissue forms a distinct tumour, either in the skin, when it is of a dark red colour, or beneath it, when it may sometimes be recognised by a blue or purplish tinge. The most frequent situations of these vascular nævi are the skin and subcutaneous cellular tissue of the face and head; but they may occur elsewhere. The popular belief is that they are caused by the longing of the mother during her pregnancy for a lobster, or strawberry or raspberry, or some other red-coloured article of food, and that the influence of her mind has impressed upon the fœtus a more or less vivid image of the thing she longed for; and hence the name of *mother-spot*. Sometimes these tumours waste away spontaneously, and give no trouble; but frequently they increase rapidly, invade the adjacent tissues, and ulcerate or slough, and thus become dangerous to life by hæmorrhage. When these tumours do not show a tendency to increase no treatment is necessary, except to remove the disfigurement. When treatment is desirable many different methods may be employed, according to the form and situation of the tumour: e.g. removal by knife or ligature; coagulation of the contained blood by electrolysis; production of inflammation by application of caustics or, in infants, by vaccination upon the nævus.

Naga is, in Hindu Mythology, the name of deified serpents. Their king is Sesha, the sacred serpent of Vishnu.

Naga Hills, a district of British India, the south-eastern extremity of Assam, with an approximate area of 6400 sq. m. and a pop. of 110,300. It consists of a mountainous region, covered with jungle and forest, the haunt of various wild animals, and is inhabited by the aboriginal Nagas and other semi-savage people, whose incessant raids into the more orderly British provinces occasioned much trouble from 1832 down to 1881. In that year their country was made an administrative district, and garrisoned with a native regiment.

Nagar. See BEDNOR.

Nagasaki, a seaport of Kyûshû, Japan, and for more than two centuries the only gate of communication for that empire with the outer world. Its harbour, famous for its beauty, is a narrow inlet about 3 miles in length. Near its head, beside the native town, is the low, fan-shaped island of Deshima, where the Dutch factory was situated. From 1637 to 1859 the Dutch traders were immured in this prison of 250 × 80 yards, the monotony of their lives being varied by the arrival of the yearly ship from Batavia, and the annual journey to Yedo, when presents were made to the Shôgun. Chinese traders were also permitted to carry on a limited trade. In 1859 Nagasaki became one of the five open ports. The great Takashima coal-mine, situated on an island 8 miles seaward of

the entrance to the harbour, serves to give importance to Nagasaki as a coaling station. Nagasaki also possesses a fine dockyard and patent slip. The foreign settlement is situated on the flat land at the east side of the harbour. The Roman Catholic Church has a strong mission here, and in one of the valleys in the neighbourhood is a community of historical native Christians. Protestant missions are represented by the English Church Missionary Society, and the American Methodist, Episcopal, and (Dutch) Reformed Church missions. At the mouth of the harbour is the small island of Pappenberg (Takaboko), from which 300 Christians are said to have been hurled in the frightful persecutions of the 17th century. Pop. (1889) 38,229.

Nagina, a town in the North-west Provinces of India, 48 miles NW. of Moradabad. Pop. 20,503.

Nagpur, a city of British India, the seat of administration for the Central Provinces, 450 miles ENE. of Bombay by rail. It lies embosomed in trees, has several handsome tanks, gardens, and temples, and extensive suburbs, but is not a healthy city, the mean temperature being 78°·7 F. Fine cloth fabrics are woven, and there is an active trade in wheat, salt, spices, and European goods. Here, on the 26th and 27th November 1817, a British force of 1350 men, commanded by Colonel Scott, defeated a Mahratta army of 18,000 men. Pop. (1872) 84,441; (1881) 98,300.—The *district* of Nagpur has an area of 3786 sq. m. and a pop. (1881) 697,356; the *division*, 24,040 sq. m. and 2,758,056 pop.—Chota Nagpore (q.v.) is a division of Bengal.

Nag's Head Consecration, a calumnious legend first circulated by Roman Catholics forty years after the event with respect to Archbishop Parker's consecration (1559), to the effect that he was consecrated in the most casual and irregular manner in the Nag's Head Tavern, Cheapside. The facts of the case are that the election took place in the chapter-house at Canterbury, the confirmation at St Mary-le-Bow's Church in Cheapside, and the consecration in the chapel of Lambeth Palace, the consecrating bishops being Barton, Scory, Coverdale, and Hodgkin.

Nahant, a summer-resort on a small, rocky peninsula of Massachusetts Bay, 12 miles NE. of Boston. Pop. (1890) 880.

Nahum. The seventh of the twelve minor prophetic books of the Old Testament is inscribed: 'The burden of Nineveh. The book of the vision of Nahum the Elkoshite.' The opening verses speak (i. 2-8) in general terms of the certainty and awfulness of the divine judgment against the enemies of God, and of his unfailing goodness to those who put their trust in him; these principles are then applied (i. 9-15) on the one hand to some power, not yet named, 'that imagineth evil against the Lord'; and, on the other, to Judah (i. 15), who, though now afflicted, is to be afflicted no more. The second chapter opens with a rapid sketch of a military armament—the red shields, scarlet uniforms, flashing chariots, brandished spears—hurriedly summoned for defensive war; then Nineveh, first named in ii. 8, is seen as a ruined site which an inundation has swept bare, and the great spoil of the 'dwelling of the lions' is indicated rather than described. The subject is continued in the concluding chapter, which predicts for the bloody city, full as it is of lies and rapine, the same fate as has already overtaken 'populous No' (iii. 8) or No-ammon, the Egyptian Thebes. The date of the prophecy must thus be placed somewhere between the fall of Thebes—i.e. not earlier than 666 B.C., and that of Nineveh—i.e. not later than 606 B.C. The explanation of i. 11 by former interpreters as alluding to

Sennacherib is thus excluded; the reference must rather be to some actual or threatened invasion of Judah in the reign of Manasseh, and most probably to that of Assurbanipal about 647 B.C., in which Manasseh was himself carried into captivity. The prophecy is written in classical Hebrew, and is characterised by a bold and vivid originality of style, if also by a conciseness sometimes bordering on obscurity; in more than one expression it has been thought that the writer betrays personal acquaintance with Ninevite affairs, and it is conjectured that he may have been either an Israelite of the northern kingdom who in early youth had been deported after the fall of Samaria, or a Judæan who had been carried captive along with Manasseh. Of his personal history nothing is actually known; the name, which is not a very common one, reappears in Luke, iii. 25, and in the name of the Galilean Capernaum ('village of Nahum'). He is described as a native of Elkosh, by which perhaps is to be understood the modern El-Kauseh, near Ramah in Upper Galilee, though others think of Al-Kôsh near Mosul, on the left bank of the Tigris, where the grave of the prophet has been shown since the 16th century. See commentaries by O. Strauss (1853), C. A. Blomquist (1853), F. Gihl (1860), M. Breitenicher (1861), L. Reinke (1867), and E. Mahler (1886), and works mentioned under HOSEA.

Naiads. See NYMPHS.

Naihati, a town of Bengal, 23½ miles NW. of Calcutta by rail. Pop. 21,533.

Nails are flattened, elastic, horny plates, which are placed as protective coverings on the dorsal surface of the terminal phalanges of the fingers and toes. Each nail consists of a *root*, or part concealed within a fold of the skin; a *body*, or exposed part attached to the surface of the skin; and a free anterior extremity called the *edge*. The skin below the root and body of the nail is termed the *matrix*, from its being the part from which the nail is produced. This is thick, and covered with highly vascular papillæ, and its colour is seen through the transparent horny tissue. Near the root the papillæ are smaller and less vascular; hence the portion of nail corresponding to this part is of a whiter colour; from its form, this portion is termed the *lunula*. It is by the successive growth of new cells at the root and under the body of the nail that it advances forwards, and maintains a due thickness, whilst at the same time its growth in a proper direction is ensured. The chemical composition of the nails is given in the article HORN, to which class of structures they belong. According to the observation of Beau, the finger-nails grow at the rate of about two-fifths of a line in a week, while the toe-nails only grow with about one-fourth of that rapidity. When a nail has been removed by violence, or has been thrown off in consequence of the formation of matter (pus) beneath it, a new nail is speedily formed, provided the matrix has not been seriously injured.

There is a very common and troublesome affection popularly known as *ingrowing nail*. Its most usual seat is by the side of the great toe. It does not in reality arise from any alteration of the nail, but from the adjacent soft parts being constantly pressed by the use of tight shoes against its edge. These parts become swollen and inflamed; supuration ensues, and an intensely sensitive ulcer is formed, in which the nail is imbedded. Surgical advice should at once be resorted to in these cases, as there is no probability that the ulcer will heal spontaneously, especially if the patient continue to move about, and thus keep up irritation. In obstinate cases it is not unfrequently necessary to

remove a portion of the nail, an operation attended with much pain, although quickly performed.

Nails. The making of nails by hand has been an established manufacture in the Birmingham district for 300 years. Before the successful (but very gradual) introduction of machine-made nails, men, women, and children, to the number of 60,000, were engaged in the industry. They all worked, as nailers who forge nails by hand still do, in small shops or sheds attached to their houses. In 1861, when the number employed at this work had dwindled down to 26,000, nearly one-half were females. At the village of St Ninians near Stirling in Scotland, where within the memory of persons still living 400 hands were employed in forging nails, there are now scarcely a dozen. After the introduction of slitting mills into England in 1865, which supplied nail-rod of the proper section to nail-makers, the trade became localised where it still is and gradually prospered. Iron plates are cut up into nail-rods by a pair of slitting rolls with square grooves on their surface.

In making nails by hand, the nailer heats the end of the nail-rod at his small forge, and brings it into the form of the spike of a nail by a few strokes of his hammer on the anvil. It is then cut to whatever length is wanted on a chisel, leaving it still attached to the rod. Dropping it next into one of two holes in a 'bolster,' and detaching it from the rod, the nailer forms the head from the projecting end by a few more strokes of his hammer, and then the nail is finished. Dies or 'swages' are required for the heads of ornamental nails.

Nail-making machines are complicated and can hardly be understood without a number of illustrations and a lengthy description. We can only name the principal parts of one for making wrought nails from 'ridge' rolled iron plate, which, though not of very recent design, has been much used. From a strip of this sheet or plate, which has a single or double ridge along its edge, the machine cuts the nails crosswise and partially forms the head of each from the ridge at right angles to the spike. These cut pieces or blanks are next moulded to the required form between suitable dies or forming tools, and then other tools come into play to shape and finish the heads. In this process the nails are formed while the iron is heated. A brief description of the machines in use at one of the largest English nail-works is given in the *Engineer*, 3d September 1886.

Cut nails are made from strips of cold iron the breadth of which corresponds to the length of the nail, and the fibre of which runs the long way of the nail. In cut nails the production of shank and point is done at the same time, but an

additional operation is necessary if they require to be headed. The annexed diagram shows how these nails are made without waste of material.

Horseshoe-nails, which are formed of the best charcoal iron, have hitherto been the most difficult to make by machinery, but machine-made nails even of this kind are now rapidly taking the market. A very large proportion of cut nails, as well as other kinds, are now made from Bessemer and Siemens-Martin steel, and the quality of these is superior to most of the old wrought-iron nails. Cast nails are also made for horticultural purposes, and for nailing laths to hold plaster. Some cast nails are annealed, and are then almost as tough as wrought nails. Cast nails are also made

in brass. Wire nails, which are of French origin, are made by a machine in which the end of a reel of wire, while held for a moment by cam grippers, receives a blow from a punch to form the head. The wire is then pushed forward the length of a nail and two punches advance to form the point, when a 'knocker-off' throws out the finished nail.

Since 1889 nails have been successfully made in America from tinplate scrap. This substance is sheet-iron, usually of excellent quality, and its coating of tin is an advantage for some, if not for most kinds of nails. Moreover, scraps of it accumulate in large quantity wherever tinplate goods are extensively made. For one size of nail, a blank of tinplate about 1½th inch by ⅙th inch is crushed up or flattened edgewise into the form of a nail spike much in the same way as a fan is folded up; or the blank can be rolled up into a round nail. The machine for making these is the invention of Mr G. H. Perkins of Philadelphia, and has passed through several experimental forms. It performs the cutting, crushing, gripping, and heading operations.

Naini Tal, the summer-resort of the lieutenant-governor of the North-west Provinces of India, nestles between spurs of the Himalaya, beside a beautiful lake 6409 feet above sea-level, 70 miles N. of Bareilly. By a disastrous landslide here in 1880, 150 lives were lost. There is a military convalescent dépôt. Pop. 6576, but over 10,000 in the season (September).

Nairne, CAROLINA OLIPHANT, BARONESS, song-writer, was born 16th August 1766, at the 'auld house' of Gask in Perthshire, the third daughter of its Jacobite laird. In 1806 she married her second cousin, Major William Murray Nairne (1757-1830), who in 1824, by reversal of attainder, became the sixth Lord Nairne, and to whom she bore one son, William (1808-37). They settled at Edinburgh, and after her husband's death she lived for three years in Ireland, then for nine on the Continent, returning at last to the new house of Gask—the old one had been pulled down in 1801. Here she died, 27th October 1845. Her eighty-seven songs appeared first under the pseudonym 'Mrs Bogan of Bogan' or 'B.B.' in *The Scottish Minstrel* (1821-24), and posthumously as *Lays from Strathearn*. Not a few of them are mere Bowdlerisations of 'indelicate' favourites; but four at least live, and shall live, with the airs to which they are wedded—the exquisite 'Land o' the Leal' (c. 1798), and 'Call'er Herrin', 'The Laird o' Cockpen,' and 'The Auld House.'

See Charles Rogers' *Life and Songs of Lady Nairne* (1869), and T. L. Kington Oliphant's *Jacobite Lairds of Gask* (Grampian Club, 1870).

Nairnshire, the fourth smallest county of Scotland, is washed on the north for 10 miles by the Moray Firth, and elsewhere bounded by Elgin and Inverness shires. Till 1891 it consisted of a main body, with a maximum length of 18 miles, a mean breadth of 11, and an area of 169 sq. m., and also of five detached portions situated in Elgin, Inverness, and Ross shires, which, having a total area of 31 sq. m., were annexed to Nairnshire in 1476, but disjoined therefrom by the Boundary Commissioners in 1891. The chief rivers are the Nairn and the Findhorn, the former rising in Inverness-shire, and flowing 38 miles north-eastward to the Moray Firth. The surface has a generally southward ascent from the fertile and well-wooded 'laich of Moray' near the coast, till at Carn Glas on the southern boundary it attains 2162 feet. Loch Loy (1½ by ¼ mile) is the largest of seven small lakes. Less than one-fifth of the entire area is in cultivation, more attention being paid to stock than to crops. The chief antiquities are Kilravock (1400)

and Cawdor Castle (q.v.); at Auldearn, near Nairn, Montrose (q.v.) won his fourth victory. With Elginshire the county returns one member; and with Inverness, &c. Nairn town returns another. Pop. (1801) 8322; (1841) 9217; (1881) 10,455 (1880 Gaelic-speaking); (1891) 10,019.

NAIRN, the county town, stands on the west bank of the river Nairn at its mouth in the Moray Firth, 16 miles by rail E.N.E. of Inverness. A pleasant little watering-place, with a small harbour, it was constituted a royal burgh by William the Lion. Grant, the African traveller, was a native. Pop. (1841) 2388; (1881) 4161; (1891) 4651.

Nairs, a Mohammedan caste in Malabar, who have peculiar marriage customs, described under Family (q.v.). Colonel H. Drury tells much about the Nairs in his *Reminiscences* (1890).

Nala is a legendary king of ancient India, whose love for Damayantī, the daughter of Bṛhama, king of Vidarbha, and the adventures arising therefrom, forms a celebrated episode of the *Mahābhārata* (q.v.), as also of a separate poem, the *Nalodaya*, attributed to Kalidasa as its author.

Namaquas, the principal existing tribe of the race generally known under the name of Hottentots (q.v.). They inhabit the region called Great Namaqualand, north of the Gariep or Orange River, and the country a few miles south of it, as far as the Kamiesbergen. They are a pastoral people of rather predatory habits, and live under the rule of their chiefs.

GREAT NAMAQUALAND, or NAMALAND, is the extensive region in South Africa north of the Cape Colony, extending from the Orange River to Damaraland (q.v.) northwards, and stretching inland from the west coast to 20° E. long., the borders of British Bechuanaland. Since 1885 a German possession, with the exception of the small British coast territory of Walvisch Bay (q.v.), it has an area estimated at 460,000 sq. m. It is mainly a most sterile and barren region, and along a coast-line of upwards of 400 miles does not present a single running stream; but a few little bays along the coast, such as Angra-Pequena (q.v.), Sandwich Harbour, and Walvisch Bay, afford safe anchorages. The Rhenish Mission, which has long been active here, has six stations in Namaland with over 2500 converts. There has often been war between Namaquas and Hereros (see DAMARALAND). LITTLE NAMAQUALAND is a barren district of Cape Colony (q.v., Vol. II. p. 738), south of the Lower Orange River. Much copper is mined here.

Names are usually classed as either *local* or *personal*, but neither class can be profitably studied apart from the other; since the names of places are frequently derived from the names of persons, while numerous personal names prove ultimately to be derived from local names. Thus, Washington, the capital of the United States, derives its name from George Washington the first president; his name in turn was derived from that of a Durham village where his ancestors resided, and this village itself obtained its name from the Wasings, a Teutonic clan. Names must therefore not be regarded as arbitrary signs—they have a meaning and a history, though owing to the absence of early documents the history may be lost, and the meaning may be unascertainable with certainty.

Local names are usually either descriptive, like Red River; personal, like Charleston; historic, like Point Turnagain; or transferred, like New South Wales. Another broad distinction may be drawn between the names of physical features, such as rivers and mountains, which are frequently the memorials of extinct or very ancient races, and the names of villages and hamlets, which are

usually of more recent origin, and to a large extent are derived from the personal names of early settlers. Thus, in the United States, while the Red Men have disappeared, or have been withdrawn to remote reservations, they have left behind them such familiar names as Niagara, Ohio, Potomac, Mississippi, Missouri, Huron, Erie, Michigan, Connecticut, and Massachusetts; while places of habitation bear modern names, like Brownsville, Grantstown, or Madison, derived from the names of settlers or politicians. In England also the names of rivers are chiefly ancient and Celtic, while those of places of habitation are mainly recent and Teutonic. There are four rivers in England called Avon, a word which in Celtic means 'river'; while from the Celtic word *uisge* or *wysg*, 'water,' we derive the names of the Esk, the Usk, the Exe, the Axe, the Ash, and the Wye; and from *dubr*, *dufr*, or *dur*, 'water,' we have the Dove, the Dovy, and probably the four Derwents; while *tam*, 'wide,' gives us the Tame and the Thames. On the other hand we know that Clapham was the 'home' of the Osgod Clapa, in whose house Harthacnut drank himself to death, while Addlethorpe was the place where Ardufr settled.

All over Europe local names bear witness to races departed or absorbed. Thus, we find traces of Slavs and Celts in Germany, of Romans and Celts in Gaul, of Phœnicians on the Mediterranean coasts, of Arabs in Sicily and Spain. Not a few names attest the early extension of Phœnician commerce. Such are Malta, 'the refuge'; Catania, 'the little' harbour, in Sicily; Carthage, 'the new town'; Carthage in Spain is Carthago Nova or New Carthage; Seville is the city 'on the plain'; Malaga, 'the place for salting' fish; Tarragona is 'the palace'; Cordova, 'the olive-press'; and Lisbon, 'the walled' town. Arabic names are naturally more numerous both in Sicily and Spain. In Sicily, besides Marsala, 'the port of Allah,' we have several names containing the word *kalat*, 'a castle,' and *ras*, 'a cape,' such as Caltanissetta, Caltagirone, Calascibetta, Calatafimi; together with Rasicanzir, Rasicalbo, and Rasacarami. In Spain numerous rivers exhibit the Arabic *wadi*, 'a river' or 'valley,' in the Spanish form *Guad*. Such are Guadalquivir, 'the great river'; Guadalquivir, 'the white river'; Guadalupe, 'the river of the bay'; and many others. We find the Arabic article *al* as a prefix in Algeciras, 'the island,' which is the same name as Algiers; as well as in Almanza, 'the plain'; Almaden, 'the mine'; Alcazar, 'the palace'; Alcantara, 'the bridge.' The province of Algarvé means 'the west'; Alcala is 'the castle'; *kalat*, 'castle,' so common in Sicily, reappearing in the names of Calatrava and Calahorra. The word Medina, 'a city,' is seen in Medinaceli and Medina Sidonia; while Gibraltar, 'the mountain of Tarik,' preserves the name of one of the earliest invaders.

French cities, unlike those in England, frequently preserve the Celtic names of the Gaulish tribes of which they were the capitals. Thus, Paris was the capital of the Parisii, Rouen of the Rothomagi, Amiens of the Ambiani, Arras of the Atrébates, Evreux of the Ebuovices, Beauvais of the Bellovaci, Lisieux of the Lexovii, Chartres of the Carnutes, Rheims of the Remi, Châlons of the Catalauni, Sens of the Senones, Saintes of the Santones, Soissons of the Suessiones, Troyes of the Tricasses, Limoges of the Lemovices, Poitiers of the Pictones, Tours of the Turones, Cahors of the Cadurci, Toulouse of the Tolosates, while Berri was the seat of the Bituriges. Such names are rare elsewhere, but Trèves (Trier) preserves the name of the Treviri, Turin of the Taurini, Venice of the Veneti, Worcester of the Huicci, Devon of the Damnoni.

The way in which the dominion of Rome was established by the foundation of colonies and privileged cities can be traced over the greater part of Europe. The name of Cologne is a corruption of Colonia Agrippina, Lincoln of Lindum Colonia; Lodi was Laus Pompeii, Pampeluna was Pompelo or Pompeiopolis. Friuli and Fréjus are variant corruptions of Forum Julii, Forli of Forum Livii, Jülich of Juliacum, Lillebonne of Juliabona, Beja of Pax Julia. Badajoz was Pax Augusta, Merida was Augusta Emerita, Saragossa was Cæsarea Augusta. Augsburg, Aosta, Aoust, Augst, and Auch are corruptions of Augusta, Autun of Augustodunum. Klagenfurt was Claudii Forum, Fiora was Forum Aurelii, and Orleans was Aurelia. We find the name of Valentinian in Valenciennes, of Gratian in Grenoble, of Hadrian in Adrianople, of Constantine in Constantinople; while Constance and Coutances bear the name of Constantius. Of the same class are Alexandria, Scanderoon, Antioch, and Seleucia, which recall the dominion of Alexander and his successors.

The Roman cities in Britain are commonly designated by dialectic variations of the Anglo-Saxon *ceaster* (a word derived from the Latin *castra*), which is usually appended to a fragment of the primitive Celtic name. Thus, in the Saxon region we have such names as Winchester, Chichester, Dorchester, Rochester, and Colchester. In Mercia we have Gloucester, Worcester, Leicester, Manchester, and Chester. In the Anglian district we find Tadcaster, Lancaster, Doncaster, and on the Welsh or Cornish frontier Wroxeter and Exeter. But many of our larger towns grew up in post-Roman times near the great fords over rivers; such are Oxford, Hereford, Hertford, Bedford, Chelmsford, Guildford, Stafford, Stratford. That only the smaller streams were bridged is shown by the names of Cambridge, Tunbridge, Weybridge, and Uxbridge.

The nomenclature of Teutonic lands—Germany, England, and north-eastern France—fully bears out the description given by Tacitus of the Germans, 'Nullas Germanorum populis urbes habitari, satis notum est; ne pati quidem inter se junctas sedes. Colunt discreti ac diversi, ut fons, ut campus, ut nemus placuit.' Hence the local names in England and Germany differ essentially from those of Italy, France, Spain, Wales, and Ireland in one important respect. The first element is frequently the name of the Teutonic settler who selected his home in field or forest. Round these isolated dwellings villages grew up, and became known as the *ton*, *ham*, *thorpe*, or *by* of the first settler and his family. Thus, to take a few village-names from a small district in Yorkshire, we find that a man named Asketil settled at Asselby and another at Haisthorpe, Anlaf at Anlaby, Bardolf at Barlby, Dugald at Duggleby, Fulchar at Foggathorpe, Gamal at Ganton, Lambi at Langthorpe, Miöll at Millington, Rether at Raisthorpe, Hrolfr at Rowlston, Thorgrim at Thornthorpe. In like manner the majority of German village-names are derived from the names of the earliest Teutonic settlers. Thus, we find Hrudulf at Rudelsheim, Rudisleben, and Rüdelshausen; Wolfbert at Wolfertshausen; Dietrich at Dietersheim, Dietershausen, and Dietersdorf; Rathbold at Rappoltsweller; and Ratbert at Rappertsweller.

On the other hand, in Celtic lands—Cornwall, Wales, Ireland, Scotland, and parts of France—a more religious spirit has caused the villages more commonly to bear the name of some local hermit or evangelist, or of the saint to whom the church is dedicated. In Teutonic lands such names are rare, and, as in the case of St Albans or St Edmundsbury, St Gallen or Glarus (St Hilarius), they commonly refer to a town which has grown up

under the shadow of some great monastery. In many parts of France such names are more common, as in the case of St Omer, St Denis, St Cloud, St Malo, St Privat, St Didier, St Cyr, and about 6000 other names. In Ireland some 2700 names begin with *Kil*, which denoted a 'church,' or a monastic 'cell.' Thus Kilkiaran is the church or cell of St Ciarran, Kilkenny of St Cannech, Kilbride of St Brigid, Kilskeer of St Scire, Killaloe of St Lua or Dalua, and Kilkee of St Caeide. In the Celtic part of Scotland we have a fair number of such names, though not so many as in the Isle of Saints; such, for instance, are Kilmarnock, Kilfinan, Kilpatrick, and Kilsyth. *Kirk* ('church') is common in the Teutonic part of Scotland, as in Kirkcudbright, Kirkcaldy, and Kirkpatrick. This prefix is also found in the north of England, where we have 34 villages called Kirby or Kirkby ('church village'). In the south of England *church* occasionally is found as a suffix, as in Bonchurch and Whitechurch; while in Axminster, Kidderminster, Leominster, and Westminster the suffix denotes a monastic foundation. In Wales the ecclesiastical prefix is usually *Llan*, meaning an 'enclosure.' Thus, Llandudno is the church of St Tudno, Llanberis of St Peris, Llangollen of St Collen, Llanfair of St Mary, Llanbadern of St Padern, Llanilltyd of St Illtyd. All the Welsh sees, Llandaff, St Davids, St Asaph, and Bangor ('the white choir'), are named from churches, whereas every English see, except the modern see of St Albans, bears a name of secular origin. A very large number of Indian towns take their names from the temple of some deity; Bombay, for instance, is a corruption of Mambai, a goddess to whom an ancient temple was dedicated, and Calicut is Kali's fortress.

Names derived from conspicuous trees or the nature of the vegetation are everywhere common. From the oak we have such English names as Acton, Aclam, and Auckland; such Celtic names as Derry, Kildare, and Darrock; while there are about 200 Slavonic places called Dubrau. Those in England named from the ash, such as Ashby and Ashton, amount to nearly the same number; but there are only 27, such as Appleby and Appleton, named from the apple, and 11 from the birch. The Slavonic name of the birch (*brasa*) gives its name to 40 places; the lime (*lipa*), to upwards of 200, including Leipzig, while in England we have Lyndhurst, Linton, and a few more. We obtain Aldershot and Olney from the alder; Thorney from the thorn; Bromley from the broom; Rusholme from the rush; and Farnham and Farnborough from the fern. Selinus, one of the greatest of the Greek cities in Sicily, took its name from the wild parsley. There are also names from animals; from the fox, for instance, we have Lochmaddy, Todmorden, and Foxholes. Many towns take their names from the rivers on which they stand. In England we have Exeter on the Exe, Axminster on the Axe, Okehampton on the Oke, Taunton on the Tone, Maidstone on the Medway, Plymouth, Dartmouth, and Falmouth on the Plym, Dart, and Fal; while Hull, properly Kingston-upon-Hull, has usurped the name of the river Hull. In Asiatic Russia Tomsk, Tobolsk, and most of the chief towns are thus named.

The commonest suffixes in English place-names, denoting habitation or enclosure, are *-ton*, *-ham*, *-worth*, *-stow*, and *-bury* in the south, and *-by*, *-thorpe*, *-toft*, *-garth*, and *-thwaite* in the north. The patronymic suffix *-ing*, either alone, as in Woking and Barking, or combined with *-ton* or *-ham*, as in Buckingham and Birmingham, Islington and Kensington, denotes the settlement of a family or clan. The more usual suffixes not denoting habitation are *-ey*, *-ley*, *-field*, *-ford*, and *-bridge*. One of the commonest English village-names is

Newton. There are 120 Newtons, 17 Newbiggins, 12 Newports, 11 Newbolds, 11 Newnhams, and 10 Newcastles. Burton, which means an enclosure on a *burh* or hill, occurs 66 times; Barton (*bere-tun*), a grange or enclosure for corn or barley, occurs 45 times. Hutton, an enclosure on a *hoo* or projecting heel of land, is also very common. There are also 77 Suttons, 57 Nortons, 36 Westons, and 14 Eastons. The settlements of the Danes in Ireland are marked by the names of such important towns as Waterford, Wexford, Carlingford, Limerick, and Wicklow; and three out of the four Irish provinces, Leinster, Ulster, and Munster, where the suffix *-ster* means a settlement or district. In Normandy the Danish suffixes *-by*, *-toft*, *-thorpe*, and *-fleet* appear in the forms of *-bauf*, *-tot*, *-tourp*, and *-fleur*, as in Marbouf, Quillebeuf, Ivetot, Clitourps, Harfleur, and Honfleur. The usual suffixes in German names are *-weiler*, *-leben*, *-hof*, *-hausen*, *-heim*, *-dorf*, *-wik*, *-stadt*, *-burg*, *-bold*, *-hall*, *-sitz*, *-ing* or *-ingen*, all of which denote habitation or enclosure, while *-ried* or *-rode* signifies a clearing, and *-wald*, *-holt*, *-feld*, and *-hain* refer to uninhabited places.

In Celtic names, contrary to the Teutonic practice, the substantival element comes first, and the adjectival last. Thus, Cwmbechan is Celtic, Addiscombe is English, Dalry is Celtic, Rydal is English. The commonest element in Irish names is *baile* (Anglicised *bally*), meaning 'a town-land' or 'village,' which is found in the names of 6400 Irish town-lands. Very frequent also are *Lis*, *Rath*, *Dun*, and *Caher*, *Caer*, or *Car*, which denote 'fortified places'; *Bod* and *Tigh* (Welsh *Ty*), 'a house'; *Tre*, common in Cornwall, means 'a village'; *Kil* means 'a church'; *Ath*, 'a ford'; *Coed* and *Coil*, 'a wood'; *Clon*, *Agh*, *Gort*, *Blair*, and *Magh* or *Moy* denote 'fields and plains'; *Ben*, *Pen*, *Cenn*, *Slieve*, *Drum*, *Cefn*, *Bryn*, *Mull* or *Moel*, *Ard*, *Tulla*, *Knock*, *Ros* denote 'hills and ridges'; *Strath*, *Glen*, *Nant* are 'valleys'; *Carrick* or *Craig* means 'a rock'; *Muen* and *Clogh*, 'a stone,' the plural *Cloghan* denoting either 'stepping-stones,' or the 'gravestones' in a churchyard; *Inis* or *Inch* is 'an island'; *Cul* or *Cool*, 'a corner'; *Tober*, 'a well'; *Rhos*, 'a moor'; *Tra*, 'a strand'; and *Lough*, *Loch*, or *Lyn*, 'a lake.' Of the adjectival components the commonest are *mor*, 'great'; *beg*, 'little'; *garu*, 'rough'; *glas* and *liath*, 'green' or 'gray'; *dubh*, 'black'; *gorm*, 'blue'; *buidhe* or *boy*, 'yellow'; *dearg*, 'red'; *gal* and *ban*, 'white.' Thus, Benmore is 'the great hill'; Balfour, 'the cold town'; Ardglas, 'the gray height.'

In Turkish names the commonest components are *koi*, 'village'; *hissar*, 'castle'; *serai*, 'palace'; *kopri*, 'bridge'; *hamman*, 'hot baths'; *bazar*, 'market'; *dagh*, 'mountain'; *bagh*, 'garden'; *su*, 'water'; *ermak*, 'river'; *denghis*, 'sea'; *ili*, 'district'; with the qualifying elements *yeni*, 'new'; *eski*, 'old'; *kara*, 'black'; *ak*, 'white'; *kezi*, 'red'; *ala*, 'beautiful'; *bala*, 'high.' Thus, we have *Yeni-koi*, 'new village'; *Eski-bazar*, 'old market'; *Kara-su*, 'black water'; *Ak-serai*, 'white palace'; *Bala-hissar*, 'high castle'; *Kezi-ermak*, 'the red river'; *Ak-dagh*, 'white mountain'; *Mus-tagh*, 'snowy mountain'; *Ala-bagh*, 'beautiful garden.' Chinese names are usually easy to explain. We have names from colours, such as Hoang-ho, 'yellow river,' and Hoang-hai, 'yellow sea'; from position, such as Nan-king, 'southern capital'; Nan-shan, 'southern mountains'; Ho-nan, 'south of the river'; Yun-nan, 'south of the clouds'; Tong-king, 'eastern capital'; Shan-tung, 'east of the mountain'; or from size, as Ta-kiang, 'great river.'

Countries often take their names from some small district which first became known to the outer world; from some ruling or conquering tribe; or from relative position. Thus, Asia originally

denoted only the plain of Ephesus, Africa the plain of Carthage, Europe the plain of Thebes. India derives its name from the people who dwell on the banks of the Indus; Switzerland from the village of Schwyz; Peru from a small stream near Panama, 800 miles north of the present boundary; Italy from a district in Calabria which first became known to the Greeks; Greece from a tribe in Epirus, probably not of Greek race, who first came in contact with the Romans; Russia from a Finnic corruption of the Swedish name of the vikings who occupied Novgorod; Hungary, Bohemia, and Bavaria from a temporary occupation by Huns and Boii; Scotland from the Scots, an invading Irish sept; England from the Angles; France from the Franks, a German tribe whose chiefs founded the ruling dynasty; Sweden and Denmark from the Suiones and the Danes; Palestine from the Philistines who occupied the portion of the coast which first became known to the Greeks; and Portugal from Oporto, the first part of the modern kingdom to be conquered from the Moors. Spain is the land from which the Phenicians obtained the skins of 'rabbits'; Brazil is the land which yielded the *brasa*, a valuable dye-wood; Poland means 'the plains'; Lorraine takes its name from Lothair, Bolivia from the liberator Bolivar, China from the T'sin dynasty; Japan and Anatolia are both 'lands of the rising sun'; the Deccan is 'the south country'; Norway, 'the northern route' taken by the vikings; Austria is 'the Eastern realm'; Westphalia, the land occupied by the inhabitants of the 'western plain' of the Weser. Northumberland was originally the whole district north of the Humber; Sutherland, Surrey, Suffolk, Sussex, Norfolk, Northampton, Essex, Wessex, and Westmorland are all named from their position.

Nations are frequently called by their neighbours by a name different from that by which they designate themselves. Thus, Germany is a name borrowed by the Romans from the Gauls, and is applied to a country called Deutschland by its inhabitants, who designate themselves as Deutsche, 'the people,' while the Slavs call them Niemiec, which means the 'dumb' or 'unintelligible' people. Their French name is derived from that of the Allemannic frontier tribe; the Magyars call them Swabians, the Finns and Gypsies call them Saxons. The Welsh call us Saxons, while we call ourselves Englishmen. Welsh is a general term meaning 'foreigners,' applied by Teutonic races to non-Teutonic tribes. We apply it to the Cymry, the Germans apply it to Italians. Cornwall, properly Corn-wales, is the land inhabited by the Welsh of the horn; Walloon and Wallachian are Teutonic names used to denote neighbouring races speaking neo-Latin dialects. Those whom we call Lapps call themselves Sabme. Those whom we call Finns call themselves Quains or Suomalaiset, and by the Russians are called Tschuds, which means 'foreigners' or 'barbarians.' The people who call themselves either Slavs, 'the speakers,' or Serbs, 'kinsmen,' were called by the Germans Wends, which means 'foreigners' or 'strangers.'

The map abounds with names which record recent discovery or settlement. The Straits of Magellan, Torres Strait, the Bermudas, the islands of Juan Fernandez and Fernando Po bear the names of Spanish and Portuguese explorers; Cape Horn, the Orange River, New Zealand, New Holland, the Gulf of Carpentaria, and Tasmania or Van Diemen's Land bear witness to the enterprise of the Dutch; Montreal, Detroit, New Orleans, Louisiana, and St Louis to French colonisation in America; Behring Strait bears the name of a Dane in the Russian service; while Hudson Bay, Baffin Bay, Davis Strait, Cook Strait, Bass Strait, Vancouver Island bear the names of

English explorers. Jamestown, Charleston, Carolina, Albany, New York, and Pennsylvania date from the time of the Stuarts, while Virginia points to an earlier, and Georgia to a later period.

In attempting to discover the meaning of names it is essential to discover the oldest forms—phonetic corruption, assimilation, and popular etymology having often disguised the modern forms beyond recognition. Thus, in the case of Brighton, the ancient form Brihtelmes-stan shows that *Brigh*, the first syllable, is the genitive of the proper name Brihtelm, and that the second syllable is not *ton* but *stone*, the name probably referring to a stone house built by an early Saxon settler. So Thornthorpe is shown by its old form to have nothing to do with the thorn-tree, but to be the thorp of Thorgrimr, while Westow is the 'woman's place.' Drypool is Driptol, the muddy or dirty pool and not the dry pool; Thixendale takes its name from the sixteen dales which form the township; Durham is an assimilated form from Dunholm, and Stepney from Stebenhithe.

The old dative or locative suffixes which occur in the early forms of so many English and German names have been either disused or assimilated to other usual suffixes. Thus, the locative Wellon ('at the wells') has become Welham, Huson ('at the houses') has become Howsham, Colnun ('at the summits') is now Cowlam, Chillon ('at the springs') has become Kilham, Aclun ('at the oaks') is now Acklam, Fivelac ('five pools') is Filey, and Rodestain ('rood-stone') is now Rudston. These instances may suffice to show that it is of little use to guess at the meaning of the name from mere modern forms; it is only when the ancient form of the name has been recorded that the meaning can be ascertained with certainty.

Personal names as a rule are less obscure in their origin and meaning than local names, but owing to their tendency to transference and migration they are more liable to degradation and mutilation. Thus, John, Gian, Hans, and Ivan are derived from Joannes; Sandy and Alec from Alexander; Jim, Iago, James, and Hamish from Jacob; Beppo, Seppi, Fifine, and Joe from Joseph; Peggy, Gretchen, Maggie, and Madge from Margaret. The origin of most of our names now in common use is either Semitic, Greek, Latin, Teutonic, or Celtic. To these five classes we may therefore direct our chief attention.

The old Semitic names were frequently compounded with the names of deities, as is seen in the names of Babylonian and Assyrian monarchs. The name of Nebuchadnezzar is a prayer, 'Nebo defend the crown'; Nebushasban means 'Nebo save me'; Merodach-baladan is 'Marduk gave a son'; Abednego means 'the servant of Nebo'; Mordecai is 'belonging to Marduk'; Shalmaneser, 'Shalman is favourable.' The names of the Assyrian kings, Assur-bani-pal, Assur-dân, Assurnatsir-pal, contain the name of the eponymous god of Assyria. Many Hebrew names were formed on the same principle. Thus, Obadiah means 'the servant of the Lord' (Jehovah); Abdiel, 'the servant of God' (Elohim); Tobias or Tobiah, 'the Lord is good'; Abijah, 'the Lord is a father'; Abijah, 'the Lord is a brother'; Jehu, 'the Lord is He'; Nehemiah, 'the Lord comforteth'; Joel, 'the Lord is God'; Elijah, 'God is the Lord.' Many Hebrew names thus compounded, such as Elizabeth, Samuel, Daniel, Josiah, Joshua, and John (Jehohanan, 'whom Jehovah gave'; Gr. *Ioannes*), have become common among ourselves, together with a few, such as Mary, James, Ann, and Thomas, which do not contain the divine names. Modern Arabic names are derived either from those of the Old Testament, as Mousa, Yacoub, Yusuf, Suleiman, and Ayoub (Job); or,

like Ali, Hassan, Fatima, and Mohammed, from the family of the Prophet; or from bynames of the Prophet, like Achmet (Ahmed), 'the praised.' Many are compounded with divine titles, like Abdel-Kader, 'the servant of the Holy One'; or Abdel-Raman, 'the servant of the Exalted One.'

A Greek, like a Hebrew, bore only one name, though he might be described, for distinction, by the name of his father or of his birthplace, as Thucydides the Athenian, or Alcibiades the son of Clinias. The name of the eldest son was frequently the name or a variation of the name of that of the paternal grandfather. The usage of bearing only a single name led to the great variety of Greek names, in the invention of which much ingenuity was displayed. Such are Aristarchus, 'the best governor'; Agathocles, 'good fame'; Alexander, 'the helper of men'; Philippus, 'the horse lover'; Philemon, 'the lover of thought'; Aristobulus, 'best counsel.' Of similar construction are Demosthenes, Plutarch, Callicrates, Archimedes, Archimachus, Anaxander. There are also patronymics in *-ides*, as Aristides and Anaxandrides.

The Romans seem at first to have borne only one name, but at a very early period they adopted the Sabine practice, using a prenominal or personal name, such as Titus, Quintus, or Marcus, followed by a gentile or tribe name, ending in *-ius*, such as Julius, Claudius, or Tullius. This, in the case of patricians, was followed by a cognomen, usually derived from some personal peculiarity, such as Cæsar, Cicero, Naso, Torquatus. Thus, in the case of Marcus Tullius Cicero, Marcus is the prenominal, Tullius the nomen, and Cicero the cognomen. Occasionally, in the case of distinguished personages, an honorific agnomen, or second cognomen, was added, such as Africanus or Germanicus. A man might be called by the prenominal or the cognomen, or by the prenominal and nomen, or by the prenominal and cognomen. Thus, Caius Julius Cæsar might be called either Caius, or Cæsar, or Caius Julius, or Caius Cæsar, but our modern appellation Julius Cæsar would have been contrary to Roman usage.

The old Teutonic names were compounded of two elements, a substantive and an adjective, usually expressing the characteristics most prized by a fierce and warlike race. The commonest components are *bern*, 'bear'; *wulf* or *ulf*, 'wolf'; *arn*, 'eagle'; *her* or *hari*, 'warrior'; *helm*, 'helmet'; *gar*, 'spear'; *stan*, 'stone'; *wine*, 'friend'; *wald*, 'power'; *mund*, 'protection'; *rath* or *red*, 'counsel'; *grim*, 'fierce'; *hard*, 'stern'; *bald*, 'bold'; *adal* or *ethel*, 'noble'; *hrod* or *rod*, 'glorious'; *bert*, 'bright.' Thus, Bernard is 'the stern bear'; Arnold, 'eagle strength'; Roger, 'glorious spear'; Richard, 'stern might'; Robert, 'glorious brightness'; Albert, 'noble brightness'; Alfred, 'noble peace'; Athelstan, 'noble stone'; Edmund, 'noble protection'; Ethelred, 'noble counsel.'

The Teutonic name system prevailed among the Franks, Burgundians, and Normans in France, the Goths and Lombards in Italy and Spain, as well as in England, Germany, and Scandinavia. Hence we get such French names as Louis (Hlodwig) and Lothair (Hlodochar), with Italian names, such as Humberto and Garibaldi, and Spanish names, such as Gonzalo and Fernando. In England a complete change came in with the Norman conquest. In the early entries in the Durham *Liber Vitæ* we find only such Anglian names as Herebald, Cynbert, Edwin, Arkel, and Bernulf. In the Durham *Boldon* book, compiled about a hundred years after the Conquest, Norman names, such as William, Robert, Walter, and Ralph, are usual among tenants, but the fathers of these men, when their names are recorded, are mostly of the old English type, such as Osbert and Turkil.

In 1380, when Bishop Hatfield made his survey of the same manors, the old English names had disappeared. No less than 40 per cent. of the men are named John, followed by William with 22 per cent., while, if we add Robert and Thomas, 80 per cent. of all the men's names are accounted for. In the West Riding poll-book of 1379 John also heads the list, and more than half the men are called either John, William, Thomas, or Richard. In the 13th century William is the commonest name, in the 14th and following centuries John is first, with William second, till after the Revolution of 1688 William resumed, and has ever since retained the first place. This popularity of John, a name hardly to be found in Domesday, is believed to be due to the supposed suitability in baptism of the Baptist's name. So Jordan was a name commonly given to children who were baptised in water which had been brought from the Jordan by pilgrims or crusaders. The prevalence of William is due to William the Conqueror, of Robert to sympathy with the misfortunes of his son. Thomas came in with the murder of the great archbishop; the crusading exploits and the imprisonment of Richard I. made the name popular, while to the adventures of the paladins we owe Roland, Roger, and Reginald. In the 14th century Charles, James, and George are almost unknown, and even Henry is unusual. Charles only became popular after the execution of Charles I., and George came in with the Hanoverian dynasty. In the 14th century Mary, Sarah, and Ann, now so common, are scarcely to be found, and Elizabeth usually appears in the form of Isabella. One-third of the women are named either Agnes or Alice. If to these we add Joan, Margaret, Isabella, Cecilia, and Matilda, 75 per cent. of the women are accounted for. The great vogue of Agnes and Alice is explained by popular metrical legends. In the time of Charles I. Agnes has descended from the first place to the tenth, and Alice from the second to the sixth. Ann and Elizabeth now head the list, followed by Jane, Margaret, Mary, Alice, Isabel, Dorothy, and Ellen, in the order named, while Sarah is seventeenth. It may be noted that it was not till after the Restoration that two baptismal names were given to the same person.

Surnames were of very gradual introduction. In the case of Ethelred the Unready, Edmund Ironside, or Harold Bluetooth, we have not surnames, but mere nicknames, which did not descend to the children. Hereditary surnames make their appearance in the 12th century, in the 14th they are usual rather than exceptional, and even now in the mining districts of England and in some parts of Wales they are not universally used. It is easy to detect the process by which surnames were introduced. Thus, at the end of the 14th century we have Richard Johnson, son of John Richardson, where Johnson and Richardson are plainly descriptions or designations, but not true surnames. In the next generation Johnson would become the surname. In the same century we find families whose members are designated as John Smyth, son of Thomas Wright, Agnes Smythwyf, and Alice Smythdougher. We may detect the origin of such residential surnames as Wood, Green, Lane, Townshend, Yates, and Wells in the descriptive entries John at the Wode, William by the Green, Alice in the Lane, Agnes at the Townend, Richard by the Kirkgate, Thomas at the Welle. Other names, chiefly those of tradesmen and artisans, indicate recent migration, such as John of Doncaster, or William of York, while among the franklins and esquires we find territorial surnames such as John de Cawood of Cawood. In addition to these residential and territorial surnames, patronymics, such as Jones, Johnson,

and Jenkins, are innumerable. There are also nicknames like White, Hogg, and Goodfellow, which have become hereditary; surnames of office, such as William le Mayor and Robert le Falconer; and a very large class of names of occupation. Thus, the surnames Lister, Walker, Dyer, Fuller, Tozer, Tucker, and Webster all refer to the manufacture of cloth; Skinner, Barker, Lorimer, and Sadler to that of leather.

The oldest Celtic names resemble the Teutonic names in their construction. Thus Dumnorix may be translated 'the world king'; Toutorix, 'the tribe king'; Vergobretos, 'the excellent judge'; Cunobelinus (Cymbeline), 'the war chief'; Boadicea, 'the victorious.' At a later time we get names of another description, such as Ruadhri (Anglicised Rory), 'the red'; Buidhe (Anglicised Boyd), 'the yellow'; Cumara, 'the sea-hound' (whence MacNamara); Scolaidhe, now Scully, 'the reciter' or 'story-teller'; Bhaird, now Baird, 'the bard'; Taidhig, now Teague and Tighe, 'the poet'; and Liagh, now Legge, 'the physician' or 'leech.' With the introduction of Christianity we get names of another class, as Taggart (a corruption of *sacerdos*), 'the priest.' From *maol*, 'a tonsured servant,' we have such names as Malone, Malony, and Mulready. Malcolm means 'the tonsured servant of St Columba.' From *giolla* (Anglicised as *gillie*), 'a youth' or 'servant,' we obtain Kelly, 'the servant'; Gilchrist, 'the servant of Christ'; Gillespie, 'the servant of the bishop'; Gilfil, 'the servant of St Paul'; Gilbride, 'the servant of St Bridget'; Gilroy, 'the red-haired servant.' Maq or Mac, 'son,' which in Welsh becomes Map and Ap, has given rise to a host of patronymic surnames. Maclean is Mac-giolla-Ean, 'the son of the servant of John.' Mackay, Magee, and Kay are corruptions of MacAedha; Kegan is MacEgan, Quain is MacIain (Johnson), Kew is MacHugh, Keary and Carey are MacCiardha, Quin is MacCoinn, Quirk is MacCore, Kane and Caine are MacCathain, Cleg is MacLeagh, Cayley is MacCaolaidhe, and Macpherson means 'the son of the parson.' So in Wales Price and Bryce are Ap Rhys, Powell is Ap Howel, Pugh is Ap Hugh, Parry and Barry are Ap Harry, Bowen is Ap Owen, and Bevan is Ap Evan (Johnson). The Irish *ua*, 'grandson' or 'descendant,' which has become O', has also given rise to innumerable patronymic surnames, but is not found in Scotland or the Isle of Man.

It may be mentioned that in England any one may take another surname or as many surnames as he pleases without either an act of parliament or royal license.

The literature of the subject is very extensive, but for the most part is either obsolete or uncritical. Three painstaking monographs, Förstemann's *Alteutsches Namenbuch*, Joyce's *Origin and History of Irish Names of Places*, and Moore's *Surnames and Place-names of the Isle of Man*, may be almost unreservedly commended. The *Etymologisch-geographisches Lexicon* of Dr Egli is fairly comprehensive, dealing with more than 17,000 names, and, though not invariably accurate, is a useful book of reference. Dr Taylor's *Words and Places* and Mr Bardley's *English Surnames* are less technical, and cover a wide field. Lower's *Patronymica Britannica*, Cocheris' *Les Noms de Lieu*, Buttman's *Die Deutschen Ortsnamen*, Miss Yonge's *History of Christian Names*, Miss Blaikie's *Dictionary of Place-names*, and two books by Mr Ferguson, *Surnames as a Science* and *The Teutonic Name System*, may also be consulted, always with caution, though usually with advantage.

Namur (Flem. *Namen*), a city of Belgium, at the confluence of the Sambre with the Meuse, 35 miles by rail SE. of Brussels. With the exception of the picturesque citadel (1784), the old fortifications have been razed since 1866, their place being taken by a cordon of seven forts. The town itself

has suffered so much by war that it offers little of interest—the cathedral, completed in 1772, with the grave of Don John of Austria; the Jesuit church of St Loup (1653), a large military school, an antiquarian museum, monuments of Leopold I. and the geologist Omalius d'Hallo (1783–1875), &c. Namur is noted for its cutlery, and also manufactures firearms, leather, paper, and tobacco. Pop. (1874) 26,030; (1889) 28,706. Namur was captured by Louis XIV. in 1692, but recaptured in 1695, after a ten weeks' siege, by William III. and 'my uncle Toby.'

The province of Namur, on the French frontier, lying between Hainault and Luxembourg, has an area of 1414 sq. m. Fertile and rich in minerals, it is watered by the Meuse, Sambre, and Lesse, and traversed by wooded spurs of the Ardennes (2000 feet). Pop. (1871) 313,655; (1889) 338,186.

Nanaimo, a town on the east coast of Vancouver Island, 74 miles by rail NNW. of Victoria. There are large coal-mines in the district, and the town is the chief seat of this trade. Pop. of district, 2803.

Nana Sahib, the name under which Dundhu Panth, adopted son of the ex-peshwa of the Mahrattas, became known as the leader of the Indian Mutiny in 1857. Born about 1821, the son of a Brahmin in the Deccan, and educated as a Hindu nobleman, he was bitterly disappointed that when the peshwa died in 1851 the latter's pension was not continued to himself; and, industrious in fanning discontent with the English rule, on the outbreak of the Mutiny he was proclaimed peshwa, and was responsible for the massacres at Cawnpore (q.v., and see INDIA). After the suppression of the rebellion he escaped into Nepal. The date of his death is not known.

Nancy, a beautiful French town, capital of the department of Meurthe-et-Moselle, lies on the left bank of the river Meurthe, at the foot of wooded and vine-clad hills, 220 miles by rail E. of Paris and 94 E. of Strasburg. It comprises, besides several suburbs, the old and new towns (the former with narrow irregular streets, the latter open and handsome). It contains many fine squares and imposing edifices, and owes much of its architectural adornment to Stanislas Leszcinski, who, after abdicating the crown of Poland in 1735, continued to reside here as Duke of Lorraine till his death in 1766. His statue (1831) stands in the Place Stanislas, the principal square, which is surrounded by important public buildings, as the hôtel-de-ville, the bishop's palace, and the theatre. Other noteworthy features are the cathedral (1742); the churches Des Cordeliers and Notre Dame de Bon Secours (1738), both with interesting monuments; St Epvre (1875); the 16th-century ducal palace, with the Lorraine museum; statues of General Drouot (1853) and Thiers (1879); and half a dozen gates, looking more like triumphal arches. The institutions include a university with four faculties, a lyceum, and a library of 40,000 volumes. It has been the main centre of research into the therapeutic value of hypnotism. Nancy, which has grown much in importance since the German annexation of Alsace-Lorraine, has manufactures of cotton and woollen goods, artificial flowers, iron, tobacco, &c.; but its staple industry is embroidery on cambric and muslin. Pop. (1872) 52,565; (1886) 79,020. Nancy, dating from the 12th century, was the capital of the duchy of Lorraine (q.v.). It was the scene of the death of Charles the Bold (1477), and the birthplace of Callot and Claude Lorraine. See works by Cayon (1846), Lepage (1866), and Courbe (1886).

Nanda Devi. See HIMALAYA.

Nandu. See RHEA.

Nankeen Cloth is a very durable fabric made of a kind of cotton grown in China which is naturally of a buff-yellow colour, and this is also the colour of the cloth. The plant which yields it is a mere variety of *Gossypium herbaceum*, the species which yields the ordinary white cotton of India and China. In the first half of the 19th century Nankeen cloth was much used in Great Britain for ladies' and children's attire, and also for men's trousers. It is still exported from China, but is now seldom seen in England. Imitations of it were made in Europe by dyeing white cotton, and the name 'Nankeen,' when now applied, as it sometimes is, to certain kinds of cotton goods manufactured in England, is not confined to fabrics resembling genuine Nankeen cloth.

Nanking, capital of the province of Kiangsu, formerly the capital of China, on the Yangtse River, 130 miles from its mouth. Its name signifies the Southern Capital. Since the removal of the seat of government to Peking (Northern Capital) in the beginning of the 15th century, the official name has been Kiangning, though the old name is preferred popularly. From 1853 to 1864 it was the capital of the Taiping rebels, who destroyed nearly all the magnificent public buildings for which the city was once famous. Previous to that time the walls enclosed an area nearly 20 miles in circumference, and reached in many places an elevation of 70 feet. The most memorable of the ruined buildings were the Porcelain Tower, described under CHINA (Vol. III. p. 186; for illustration, see PAGODA), the summer palace, and the tombs of the kings, with remarkable sepulchral statues. Since its recapture by the Chinese imperialists, Nanking has resumed its position as the seat of the viceregal government, but shows few signs of recovery from its desolation. Although the manufacture of the well-known nankeen, and of satin, has been revived, very little of the pottery, artificial flowers, and paper, for which it was once celebrated, are now produced. The government have, however, established an arsenal on the European model. In 1842 it was captured by the British, and Sir Henry Pottinger signed the treaty of Nanking. Although specified in the treaty of Tientsin (1858) as a river-port to be opened to foreign trade, little or nothing has come of this concession. Pop. 150,000.

Nantes, the seventh largest city of France, capital of the department of Loire-Inférieure, lies on the right bank of the tidal Loire (here 2000 yards wide, and joined by the navigable Erdre and Sèvre-Nantaise), 35 miles from the sea, and 248 by rail SW. of Paris. The natural beauties of the site have been much improved by art, and, the old town having been demolished between 1865 and 1870, Nantes is one of the handsomest cities in all France, with its noble river, quays, bridges, shady boulevards, squares, and statues. The unfinished cathedral (1434–1852) contains Colomb's splendid monument (1507) to the last Duke and Duchess of Brittany, and another (1879) to General Lamoricière. The ducal castle, founded in 938, and rebuilt in 1466, was the occasional residence of Charles VIII. and most of his successors, the prison of Cardinal de Retz and Fouquet, and the place where on 15th April 1598 Henry IV. signed the famous Edict of Nantes, which gave freedom of religion to the Huguenots (q.v.), and whose revocation by Louis XIV. on 18th October 1685 drove 400,000 French into exile. Other noteworthy buildings are the splendid church of St Nicholas (1854), the palais de justice (1853), the theatre (1787), and the new post-office (1884), besides a museum, a picture-gallery, and a library of 50,000 volumes. Between 1831 and 1887 £180,000 was

expended on harbour-works, but the rise since 1845 of the port of St Nazaire (q.v.), near the mouth of the Loire, and the increasing difficulty in the navigation of the river, have combined with depression of trade to reduce the commercial importance of Nantes; to restore which is the object of the ship-canal (1891) between the two places. The chief exports are hardware, cereals, and preserved provisions, the chief imports sugar, iron, cocoa, and wines; and their value respectively in 1872 was £2,200,000 and £2,800,000, in 1889 only £560,000 and £2,100,000. Shipbuilding also has greatly fallen off, but still is one of the leading industries, together with the preparation of sardines, and the manufacture of sugar, leather, iron, nets, soap, machinery, &c.; whilst 10 miles below Nantes is the vast government steam-engine factory of Indret, employing from 2000 to 3000 hands, and familiar to every reader of Daudet's *Jack*. Pop. of Nantes (1872) 112,947; (1886) 120,106. The *Portus Namnetum* of the Romans, and the former capital of Brittany—a rank it disputed with Rennes—Nantes has witnessed the marriage of Anne of Brittany to Louis XII. (1499), the embarkation of the Young Pretender (1745), the 'noyades' of the execrable Carrier (q.v.), the fall of the Vendéan leader Cathélineau (1793), and the arrest of the Duchess of Berri (1832). Fouché was a native. See works by Travers (1844) and Mellier (1872).

Nantucket, an island (15 miles long) off the south-east coast of Massachusetts. On the north shore is Nantucket town (pop. 3268), with a nearly landlocked harbour. It was formerly a great seat of the whale-fishery, but is now mainly noted as a summer-resort.

Nantwich, a market-town of Cheshire, on the Weaver, 4 miles SW. of Crewe. It has some quaint old timber houses; a fine cruciform parish church, Early English to Perpendicular in style, with a central octagonal tower, 110 feet high; a Gothic town-hall (1858); a market-hall (1867); a grammar-school (1611); and brine-baths (1883). The *Halen Guym* ('white salt town') of the Welsh, Nantwich was once the second largest town in Cheshire, the seat of 300 salt-works in Leland's day, a number reduced to 100 through the discovery of better brine-pits in other parts of the Weaver's valley in 1624, since which date the industry has gradually quite died out. Boot and shoe making now is the principal industry. A great fire (1583), and its siege by the royalists under Lord Byron (1644) are the chief events in the history of Nantwich. Pop. (1851) 5424; (1881) 7495; (1891) 7412.

Naphtha is derived from the Persian word *nafata*, 'to exude,' and was originally applied to liquid hydrocarbons which exude from the ground in the neighbourhood of the Caspian Sea; in like manner it was applied to the natural oils found more or less plentifully in nearly all countries of the world, and also to the oil distilled from Bog-head mineral in Scotland. But the inconvenience and danger of classing all these oils indiscriminately as naphthas became apparent after the Scotch paraffin and the American petroleum refined oils began to be used for domestic illumination. The word naphtha is still used in a very general and vague sense, and has no specific application either scientifically or commercially to any particular liquid; but since the more general application of the words paraffin and petroleum to mineral oils the sense in which the word naphtha is used has been narrowed considerably. The various British Petroleum Acts since 1862 have also aided in the interest of public safety in emphasising the wise distinction now made between the heavier and safe hydrocarbon oils on the one hand, and the

volatile and unsafe hydrocarbon spirits or naphthas on the other.

Commercially, naphtha is now understood to apply to the inflammable distillates of crude mineral oils and coal-tar. For trade convenience the volatile distillates of petroleum and shale oil are known respectively as petroleum spirit and shale spirit, to distinguish each from the other, and both from coal-tar naphtha. The term naphtha also embraces distillates of india-rubber, bones, peat, and wood, the last of these being known as wood-spirit or methyl alcohol. A few words with regard to each of these naphthas may serve to indicate more particularly the nature and method of production, and also the uses to which they are applied.

Petroleum spirit is obtained from crude petroleum in the process of refinement by distillation. The first or lightest portion of the oil which passes over from the still, being highly inflammable, is not allowed to mix with the burning oil, but is run into a separate or naphtha tank. American crude petroleum yields from 15 to 20 per cent. of crude naphtha, which in some of the refineries is separated into gasoline, sp. gr. '640 to '650; benzine, sp. gr. '670 to '710; and benzoline or deodorised spirit, sp. gr. '710 to '730. Russian crude petroleum yields a comparatively small proportion of naphtha, about 5 or 6 per cent., which is separated into light benzine and heavy benzine, varying in sp. gr. from '730 to '775. Shale spirit is a product of the crude oil distilled from shale, which is one of the important mining and chemical industries of Scotland. This crude oil contains 4 to 5 per cent. of naphtha, having a sp. gr. of '715 to '740; but some of the shale-oil works produce a small quantity of gasoline with a sp. gr. of '640 to '680. Coal-tar naphtha is distilled from the tar obtained from coal in gas-works. The production of tar is 10 to 12 gallons per ton of coal put through the retorts. This tar on distillation yields from 5 to 20 per cent. of naphtha according to the quality of coal used. Gas-tar from Newcastle coal gives only 5 per cent. of naphtha, while the tar from some cannel coals yields as much as 20 per cent. Coal-tar naphtha has a sp. gr. varying from '850 to '950, and is thus much heavier than the naphthas obtained from crude mineral oils. Coal-tar naphtha may be fractionated into a variety of hydrocarbons with boiling-points ranging from 175° to 350°; but the two of the greatest commercial importance are benzole and ordinary naphtha. Caoutchine is a naphtha obtained by the destructive distillation of caoutchouc or india-rubber. It also may be fractionated into a number of hydrocarbons of different densities and boiling-points. Bone-naphtha is obtained by the distillation of bones in the manufacture of animal charcoal. It is known also as bone-oil, or Dippel's animal oil. Owing to some neutral or nitrogenous substance as yet unknown, it possesses a peculiarly offensive smell, and until some easy means is discovered of removing this very objectionable feature bone-oil can never become of much use as a naphtha. The crude naphthas obtained from these various sources are all refined or purified by similar processes—viz. simple redistillation by means of steam, as in America, for the lightest fractions; but for the heavier spirits a treatment with sulphuric acid and then with caustic soda, and a subsequent washing with water are necessary previous to redistillation.

The uses to which in the industrial arts the different qualities of naphtha are applied are very numerous. The lighter spirits, such as benzole and benzine, being solvents of grease and oil, are used for detergent purposes. Benzoline was for some years burned pretty generally by the poorer classes

in cheap benzoline or sponge lamps; but its use in this way has happily been greatly restricted, if not quite superseded, by the low price at which petroleum and paraffin oils have for some years been obtainable. The light naphthas are also used for extracting the perfumes of flowers and plants, and the oil from various seeds. Gasoline is employed exclusively for carburetting air-gas. The bulk of the coal-tar naphtha, and much of the shale and petroleum spirit, are employed as solvents in the manufacture of india-rubber and gutta-percha goods. They are also solvents of wax, and fatty and resinous bodies generally, and are so used in refining the best qualities of paraffin wax. Large quantities are consumed in naphtha, torch, and other flaring lamps for outside use. They are also used as a substitute for turpentine in the preparation of paints; and in Scotland the solvent action of shale spirit is turned to account in the preparation of an anti-damp or stone- and timber-preserving fluid called Alexinton. A considerable percentage of paraffin wax is dissolved and held in solution by the spirit; and if this liquid be applied to freestone, brick, or wood, it passes into the pores of the material, and the spirit rapidly evaporating leaves the wax permanently in the stone or wood, so that water cannot be absorbed by it. While for these various purposes all the naphthas produced in Britain find a ready market, in America and Russia petroleum spirit is made in such quantities that it is impossible to find profitable outlets for it all; and although large quantities in many petroleum refineries are consumed as fuel under the stills, yet much of the crude naphtha has to be burned in waste pits to get rid of it.

Naphthalene, $C_{10}H_8$, is a solid substance obtained from Coal-tar (q.v.). It forms thin, transparent, brilliant plates with a pearly lustre and unctuous to the touch. It melts at 176° (80° C.) and boils at 422° (217° C.), but it readily sublimes at a much lower temperature. Although not very inflammable, it is used (as in the Albo-carbon light) to increase the illuminating power of coal-gas, the naphthalene being placed in a metal receiver heated by the gas-flame, and the illuminating gas passed slowly through. A smoky but brilliant light is thus obtained which under some circumstances may be useful. Naphthalene is of most importance from a scientific standpoint. Its molecule of $C_{10}H_8$ may be regarded as made up of two aromatic nuclei, having two atoms of carbon in common; but for further information on this point, see AROMATIC SERIES. Naphthalene forms an extensive series of derivatives in which one or more atoms of hydrogen are replaced by NO_2 —chlorine, bromine, &c.

Napier, the chief port and city of the provincial district of Hawke's Bay, New Zealand, on the east coast of the North Island. Port Aluriri (or Scinde Island), where most of the wholesale stores are situated, is within the municipal boundary. A railway, intended eventually to connect with Wellington, was open to Woodville (97 miles) in 1889. The harbour has been deepened in order to accommodate large vessels. There is a considerable export of timber and wool, tinned and frozen meat. The exports for the year ending June 1888 amounted to £738,652 (wool, £589,576). It is the seat of the bishop of Waiapu. Pop. (1889) 8597.

Napier, SIR CHARLES, English admiral, was cousin to the hero of Sind and the historian of the Peninsular war, and was born 6th March 1786, at Merchiston Hall, near Falkirk. At thirteen he went to sea as a naval volunteer. In 1808 he received the command of the *Recruit*, 18 guns, and had his thigh broken by a bullet. He kept up a running fight in the West Indies with a French line-of-battle ship, and assisted in her

capture. This obtained him a post-captaincy; but being thrown out of active service, he served ashore as a volunteer in the Peninsular army, and was wounded at Busaco. Commanding the *Thames* in 1811, he inflicted an incredible amount of damage upon the enemy in the Mediterranean. In 1814 he led the way in the hazardous ascent and descent of the Potomac; and he took an active part in the operations against Baltimore. In 1829 he received the command of the *Galatea*, a 42-gun frigate, and was employed 'on particular service' on the coast of Portugal. Becoming acquainted with the leaders of the Constitutional party, he accepted the command of the fleet of the young queen; and by defeating the Miguelite fleet he concluded the war, and placed Donna Maria on the throne. He was made admiral-in-chief of the Portuguese navy, and attempted to remodel it; but official and corrupt influence was too strong for him, and he returned to England. In the war between the Porte and Mehemet Ali he organised a land force, with which he stormed Sidon and defeated Ibrahim Pasha among the heights of Mount Lebanon. He took part in the naval attack on Acre, blockaded Alexandria, and concluded a convention with Mehemet Ali. In 1847, now a K.C.B., he received the command of the Channel fleet. When the Russian war broke out he was sent out to command the Baltic fleet; but the capture of Bomarsund failed to realise the high expectations formed, and he was deprived of his command. He twice sat in parliament, for Marylebone and Southwark, and, until his death at his Hampshire seat, Merchiston Hall, November 6, 1860, he laboured to reform the naval administration. See his *Life and Correspondence* (1862).

Napier, SIR CHARLES JAMES, the conqueror of Sind, was great-grandson of the fifth Lord Napier and a descendant of Napier of Merchiston. He was born at Westminster, 10th August 1782, and, having received a commission in his twelfth year, served in Ireland during the rebellion. He commanded the 50th Foot during the retreat on Coruña; and at the fatal battle in which Sir John Moore fell he was wounded in five places and made prisoner. Marshal Ney dismissed him, with permission to go to England, where he engaged in literary work, and even wrote an historical romance. In 1811 he returned to the Peninsula. At Coa, where he fought as a volunteer, he had two horses shot under him. At Busaco he was shot in the face, having his jaw broken and his eye injured. He recovered in time to be present at the battle of Fuentes d'Oñoro and the second siege of Badajoz. He took part in a fighting cruise off the Chesapeake, capturing American vessels, and making frequent descents upon the coasts. He did not return to Europe soon enough for Waterloo, but was engaged in the storming of Cambrai, and accompanied the army to Paris. After the peace he was, in 1818, made governor of the island of Cephalonia, the affairs of which he administered with great energy and intelligence; but, being of an excessively combative disposition, he became embroiled with the authorities at home. In 1838 he was made a K.C.B., and in 1841 was ordered to India to assume the command of the army of Bombay against the ameer of Sind. His destruction of a fortification called Emaun Ghur, in 1843, was a most remarkable military feat. The fearful battle of Meeanee (q.v.), on 17th February, followed, where Napier, with 2800 English and sepoys, defeated 22,000 Baluchs, strongly posted. The ameers surrendered, except Shere Mohammed, who brought 25,000 men into line of battle at Hyderabad. Napier had only 5000 men, but in three hours his little army gained a decisive victory. A few days afterwards Napier was in the palace

of the ameers, and master of Sind; and after the annexation Lord Ellenborough made him governor of Sind. He gained the respect and reverence of the inhabitants, but soon became engaged in an acrimonious war of despatches with the British authorities. In 1847 he returned to England. After attending a series of festivals in his honour, he lived in retirement until the disasters of the Sikh war caused the eyes of his countrymen to be turned to the hero of Sind. He went to India, but found on his arrival that the Sikhs had been routed. He now turned his attention, as commander-in-chief of the army in India, to the subject of military reform, and quarrelled with Lord Dalhousie. He bade a final adieu to the East in 1851, and returned to his native country, where he resided until his death, which took place at his seat, at Oaklands, near Portsmouth, on 29th August 1853. He had then attained the rank of lieutenant-general, was G.C.B., and colonel of the 22d Foot. It must be remembered to his honour that he was the first English general who ever recorded in his despatches the names of private soldiers who had distinguished themselves, side by side with those of officers. Brave to rashness, ready alike with tongue, pen, and sword, quarrelsome with his superiors, but beloved by his soldiers, and, to crown all, of wild yet noble and striking appearance, Napier was one of the most remarkable men of his time. See the biography by his brother (4 vols. 1857), that by W. Napier Bruce (1885), and the short Life by Sir W. Butler (1890).

His brother, SIR WILLIAM FRANCIS PATRICK NAPIER, K.C.B., was born 17th December 1785, served in the Peninsular campaign, and became lieutenant-general. Besides his famous *History of the War in the Peninsula* (6 vols. 1828-40), he published *The Conquest of Scinde* (1845), and the Life of his brother Sir Charles (1857). He died at Clapham, 12th February 1860. See his Life by H. A. Bruce (1864).

Napier, JOHN, Laird of Merchiston, was born at Merchiston Castle, near Edinburgh, in 1550. He matriculated at St Andrews in 1563, and travelled for some time on the Continent, returning to his native country highly informed and cultivated; but, declining all civil employments, he preferred the seclusion of a life devoted to literary and scientific study. In 1593, however, he was one of a deputation of six to the king regarding the punishment of the 'Popish Rebels'; and in the same year he published his *Plaine Discouery* (or 'Interpretation') of the whole Revelation of Saint John (revised ed. 1611; 5th ed. 4to, 1645). In the dedication to King James VI. he gave his majesty some very plain advice regarding the propriety of reforming his 'house, family, and court;' and the work went through numerous editions in English, Dutch, French, and German. In July 1594 he made a contract with Logan of Restalrig for the discovery of treasure in Fast Castle. About this time he seems to have devoted much of his time to the invention of warlike machines for the defence of the country against Philip of Spain, and a list of the same exists at Lambeth Palace, dated 1596. Like other eminent men of the time, Napier, though a strict Presbyterian, seems to have been a believer in astrology and divination. In 1596 he proposed the use of salt as a fertiliser of land. In 1614 he first gave to the world his famous invention of Logarithms (q.v.), in a treatise entitled *Mirifici Logarithmorum Canonis Descriptio* (4to, Edin.). Napier's next work was *Rabdologia seu Numerationis per Virgulas libri duo* (Edin. 1617), detailing an invention for simplifying and shortening the processes of multiplication and division mechanically by means of the device subsequently known as *Napier's*

Bones—an arrangement of narrow slips of bone, ivory, metal, or pasteboard, inscribed with figures. This ingenious contrivance, however, was superseded by his logarithms. He also prepared a second work on logarithms, showing their mode of construction and application, with an appendix containing several propositions of spherical trigonometry, and those formulæ which are now known by his name. This work was published after his death (4th April 1617) by his son Robert in 1619. There is an English translation by W. R. Macdonald, *The Construction of the Wonderful Canon of Logarithms*, with a catalogue of the various editions of Napier's works (1889). Napier's eldest son, Archibald, was raised to the peerage as the first Lord Napier by Charles I. in 1627, and his descendants still bear the title—the ninth Baron Napier having in 1872 become also Baron Ettrick in the peerage of the United Kingdom.

Two Lives of Napier have been published, the one by the Earl of Buchan (1787), and the other by Mark Napier (1834), who also edited *Ars Logistica*, 'The Baron of Merchiston his booke of Arithmetick and Algebra' (1839), reprinted from a manuscript copy for the Bannatyne Club. This work had been originally transcribed from Napier's notes by his son Robert.

Napier, MACVEY, born at Glasgow, 11th April 1776, was educated there and in Edinburgh, and in 1799 became a writer to the Signet, in 1805 Signet Librarian (which post he retained till 1837), and in 1824 first professor of Conveyancing. He edited the supplement to the fifth edition of the *Encyclopædia Britannica* (6 vols. 1816-24), and in 1829 succeeded Jeffrey as editor of the *Edinburgh Review* (q.v.). Among his contributors were Macaulay, Carlyle, J. S. Mill, Sir William Hamilton, and (alas for the editor!) Brougham. He died 11th February 1847. See his interesting *Correspondence* (1879).

Napier of Magdala, LORD. Robert Cornelius Napier was born in Ceylon, 6th December 1810, and was educated at the Military College at Addiscombe. He entered the Bengal Engineers in 1826, served in the Sutlej campaign, was wounded while acting as chief-engineer at the siege of Multan, and had a prominent share in the battle of Gujrat. As chief-engineer of the Punjab, with the rank of colonel, he greatly developed the resources of the country. During the Indian Mutiny he was chief-engineer in Sir Colin Campbell's army, and especially distinguished himself at the siege of Lucknow, and was made K.C.B. He received the thanks of parliament for his services in the Chinese war of 1858. As commander of the expedition in Abyssinia (q.v.) in 1868, he achieved a brilliant success, both by his whole management of the short campaign and in the storming of Magdala, which ended it. On his return he received the thanks of parliament, an annuity of £2000, was made G.C.B., and created Baron Napier of Magdala. In 1870 he was appointed Commander-in-chief of the forces in India, and nominated a member of the Indian Council. In 1876-82 he was governor of Gibraltar, and on resigning was made Field-marshal, in 1886 Constable of the Tower. He died 14th January 1890.

Naples owes its foundation to a body of Greek colonists, two settlements, Palaepolis and Neapolis, existing for many years side by side as one community, Parthenope. In 328 B.C. both were subdued by Rome; from that time Palaepolis disappears, whilst its neighbour was made an ally of Rome. It resisted Pyrrhus, deterred Hannibal, but fell through treachery into the hands of Sulla's partisans (82 B.C.), who massacred the people. Under the empire it was a favourite place of residence for the emperors and the upper classes of Rome, and of the poets Virgil, Statius, Silius Italicus, luxury and pleasure, and its beautiful

climate, being the sources of attraction. After Rome fell, it sided with the Goths, but was seized by Belisarius (536), and six years later by Totila. Narses recovered it soon after for the Byzantine emperors, who made it the head of a duchy. This in the beginning of the 8th century asserted its independence, and retained it until the whole country was subdued by the Normans (q.v.) in the 11th century. To the Norman dynasty succeeded that of the Hohenstaufen. But their arch-enemies, the popes, conferred the sovereignty of Naples upon Charles of Anjou, who in the battle of Benevento (1266) annihilated the power of the imperial (Ghibelline) party. The predominance of the papal (Guelph) party during the reign of Robert I., who was the patron of Dante and Boccaccio, the depraved libertinism of his heiress and granddaughter Joanna, the ravages committed by German mercenaries and by the plague, futile attempts to recover Sicily, and the feuds of rival claimants to the throne, are the leading features during the rule of the Angevine dynasty, which expired with the profligate Joanna II. in 1435. It was succeeded by that of Aragon, which had ruled Sicily from the time of the Sicilian Vespers (1282). During the tenure of the Aragon line, various unsuccessful attempts were made by the House of Anjou to recover their lost sovereignty; and the country, especially near the seacoast, was repeatedly ravaged by the Turks. Between 1494 and 1504 the French and Spanish disputed between them the possession of Naples, and victory inclined to the latter. Naples was united with Sicily, forming the kingdom of the Two Sicilies, and was governed by viceroys of Spain down to 1707. The most striking episode during this period was the revolt of Masaniello (q.v.). During the war of the Spanish Succession (q.v.), Naples was wrested from Spain by Austria (1707); but in 1735 was given to Don Carlos, third son of Philip V. of Spain, who founded the Bourbon dynasty. In 1789 the troops of the French Republic invaded Naples and converted it into the Parthenopean Republic (1799). For Nelson's share in Neapolitan politics at this time, see NELSON. A second invasion by Napoleon (1806) ended in the proclamation of his brother, Joseph, as king of Naples; and, when Joseph assumed the Spanish crown in 1808, that of Naples was awarded to Joachim Murat. On the defeat and execution of Murat in 1815 the Bourbon monarch, Ferdinand IV., was restored. The insurrectionary movements of 1821 and 1848 were the forerunners of the overthrow of the Bourbon rule by Garibaldi (q.v.) and the Sardinians, and the incorporation of Naples in the kingdom of Italy (1861).

See *History of the Kingdom of Naples* (1734-1825), by Colletta, Eng. trans. by S. Horner (2 vols. Edin. 1858); and see also ITALY, SICILY, and FERDINAND I. and II.

Naples (Gr. and Lat. *Neapolis*, Ital. *Napoli*), till 1860 the capital of the kingdom of Naples, is the largest of Italian cities, and, with the doubtful exception of Constantinople, the most beautifully situated in Europe, 161 miles by rail SE. of Rome. It is the seat of an archbishop. Pop. (1881) 463,172; (1889) 514,286. Naples is one of the busiest ports of the kingdom, exporting wine and olive-oil (£504,150), chemicals and perfumery

(£285,800), live animals and animal products (£249,700), hemp and flax (£293,450), cereals (£94,700), curriery (£100,250), &c., to the annual value of £1,672,000; and importing cereals (£1,363,500), metals (£736,800), cottons (£707,250), woollens (£386,300), live animals (£354,900), earthenware, glass, &c. (£336,150), curriery (£256,250), silks (£179,500), groceries (£173,400), specie, hemp and flax, dyes, chemicals, &c., to an average total of £5,563,000. She trades principally with Britain (annual total, £2,266,400) and France (£1,861,900). Naples has many employments but few industries, and these insignificant, consisting mainly of woollen, silk, and linen manufactures, gloves, soap, perfumery, jewellery, earthenware, hats, and carriages. Macaroni (q.v.) is almost indigenous to the Neapolitan seaboard. Fishing supports many of the inhabitants. The neighbourhood is the market-garden of Italy.

Its attractiveness, due not only to its site, but to its tonic and bracing climate, specially delightful in autumn and winter, and, thanks to the sea-breeze, quite tolerable in the summer-heat, has inspired the well-known proverb, 'See Naples and then die.' Its charms have remained proof against innumerable sanitary drawbacks, defective drainage, impure water-supply, and the fever preserves of its poorer quarters with their subterranean dens,

in course of removal since June 1889. The impetus to this work was given by the fearful cholera explosion of September 1884, when in one night nearly 2000 people were attacked, and about 1000 of them died. The new drainage-works carry the sewage to Cumæ, thus relieving the sea-margin, under the principal hotels, of the liquid poison that used to stain the water black hard-by the most frequented marine-baths, and infect the oysters moored in baskets near the shore. An aqueduct opened in 1885 furnishes pure drinking-water to every part of the city. Along the quay considerable improvements are in progress—a new harbour, solid embankments, and commodious promenades following up the handsome squares, planted with trees and parterres, new streets cut through the more populous quarters, a fine embankment carried along the sea-front, and the Corso Vittorio Emanuele, a road traversing all the heights above the city—these latter improvements begun and partly finished under King Victor Emmanuel.

Naples occupies the base and flanks of a hill-range rising, amphitheatre wise, from the sea, and divided into two unequal parts by the Capodimonte, S. Elmo, and Pizzofalcone heights, the latter ending in the small ridge crowned by the

Castel dell' Ovo. The most ancient and populous part of the city lies in the eastern crescent, and is intersected from north to south by the Via Toledo (now Via di Roma), the main historic street of Naples, more densely peopled than any other of equal space in Europe. Numerous broad streets have lately been built on this side of the city. A fine quay extends eastward to the Castel del Carmine. To the back of this lies the poorest and most populous quarter, now being dismantled. Westward runs the less ancient city, smaller in extent, but freer as to air and prospect, and frequented by the more favoured classes, resident and migratory. Along the sea-margin extend the royal gardens and the Riviera di Chiaja, the lower boundary of the comparatively new quarters built against the slope. On the Vomero Hill, in the north-west, house-construction is busily going on to accommodate the inhabitants of the dismantled 'rookeries' near the harbour, for whom dwellings have also been built beyond the railway station to the east of the city. Naples is three miles long and two broad. It has a modern look, but in spite of external change still presents the same noisy, vivacious, mercurial life so astonishing and ere long so oppressive in its monotony to the new-comer from the north. From the precocious street arab to the gray-haired and vociferous mendicant, with a whole army of importunate pedlars, cabmen, new-vendors, flower-girls, and touts between, there is no pause night or day—that 'Naples never goes to bed' is indeed a scarcely exaggerated saying! The historic interest of the suburban quarters along the shore is greater than in the city. But its poverty in Græco-Roman antiquities is made up for by its National Museum, becoming daily richer in archaeological treasure-trove from Pompeii, while its splendid aquarium teems with typical specimens of the flora and fauna of the Mediterranean, and forms the exhibition-room of its Zoological Station (q.v.). Of architectural interest Naples has little. Besides her five forts and four gates of mediæval construction, she has upwards of 300 churches, including the cathedral (1272–1316) of St Januarius (q.v.), whose blood is said to liquefy in the phials containing it on three yearly festivals. The university (1224), with nearly 100 teachers and 4150 students, the royal palace, the catacombs, and, still more, the law-courts are worth visiting. Naples is excellently equipped with libraries: the National Library (1804) has 275,000 books and 8000 MSS.; the University Library (1812), 150,000 books; and the Brancacciana (1673), 150,000 books and 3000 MSS. The San Carlo Theatre (chiefly for opera) is one of the largest in Italy, though much less popular than the San Carlino, sacred to 'Pulcinella' (the Italian Punch). In fine art Naples is poor—her music, in spite of her devotion to opera, adding nothing to the European repertory; the plaintive songs of her fishermen are as distinctive of the Mediterranean as the Venetian *barcaruole* are of the Adriatic.—The province has an area of 336 sq. m., and a population (1889) of 1,060,032.

Napoleon I., emperor of the French. Napoleon Bonaparte, the second son of Charles Bonaparte and his wife Letizia de Ramolino, was born at Ajaccio, in Corsica, on the 15th August 1769. In 1779 he entered the Royal Military School of Brienne le Château; there he remained till the autumn of 1784, when he was transferred to the Military School of Paris, according to the usual routine. An official report on him by the Inspector of Military Schools in this year speaks highly of his conduct, and notifies his great proficiency in mathematics and fair knowledge of history and geography, but says he is not well up in ornamental studies or in Latin, and, curiously enough, adds that he will make an excellent

sailor. Napoleon lost his father in 1785, and the same year he was commissioned as second-lieutenant of artillery, in which capacity he served at Valence and other garrisons. He spent his periods of leave in Corsica, and appears to have wished to play the leading part in the history of his native island, showing the first signs of his ambitious and energetic character. During the critical times following the first French Revolution, he at first joined the moderate party of Paoli; but, trying for military power, though by untiring activity and reckless audacity he succeeded in being elected lieutenant-colonel of the National Volunteers of Ajaccio, he failed in an attempt to seize that town and was obliged to return to France. Although he had forfeited his French commission by overstaying his leave, the second Revolution of 1792 was now in progress, and the new government could not spare the few trained officers whom emigration had left, and his rank was restored to him. He returned to Corsica and accompanied an expedition which unsuccessfully tried to get possession of Sardinia. The French government soon made an endeavour to crush Paoli and do away with Corsican privileges, and the islanders rallied round the patriot. Napoleon now turned against him and attempted to seize the citadel of Ajaccio for the French; but failing again, with all his relatives he fled a second time to France.

From this time onwards Napoleon looked to France for his career. The narrow horizon of his native island was no longer wide enough for him, but from its bracing mountain air and from the quick blood of his race he drew a magnetic force which imparted to his decisions and actions a rapidity and energy that carried all before them, while at the same time a power of calm calculation, of industry, and of self-control enabled him to employ his genius to the best advantage. The force of his personality was so overwhelming that in considering his career the regret must ever be present that the only principle that remained steadfast with him, and is the key to his conduct throughout, should have been the care for his own advancement, glory, and power. Napoleon now joined the army under Carteaux, which acted against the Marseillais who had declared against the National Convention and occupied Avignon. At this time he became attached to the younger Robespierre, who was a commissioner with the army, and embraced his Jacobin principles. He was shortly promoted Chef de Bataillon, and commanded the artillery at the siege of Toulon, where he highly distinguished himself, and is generally believed to have been the author of the plan of attack which led to the fall of the place. He was then promoted general of brigade.

On the fall of the Robespierres, Napoleon incurred serious danger, but was saved by powerful influence enlisted in his favour. He was, however, ordered to take command of an infantry brigade in the Army of the West. This he considered would stifle his military career, and neglecting to obey the order, he was in consequence removed from the list of employed general officers. Disgusted with his apparent lack of prospects, he was now anxious to be sent to Turkey to re-organise the Turkish artillery. But on the eve of the 13th Vendémiaire (5th October 1795) he was appointed second in command of the Army of the Interior under Barras, and did the National Convention good service next day in repelling the attack of the Sections of Paris. Influenced partly by fear and partly by appreciation of his talents, the Directory appointed General Bonaparte to the command of the Army of Italy on 23d February 1796. On 9th March he married Joséphine Tascher

de la Pagerie, widow of General Vicomte Alexandre de Beauharnais, and left Paris for Italy two days later.

On joining the army Bonaparte inaugurated a new era in the wars of the Republic. Previously the leading motives had been pure patriotism and love of liberty; Bonaparte for the first time, in his proclamation on taking command, invoked the spirit of self-interest and plunder, which was to dominate the whole policy of France for the next twenty years. Evil as were the passions which he aroused, Napoleon's great military genius flashed forth in its full brilliancy in this his first campaign. His power lay in the rapidity and boldness of his decisions, and in the untiring energy with which he carried them out, confounding his enemies by the suddenness and lightning rapidity of his blows, which never gave them time to recover. He found the French army about 36,000 strong, distributed along the crests of the mountains from Nice to Savona, and opposing 20,000 Piedmontese under Colli and 38,000 Austrians under Beaulieu. These two generals had, however, differing interests: Colli's main object was to protect Piedmont, Beaulieu's to cover Lombardy. Hence, if Bonaparte could penetrate the point of junction of the two armies, it was probable they would separate in their retreat, and could be beaten singly. He therefore attacked the centre of the allied line, and, driving back the Austrians from Montenotte on the 12th April, turned against the Piedmontese and defeated them at Millesimo the next day. Losing no time he left a division under Augereau to keep the Piedmontese in check, and led the bulk of his army against the Austrians, defeating them heavily at Dego on the 14th. The allied armies then retreated in diverging directions as expected, and Bonaparte, following the Piedmontese, beat them at Ceva and Mondovi, and forced the king of Sardinia to sign the armistice of Cherasco, leaving him free to deal with the Austrians. He crossed the Po at Piacenza on the 7th May, and obliged the Austrians to retreat to the Adda. Following them he forced the bridge of Lodi on the 11th May, and entered Milan amid the rejoicings of the people on the 15th. But his ill-omened proclamation had done its work; violence and pillage were rampant in the French army, and he could do little to restrain them. Indeed, he himself showed an example of plundering, though under more organised forms. Heavy contributions were exacted, curiosities and works of art were demanded wholesale and despatched to France; and the Directory, demoralised by the unaccustomed wealth that flowed in upon them, became fully as eager as Napoleon for fresh conquests and their accruing spoils. Insurrections followed at Pavia and in the Milanese, but were ruthlessly put down, and on the 27th May the army left Milan to follow Beaulieu to the Mincio. The Austrians defended the whole line of this river, but Napoleon, drawing the bulk of their forces northward by a feint, broke through their centre at Borghetto, and Beaulieu retreated into Tyrol, leaving the line of the Adige to Napoleon. This he at once occupied, taking Verona and Legnago from the neutral republic of Venice, whom he frightened into submission.

The Austrians still held Mantua, which Napoleon now besieged, occupying himself at the same time in consolidating his conquests. The Austrians made strenuous efforts to save the fortress. They had about 20,000 men in Mantua, and Wurmser advanced through Tyrol with 50,000 more, while the French were only some 45,000 strong including the siege corps. Wurmser moved in three columns: one descended the Adige and threatened Verona, another moving between the Adige and the Lake of Garda drove Joubert and Masséna from Rivoli

and Corona, while the third under Quasdanovich moved west of the Lake of Garda and seized Brescia, threatening the French communications. Napoleon's position was very critical, but he made a rapid decision, raised the siege of Mantua, spiking his guns and destroying his stores, moved all the force he could collect against Quasdanovich, and defeated him at Lonato on the 31st July. Wurmser moving on Mantua found no enemy there, and missed being at the decisive point at the right time. Napoleon, leaving a small force to watch Quasdanovich, turned rapidly back against the other two Austrian columns which were not yet fully united, and beat their most advanced troops at Lonato again on the 3d August and Wurmser himself at Castiglione on the 5th, driving him back into Tyrol with the loss of half his army. Mantua was again invested, but, the siege-artillery having been lost, the operations against it were reduced to a blockade. In the beginning of September Napoleon took the offensive against Wurmser, and passing boldly behind him defeated him at Bassano, cut off his retreat, and forced him to take refuge in Mantua on the 15th September. Again, at the end of October, an Austrian army of 50,000, but mostly recruits, advanced under Alvinzi. Napoleon could now dispose of from 38,000 to 40,000 men, having in the meantime formed the Cispadane Republic and raised an Italian legion which set free most of his garrisons. Alvinzi arrived before Verona, while a column under Davidovich moved by the eastern shore of the Lake of Garda. Napoleon hastily caused the positions of Rivoli and Corona to be reoccupied to check Davidovich, and moved himself by night from Verona down the right bank of the Adige, crossed it at Ronco, and came upon Alvinzi's rear. Then followed the three days' battle of Arcola, during which Napoleon had a very narrow escape, but which ended in Alvinzi's defeat and retreat on Tyrol. From Arcola Napoleon dated his firm belief in his own fortune. Once again, in January 1797, Alvinzi tried to relieve Mantua. Feinting against Legnago to deceive Napoleon, he intended to make his main advance between the Adige and the lake. But Napoleon was too skilful to take decided action without full knowledge, and keeping his reserve half-way between Rivoli and Legnago waited for more certain news. When he ascertained the direction of the real attack, he moved in full force on Rivoli and won a decisive battle there on January 14, the Austrian detachment on the Lower Adige having to lay down their arms next day at Roverbella. Wurmser capitulated at Mantua on the 2d February, Napoleon treating him with generosity. This first Italian campaign was perhaps the most skilful of all those of Napoleon. Everything was done accurately and rapidly, and without throwing away chances. Some of his later campaigns, though equally brilliant, show him acting more with the gambler's spirit, running unnecessary risks with almost a blind reliance upon his star, in the hope of obtaining results which should dazzle the world.

In political matters during this time Napoleon was acting less as a servant of the French Directory than as an independent ruler. He entirely ignored the instructions he received from Paris, levying contributions, entering into negotiations and deposing princes at his own will, and writing that he is not fighting 'for those rascals of lawyers.' His policy was in fact regulated in accordance with his own ambitious schemes; and we find him adopting a conciliatory attitude towards Rome with an eye to the future support of the church.

When his position in Italy was secured by

the fall of Mantua, and by treaties with Rome and Sardinia, he prepared to advance through Carinthia and Styria on Vienna. He pushed back the Archduke Charles from the Tagliamento, and advanced till he reached Leoben in Styria on the 7th April 1797. Then Austria sued for peace, and the preliminaries of Leoben were signed on the 18th April pending the conclusion of a definite peace. But further negotiations dragged on, as Austria thought a revolution might be impending in France from which she could obtain advantage. In fact a party was rising against the Directory, consisting mainly of moderates who were eager only for a respectable government, but containing also a few royalists. Their inclusion was fatal to the party. It gave a pretext for raising the cry that the Republic was in danger, and Augereau, sent by Napoleon to Paris, aided the Directory to carry out the *coup d'état* of the 18th Fructidor, when the Corps Legislatif was surrounded by troops and the obnoxious representatives arrested. This strengthened the Directory for the moment, but was a step towards military despotism under Napoleon. Austria, seeing the Directory again firmly seated in power, became more eager for peace, the negotiations were hastened, and on 17th October 1797 the treaty of Campo-Formio was signed. By this France obtained Belgium and the Ionian Islands, Austria also acknowledging the Cisalpine Republic, and ceding to it Lombardy, and engaging to try and get the left bank of the Rhine for France from the Germanic body. As an indemnity Austria obtained Istria, Dalmatia, and the territory of the Venetian Republic, with whom, although neutral, Napoleon had managed to pick a quarrel with this end in view.

Napoleon returned to Paris on the 5th December 1797. The Directory, fearing his ambition, thought they could only keep him quiet by employing him, and gave him command of the so-called Army of England. But he was bent on the conquest of Egypt. He appears to have had something visionary in his temperament, and to have dreamed of founding a mighty empire from the standpoint of the East, the glow and glamour of which seem always to have had a certain fascination for him. He therefore employed the resources of the Army of England to prepare for an expedition to Egypt, and the Directory yielded to his wishes, partly no doubt through the desire of getting him away from France. But their aggressive policy was at the same time fast bringing on another European war. The expedition sailed from Toulon on the 19th May 1798, captured Malta from the Knights of St John by treachery, and, escaping by great luck from the British fleet under Nelson, arrived at Alexandria on the 30th June. The army was disembarked in haste, for fear lest Nelson should arrive, and on the 8th July Napoleon marched on Cairo. He defeated the Mamelukes at Chebreiss and the Pyramids, and entered Cairo on the 24th July. He then occupied himself with organising the government of Egypt, but his position was rendered very hazardous by the destruction of the French fleet on the 1st August by Nelson at the battle of the Nile, and he saw that his dream of founding an empire in the East could not be realised. He thought, however, that he might create a revolution in Syria, by the aid of which he might overthrow the Turkish power and march in triumph back to Europe through Asia Minor and Constantinople. He accordingly entered Syria in February 1799 with 12,000 men, but was brought to a standstill before St Jean d'Acre. Failing to capture that fortress, supported as it was by the British squadron under Sir Sidney Smith, in spite of the most desperate efforts, he was obliged to return to Egypt. The expedition to Syria was disgraced by

the massacre in cold blood of 2500 prisoners at Jaffa; but there seems to be some doubt about the truth of the story that in his retreat Napoleon caused the sick he could not transport to be poisoned. After his return to Egypt, Napoleon defeated a Turkish army which had landed at Aboukir, but learning the reverses that had been suffered by the French arms in Europe, he resolved to leave Egypt and return to France. He embarked secretly on the 22d August, leaving a letter placing Kléber in command of the Army of Egypt, and landed in France six weeks later.

He found matters at home in great confusion. The wars had been mismanaged, Italy was almost lost, and the government in consequence was in very bad odour. Siéyès, one of the Directors, meditated a *coup d'état*, but was at a loss for a man of action to take the lead. At this juncture Bonaparte arrived, and, though for some time there was no *rapprochement* between him and Siéyès (the latter fearing Bonaparte's masterful character, and Bonaparte uncertain what party it would be most to his advantage to join), they at length coalesced, and the revolution of the 18th Brumaire followed (9th November 1799), when the legislature was forcibly closed and a provisional executive of three consuls, Siéyès, Roger-Duclos, and Bonaparte, formed to draw up a new constitution. This was promulgated on the 13th December; the executive was vested in three consuls, Bonaparte, Cambacères, and Lebrun, of whom Bonaparte was nominated First Consul for ten years. He was practically paramount, the two remaining consuls being ciphers, and the other institutions being so organised as to concentrate power in the executive. Siéyès became president of the senate. The governmental crisis being settled, energetic steps were taken with regard to the civil war in the west. A proclamation was issued promising religious toleration at the same time that decided military action was taken, and these measures were so successful that all was quiet at home by the end of February 1800. Then Napoleon turned his attention abroad. He made overtures for peace to England and Austria, now the only belligerents, as he wished to lull suspicion by posing as the friend of peace, not as a military ruler; but he inwardly rejoiced when they rejected his overtures.

The situation of the belligerents on the Continent was this: the Army of the Rhine under Moreau, more than 100,000 strong, was distributed along the Rhine from the Lake of Constance to Alsace, opposed to Kray, whose headquarters were at Donaueschingen in Baden; while Masséna with the Army of Italy was on the Riviera and at Genoa, opposed to an Austrian army under Melas. Napoleon intended to gain himself the chief glory of the campaign; so, giving Moreau orders to cross the Rhine but not to advance beyond a certain limit, and leaving Masséna to make head as best he could against Melas, with the result that he was besieged in Genoa and reduced to the last extremity, he prepared secretly an army of reserve near the Swiss frontier, to the command of which Berthier was ostensibly appointed. Outside and even inside France this army of reserve was looked upon as a chimera. Moreau crossed the Rhine on the 24th April and drove Kray to Ulm, but was there checked by Napoleon's instructions, according to which he also sent a division to co-operate with the army of reserve. Napoleon himself went to Geneva on the 9th May, and assuming command of this army crossed the St Bernard and reached the plains of Italy before Melas had convinced himself of the existence even of the army of reserve, and whilst his troops were scattered from Genoa to the Var. Napoleon's obvious course would now have been to move straight on Genoa, relieve Masséna, and beat

in detail as many of Melas' troops as he could encounter. But this would not have been a sufficiently brilliant triumph, as the bulk of the Austrian army might have escaped; and trusting in his star he resolved to stake the existence of his army on a gambler's cast. Leaving Masséna to be starved out, he moved to the left on Milan, and occupied the whole line of the Ticino and Po as far as Piacenza, so as to cut off entirely the retreat of the Austrians. He then crossed the Po and concentrated as many troops as he could spare at Stradella. The strategy was brilliant, but the risk run excessive. His army was necessarily scattered, while Melas had had time to concentrate, and he was besides ignorant of the Austrian position. He sent Desaix with a column to seek information, and moved himself on Alessandria, where he found Melas. Next day, the 14th June, Melas marched out to attack the French on the plains of Marengo, and despite all Napoleon's efforts had actually defeated them, when fortunately Desaix returned, and his advance, together with a cavalry charge by Kellermann, changed defeat into victory. Melas, losing his head, signed a convention next day giving up almost all North Italy, though Marmont says that if he had fought another battle he must have won it. Napoleon returned to Paris with the glories of this astonishing campaign; but peace did not follow till Moreau, when his liberty of action was restored to him, had won the battle of Hohenlinden on 3d December 1800. Then followed the treaty of Lunéville with Germany in February 1801, the concordat with Rome in July 1801, and the treaty of Amiens with England in March 1802, so that Napoleon was able to figure as the restorer of peace to the world. He then devoted himself to the reconstruction of the civil institutions of France, employing in this great work the best talent that he could find, and impressing on their labours the stamp of his own genius. The institutions then created, which still remain for the most part, were the restored church, the judicial system, the codes, the system of local government, the university, the Bank of France, and the Legion of Honour.

France at this period, sick of the failure of republican government, was gradually veering towards monarchy, and Napoleon knew how to take advantage of events to strengthen his position, and in due time establish his own dynasty. The plot of Nivose (24th December 1800), when his life was threatened by a bomb, gave him a pretext for arresting and transporting 130 members of the Jacobin party, with which he had long since broken; and after the conclusion of the peace of Amiens a great step was taken when, as a mark of public gratitude for the pacification of the world, he was elected First Consul for life. But though he desired the credit of making peace, so as to enable him to establish his authority over France, when that end was secured he became again eager for war, with a view to further extension of his power. He also desired to humble England, a desire that led to the rupture of the peace of Amiens in 1803. The immediate causes of this rupture were his aggressions in Holland, in the Cisalpine Republic, in Genoa, and Piedmont, and his monstrous demand that England should suppress every print that dared to criticise his actions, and drive all French refugees from her shores. Having thus forced England to resume hostilities, he made vast preparations for her invasion, at the same time taking the first step towards establishing his ascendancy in Germany by seizing Hanover. The assumption of the crown soon followed, Napoleon preparing the way with consummate cunning. He rid himself of Moreau, his most dangerous rival, by accusing him of conspiring with the royalists, into whom he then struck terror

by the execution of the Duc d'Enghien. He thus succeeded in inspiring even republicans with the conviction that the best way of preventing the inauguration of a new reign of terror was by confirming his position. He chose the title of emperor as least obnoxious to the republican feeling of the army, and the change was made by a decree of the senate of the 18th May 1804.

Preparations for the invasion of England had been steadily proceeding, but Napoleon's aggressive demeanour after becoming emperor alarmed the European cabinets, so that Pitt was able to revive the coalition, and in 1805 Napoleon found himself at war with Russia and Austria, as well as with England. Forced by England's naval supremacy to abandon the notion of invasion, he suddenly changed front in August 1805, and led his armies through Hanover and the smaller German states, disregarding the neutrality even of Prussia herself, and reached the Danube in rear of the Austrian army under Mack, which was at Ulm. The surprise was complete; Mack surrendered on the 19th October, and Napoleon then marched on Vienna, which he entered on the 13th November. But his position was critical. The Archduke Charles was approaching from Hungary, a Russian army was entering Moravia, and Prussia, incensed at the violation of her territory, joined the coalition. A short delay would have surrounded Napoleon with his enemies, but the Czar was impatient, and the Russian army, with a small contingent of Austrians, encountered Napoleon at Austerlitz, December 2, 1805, and was signally defeated. This caused the break-up of the coalition; the Holy Roman Empire came to an end, the Confederation of the Rhine was formed under French protection, and the Napoleonic empire was firmly established. Napoleon then entered into negotiations for peace with Russia and England, endeavouring to conciliate those powers at the expense of Prussia. The negotiations failed, but Prussia was mortally offended, and mobilised her army in August 1806, about which time Russia finally rejected the treaty with France. Napoleon acted with his usual promptitude, and advanced against Prussia before she could get help either from England or Russia. Although the rank and file of the Prussian armies was good, their generals were antiquated, and Napoleon crushed them at Jena and Auerstädt on the 14th October, and entered Berlin on the 27th. He had then to carry on a stubbornly-contested campaign with Russia. An indecisive battle at Eylau was followed by a hardly-earned French victory at Friedland, 14th June 1807, and the peace of Tilsit ensued, by which Prussia lost half her territory, and had to submit to various humiliating conditions, while Russia escaped easily, and indeed got a share of the spoils.

Napoleon was now at the zenith of his power; he was the arbiter of Europe and the paramount head of a confederation of princes, among whom the members of his own family occupied several thrones. To reward his partisans he at this time created a new noblesse, and lavished upon them the public money. Full of inveterate hostility to England, Napoleon endeavoured to cripple her by the so-called Continental System (q.v.), by which all the states under his influence engaged to close their ports to English ships, and he also tried to combine all the European navies against her; but England, perceiving his aim, took the initiative and herself seized the Danish fleet. The emperor also turned his eyes to the Peninsula, where the dissolute conduct of the Queen of Spain and the intrigues of 'the Prince of the Peace' (see ALCUDIA) gave him an opportunity. He sent an army under Junot to Portugal, and another to Spain, which, under Murat, took Madrid. Napoleon

then procured the abdication of the king of Spain and placed his brother Joseph on the vacant throne. But he did not foresee the consequences. The spirit of the nation was roused, and a formidable insurrection broke out, while a British army, under Sir Arthur Wellesley, landed in Portugal, defeated Junot at Vimiera, and forced him to sign the Convention of Cintra, evacuating Portugal. So began the Peninsular war which for the future was to paralyse half Napoleon's strength.

In Germany also a spirit of revolt against his tyranny was rising, Austria at first taking the lead, and this brought on the war of 1809 against that power. Prussia, already beginning to recover her strength under the military system of Scharnhorst and Stein (see SCHARNHORST, STEIN), was hostile to Napoleon in sentiment, but was kept down by the pressure of Russia. Napoleon declared war on the pretext that Austria was arming, and marching through Bavaria drove the Austrians out of Ratisbon, and entered Vienna on the 13th May. Eugène Beauharnais, at the head of the Army of Italy, drove the Austrians before him into Hungary, defeated them at Raab, and joined Napoleon. The emperor then tried to cross the Danube, but was checked at Aspern and obliged to retire to the island of Lobau. Five weeks of preparation then followed, the peasant war under Hofer being carried on in Tyrol, and then Napoleon made a fresh and successful attempt to cross the Danube, and won the battle of Wagram on the 5th July. This was followed by the armistice of Znaim and the treaty of Schönbrunn, October 20, 1809, by which he obtained a heavy indemnity in money and considerable accession of territory in Carniola, Carinthia, Croatia, and Galicia. But he mortally offended the Czar by giving a large portion of the ceded territory of Galicia to the duchy of Warsaw—i.e. to Poland.

On the 16th December 1809 Napoleon, desirous of an heir, divorced Joséphine, who was childless, and married on the 1st April 1810 the Archduchess Maria Louisa of Austria. He had no doubt the wish also to get a footing in the circle of the legitimate reigning families of Europe. A son, to whom the title of King of Rome was given, was born on March 20, 1811.

Still bent on the humiliation of England, Napoleon now tried to effect his purpose by increasing the stringency of the Continental System, but this ended in bringing him into conflict with Russia. He first annexed the kingdoms of Holland and Westphalia, to give him command of their seaboard, and then prohibited English trade even when carried in neutral bottoms. The Czar, already estranged by Napoleon's alliance with Austria and his conduct as regards Poland, refused to adopt this policy, and the relations between them gradually became so strained that war was inevitable, and Napoleon took the momentous resolve to invade Russia. With Maria Louisa, he arrived at Dresden on the 16th May 1812, and was there greeted by the emperor of Austria, the king of Prussia, and other sovereigns. His army for this gigantic enterprise numbered about 600,000, including French, Germans, and Italians. He crossed the Niemen on the 24th June, reaching Vilna, which was evacuated by the Russians, on the 28th; and he remained at Vilna till the 16th July, hesitating to take the final resolution to invade the heart of Russia. He made overtures for peace to the Czar, who refused to treat as long as an enemy remained on Russian soil. Foiled here Napoleon at last decided to go on with his enterprise; so he advanced, and at first the Russians were in no condition to meet him, their forces being scattered. If Napoleon could have advanced rapidly to Smolensk, he might have cut the Russian forces in two, but his

vast host appears to have been unmanageable. Barclay de Tolly and Bagration succeeded in uniting at Smolensk, but were driven from it on the 18th August after an obstinate defence. At Smolensk Napoleon again hesitated as to whether he should go into winter-quarters, but eventually decided to press on to Moscow, trusting to the moral effect of the fall of the ancient capital. It seems as if, while his superstitious belief in his star still remained, bodily ailments had caused a deterioration in his power of rapid decision and in his energy of action. Meanwhile, great discontent had been caused in Russia by the continued retreat of the armies. Kutusoff was appointed to the chief command, and stood to fight at Borodino on September 6. Napoleon won the battle, but with unwonted and misplaced caution refused to engage his Guard, and the victory was almost fruitless.

He entered Moscow on the 14th September, and fire broke out the next night, the first effect of which was still further to alarm the Russians, who believed it to be the work of the French. The fire raged fiercely till the 20th, and a great part of the city was burned to the ground. Had the victory of Borodino been more decisive the Czar might now have yielded; but as it was he listened to the advice of Stein and Sir R. Wilson and refused to treat, thus putting Napoleon in a dilemma. His plans were always made on the basis of immediate success, and the course to be adopted in case of failure was not considered. Again he hesitated, with the result that when at last he resolved to retire from Moscow the winter, coming earlier than usual, upset his calculations, and the miseries of that terrible retreat followed. He left Moscow on the 18th October, and, reaching the Beresina with but 12,000 men, was joined there by Oudinot and Victor, who had been holding the line of the Dwina, with 18,000. His passage of the river was opposed, but he succeeded in crossing, and on the 6th December the miserable remnant of the Grand Army reached Vilna. Macdonald, Reynier, and Schwarzenberg, with 100,000 men, on the Polish frontier and in the Baltic provinces, were safe, but this was the whole available remnant of the 600,000 with which the campaign commenced. It might have been expected that Napoleon would now be anxious for peace, but his haughty spirit could not brook any diminution of his prestige, and, determining to try and efface the past with fresh triumphs, he returned to Paris to raise new levies. The Czar fully understood that no half-measures would be of any avail, but that he must follow up what had been begun and carry the war into Germany the next year, rousing the Germans to his aid. On the 30th December 1812 the Prussian contingent of the Grand Army, under York, came over to the Russians, and on the 22d January 1813 Stein procured the meeting of the estates of East Prussia, when the Landwehr was called out. Saxony also joined Russia, contrary to the wishes of the king, but Austria and the middle states still clung to Napoleon.

Napoleon left Paris for Mainz on the 15th April 1813, his object being Dresden, which was held by the Czar and the king of Prussia. Eugène Beauharnais was on the Lower Saale with 70,000 men, and Napoleon, with 150,000 men, well officered, though raw and short of cavalry, moved to meet him by way of Erfurt. Davout was holding down insurrection in north Germany with 30,000. The allies at first had only 100,000 available, the process of calling out and drilling the people being slow. Napoleon moved on Leipzig, and won the battle of Lützen on the 2d May, which restored Dresden to the king of Saxony. He then followed the allies, beat them, though with heavy loss, at Bautzen on the 20th and 21st May, and forced

them to retire into Silesia. The armistice of Poischwitz, signed on the 4th of June, closed the first period of the campaign. Austria then asked for certain concessions, which if Napoleon had granted he might have checkmated the coalition of Prussia and Russia; but he seems to have been unable to bring himself to accede, and contemplated rather war with Prussia, Russia, and Austria combined, to say nothing of England, which was still carrying on the war in the Peninsula. A treaty was signed at Reichenbach on the 14th June, by which Austria engaged as mediating power to offer conditions of peace to Napoleon and to declare war on him in case of refusal. The conditions offered were that he should withdraw from north-west Germany, dissolve the duchy of Warsaw, and cede Illyria. These terms were very moderate, but Napoleon seems to have thought his position insecure without fresh success in war, and procrastinated. An ultimatum was delivered to him on August 8th to which he paid no attention; so on the night of the 10th to 11th August the armistice was declared at an end, and the drama swept rapidly to its crisis.

Napoleon had now 400,000 men along the Elbe from Bohemia to its mouth, but his position was weakened by the adhesion of Austria to the coalition, as she massed her troops in Bohemia, threatening Dresden and his communications. The allies had nearly 500,000 men in three armies, the Austrian under Schwarzenberg in Bohemia, the old Prusso-Russian under Blücher in Silesia, and the bulk of the Prussian force under Bernadotte in Brandenburg. The French armies were discouraged, and the allies enthusiastic; but the latter had difficulties to contend with from their heterogeneous composition and diversity of interests. The campaign opened with varying fortune. A blow at Berlin was parried by Bülow at Gross-Beeren on August 23. Napoleon himself forced Blücher back to the Katzbach, but had to retire again to defend Dresden from the Austrians; and his lieutenant Macdonald was defeated in the battle of the Katzbach on the 26th August. Napoleon inflicted a crushing defeat on the Austrians before Dresden on the 27th, but, while preparing to cut off their retreat, was disturbed by the news of Gross-Beeren and the Katzbach and by sudden illness, and at Kulm lost Vandamme with 20,000 men. September was spent in fruitless marches, now into Bohemia, now into Silesia, and towards the end of the month the allies began their converging march on their preconcerted rendezvous at Leipzig. At the same time the Confederation of the Rhine began to dissolve. The kingdom of Westphalia was upset on the 1st October, and on the 8th Bavaria joined Austria. The toils were closing round Napoleon, and between the 14th and 19th October he was crushed in that battle of the Titans at Leipzig, and, brushing aside the Bavarians who tried to stop him at Haynau, on the 1st November led back the remnant of his army, some 70,000 strong, across the Rhine at Mainz.

The allies now made overtures for peace on the basis of natural frontiers, which would have left France the fruits of the first Revolution—viz. Belgium, the left bank of the Rhine, Savoy, and Nice; but Napoleon could not be content with such curtailment of his power. Evading at first the proposal, he would have accepted it, but with suspicious qualifications, when too late. The invasion of France followed. The allies issued on the 1st December a manifesto saying they were waging war against Napoleon alone, and advanced with three separate armies. Schwarzenberg led the Austrians through Switzerland, Blücher crossed the Middle Rhine towards Nancy, while the northern army passed through Holland. Napoleon had

yet hopes of success on account of the forces he still had in the German fortresses, the mutual jealousies of the allies, his connection with the emperor of Austria, and the patriotism which would be aroused in France by invasion. But the allies gave him no time to utilise these influences, and Paris was not fortified. Napoleon carried on a campaign full of genius, gaining what advantage he could from the separation of his enemies. He attacked Blücher and won four battles in four days at Champaubert (February 10, 1814), Montmirail (11th), Château-Thierry (12th), and Vauchamps (13th). These successes would have enabled him to make a reasonable peace, but his personal position forbade this, and he tried subterfuge and delay. The allies, however, were not to be trifled with, and in the beginning of March signed the treaty of Chaumont, which bound them each to keep 150,000 men on foot for twenty years. The battles of Craonne and Laon followed, in which Napoleon held his own, but saw his resources dwindle. On the 18th March the conferences at Chatillon came to an end, and on the 24th the allies determined to march on Paris. Marmont and Mortier, with less than 30,000 men, could make no head against them, while Napoleon himself tried a fruitless diversion against their communications. Joseph Bonaparte withdrew Maria Louisa and the king of Rome to Tours. On the 30th March the allies attacked Paris on three sides, and in the afternoon the French marshals offered to capitulate. Napoleon, when he learned the real state of affairs, hurried up in rear of the allies, but was too late, and had to fall back to Fontainebleau. His position was desperate, and to add to his difficulties Wellington, whose career of success had gradually cleared the French out of the Peninsula, had now led his victorious army across the Pyrenees into France itself.

Napoleon therefore at first offered to abdicate in favour of his son, but, when he found that would not be sufficient, he signed an unconditional abdication on the 11th April 1814. He was given the sovereignty of the island of Elba, and the Bourbons in the person of Louis XVIII. were restored to the throne of France. But the condition of affairs was very precarious. The return of the Bourbons was most unpopular. It indeed restored the parliament, but it unsettled the position of public men and the title to estates. The army was disgusted at the appointment to commands of émigrés who had fought against France. The church began to cause alarm to the holders of national property; and by the release of prisoners and the return of the garrisons of German fortresses very large numbers of Napoleonic soldiers became dispersed over France. The coalition, too, broke up, and fresh alliances began to be sought with a view to check the aggressive spirit which Russia seemed inclined to manifest. Altogether affairs in Europe and France were in such a state as to make it not impossible that the magic of Napoleon's name might replace him in power. He accordingly resolved on making the attempt, left Elba on February 26, 1815, and landed on the French coast on the 1st March. On the 20th he entered Paris, having been joined by the army. He had the advantage of being able to appear as the liberator of France from the yoke put upon her by foreigners, but he could only re-establish his position in the face of the rest of Europe by war, and he was not quite the Napoleon of old, for his physical powers had declined, he had become stout, and had attacks of illness, sleepiness, and indolence. He had been epileptic from his youth. His mind and genius were unimpaired, and his conception of the Waterloo campaign was clear and brilliant as of yore, but the execution failed.

Europe had declared war against him, and a new coalition had been formed, but only two armies were immediately ready to take the field; a mixed force under the Duke of Wellington in Belgium, and a Prussian army under Blücher in the Rhine provinces. The English army had its base on the sea, and the Prussian on the Rhine, so that they had diverging lines of operation. Napoleon's idea was to strike suddenly at their point of junction before they could concentrate, push in between them, drive them apart, and then defeat each separately. The plan was unexceptionable, resembling that of his first campaign in 1796, and the opening moves were successfully carried out. Napoleon left Paris on the 12th June, his army being then écheloned between Paris and the Belgian frontier, so that the point where the blow would fall was still doubtful. On the 15th he occupied Charleroi, and was between the two allied armies, and on the 16th he defeated Blücher at Ligny before Wellington could come to his assistance. So far all had gone well with him; but now apparently his energy was not sufficient to cope rapidly with the difficulties that no doubt beset him through the shortcomings of his staff, and the spirit of mutual distrust that reigned among his officers. He did nothing till the morning of the 17th, and it was not till 2 P.M. that he sent Grouchy with 33,000 men to follow the Prussians in the supposed direction of their retreat towards Liège, and keep them at a distance whilst he turned against Wellington. But he had lost his opportunity; the wasted hours had enabled the Prussians to disappear, and he did not know the fact that Blücher had taken the resolution to move on Wavre, giving up his own communications in order to reunite with Wellington. The latter had retired to a previously-chosen position at Mont St Jean, and received Blücher's promise to lead his army to his assistance. So on the 18th, when Napoleon attacked the Duke, unknown to him the bulk of the Prussian army was hastening up on his right flank while Grouchy was fruitlessly engaged with the Prussian rear-guard only. This led to the crowning defeat of Waterloo, where Napoleon's fortunes were finally wrecked. He fled to Paris, and abdicated for the last time on 22d June; and, finding it impossible to escape from France, he surrendered to Captain Maitland of the *Bellerophon* at Rochefort on the 15th July. He was banished by the British government to St Helena, where he arrived on the 15th October 1815, and died there of cancer of the stomach on the 5th May 1821.

The literature referring to Napoleon may be divided into three categories: First, books dealing with his military and political career by writers contemporary with him or nearly so, such as Thiers' *Histoire du Consulat et de l'Empire*; Jomini's *Vie politique et militaire de Napoléon* (Eng. trans. 1885); Montholon and Gourgaud's *Mémoires pour servir à l'Histoire de France sous Napoléon*; and the memoirs of his generals, such as Marmont, Masséna, and Sachet. Secondly, books touching his private life by contemporaries, such as Bourrienne's *Mémoires de Napoléon Bonaparte*; Las Cases' *Journal of Private Life and Conversations of Napoleon at St Helena*; Forsyth's *History of the Captivity of Napoleon at St Helena, from Letters and Journals of Sir Hudson Lowe*; O'Meara's *Napoleon at St Helena*. These two classes should be read with caution as more or less one-sided. The third class are the modern works written in a more critical spirit, such as Lanfrey's *Histoire de Napoléon I.*, and Colonel Jung's *Bonaparte et son Temps* and Lucien Bonaparte et ses *Mémoires*, Seeley's *Short Life*, and Taine's *Orig. de la France Contemp.—Le Rhytme Mod.* (vol. i. 1890). Most valuable also is the *Correspondance de Napoléon I.* (32 vols.). See also articles BONAPARTE, CODE NAPOLEON, FRANCE, JOSÉPHINE, WATERLOO, WELLINGTON.

Napoleon II., king of Rome and Duke of Reichstadt (1811–32), was the son of Napoleon I. and Maria Louisa (q.v.).

Napoleon III., by name CHARLES LOUIS NAPOLEON BONAPARTE, the second emperor of the French, was born at Paris on the 20th of April 1808. His father was Louis Bonaparte, king of Holland, brother of the first emperor, and his mother Hortense Beauharnais, Napoleon I.'s step-daughter (see BONAPARTE). Louis Napoleon and his elder brothers were heirs-presumptive to the imperial throne till the birth of a son to the emperor cast them into a secondary position, whence Louis Napoleon, the only survivor, was drawn in 1832, at the death of Napoleon's only son, to become head of the House of Napoleon. That house, astoundingly risen from the nursery of a Corsican lawyer's wife to imperial and royal thrones, thrust back into private life after a complete mastery in Europe, was again raised to imperial dignity in the person of Napoleon III., only to return to obscurity in the midst of appalling disasters; and it failed to present one of the most truly tragic dramas of all time through the want of real grandeur in both Napoleons and in almost all their blood. Had the nephew been born a scion of the Bourbon house, the part of Louis-Philippe might have been his. But brought up by his mother from the year 1815, precluded by exile and imprisonment till he was far advanced in the years of manhood from learning practical politics, he became a theorist in statecraft and a brooder on the Napoleonic legend which was his only claim to the attention of the nation. He received his early education at his mother's residence, the castle of Arenenberg, in Switzerland, on the borders of Lake Constance. Sent to the gymnasium at Augsburg, he not only acquired there, as well as from the prolonged German surroundings of his private life, a marked German accent, but also developed those features in his individual character which were most akin to the sluggishness of his temperament—uncertainty and indefiniteness of thought, philosophic dreaminess laming every conviction, ambition touched with fatalism firing a morally indifferent soul.

Switzerland was the real foster-mother of the brighter and healthier side of his nature. Had he been practical and a man of rectitude, he could have extracted from his political and social experience of that country principles sufficiently clear and wise to prove themselves the palladium of his later reign. There he developed his aptitude for military science: he followed the courses of instruction given to the Swiss militia officers. Fairly competent in artillery, in engineering, in the exact sciences, in history, and in athletic exercises, he wrote and published at Zurich (1836) a *Manuel d'Artillerie*. He hastened with his elder brother Louis into Italy in 1830 to assist the province of Romagna in its revolt against pontifical rule, an expedition in which Louis perished of fever, and he was himself severely stricken, but was nursed out of danger by his tender mother. This expedition, though proving that he could act with energy in the discharge of Bonapartist responsibility, was a mere episode in that Swiss period of his life, extending from 1824 to 1836, in which he was exclusively a student and a writer. When at the death of the Duke of Reichstadt he became the head of that rootless growth, the Napoleonic dynasty, he sought as a pretender to lean less on any concrete historical claim to the throne of France than on the partiality of the French to a vainglorious rule, and on the intellectual interest with which he, as a man of letters, could invest the so-called Napoleonic ideas. For sixteen years he sued for the hand of France and the attention of the world, interrupting twice the method of literary courtship to make personal raids upon the kingdom of Louis-Philippe. He had indeed a

fair chance. Outside of France, nationalities whose emancipation had been planned by Napoleon I., such as Poland, looked to him to effect their long-deferred liberty (1831). In France he was an outlaw, because a formidable rival to Legitimacy; in the struggle between the junior branch of the Bourbon dynasty and the forces at work since the Revolution, the Bonapartists had a permanent power of intervention and might enlist as their own partisans the masses of Frenchmen who were lukewarm politicians. Moreover, Napoleon I.'s utter failure as an international politician had in no wise shaken the organisation he had given to France; his home legislation had become part and parcel of the nation; French law, French public education, French military institutions, the joint restoration of state and church stood forth as his lasting work.

Almost a stranger to France in nurture of thought and tone of mind, an adventurer rather than a pretender, a philosopher rather than a man of action, taciturn, speculative, driven from within by a set motive rooted in a fixed idea, absorbed with German mysticism and Italian wiliness in a career so fateful to his mind that moral bridling could not avail at its turning-point, a philanthropist in some of his dreams, an idealist in some of his deeds, the heir of the French Cæsar drifted to his destiny, not without some vigour and brightness, a victim to the alleged mission of his race, to which he was enslaved as by hypnotic suggestion. He published in 1832-36 his *Réveries politiques, Projet de Constitution, and Considérations politiques et Militaires sur la Suisse*. In 1836, speculating on the instability of Louis-Philippe's throne, the disaffection of some of the middle classes, the general favour of his semi-socialistic theories with the advanced parties, and the unspent prestige of Napoleon I., he put his chances to a premature test by appearing among the military at Strasburg, hoping to bribe them into his service by the prospect of their resuming the paramount position which soldiers could not but occupy in a Napoleonic state. The rash young man was easily overpowered and conveyed to America, without being brought to trial. Being under no pledge to stay in America, Louis Napoleon returned to Europe on hearing of his mother's illness. He found her dying; two months later he received her last sighs (3d October 1837). Although the affair of Strasburg had naturally enough caused many people to doubt the talent and the judgment of Louis Napoleon, still Louis-Philippe, who was politically an extremely timid monarch, dreaded some new conspiracy; the French government demanded of Switzerland the expulsion of the obnoxious prince, M. Molé actually enjoining the French ambassador to demand his passports, in case of a refusal. Switzerland had neither the right nor the wish to expel, and was on the point of going to war for the distinguished refugee (who was, in fact, a Swiss citizen) when he resolved to prevent a rupture by leaving his adopted country. He now proceeded to England, and settled in London. With certain members of the British aristocracy he came to live on a footing of considerable intimacy, and he was also an object of languid wonder and interest to the community generally, but he impressed nobody with a belief in his future and his genius; nay, Englishmen erred so far as to suppose that the 'silent man' was merely 'dull.' In 1838 he published in London his *Idées Napoléoniennes*, which, read in the light of subsequent events, are very significant. Europe generally regarded them as idle dreams; but in France the book went through numerous editions. In 1839 Louis Napoleon was in Scotland, and took part in the celebrated Eglinton tournament. Next year (1840) he made his second attempt on the throne

of France at Boulogne. It was as grotesque a failure as the one at Strasburg. Captured on the shore, while endeavouring to make his escape to the vessel that had brought him from England, Louis Napoleon was now brought to trial, and condemned to perpetual imprisonment in the fortress of Ham. Here he continued his Bonapartist propaganda by writing *Aux Mânes de l'Empereur, Fragments Historiques, Analyse de la Question de la Suisse, Réponse à M. de Lamartine, Extinction du Paupérisme, &c.*; and actually took part in editing the *Dictionnaire de la Conversation*, a valuable French encyclopædia. After an imprisonment of more than five years, spent in patient meditation, he made his escape (25th May 1846), by the help of Dr Conneau, in the disguise of a workman, and gained the Belgian frontier, whence he returned to England.

The revolution of February (1848) was a victory of the working-men to whom some of his political theories were especially addressed; he hurried back to France as a virtual nominee of the *Fourth Estate*, or working-classes in town and country—an embarrassing position, from the obligations of which the smashing up of the Parisian socialists by the forces of General Cavaignac released the future emperor. Being elected deputy for Paris and three other departments, he took his seat in the Constituent Assembly, 13th June 1848. On the 15th he resigned his seat and left France. Recalled in the following September by a quintuple election, he once more appeared in the Assembly and commenced his candidature for the presidency. The direct election of the head of the state by the people, intended as a republican institution, proved itself to be a stepping-stone to Cæsarism, as Louis Napoleon's peculiar conception of a modern imperial democracy is called; in the constitutional history of the second empire such appeals to universal suffrage bear the name of *plébiscites*. Out of seven and a half million of votes 5,562,834 were recorded for Prince Louis Napoleon; General Cavaignac, his genuine republican competitor, obtaining only 1,469,166.

On the 20th December he took the oath of allegiance to the Republic. For a few days concord seemed established between the different political parties in the Assembly; but the beginning of the year 1849 witnessed the commencement of a series of struggles between the president and his friends on the one side and the majority of the Assembly on the other—the latter being justly penetrated with the conviction that Louis Napoleon was not devoted to the interests of the Republic, but to his own. He became practically a traitor to his republican oath when, in league with monarchical Austria and the king of Naples, he put down the republican movement in Rome. Then he committed the command of the army to hands devoted to him, he established his personal supporters in posts of honour and influence, he gained by frequent visits the favour of the provincial towns, and by acts of liberality and clemency kept that of the people. He paraded as a protector of popular rights and of national prosperity, laying to the door of the Assembly the deficiencies in his government. Resolved to transform his tenure of power by periodical election into a life-long one, he was hampered by the National Assembly; and, with the example of his uncle's *coup d'état* (18th Brumaire 1799) before him, he deliberately threw off the mask of a constitutional president, forswore his formal oath, and became a traitor to all society. From that moment a perpetual misunderstanding, badly cloaked by material prosperity and military glory, underlay Napoleon's relation to the French and to Europe generally. His methods of government belonged to no acknowledged régime.

He whom Victor Hugo has satirically called Napoleon-le-Petit fatuously chose the anniversary of the battle of Austerlitz and of Napoleon I.'s coronation to rid himself by arms of the National Assembly, to make himself absolute ruler with the help of the military, and to muzzle all parliamentary opposition (2d December 1851). Imprisonment, banishment, deportation, the bloody repression of popular rebellion marked this black day's work, in which the president was assisted by Morny, Maupas, and St Arnaud. France, whether wearied of the incompetent Democrats, or (as Kinglake supposes) 'cowed' by the terrible audacity of the president, appeared to acquiesce in his act; for when the vote was taken upon it on the 20th and 21st of the same month, he was re-elected for ten years, with all the powers he demanded, by more than 7,000,000 suffrages. The imperial title was assumed exactly a year after the *coup d'état*, in accordance with another plebiscitary expression of the people's will.

An unlawful empire was now legally established. Men of astuteness and mediocrity took the helm of the state. The parliamentary trappings of the first empire were brought out. Resting on such artificial props as the army and police, Napoleon III. boasted that he was the upholder of law and order. Political parties were either demoralised or broken. He gagged the press, awed the *bourgeoisie*, and courted the clergy to win the peasantry. Liberals accepted him for fear of the Socialists; the Socialists applauded his plunder of the Orleans family; his duly-rewarded parasitic supporters, such as Jean Fialin, made Vicomte de Persigny, clung to him as to the fount of all honour and profit; foreign monarchies accepted him as a welcome ally in the struggle against liberalism. But unlike his uncle he did not seek matrimonial alliance with the old royal houses. He liked to profess himself the Cæsar of the people, and led to the altar Eugénie de Montijo, a Spanish countess of ordinary blue blood. He endeavoured to gain international acceptance for the just, but in his mouth sophistical, doctrine as to the right of peoples to choose their own masters, availing himself of it in the annexation of Savoy and Nice to France, in his Mexican intervention, and in his handling of the Italian question. At home he kept the people well in hand by an active economic policy. The price of bread was regulated, public works occupied and enriched the working-men in towns, while others were undertaken to protect and enhance in value the property of the peasantry. The complete remodelling of Paris under the direction of Baron Haussmann raised considerably the value of house-property, and by the opening of a network of thoroughfares suitable for the manœuvres of artillery and cavalry reduced to a minimum the risk arising from insurrectionary movements. The holding of international exhibitions and the signing of treaties of commerce with foreign states acted as a further inducement to internal peace; but the formation of unscrupulous financial, court, and clergy cliques was an ugly blot on this picture of a purely material prosperity.

To the blandishments of work and wealth at home Napoleon III. added the charm of a brilliant foreign policy. We need not dwell on the Crimean war, the campaign in Lombardy against Austria, to which Napoleon was somewhat paradoxically encouraged by the murderous attack of Orsini on his person, the expeditions to Mexico and to China. In all those undertakings Napoleon enjoyed the support if not always the actual co-operation of Great Britain. To Prussia his relations were of a very different kind, a mixture of jealousy and patronage which boded ill for France in the event of an actual conflict.

At the death of Morny in 1865 the soothing effect of Napoleon's measures and also his power to control the nation were well-nigh spent. Again the spirit of France stirred abroad. Napoleon's book, *La Vie de Cæsar*, which he wrote to extol his own methods of government under the guise of honouring Cæsar, met with loud protests. Forewarned, Napoleon reorganised his army, set himself up more proudly as an arbiter in Europe in order to flatter his subjects, and took a more conciliatory attitude to liberalism. His concessions at home were taken advantage of to set up a regular journalistic and parliamentary opposition. In 1869 the Liberal deputy Ollivier was granted a personal interview that he might explain to the emperor the wishes of the people, and Rouher, Napoleon's prime-minister, an advocate of absolutism, was dismissed from office. New men were called into power with Ollivier to liberalise the constitution. Some wrong-headed Bonapartists suggested another *coup d'état* against the Legislative Assembly, now leavened with opposition. Napoleon was firm enough to resist such nefarious counsels, and appears to have been fairly sincere in his latter-day liberalism. That it was not yet too late to stem the tide of discontent was shown by the result of another plebiscite (the fourth), by which Napoleon's new parliamentary scheme was sanctioned by 7½ million votes (8th May 1870). But burdened as he was by a new policy at home, by financial embarrassments and worries in his own family, in ignorance of the corruption that existed in his ministry of war, he sought in foreign affairs a diversion to his troubles, and thus brought himself all of a sudden to the edge of the abyss. For the Franco-German war, see FRANCE (Vol. IV. p. 782).

Napoleon III. surrendered himself a prisoner at Sedan in September. Till the conclusion of peace he was confined at Wilhelmshöhe. In March 1871 he joined the empress at Chislehurst, Kent, and resided there till his death on 9th January 1873.—His son, Eugène Louis Jean Joseph, Prince Imperial of France, was born 16th March 1856. He was in the field with his father in 1870, but after the fall of Sedan escaped to England, where he entered the Woolwich Military Academy, and in 1875 completed with distinction a regular course of study. Volunteering to serve with the English artillery in the Zulu campaign of 1879, he was killed on 1st June, when reconnoitring, by a party of Zulus in ambush.

Paris, 1869-75); Simson, *Die Beziehungen Napoleons III. zu Preussen und Deutschland* (1882); C. E. de Maupas, *Story of the Coup d'État* (Eng. trans. 2 vols. 1884); Hugo's *Hist. d'un Crime* (1877); E. Barlees, *Life of the Prince Imperial* (1880); and the *Memoirs of the Duke of Coburg*, vols. iii. and iv. (1890).

Napoleon, PRINCE. See BONAPARTE.

Napoleon. See LOUIS D'OR.

Napoleon, a round game at cards. Five cards are dealt to each player by one at a time, as at whist. Each player in rotation to the dealer's left looks at his hand and declares the number of tricks he will stand for, or whether he will pass. If all pass, the first player must stand for one trick. When a declaration is made subsequent players must stand for more tricks or pass. If *Nap* (all five tricks) is declared, no further declaration is made. The stand-hand leads; the card he first leads makes the trump suit. The other players follow suit in rotation, as at whist, the winner of the trick leading to the next. The cards rank as at whist. A player not able to follow suit may play any card. No one is obliged to head the trick. If the stand-hand wins the number of tricks he stood for, he receives so much for each trick from each of

the other players. If he fails he similarly has to pay all round. If Nap is declared and won, the stand-hand receives double all round; if lost, he only pays single. Sometimes this rule applies to four tricks, when Nap receives triple and only pays single. There is no misdeal; errors in dealing require a fresh deal. A player who exposes a card before all have declared, or declares out of turn, cannot stand on that hand. A player who exposes or detaches a card after the play has begun, or who plays out of turn, is fined the value of three tricks to the stand-hand, besides what he loses if the stand-hand wins. If the stand-hand loses, the player fined receives nothing. The stand-hand is liable to no penalty for exposing or detaching a card, nor for playing out of turn. If the stand-hand revokes he loses what he stood for. If any other player revokes, and the stand-hand wins, the revoker has to pay for all the players; if the stand-hand loses he has to pay to all but the revoker, who receives nothing. Cards played after the correction of a revoke are replayed. See H. G. Playfair's *Game of Napoleon* (1884).

Napoleona (also called *Belvisia*), a tropical African genus of myrtaceous plants, of which the one known species *N. imperialis* has showy red, white, or blue flowers, and a fruit resembling a pomegranate.

Narbonne, a town in the French department of Aude, on the La Robine branch of the Canal du Midi, 8 miles from the Mediterranean and 93 by rail ESE. of Toulouse. The removal since 1865 of the fortifications has been an improvement, but the place remains dirty and unattractive, with only three noteworthy buildings. These are the Romanesque church of St Paul (1229); the quondam cathedral of St Just (1272-1332), only the fine Gothic choir of which, 131 feet high, has been completed; and the former archbishop's palace, now the hôtel-de-ville, in one of whose three old towers Louis XIII. in 1642 signed the order to arrest Cinq Mars, and in which are a good museum, a library, and a picture-gallery. The white heather-honey of Narbonne maintains its ancient celebrity; the wine is chiefly used for blending purposes. Pop. (1872) 14,150; (1886) 26,391. Narbonne is the *Narbo Martius* of the Romans, their earliest colony (118 B.C.) beyond the Alps; and, situated on the high-road to Spain and the basin of the Garonne, was a place of great commercial importance. Under Tiberius it flourished greatly, its schools for a long time rivalling those of Rome. About 309 A.D. it became the capital of *Gallia Narbonensis*, and had its capitol, forum, theatre, aqueducts, triumphal arches, &c. In 412 it was taken by the Visigoths, in 719 by the Saracens, from whom it was recovered by Pepin in 759, to fall just a century later to the arms of the Northmen. During the 11th and 12th centuries it was a prosperous manufacturing city, but subsequently it decayed. Varro and Montfaucon were natives.

Narcissus, according to a Greek fable, was the son of the river god Cephissus and of the nymph Liriope or Lirioessa of Thespie, in Boeotia. He was a youth of extraordinary beauty, of which he was excessively vain; and for this he was punished by Nemesis by being made to fall in love with himself on seeing the reflection of his own face in a fountain. He died of this love-sickness; and on the place where he died sprang up the flower which bears his name. The story of Narcissus, narrated by Ovid, is of comparatively late origin.

Narcissus, a genus of plants of the natural order Amaryllideæ, having a perianth of six equal petal-like segments, and a bell-shaped corona of various magnitude. The species are natives of the south of Europe, the north of Africa, and

the temperate parts of Asia. The Common Daffodil is the only one which can be regarded as truly a native of Britain.

Many are cultivated in gardens for the sake of their beautiful and often fragrant flowers, which in general appear early in the season. Some of them are known by the names of Daffodil (q.v.) and Jonquil (q.v.). The name narcissus is popularly restricted to those which have flat (not rush-like) leaves, and a short (not bell-shaped) corona. Of these one of the best known is the Poet's Narcissus (*N. poeticus*), with generally one-flowered scape, the flower white and fragrant, the corona with a deeply-coloured border; others with one or two flowers on the scape are in common cultivation. The Polyanthus Narcissus (*N. tazetta*) has a number of flowers on the scape. It grows wild in stony places near the Mediterranean and eastwards to China. Many varieties of it are in cultivation. It is grown not only in gardens and greenhouses, but in water-glasses, like the hyacinth. It is very common in gardens in India, where it is highly esteemed as a flower. The narcissi in general are propagated either by seed or by offset bulbs. They succeed best in a rich light soil.

Narcissus poeticus.

Narcotics (Gr. *narkē*, 'stupor') are remedies which produce stupor if the dose be increased beyond a certain point. Opium is the most important member of the group, and the type from which most descriptions of the action of this class of medicines have been drawn; but it includes substances of very various properties. Some, as alcohol, produce intoxication in lesser doses; some, as belladonna, delirium; most have a primary stimulating effect: in fact, almost every one presents some peculiarity in the way in which it affects the system, and no satisfactory general description of their minor effects is possible. Their power of inducing sleep has procured for them the names of Hypnotics and Soporifics; while many of them are termed Anodynes, from their possessing the property of alleviating pain. Next to opium, Henbane, Indian Hemp, and Chloral may be regarded as the most important narcotics. Numerous artificially-produced organic compounds have been introduced during the last few years, some of which (e.g. paraldehyde, sulphonal as hypnotics; antipyrin, exalgin—an aniline derivative—as anodynes) will probably take a permanent place among useful remedies.

Narcotics are usually administered either with the view of inducing sleep or of alleviating pain or spasm. As, however, their action is much modified by a variety of circumstances—such as age, idiosyncrasy, and prolonged use—they should be administered with extreme caution, and, as a general rule, only under competent advice. The various quack medicines for children which are known as *Carminatives*, *Soothing Syrups*, &c. almost always contain some form of opium, and are a fertile cause of the great mortality that occurs in early life, especially among the poorer classes. All the narcotics when taken in excess are poisonous (see POISONS).

Narcotine ($C_{22}H_{23}NO_7$) is one of the organic bases or alkaloids occurring in opium, in which it usually exists in the proportion of 6 or 8 per cent. It is nearly insoluble in water, but dissolves sparingly in alcohol, readily in chloroform and ether. Narcotine possesses very slight alkaline properties; its salts do not readily crystallise, and are even more bitter than those of morphia, although the substance itself is almost tasteless. When first discovered (in 1803) it was supposed to be the stimulant principle of opium; but in reality it possesses very little activity. Its sulphate has been used in India as a substitute for quinine. Narcotine yields a great variety of compounds by decomposition, perhaps the most interesting being vanillin, the flavouring principle of vanilla.

Nard. See SPIKENARD.

Nardoo (*Marsilea macropus*), a plant of the order Marsileæ (see RHIZOCARPS), the only plant of that order which is used in any way by man. It is found in Australia, and affords important supplies of food to the natives of some regions;

Nardoo (*Marsilea macropus*).

It is then that the spore-cases are gathered for food. They are oval, flattened, about an eighth of an inch in length, hard and horny, and requiring considerable force to pound them when dry, but becoming soft and mucilaginous when moistened. The spore-cases, pounded with their contents, are made into cakes like flour.

Nariad, a town in the presidency of Bombay, 29 miles SE. of Ahmadabad by rail. It does a great trade in tobacco and ghee, and has a government experimental farm. Pop. (1881) 28,304.

Narragansett Bay. See RHODE ISLAND.

Narses, a statesman and general, and almost the last stay of the old Roman empire in Italy, was born in Persian Armenia about 475 A.D., and being a eunuch was probably sold as a slave in childhood. From some menial office in the imperial household at Constantinople he rose to the post of keeper of the privy-purse to the Emperor Justinian. In 538 he was sent to Italy in command of a body of troops, professedly to act in concert with Belisarius (q.v.), but in reality, it is believed, with a secret commission to observe and to control that general. After some successes Narses, having disputes with Belisarius, assumed an independent authority; but his separate command was unfortunate, and he was recalled to Constantinople in 539. After some years, however, Belisarius was recalled, and Narses was appointed to the chief

command in Italy. His conduct of that expedition extorted the admiration even of his enemies. Not having the command of a sufficient number of transports, he marched his army along the whole circuit of the shore of the Adriatic, and, while the enemy's fleet were still in possession of the sea, was enabled to encounter them at Taginæ (in the Apennines), where, after a desperate engagement, the Ostrogoths were totally defeated, and their king, Totila, slain. Narses took possession of Rome, and, after a series of successes both in Southern and Northern Italy, completely extinguished the Gothic power in that peninsula. Justinian appointed Narses prefect of Italy in 554. He fixed his court at Ravenna, and continued till the death of Justinian to administer the affairs of Italy with vigour and ability. But he was charged with avarice; and his exactions pressed so heavily on the exhausted resources of the population that on the death of Justinian the Romans complained to Justin of the exactions of Narses, and that emperor deprived him in 567 of his office. He is accused of thereafter intriguing with Alboin, king of the Lombards, for a new invasion of Italy; and he died at Rome about 573. See GOTHs, JUSTINIAN; and Hodgkin's *Italy and her Invaders*.

Narthex. See BASILICA.

Narva, a Russian town 101 miles WSW. of St Petersburg, on the Narova, 10 miles from its mouth in the Gulf of Finland. The navigation of the Narova is impeded by a waterfall near Narva, 14 feet high, which is taken advantage of for driving cotton-mills, sawmills, &c. Pop. 8600. Charles XII. (q.v.) won a great victory here in 1700.

Narvaez, RAMON MARIA, general and statesman, was born at Loja, in Andalusia, 5th August 1800, and when very young served in the war of liberation against the French. In 1822, when a reactionary party took up arms to destroy the work of the revolution, Narvaez ranged himself on the side of the liberals. The invasion of Spain by a French army in 1823 forced him to retire from active life until the death of Ferdinand VII. in 1832. In 1834 he maintained a hot struggle against the Carlists of the Basque Provinces, and in 1836 completely routed the Carlist leader, Gomez, near Arcos. He now became immensely popular, and was regarded as the rival of Espartero. In 1838 he cleared the district of La Mancha of brigands, and was appointed in 1840 captain-general of Old Castile. He took part in the insurrection against Espartero that broke out at Seville in 1840, but, that having failed, he was compelled to flee to France, where he was shortly after joined by Queen Christina (see MARIA CHRISTINA), and commenced those plots against the government of Espartero which in 1843 effected its overthrow. In 1844 he was appointed president of council, and created Duke of Valencia. His ministry was thoroughly reactionary, but was overthrown in 1846. After a brief exile as special ambassador at the French court, he returned to power from 1847 to 1851, in 1856-57, and again in 1864 and in 1866; and, despite the efforts of O'Donnell and Prim, he retained power till his death, 23d April 1868.

Narwhal (*Monodon*), a genus of Cetacea, belonging to the Odontocetes or toothed whales (see WHALE); it is characterised by the presence in the adult male of a long tusk, and by the early disappearance of the other teeth, and by other structural points of less importance. The tusks represent canine teeth, and there are sometimes a pair of them present, lying side by side in the upper jaw; there is such a specimen in the Cambridge Museum. When there is only one tusk, it is the left; rarely the female has a tusk, so rarely, however, that there are only three instances

on record. There is only one species known, *M. monoceros*, which inhabits the northern seas, and has been on one or two occasions stranded on British shores; it was first recorded in Britain by Vulpinus from the Isle of May in 1648; another was observed in 1800 in the Wash in Lincolnshire. It is common off the shores of Greenland, and is hunted for its oil as well as ivory; as the creature

Narwhal (*Monodon monoceros*).

is gregarious, sometimes travelling in herds 'of many thousands,' it is captured in considerable abundance. In early times the tusk of the narwhal was valued in medicine, and to this day is so used by the Chinese. The ivory is very fine, and in the castle of Rosenborg at Copenhagen is a throne of the kings of Denmark made of this substance. The female narwhal is more spotted than the male, and the young darker. The fact that the female has not the tusk seems to negative the view that it is of use in spearing fish; it is no doubt used by the males for fighting—for examples are seldom unbroken. Fabricius thought that their use was to break and keep open holes in the ice during the winter, and observers have seen such breathing-holes crowded with heads of narwhal and other whales.

Naseby, a Northamptonshire parish, 7 miles SW. of Market-Harborough. Here, on 14th June 1645, 7500 royalists under Charles I. and Prince Rupert were totally defeated by 14,000 parliamentarians under Fairfax and Cromwell, the king losing cannon, baggage, and 5000 prisoners. A 'blockhead obelisk,' which does not mark the battlefield, was erected in 1823 on the Naseby ridge (648 feet). See Gardiner's *History of the Great Civil War* (vol ii. 1889).

Nash, JOHN, architect, born in London in 1752, after the usual course of training for his profession entered into some building speculations which enabled him to buy a small property in Carmarthen. Here in fresh speculations he lost much money; therefore, in 1792, he returned to London and architecture, in which he speedily rose to eminence. On the strength of a patent (1797) for improvements in the construction of the arches and piers of bridges, he claimed a great part of the credit of introducing the use of metal girders. A large part of his time was occupied in designing and constructing mansion-houses for the nobility and gentry in England and Ireland, but he is chiefly celebrated in connection with the great street improvements in London. From February 1815, when he was appointed 'architect, valuer, and agent to the Board of Woods and Forests,' down till near the end of his professional career, he was busily engaged in the planning of routes, grouping of buildings, and fixing of sites. Regent Street, Haymarket Theatre, and the terraces in Regent's Park are

specimens of his designs. The Pavilion at Brighton, about which he published a book, was another of his works. He retired from his profession in 1834, and died May 13, 1835. Nash, notwithstanding his many defects, possessed great power of effective grouping, as is well shown in his works. In the architecture of mansion-houses, the designing of 'interiors' was his forte.

Nash, RICHARD, better known as 'Beau Nash,' was born the son of an impoverished Welsh gentleman at Swansea, October 18, 1674. He was educated at Carmarthen and Jesus College, Oxford, held for some time a commission in the army, and next entered at the Middle Temple, but found greater attractions in the dissipations of society than the pursuits of law. He conducted the pageant at the entertainment of William III. by the Inns of Court, and is said to have declined the honour of knighthood without a pension. He made a shifty living by gambling, but in 1704 he found his true function as master of the ceremonies at Bath, where he conducted the public balls with a splendour and decency never before witnessed. In this way he came to acquire an imperial influence in the fashionable society of the place. It appears that he was also distinguished by his sentimental benevolence. He played hard and successfully; yet if he heard an individual sighing behind his chair: 'Good Heavens! how happy would that money make me,' Nash would thrust his own winnings into his hands, with theatrical generosity, and exclaim: 'Go, and be happy.' His own equipage at this period of his career was sumptuous. He used, we are told, to travel to Tunbridge in a post-chariot and six greys, with outriders, footmen, French-horns, and every other appendage of expensive parade. He is praised for the great care which he took of the morals of the young ladies who attended the Bath balls, always putting them on their guard against needy adventurers like himself. In his old age Beau Nash sank into poverty, and often felt the want of that charity which he himself had never withheld. He died at Bath, February 3, 1761, and received a public funeral. *A Life by Goldsmith* was published anonymously in 1762.

Nash, THOMAS, a busy writer in the last decade of Elizabeth's reign, was born at Lowestoft in 1567, studied almost seven years at St John's College, Cambridge, travelled abroad, visiting Italy and Germany, and thereafter plunged recklessly into the life of letters in London, and forced a shifty living from fate until the close. He kept ever a high heart amid manifold troubles, and, satirist as he was, his inexhaustible gaiety and goodness made him the darling of his friends—the 'sweet boy' and 'sweet Tom' of Greene and Francis Meres. He was dead by 1601, as prematurely as Marlowe, Peele, and Greene. Nash had a genuine relish for good literature; he praises warmly Rabelais, Aretino, Spenser, Sidney, and Marlowe. He had also a great faculty for vituperation, and the times were favourable for its exercise. His first writing was his vigorous preface to Greene's *Menaphon* (1589), and this was quickly followed by the *Anatomie of Absurditie* (1589), a satirical discussion on social manners; a series of impetuous tractates flung into the Marprelate controversy; *Pierce Penilesse, his Supplication to the Divell* (1592), full of keen observation and satire, and rich in autobiographical interest; *Strange Newes* (1593); and *Have with you to Saffron Walden* (1596), containing a vehement onslaught on Gabriel Harvey; *The Terrors of the Night, or a Discourse of Apparitions* (1594); *Christ's Tears over Jerusalem* (1593), a long, edifying discourse; *The Unfortunate Traveller, or the Life of Jack Wilton*

(1594), the best specimen of the picaresque tale in our literature before Defoe; *The Isle of Dogs* (1597), which was at once suppressed, and is now lost, and for which the author was sent to prison; and *Lenten Stuffs* (1599), 'in praise of the red herring,' really a humorous description of Yarmouth. The tragedy of *Dido* was written in collaboration with Marlowe; *Summer's Last Will and Testament*, by Nash alone.

See the Memorial Introduction in Dr Grosart's *Complete Works of Thomas Nashe* (6 vols. 4to, Lond. 1883-84); also chap. vi. of Jusserand's work, *The English Novel in the Time of Shakespeare* (Eng. trans. by Eliz. Lee, 1890).

Nashua, a manufacturing city of New Hampshire, is 40 miles by rail NW. of Boston, at the junction of the Merrimac and Nashua rivers. The falls of the latter, rendered available by a canal 3 miles long, supply motive-power to many manufacturing establishments, including very extensive cotton-factories and ironworks, paper and carpet mills, &c. Pop. (1880) 13,397; (1890) 19,311.

Nashville, the capital of Tennessee, is on the navigable Cumberland River, 200 miles above the Ohio, and 185 miles by rail SSW. of Louisville. The city, which is one of the principal railway centres in the southern states, is built mainly on the left bank of the river, which is crossed by a suspension bridge and a railway drawbridge to the suburb of Edgefield. Nashville is a handsome, well-built town, with an imposing state capitol of limestone (\$1,500,000), a penitentiary (400 cells), and a large lunatic asylum. As an educational centre the city is of considerable importance. The public-school system is excellent; and here are the Nashville University (1806), Vanderbilt University (Methodist Episcopal South, 1875), Central Tennessee College (for coloured Methodists, 1866), Fisk University (Congregationalist, 1867, with few but coloured students), Roger Williams University (Baptist, also for coloured students), the state normal college, &c. Most of these institutions are open to both sexes. The city has a large wholesale trade, the staples being cotton and tobacco; while its manufactures, which are rapidly extending, include cotton, flour, oil, paper, furniture, timber, leather, iron, and spirits. Founded in 1780, Nashville became the legal capital in 1843. In December 1864 the Confederates under Hood were completely defeated here by General Thomas. Pop. (1870) 25,865; (1880) 43,350; (1890) 76,168.

Nasik, a town of Bombay, on the Godavari, 31 miles from its source, with a railway station (4 miles distant), 100 miles NE. of Bombay. It ranks as one of the most sacred of Hindu places of pilgrimage, the banks and even the bed of the river being crowded with temples and shrines. Formerly it was a Mahratta capital; now it manufactures paper, cotton, and excellent brass and copper work. Pop. (1881) 27,070, including 2967 at the cantonment of Deolali.—The district of Nasik has an area of 5940 sq. m., and a pop. (1881) 781,206. See MAGIC SQUARES.

Nasmyth, JAMES, inventor of the steam-hammer, was the son of Alexander Nasmyth (1758-1840), portrait and landscape painter, best known by his portrait of Burns. He was born in Edinburgh, August 19, 1808. From boyhood he evinced a turn for mechanics, and in his father's house became accustomed to use a lathe. At seventeen he constructed a small working steam-engine for grinding his father's colours, and made besides five models of a condensing steam-engine, and later a small road locomotive. Employed in 1829 by Maudsley, he started in business at Manchester in 1834, gained a good connection, and established at Patricroft what afterwards became known as the Bridge-water Foundry. The invention of the Steam-

hammer (q.v.) was conceived in 1839, the occasion being the necessity for forging an enormous wrought-iron paddle shaft. But it did not take shape till 1842, when he found the steam-hammer as he had planned it at work at Creuzot in France. It had been adapted from his own scheme-book. Nasmyth patented his invention on his return to England, and it was adopted by the Admiralty in 1843. Business increased, and by 1856 he was able to retire with a handsome fortune, and settled at Penshurst, Kent. Amongst his other inventions was a steam pile-driver. He published *Remarks on Tools and Machinery* (1858), and a volume on the *Moon* (1874). He died in London, May 7, 1890. See *Life* by Smiles (1883).

Naso. See OVID.

Nassau, formerly a German duchy, now Wiesbaden, a district of the Prussian province of Hesse-Nassau (q.v.). The soil is fertile and produces some of the most esteemed Rhenish wines. The chief towns are Wiesbaden (q.v.), the capital of the district; Schwalbach, Schlangenbad, Fachingen, Selters, and Geilnau.—The family of Nassau, the elder branch of which reigned till 1866, dates from the 10th century. The younger branch inherited in 1544 the principality of Orange (q.v.), and as the princes of Orange took an important place in European history (see HOLLAND). The reigning Duke of Nassau sided against Prussia in 1866, and his duchy was incorporated with Prussia (see PRUSSIA, GERMANY); and on the extinction of the male line of the Orange branch by the death of William III. of Holland, in 1890, the Duke of Nassau became Grand-duke of Luxemburg.

Nassau, the capital of New Providence, is the centre of the trade and seat of government of the Bahamas (q.v.) and a bishop's see. Pop. 5000.

Nasturtium, the botanical name properly of the Water Cress (see CRESS), but also the popular designation of the Indian Cress (*Tropæolum majus*). The genus *Tropæolum* is the type of the small natural order Tropæolaceæ, and comprises some beautiful garden climbers, such as the widely cultivated Canary Creeper (*T. aduncum*), a native of Peru, and the more recently introduced *T. speciosum*, a native of Chili, which has established itself in many districts in the north of Scotland and in Wales, and garlands the walls and roofs of cottages in summer and autumn with its festoons of vivid green leaves and brilliant crimson flowers. The Indian Cress is also a native of Peru; the whole plant is characterised by a warm pungent taste and tonic stimulant, and antiscorbutic properties are ascribed to it. The flowers are employed as an ingredient in salads and for garnishing the same. The seeds when green are pickled in salt and vinegar and used as a substitute for capers. As an ornamental garden climber or creeper, the Indian Cress has been long known and admired by cottagers and others.

Natal, a British colony on the south-east coast of Africa, was discovered by Vasco da Gama on the Christmas-day (hence its name) of 1497. In the 18th century intermittent trading was carried on between the Cape Colony and Natal, which in 1800 was peopled by ninety-four distinct tribes of natives. From 1805 to 1828 the despotic Zulu chief Tyaka (Chaka) enforced his own rule and that of his own immediate tribe or family clan, the Amazulu, over the congeries of tribes reaching from the Limpopo on the north to the Kei River in the south. Tyaka was killed in 1828 by a political faction who placed his younger brother Dingaan on the throne. Predatory Boers who had left the Cape Colony to escape British rule divided into parties and settled in the territories now known as Natal and the Transvaal; and conflicts

between Boers and natives were very frequent. In 1838 an embassy of Boers were massacred by Dingaan, and a force of Boers proceeded to Zululand to avenge their friends. The country was at this time divided into two factions, one supporting Dingaan, and the other his younger brother Umpande (Panda). The Boers entered into a secret treaty with the latter, and a combined attack was made on Dingaan, who fled and was killed. Panda succeeded him as king, and the Boers were recognised as lords of the soil of Natal. In December 1838 Sir George Napier, the Cape governor, had sent a detachment of Highland troops to take possession of the inland territory and Port Natal; but owing to the Cape Kafir disturbances the Highlanders were withdrawn, and the Boers at once hoisted the flag of 'the Republic of Natalia.' Two British ships of war were sent from the Cape to force a landing at Durban. After a short struggle there the Boers gave up the port, and fell back on Pietermaritzburg, the capital, the name of which is a compound of the Christian name of Pieter Retief and the surname of Gert Maritz, two leaders of the Boers. Civil negotiations were then entered on by Mr Cloete, and many of the Boers accepted British rule and settled down in Natal, forming there, as a portion of them and their descendants still do, an important and loyal section of the Queen's subjects in that colony. Those of the malcontents who crossed the Drakensberg and struck north soon found themselves fighting against Umzilikatzé (father of Lobengula of Matabeleland) in the territory now known as the Transvaal. In 1843 Natal was officially declared to be a part of the British dominions, and the colony was formally annexed to the Cape of Good Hope on the 31st of May 1844. At that time the natives numbered about 150,000, although in the previous century their total was nearly a million. But intertribal fights and the struggles for supremacy of Tyaka scattered the clans of Natal far and wide. Subsequent to the annexation by the crown and its attendant peace the aborigines of Natal gradually returned from distant places, and their numbers are now nearly half a million. In 1855 there was a great flood in the colony and Zululand, and in the following year a very sanguinary fight for the Zulu succession took place on the Natal northern border, between two sons of Umpande—viz. Cetewayo and Umbulaze. After a bloody battle on the Tugela River the forces of the former won the day and Umbulaze's beaten men took refuge in Natal. On the 15th of July 1856 Natal was declared to be a separate British colony, and it was then given a limited form of representative institutions. During the decade ending with 1860 considerable immigration from Great Britain took place, and the immigrants of that time and their descendants occupy the most of the land of the colony to-day.

In 1873 friction arose between Langalibalele, one of the chiefs on the north-west boundary, and the next magistrate. Some of the chief's young men disobeyed the mandate of the magistrate to give up their guns. Orders were issued to apprehend the chief and certain of his followers. They retreated before the crown forces, but some of the Natal volunteers and mounted police cut them off in one of the mountain-passes; bloodshed ensued, and three well-known young colonists were killed. Langalibalele escaped to Basutoland, but was captured and brought back, tried very summarily in Maritzburg, and banished to the Cape Colony. Rigorous measures were adopted by the governor against Langalibalele's tribe and a neighbouring tribe. The home government, however, interfered and ended the injustice which had been done to

the natives by the colonial authorities while under a feeling of panic. Langalibalele remained in the Cape Colony till 1885, when he was allowed to return to Natal as a prisoner on parole; he died near Maritzburg in 1889.

In 1875 there being in the colony much dissatisfaction with the methods of Downing Street rule, Sir Garnet Wolseley was sent out to settle matters. He promulgated a new constitution providing for an extension of the representative system with the check of certain eminent colonists, selected by the crown, having seats in the Legislative Council as nominee members. Sir Garnet Wolseley was succeeded by Sir Henry Bulwer. During the governorship of the latter a feeling of disquiet was shown in some quarters at the strength of the colony's neighbours, the Zulus under Cetewayo. Sir Bartle Frere, Her Majesty's High Commissioner for South Africa, visited the colony and came to the conclusion that in the interests of the British colonists in South Africa it was necessary to break the power of the Zulus. Despite the protests of the Natal government and Sir Henry Bulwer, the governor, an ultimatum which in itself was calculated to precipitate hostilities was served on the Zulu king, and war ensued (see ZULUS). In this war Natal suffered severely in the lives of its young colonists, in its treasure, and in the paralysis of its trade. For several years the colony was a camping-ground for British troops, for in 1881 the Transvaal Boers invaded Natal to anticipate the advance of English soldiers being sent to support those beleaguered in the Transvaal garrisons; and the fights of Schuin's Hoogte, Ingogo, Lang's Nek, and Amajuba (see MAJUBA) were all fought on British soil.

Natal is situated between 29° 10' and 31° 10' S. lat., and covers an area of 18,750 sq. m.—more than a third of that of England. Durban lies 800 miles ENE. of the Cape of Good Hope, and the colony has a seaboard on the Indian Ocean of 180 miles. It is bounded on the N. by the Tugela and Buffalo rivers, which separate it from the Zulu Reserve and the Transvaal; on the NW., W., and SW. by the Kwashlamba or Drakensberg Mountains, and on the S. by the Umtamvuna River, separating it from Pondoland. Towards the coast the Drakensberg Mountains present a scarped and almost inaccessible face; they gradually die away, however, into the immense rolling plains of the interior. Many offshoots from these mountains traverse the colony, dividing it into a series of steps or plateaus, rising from the coast region to the foot of the mountains, and forming so many zones of natural productions.

The coast region, extending for 30 miles inland, is highly fertile, the climate being subtropical and healthy. In 1856 the cultivation of the sugar-cane was introduced on the coast, and as an industry it has thriven more or less ever since. Besides supplying all South Africa with the staple, the value of the sugar exported by the colony to England in 1888 was £71,912. The culture of the cane requiring that continuous and arduous labour which the natives did not supply, the Legislative Council had to take steps to introduce immigrants from British India. This immigration began in 1863, and in 1891 there were 35,000 coolies in the colony with their attendant traders who followed them from India. The Assam tea-plant was introduced in 1877, and steady progress has been made with the industry, the annual yield being about 150,000 lb.; this is consumed locally, and as yet the colony still imports tea largely. Coffee and tobacco have been reared, as have also indigo, arrowroot, and ginger. All tropical fruits thrive well. The mid-land terrace is more fit for the cereals and usual European crops; while on the higher plateaus along

the foot of the mountains are immense tracts of the finest pasturage for cattle and sheep.

The climate is very healthy; the thermometer ranges between 90° and 38° F., but the heat even in summer is seldom oppressive. The mean annual temperature at Pietermaritzburg, the capital, is 64·71°. The winter begins in April and ends in September. In the summer season the thunderstorms are very frequent and severe in the uplands. The annual rainfall over the whole colony averages nearly 40 inches, the greatest fall being in summer.

The colony has only one harbour worthy of the name, but that is the best on the south-east coast. It is called Durban (q.v.) or Port Natal. The harbour is of great consequence not only to the colony, but to the empire, as it must one day be an important coaling station. The principal rivers are the Tugela, Buffalo, Umkomanzi, Umgeni, Umzimkulu, and Mooli. Like the majority of African rivers, they are of little use for purposes of inland navigation; but their streams are permanent and often available for irrigating purposes.

Coal is destined to play a prominent part in the future of Natal, the area of the coal-measures being estimated at 1400 sq. m. The coal is serviceable for all ordinary purposes, the government railways being worked with it. Copper has been found, and much is hoped from the iron near the coal. The colony is also believed to be rich in other minerals, such as asbestos, mica, and plumbago. Gold has been found in the south and north. Great forests of fine timber abound in the mountain-passes, while many tracts along the coast are well wooded. The chief towns are Pietermaritzburg (15,767), 54 miles inland, the seat of government and the chief military station; Durban (18,433); Verulam and Pine Town near the coast, Harding in the south, and Richmond, Weenen, Colenso, Greytown, Ladysmith, and Newcastle, up country.

The government of Natal is now administered by a governor, assisted by an executive council of seven, of whom five are official and two nominee members, and a Legislative Council consisting of twenty-three members elected by the constituencies. Parliament exists for five years. A narrow majority in the council passed in 1891 a bill providing responsible government, but the measure has yet to receive the sanction of the imperial authorities; and an important section of the colonists has strenuously opposed the agitation for change. The home government offered the colonists responsible government in 1883 with certain guarantees for native protection, but they refused the offer. About 1865 Natal was plunged into ecclesiastical warfare. Bishop Colenso (q.v.), the then head of the diocese, was declared heterodox by a party in the church, and unsuccessful efforts were made in South Africa and England to depose him. A rival church was, however, established on the voluntary system, entitled the Church of England in South Africa, whose head bears the title of Bishop of Maritzburg. The Presbyterian (Scottish and Dutch), Roman Catholic, and other churches are well represented; many stations of the Wesleyan, American, Norwegian, and Berlin Missions exist; and the order of the Trappists do good work near Pine Town. Schools are multiplying fast.

The chief passes through the Drakensberg are Van Reenen's, Oliver's Hoek, Bezuidenhout, De Beer's, and Lang's Nek. Most of the rivers have been substantially bridged, and a very energetic policy of public works is being pursued by the government. A railway runs through the colony, and will shortly connect the coast and the Free State and Transvaal. The government lines, 300 miles long, are also laid north and south of Durban for short distances along the coast. Durban and Maritzburg were connected by the railway in 1880.

Natal's chief exports are wool, sugar, ivory, and hides. The wool exported to Great Britain in 1889 was valued at £752,182, and weighed 29,489,716 lb. The clips of three seasons from Natal and Overberg were as follows: in 1886-87, 63,300 bales; in 1887-88, 76,000 bales; and in 1888-89, 73,500 bales. The total value of exports in 1889 was £1,656,318. These comprise, in addition to those named, cotton, coffee, arrowroot, feathers, molasses, rum, horns, maize, and skins. In 1856 the exports amounted to £56,562; in that year the value of the imports was £102,512. In 1889 the imports reached £4,527,015. The revenue in 1857 was £43,780, and the expenditure in the same year was £36,438. In 1889 the revenue (raised mainly from railway receipts and customs) was £1,336,155, and expenditure £1,295,568. The increased prosperity of Natal is largely attributable to new gold discoveries in the Transvaal. The bulk of the Natal trade is with the mother-country, although a considerable business is done with Australia, India, and North and South America. Certain kinds of grape thrive well in Natal, and the wine industry is now engaging the attention of the colonists. In 1876 the population numbered 326,957 (20,490 whites); in 1889, 531,158, divided as follows: 37,390 whites, 34,480 Indian coolies, and 459,288 natives. The natives possess horses, cattle, sheep, &c. They are a fine race physically, gifted with high intelligence, of frank and courteous bearing, and very easy to govern. Upwards of 2,000,000 acres of land have been set apart as locations for the natives, and over 6,000,000 acres have been acquired by grant or purchase by Europeans, the balance of land being retained for allotment to new settlers.

The common law in the colony is that prevailing in Holland during the 16th and 17th centuries, modified by statute law in the same way practically as obtains in all the South African states. The chief difference between English and Roman Dutch law rests in the laws of marriage and inheritance, but the difference is now by statute largely optional. The coolies are subject to the laws regulating Europeans, as well as to special laws controlling Indian immigration. The natives are with few civilised and exempted exceptions subject in civil matters to native law, which is quite different from colonial law. The Supreme Court consists of the chief-justice and two puisne justices; and there are stipendiary magistrates and administrators of native law in all important centres.

Eland (q.v.) and hartebeest (see ANTELOPE) are the only big game left, and these have been made royal game. There are stringent laws for the protection of deer and game-birds. Alligators are met with in a few of the central and northern rivers. Snakes, both colubrine and viperine, are in plentiful distribution throughout the colony. Many of the snakes are innocuous, and fatal bites from the poisonous species are rare. The python, which attains a large size, is to be found in the seacoast forests, and in the reeds by the river-sides. The hippopotamus is still to be met with at the mouths of some of the northern rivers.

See *The Annals of Natal* (1889), by John Bird; *Natal Almanac*; *Annual Blue Book*; *Our Colony of Natal*, by Walter Peace; *The Natal Sugar Industry*, by W. Y. Campbell; *South Africa and how to reach it* and *Golden South Africa*, by the writer of this article; *South Africa, Past and Present* (1877), by John Noble; *Notes on Natal*, by Sir John Robinson, F.R.G.S.; *Brooks's Natal* (1869), by the late Dr Mann; *Laws and Ordinances of Natal*, by Justice Cadiz; *Code of Native Law, Civil and Penal*, by W. Y. Campbell.

Natal, a seaport of Brazil, capital of the province of Rio Grande do Norte, stands at the mouth of the river of that name. It exports principally

cotton and sugar (nearly £200,000 annually). Pop. 10,000.

Natchez, capital of Adams county, Mississippi, is on the east bank of the Mississippi River, 214 miles by rail and about 280 by water NNW. of New Orleans. It is built mainly on a high bluff, looking out far over the cypress swamps of Louisiana; the part of the city along the bank, where the heavy shipping business (mainly in cotton) is transacted, is known as Natchez-under-the-Hill. The public buildings include a Roman Catholic cathedral and a United States marine hospital. Natchez, which was settled by the French in 1716, derives its name from a former tribe of Indians (see MOUND BUILDERS). Pop. (1870) 9057; (1880) 7058; (1890) 10,101.

National Convention (1792-95). See FRANCE, Vol. IV. p. 780; GIRONDIST, JACOBINS, ROBESPIERRE.

National Covenant. See COVENANT.

National Debt. National or public debts although of early origin were relatively of small importance before the development of the modern system of banking and credit, and it is only during the present century that they have become almost universal on a considerable scale (see Gilbart on *Banking*, sect. i.). So long as it was necessary either to give pledges such as crown jewels or to assign specified revenues, it was not possible that public debts could attain any great magnitude. As soon, however, as governments were able to borrow simply on credit, national debts in the modern sense of the term grew rapidly. In less than a century after the foundation of the Bank of England (1694), when for the first time in English history the item 'Interest and Management of the Public Debt' appears in the national accounts, Adam Smith felt compelled to enter a protest against 'the progress of the enormous debts which at present (1776) oppress, and will in the long-run probably ruin, all the great nations of Europe.' At that time the public debts of the civilised world were, however, only about one-tenth of their present aggregate amount, which exceeds five thousand million pounds sterling, exclusive of local obligations. Although the English national debt received its greatest augmentation during the great Napoleonic wars, the general indebtedness of civilised nations has increased most rapidly since 1848. In fact since that year it has been calculated that there has been an annual average deficit in the public accounts of the world of over £100,000,000. In 1862 there were quoted on the London Stock Exchange foreign public stocks to the amount of nearly £700,000,000, whilst ten years later these quotations had increased to nearly £2,500,000,000. At the present time there are more than one hundred and fifty public securities dealt in the London market (see Adams on *Public Debts*, part i. chap. i.). Seeing then that national debts are now practically universal in the civilised world, and that the amounts and conditions under which they are held are constantly changing, a purely historical or statistical account is plainly out of the question in the limits of the present article. It will only be possible to indicate the most general characteristics and principles involved, and also some of the leading points of controversy. As regards *origin*, undoubtedly the most important cause of public indebtedness is, and always has been, war-expenditure. Thus the Napoleonic wars increased the English debt by over £600,000,000, the United States civil war cost the victors £450,000,000, and the Franco-German war added £390,000,000 to the total of national indebtedness.

In recent years, however, governments have added largely to their indebtedness by borrowing

for various public purposes of an industrial or social character. In France especially, in spite of great changes of government, expenditure of this kind has gone on increasing at an alarming rate; the amount of taxation per head of population has increased by seventy per cent., and this is largely due to the growth of administrative functions on the part of the state. In the British colonies also the rapid increase of public indebtedness must be ascribed principally to the same cause. The progress of civilisation necessarily imposes, as Adam Smith, Mill, and other economists have pointed out, new industrial functions upon governments, and it is impossible that these can in all cases be fulfilled in a directly remunerative manner. But, apart from this natural growth, in recent years a quasi-socialistic tendency has become pronounced, which has involved a large increase in public expenditure. The full importance, however, of this element can only be seen when account is taken of local taxation and indebtedness, which would require a separate investigation. It must also be observed that money spent on debts incurred for public purposes may in some cases—e.g. railways, docks, &c., be directly profitable, and in others—e.g. education, be indirectly remunerative.

The *nature* of public debts differs in some respects from that of private obligations. It is held, for example, that the government of a sovereign state has the discretionary power of enforcing the claims of its subjects for payment of the national (as contrasted with domestic) obligations of another state. The interests of bondholders may in consequence give rise to diplomatic intervention and thus lead to political disturbances, as has been shown recently by the action of England and France in Egypt and Tunis respectively. The growth of national indebtedness has, however, hitherto been generally accompanied by an increased sense of responsibility founded on the importance of public credit, and fundamental revolutions in government have not generally given rise to repudiation, although the new government might strongly disapprove of the objects for which the debt was incurred, or the methods by which the money was raised—compare, for example, the history of France during the present century and the recent revolution in Brazil. On several occasions, however, specious arguments for partial repudiation have been urged and met with some popular countenance.

It has been maintained that if a debt has been incurred in a depreciated currency—that is to say, if the government has only received the capital sum borrowed in this form—it is only equitably bound to pay back the principal with an allowance for its depreciation. This position was taken up by some writers as regards the English debt incurred during the period of the bank restriction, when Bank of England notes were inconvertible and depreciated, and more recently the same reasoning was advanced in the United States after the civil war. The obvious answer, however, is that a government would receive so much less capital if the lenders were not assured against uncertain depreciation. The amount actually received for a nominal capital sum will clearly vary, according to the standard in which the payment is to be ultimately met (see Mill's *Political Economy*, bk. iii. chap. xiii.). In the same way it has sometimes been maintained that if a government has borrowed at a discount, and its stock has afterwards risen to par, the fundholders have no equitable right to this rise in value caused by the growth of credit and national prosperity. But again the reply is that the chance of their rise in the future was taken into account by those who made the original advances, and that they would have required so much more interest if they were to be entitled

simply to a return of the original sum actually advanced. The practical conclusion to be drawn from this argument is that in general it is bad policy for a nation to borrow at a discount, because it is deprived of the opportunity of conversion to a lower rate of interest. Suppose, for example, that a nation can only borrow at par at six per cent., it is better to do this than to borrow nominally at three per cent., and create (roughly) double the amount of capital obligation for the same sum actually received. In the former case every fall in the rate of interest at which the nation can borrow may be taken advantage of by a process of conversion, whilst in the latter case the whole gain accrues to the fundholders. It is of course assumed that the debt may be paid off at any time (or with a short notice), and that payment is not definitely fixed for certain dates. The opposite case of the United States shows the importance of this provision.

It is, however, true as before that the certainty of high interest for a fixed period will operate upon the amount actually given for every nominal hundred, but the point is that the state is better fitted to take advantage of the probable ultimate fall in the rate of interest. A somewhat similar argument has been advanced by Dr Chalmers and others to show that, considering the nature of a state, it is better always to meet current expenses, however extraordinary, out of present taxation, rather than to resort to loans. The contention is that to meet the actual expenditure the government must in some form or other actually take the required amount from the sum total of the national wealth. If it makes a loan it is said that it really takes the capital amount and diverts it from productive purposes, just as effectively as if it obtained the money directly by taxation, but in addition is burdened in perpetuity with the interest. The circumstances under which the national debt of England was so largely increased in the Napoleonic wars no doubt seemed to justify this position. According to a Parliamentary Return of 1869 it was shown that from 1793-1816 the total income raised from taxes amounted to 1149 millions, and the total expenditure, except for the interest on the debt, amounted to 1103 millions. That is to say, for the twenty-three years (apart from the interest on the debt) the whole civil, military, and naval expenditure was less than the amount received in taxes by 46 millions. Now the charge on the original debt before the war was about 9½ millions per annum, or for the twenty-three years about 220 millions. Against this must be set the 46 millions of surplus shown above, leaving on the net deficit for the twenty-three years about 174 millions. But to meet this sum the national debt was by a process of borrowing and repayment actually increased by some £622 millions (see Noble's *National Finance*, p. 3, note). In answer to the general argument, however, it may be pointed out that the borrowing may be made not from the productive resources of a country, but from foreign capital or the general accumulations of the world, or that the loan may absorb wealth which otherwise would not have been saved at all, or may intercept wealth which might otherwise have gone abroad. Mill argues (*Political Economy*, bk. v. chap. vii. sect. i.) that a sufficient test whether the loan is really made from productive capital is given by the effect on the rate of interest. If the rate rises the presumption is that the productive capital has been really drawn upon. This test, however, can only be used with caution, if at all, for the rate of interest depends upon many factors—e.g. the state of credit, the general economic conditions of other nations, &c.; and on the anticipation of the outbreak of war a rise is certain to take place

independently of the action upon the productive capital of the country.

The question next arises: Supposing a national debt in existence, should any effort be made to extinguish the principal? The chief arguments against any special exertion towards repayment are the following: (1) It is said that the payment of the interest constitutes a mere transfer of wealth from one class of the community to another, and therefore is no real burden. But in reply it may be urged that all taxation necessarily implies loss both directly and indirectly, the indirect and 'unseen' loss being much greater. Thus in the United Kingdom, whilst the direct expense of the customs duties has been placed at only 3½ per cent., the indirect loss has been calculated by Cliffe Leslie and others at from 20 to 30 per cent. In some cases also the national creditors are foreigners, and in this case the payment of interest must take the form of a real exportation of wealth without any corresponding importation. (2) It is argued that with the natural progress of society industrial countries become more and more wealthy, that the burden of the debt becomes proportionately less, and that its extinction can be more easily effected at a more remote period. It ought to be observed, however, that the rapid accumulations of the past fifty years have been largely due to exceptional and great changes in connection with machinery, railways, telegraphs, financial reform, foreign trade, education, &c., and that although the same causes will remain in operation, the rate of increase may not be so great. It is worth noting that the calculations of Mr Giffen (see *Growth of Capital*) on the accumulations of capital in the United Kingdom for the ten years 1865-75 are less than those for 1875-85. In certain countries also, notably France, population is almost stationary, and in nearly all the marriage rate is declining. (3) It is said that the rate of interest tends to fall, and that therefore by conversion the real burden may become less and less. The recent experience of the United Kingdom and of the United States tends to support this view; but, on the other hand, there are various elements of uncertainty—e.g. the opening up of new countries, the possibility of great wars, &c. (4) It is maintained that the existence of a national debt, which consists practically of perpetual annuities guaranteed by the state, is a national convenience; and further, that if the debt were extinguished, capital would tend to be sent abroad. The answer is that under modern conditions there are many safe investments, and that only surplus capital migrates from a country. (5) It is said that it is unjust to the present generation to impose a burden upon it simply for the benefit of future and probably more wealthy generations; but it may be rejoined that we must consider the continuity of national life, and remember that the present race is supposed to enjoy the benefits of former sacrifices.

On a balance of arguments most economists have approved of the rule that it is advisable to pay off debt, so long as the taxes by which the surplus is raised do not directly or indirectly impose still greater burdens. A bad system of customs and excise duties, for example, by checking the natural development of production and trade, may practically leave the nation poorer than if it had not paid off its debt by such means. On the other hand, if remissions of taxation have, as in the United Kingdom, already been carried so far as to leave the burden of taxation comparatively light, it is better to use any surplus rather for the payment of debt than for a further reduction of taxation. In support of this view, it may be added that the less the previous debt so much the greater would the power of a state be in making a loan in

case of exceptional need. A nation already overburdened with debt might be obliged, in the case of a great war, immediately to resort to a forced currency, which would be liable to a serious or fluctuating depreciation. An issue of inconvertible notes is generally the worst method of incurring a national obligation, being in reality a species of forced loan. Some years ago a favourite argument against the immediate repayment of public debts was the assertion that there was in progress a natural depreciation of gold, owing to great discoveries and to the use of credit substitutes. This argument must, however, now be reversed, for there can be little doubt that since 1875 the tendency has been towards an appreciation of gold. Such an appreciation of the standard in which most debts have been contracted—in other words, a general fall in prices—makes the real burden of these debts so much heavier. With low prices, including low money incomes, the same amount of nominal taxation involves greater sacrifices on the part of the taxpayers. Accordingly, if the standard is likely to appreciate still further (see Bimetallism) and no remedy is adopted, it will be advisable to reduce money debts of all kinds as rapidly as possible. It should also be noticed that 'an old tax is no tax,' and that in a period of prosperity it is not advisable to lessen or abolish taxes which must afterwards be re-imposed. It is preferable to create a surplus for the extinction of debt. The case of the United States with a surplus larger than can be made use of, and raised to a great extent by burdensome indirect taxation, may be regarded rather as an exception which proves the rule.

In conclusion, attention may be called to the principal methods adopted for the extinction of public debts. These are mainly two, with variations in detail. First, there is the simple plan of raising directly more in revenue than is required for expenditure, and devoting the surplus directly to the purchase of the bonds or stock representing the debt. A continuous surplus of this kind is a real sinking fund. In former times many fallacies have been current regarding the powers of a sinking fund. Financiers have been deluded through spurious figures on the powers of indefinite accumulation of a small sum at compound interest, and have imagined that if a certain sum were set aside and allowed to grow in this manner, it would insensibly extinguish any debt. If, however, in the meantime, the state, as in the case of England during the Napoleonic wars, continues to borrow at higher rates, a sinking fund of this kind is directly worse than useless, although indirectly it may find defenders on the ground that a suspension would injure the national credit. The second method of repayment which has met with much favour in the United Kingdom is the substitution of terminable annuities, at a higher rate, for the perpetual annuities which constitute the interest on the debt. The great advantage of this plan is that there is so far no apparent surplus which the government or the people can devote to a reduction of taxes or to new modes of expenditure, whilst a sinking fund is always open to attack. If the stock has originally been issued at a discount, and a rise may be expected, the adoption of terminable annuities gives the nation the benefit of this rise, whilst the gradual diminution of the debt of itself increases the tendency to rise.

A third method of getting rid of public debts has sometimes been proposed, founded upon the fact that a state can borrow on lower terms, or that its credit is better than is the case of private individuals or companies. Thus it is argued that the state might purchase the railways, the ordinary stock of which in the United Kingdom earns about

four per cent., with money borrowed at less than three per cent. Adam Smith, however, long ago pointed out that a nation can rarely make a profit of any industrial undertaking, and to judge by recent experience, governments are likely to pay far more than the real market value of any stock they may purchase.

DEBT OF UNITED KINGDOM AT VARIOUS DATES.

At the Revolution of 1688.....	£664,268
At the accession of Queen Anne.....	12,767,225
At the accession of George I.....	86,175,460
At the end of the Spanish war 1748.....	75,812,182
At the Peace of Paris, 1763.....	132,716,049
At the end of the American war, 1784.....	243,063,145
At the Peace of Paris, 1815.....	861,039,049
At commencement of Crimean war, 1854.....	769,062,549
In 1890.....	689,944,028

The debt in 1890 was divided into unredeemed funded debt, £585,959,852; estimated capital of terminable annuities, £71,731,869; and unfunded debt (i.e. debt which the state is not bound to repay), £32,252,305 (including outstanding bonds for purchase-money of Suez Canal shares). In 1750-57 took place the first great consolidation of various stocks (see CONSOLS); in 1888 there was carried out an important conversion of the 'new 3 per cents.,' 'consolidated 3 per cents.,' and 'reduced 3 per cents.;' the 'new stock' issued in their place to bear 2½ per cent. interest till 1903, and thereafter 2½ per cent. (see also EXCHEQUER BILLS).

DEBT OF PRINCIPAL BRITISH COLONIES (1888).

Canada.....	£46,860,700	Tasmania.....	£4,890,920
Newfoundland.....	694,914	New Zealand.....	36,979,661
N. S. Wales.....	44,100,149	Cape Colony.....	21,336,461
Victoria.....	34,627,882	Natal.....	4,535,126
Queensland.....	25,840,950	India.....	76,362,368
S. Australia.....	19,147,700	Ceylon.....	2,252,413
W. Australia.....	1,275,200	[Egypt, 1890.....	106,937,760]

DEBT OF UNITED STATES.

In 1791.....	\$75,463,476	In 1861.....	\$90,580,873
In 1812.....	45,209,737	In 1862.....	524,176,412
In 1832.....	24,822,235	In 1863.....	1,119,772,138
In 1835.....	37,513	In 1866.....	2,773,236,173
In 1838.....	10,434,221	In 1876.....	2,180,396,067
In 1850.....	63,452,778	In 1886.....	1,783,438,997
In 1867.....	28,699,831	In 1890.....	1,722,240,163

At the last-named date, however, the net debt—deducting the cash in the treasury—was 757,915,079 dollars; and of the whole, 764,000,095 dollars bears no interest. The bonds issued to the Pacific railways, which pay over 5 per cent., are included to the amount 64,623,512 dollars.

DEBT OF THE CHIEF EUROPEAN COUNTRIES.

Austria-Hungary—		France, 1890.....	£1,285,500,000
1889.....	£234,925,193	Holland, 1889.....	90,487,524
Austria.....	88,112,860	Italy, 1890.....	873,560,000
Hungary.....	157,792,338	Portugal, 1889.....	134,298,994
Belgium, 1890.....	99,599,435	Russia, 1888.....	746,220,720
Denmark, 1889.....	10,574,000	Spain, 1888.....	250,900,000
Germany, 1888.....	61,500,000	Sweden, 1890.....	14,257,337
Prussia, 1890.....	260,236,213	Norway, 1891.....	6,488,600
Bavaria, 1890.....	67,020,739	Switzerland, 1889.....	2,194,920
Saxony.....	32,182,504	Turkey, 1890.....	180,000,000

The debt of Brazil is said to be £120,000,000; of Japan, £60,452,000; of Chili, £17,524,600; of Mexico, £16,700,000; of China, £12,505,000.

See the sections dealing with finance and debt in the articles on the several countries; H. C. Adams, *Public Debts* (1888); J. Noble, *National Finance* (1875); P. Leroy-Beaulieu, *Traité de la Science des Finances* (2d ed. 1879); R. Dudley Baxter, *National Debts* (1871); Adolph Wagner, *Die Ordnung der Finanzwirtschaft* (in Schönberg's *Handbuch der Pol. Oekon.*, 3d ed. 1885); Sir Stafford Northcote, *Twenty Years of Financial Policy* (1862); Leone Levi, *History of British Commerce* (2d ed. 1880); A. J. Hamilton, *An Account of the Operations under the National Debt Conversion Act, 1888, and the National Debt Redemption Act, 1889* (1889); Fenn's *Compendium of the Funds* (ed. by Nash).

National Gallery, the principal depository of the pictures belonging to the British nation. The present building, which was intended to accommodate the Royal Academy and National Gallery, stands in Trafalgar Square, London, and was finished in 1838 at a cost of £100,000, but was enlarged in 1861, in 1869, in 1876, and in 1887. The nucleus of the National Gallery was the Angerstein collection of thirty-eight pictures, purchased in 1824 for £57,000, and a considerable sum is now annually voted by parliament for the purpose of adding to it, the estimates for 1889-90 showing an expenditure of £14,487. The collection is most valuable to the student of art, and occupies more than twenty-two rooms. The various early and late Italian schools are extensively illustrated; there are good examples of the chief representatives of Italian art, as Raphael, Correggio, Paul Veronese. There are a few good examples of Murillo and Velasquez and the Spanish school; and the great Dutch and Flemish painters, Rembrandt, Rubens, Van Dyck, and the others, are well represented. The last extensive bequest in the department of the 'foreign schools' was that of Mr Wynn Ellis in 1876, comprising ninety-four pictures. In the department of the 'British and modern schools' the largest additions as yet made by private munificence are the gift of Mr Robert Vernon in 1847, consisting of 157 pictures, and the bequest of Joseph M. W. Turner, R.A., in 1856, embracing 105 works in oil and an immense number in water-colours and pencil by his own hand. The entire collection now consists of over 1280 pictures. There are catalogues to the Gallery by Blackburn (1877, 1879), E. T. Cook (3d ed. 1890), and others, and the *Pall Mall's* Half-holidays at the National Gallery (1890). The Royal Academy of Arts, which used to have its headquarters here, is now established at Burlington House.

The NATIONAL PORTRAIT GALLERY, founded in 1856, was established at South Kensington in 1869, but removed on loan to the Bethnal Green Museum in 1885. In 1891, when the collection comprised nearly 900 portraits, a building for its special use was in progress at the rear of the National Gallery. There is an admirable catalogue by the director, Mr Scharf (1888).

There are also National Galleries of Art in Edinburgh and Dublin; the great public collections of Paris, Berlin, Dresden, Munich, Florence, Rome, &c. are mentioned in the articles on those cities.

National Guard, an organisation for local defence, at the disposal of the municipalities, not of the crown. Such a burgher guard had long existed in many French towns, but it was introduced into Paris only in July 1789, during the Revolution, when the revolutionary leaders decreed the formation of a national guard for Paris of 48,000 citizens; and ere long there were 300,000 for the kingdom. During the revolutionary excesses they were sometimes supine, sometimes they withstood the more violent insurrectionists. In 1794 they were the most devoted adherents of Robespierre. In 1795 they assisted in disarming the people, and were themselves reorganised so as to exclude turbulent elements, none but men of substance being allowed to serve; they even became royalist in feeling, and, rebelling against the convention, were defeated by Napoleon and the regular army, and practically ceased to exist. Napoleon re-established a national guard or militia, but, after various vicissitudes in 1814, 1830, and 1845, it has been wholly superseded by the military reorganisation since 1870.

National Hymns. The origin of the English national anthem has been a subject of controversy since the end of the 18th century, and is still involved in obscurity. 'God save the King' was first

printed in the *Harmonia Anglicana* of 1742, without name of author or composer, varying slightly from the present version; and in 1745, during the Scottish rebellion, it became widely known, versions of it being sung nightly at Drury Lane and Covent Garden Theatres with great applause. Of the numerous claims to its parentage, the view supported by most, and by several eminent writers, attributes it, both words and music, to Henry Carey (q.v.), the popular song-writer, about 1740. The evidence for this is given in Chappell's *Popular Music of the Olden Time*, and Chrysander's *Jahrbücher*, vol. i. But Mr W. H. Cummings, who thoroughly beat out the subject in a series of papers in the *Musical Times* in 1878, entitled to the greatest weight, considers this evidence unreliable; and he arrives at the conclusion that the music has been adopted (but when, and by whom, we shall probably never know) from an 'Ayre' by Dr John Bull (q.v.), found (without words) in a collection of music by him once in the hands of Dr Kitchener, afterwards of Richard Clark, the original of which seems to have disappeared. See also a paper by Major Crawford in the *Dictionary of Hymnology* (1891), by the Rev. John Julian.

The hymn was translated into German by Heinrich Harries, a Holstein clergyman, and sung to the original air at a birthday celebration in honour of the king of Denmark in 1790; and an adaptation from these words, made in 1793 by Dr B. G. Schumacher, beginning 'Heil dir im Siegerkranz,' has ever since been in use as the Prussian national hymn. It called forth the admiration of Beethoven and Haydn, and moved the latter to compose the Austrian national hymn, which was first sung on the Emperor Franz's birthday in 1797. The words now used, beginning, 'Gott erhalte Franz den Kaiser,' are by Baron Zedlitz; the original words were by Haushka. The Hungarians have two national hymns—the *Szózat* ('The Appeal'), beginning, 'Be true to the land of thy birth,' written by Vörösmarty (1800-55), the creator of Hungarian poetry of the Romantic school, and composed by Benjamin Egressy, an actor and eminent composer of sacred music; and the *Magyar Hymnus*, written by Kölcsey and composed by Francis Erkel. The Rákóczy march, by an unknown composer, dates from the end of the 17th century. The simple and dignified Russian national anthem dates from 1830, and is the work of General Alexis Lwoff (1799-1870). Of the Danish national hymn, 'Kong Christian,' the words are by Ewald and the music by Johann Ernst Hartmann (1726-91). There are several claimants to the honour of being the Norwegian national hymn, of which may be mentioned 'Sønner af Norge,' written about the beginning of the 19th century, music by C. Blom; and the modern 'Ja, vi elsker dette Landet' (Yes, we love this land), words by Björnson, music by R. Nordraak. The Swedish hymn, 'King Karl, the young hero,' was written by Esaias Tegner (1782-1846). The Dutch national hymn, 'Wien Neerlandesch Bloed,' was written by Henrik Tollens (1780-1856), and composed by J. W. Wilms. 'La Brabançonne,' the Belgian revolutionary song of 1830, was written by Jenneval, a Brussels actor, and composed by Campenhout. The 'Marseillaise' (q.v.) of the French was written and composed in 1792 by Claude Joseph Rouget de Lisle (1760-1836), and received its name from being sung by the volunteers from Marseilles who took part in the movements in Paris in that year. Various doubts have been thrown on De Lisle's authorship of the tune, but these were finally disposed of by a pamphlet written by his nephew in 1865. The Portuguese 'Hymno constitucional' was composed by Dom Pedro I., emperor of Brazil. Though scarcely to be classi-

fied as a hymn, 'Yankee Doodle' is the American air, notwithstanding the more recent rival claims of 'Hail Columbia' and 'The Star-spangled Banner,' neither of which have high intrinsic merit or have taken any great popular hold. More like a hymn is the song 'America,' which is sung to the tune of 'God save the King.' The origin of 'Yankee Doodle' is as obscure and disputed a point as that of 'God save the King.' The most probable account ascribes to the tune an English origin, and the words to Dr Schuckburgh, an army surgeon, about 1755, soon after which, during the American revolution, it came extensively into vogue. It was first printed in Arnold's opera, *Two to One*, in 1784.

National Park. See YELLOWSTONE, and YOSEMITE. In Canada a domain 26 miles by 10 in extent has been set aside as a national park at Banff in Alberta (by rail 562 miles N.E. of Vancouver and 920 W. by N. of Winnipeg). It embraces one of the most beautiful sections of the Rocky Mountains, contains hot sulphur-springs, has a handsome railway hotel, and is popular as a pleasure-resort. Roger's Pass, 135 miles to the west, is also reserved as a government park. See also NIAGARA.

Nations, LAW OF. See INTERNATIONAL LAW.

Nativity. See ASTROLOGY.

Natrolite, one of the most common of the group of minerals known as *Zeolites* (q.v.).

Natron, or TRONA, an impure sesquicarbonate of soda, which always contains sulphate of soda and chloride of sodium. It is obtained from the margins of lakes in Egypt, Siberia, Tibet, &c., and from the borders of the Black and Caspian Seas.

Natron Lakes, eight in number, are in a depression to the west of the Damietta branch of the Nile. The locality is renowned for four monasteries, from whose libraries of Arabic, Coptic, and Syriac MSS. various European collections have been enriched. In the time of St Pachomius 5000 anchorites dwelt here.

Natterjack. See TOAD.

Natural History, in its widest and oldest sense, includes all the concrete sciences, but psychology and sociology have been separated off at the one end of the series, physics and chemistry and all their branches at the other, so that natural history became synonymous with the science of living things. Most frequently, however, it simply means zoology, especially in so far as that is concerned with the life and habits of animals. See BIOLOGY, BOTANY, EVOLUTION, SCIENCE, ZOOLOGY.

Naturalisation is the process whereby an alien is invested with the privileges and made liable to the obligations of a natural-born citizen. It implies the renunciation of one political status and the adoption of another. Formerly many states absolutely refused to recognise any act of naturalisation as exempting the party naturalised from the consequences of his allegiance. Thus, the maxim of English common law, *Nemo potest exuere patriam*, precluded a natural-born subject from adopting a new political status, and rendered him liable to the penalties of treason if found in arms against his native country. The existence of this principle gave rise to many disputes, more particularly between Great Britain and the United States. It was not, however, till the Naturalisation Act of 1870 that the doctrine of the indelibility of natural allegiance was formally abandoned by Britain. In the same year a treaty was entered into between Great Britain and the United States, which provided that British subjects becoming naturalised in the United States should be treated

in all respects as United States citizens; and a corresponding provision was made with respect to United States citizens becoming naturalised in British dominions.

The conditions on which naturalisation will be allowed by the state to which the applicant seeks to affiliate himself vary in different countries. In Great Britain naturalisation is effected either through a special act of parliament or under the Naturalisation Act, 1870 (33 and 34 Vict. chap. 14). This statute, wherein are embodied the present regulations with reference to naturalisation, provides that any foreigner who has resided in the United Kingdom for five years, or has for that period held service under the crown, can obtain a certificate of naturalisation from one of the principal secretaries of state. On the granting of this certificate he is entitled to all political and other rights, powers, and privileges, and is subject to all the obligations to which a natural-born British subject is entitled or subject. The only qualification is that he shall not, when within the limits of the foreign state of which he was previously a subject, be deemed to be a British citizen unless he has ceased to be a subject of that state. British colonies have the power of making their own regulations on the subject of naturalisation, but such regulations have effect only within the limits of the colony. In the United States a foreigner must make a declaration on oath of his intention to become naturalised. This oath may be taken before any superior, district, or circuit court, and the applicant must renounce any title of nobility. After the lapse of two years from the date of this declaration, and after five years' residence in the United States, he becomes an American citizen, and a certificate of naturalisation is issued to him. There is, however, no uniform system of registration of such certificates, and, as there are about 3000 federal and state courts having power to grant them, great difficulties sometimes arise in proving naturalisation. In France a foreigner who has obtained permission to become domiciled in France is entitled to letters of declaration of naturalisation after three years' residence. Also, by the French Naturalisation Act, 1889, a foreigner who has resided in France for ten years may at once be naturalised without preliminary ceremony. In Germany naturalisation can be conferred only by the higher administrative authorities; the applicant must show that he is at liberty, under the laws of his native country, to change his nationality, or, if he is a minor, that his father or guardian has given him the requisite permission, that he is leading a respectable life, that he is domiciled in Germany, and that he has the means of livelihood. In all countries a married woman is held to be a citizen of the state of which her husband is for the time being a subject, and the naturalisation of a father carries with it that of his children in minority. In countries where military service is compulsory naturalisation in fraud of this either is prohibited or renders the offender liable to imprisonment, if he returns, and forfeiture of all property subsequently acquired in his native country.

Certain privileges of British nationality may be acquired by the issue to an alien of letters of denization granted by the crown; and for this no previous residence is required. A denizen acquires his limited privileges as from the date of the letters, and not from the date of his birth; a naturalised person, on the other hand, is placed in the same position as if he had been from birth a British subject. The difference was important so long as aliens could not inherit land; for a denizen, being without inheritable blood, could not inherit land, nor could his issue, born before his denization, inherit it from him. Since the Naturalisation

Act has swept away all the disabilities to which aliens were subjected in the taking, holding, and inheriting of land (see ALIEN), the distinction between denization and naturalisation is of little practical importance. It is, however, to be observed that the statute (12 and 13 Will. III. chap. 2, sect. 3) which disqualifies a denizen from being a member of the Privy-council or of parliament, and from holding any office of trust, civil or military, still remains in force.

See the standard works on international law; *Nationality*, by Chief-justice Cockburn (1869); and *La Nationalité*, by Cogordan (2d ed. 1890).

Naturalism, a term once used as almost equivalent to Deism, and sometimes for nature-worship, also for brutish defiance of moral law, is now usually employed as synonymous with Realism (q.v.) in art, literary or other.

Natural Philosophy is a term still frequently employed in Great Britain to designate Physics (q.v.), or the branch of physical science which has for its subject those properties and phenomena of bodies which are unaccompanied by any essential change in the bodies themselves. See SCIENCE.

Natural Selection. See DARWINIAN THEORY.

Natural Theology. See APOLOGETICS, and THEOLOGY.

Nature-printing, a process by which engravings or plates answering thereto are produced by taking impressions of the objects themselves, and printing from them, invented or improved about 1853 by Alois Auer of Vienna. Suitable objects—for they must have tolerably flat surfaces—such as dried and pressed plants, embroidery and lace, are placed between a plate of copper and another of lead, both worked smooth, and polished; the plates are drawn through a pair of rollers, under pressure; then, when the plates are separated, it is found that a more or less perfect impression of the object has been made in the leaden plate. This may be used directly as an engraved plate, if only a very few impressions are wanted; or a facsimile of it may be obtained in copper by the electrotype process. Nature-printing has been superseded by photographic methods. See ILLUSTRATION, PHOTOGRAPHY.

Naukratis, an ancient city of Egypt, situated in the Nile delta, near the modern village of Nebireh, 47 miles SE. of Alexandria, existed in the 7th century B.C. It was the only city in Egypt at which the Greeks were allowed to trade; was celebrated for its artistic pottery; and was a centre for the worship of Aphrodite. The site was discovered by Flinders Petrie in 1884, and excavated by him in that and the following year. His monograph *Naukratis* (1886) gives an account of the ruined temples and the many valuable archaeological discoveries made on this site.

Naugatuck, in Connecticut, on the Naugatuck River, 22 miles by rail NNW. of New Haven, contains the factory of the Goodyear Glove and Rubber Company, and also manufactures cutlery and ironwares. Pop. (1890) 6218.

Naumachia, a Greek word signifying literally a naval battle; afterwards, among the Romans, a spectacle which consisted in the imitation of a naval battle. Julius Caesar was the first to introduce a naumachia into Rome, 46 B.C., causing a portion of the Campus Martius to be dug to form a lake, on which the spectacle came off. Augustus also made an artificial lake near the Tiber for the same purpose, and Claudius employed Lake Fucinus, where on one occasion 19,000 combatants were engaged for this purpose. The combatants were

for the most part either captives or condemned criminals. These *naumachiae* were not *sham-fights* any more than were ordinary gladiatorial combats; both sides fought on in real earnest for dear life until one was utterly overpowered.

Naumburg, a quaint old town of Prussian Saxony, on the Saale, in an amphitheatre of vine-clad hills, 30 miles by rail SW. of Leipzig. Of its six churches, the triple-towered cathedral (1207-42) is a noble Romanesque and Gothic structure. The manufactures include ivory carvings, combs, hosiery, wine, &c. The yearly 'cherry feast' commemorates the raising of the siege of Naumburg by the Hussite leader Procopius in response to the supplication of the children (28th July 1432); but recent historians cast doubt on the whole episode. The seat of a bishopric (1059-1564), Naumburg suffered much in the Thirty Years' War; in 1814 it came to Prussia. Pop. (1875) 16,258; (1885) 19,107. See works by Puttrich (1843) and Mitzschke (1881).

Nauplia, a small fortified town and seaport with an excellent roadstead in the Morea, Greece, at the northern extremity of the Gulf of Argos or Nauplia, 25 miles S. of Corinth. At an early period it was the port and arsenal of Argos. In the 13th century it was occupied by the Venetians (who called it Napoli di Romania), and it was taken by the Turks in 1540. From 1824 to 1835 it was the capital of Greece, and had a population of upwards of 12,000; but on the removal of the court to Athens it fell into decay. Pop. 4598.

Nauplius. See CRUSTACEA.

Nausea is a distressing sensation always referred to the stomach. It is unattended by pain, but is usually accompanied by a feeling of general languor or debility, a small and often irregular pulse, a pale, cool, and moist skin, general muscular relaxation, an increased flow of saliva, and a sensation that vomiting will supervene. It is most commonly a *direct* symptom of disease or disorder of the stomach, but sometimes it is a very important *indirect* symptom of disease of some part at a distance from the stomach—as, for example, the brain or the kidney. The nausea which is so troublesome to pregnant women is due to the irritation excited by the enlarged uterus being reflected by nervous agency to the stomach. Seasickness is separately discussed.

Nautch Girls, or BAYADERES, public female dancers in India and the East Indies. Their performances constitute a principal part in the spectacular entertainment called a nautch or natch.

Nautical Almanac. See ALMANAC.

Nautilus, a remarkable mollusc in the class of Cephalopods, the only surviving member of a race once abundant. It differs conspicuously from the other extant Cephalopods or 'cuttle-fish' in possessing a shell, within the outermost chamber of which it lives, while the lobes of the 'foot' round about the mouth bear numerous tentacles retractile into sheaths, the 'siphon' consists of two free folds, the eyes are open sacs without cornea or lens, there are four gills and four kidneys, and there is no ink-bag. The spiral shell, coiled in one plane like that of the water-snail Planorbis, differs from this in being chambered; moreover, the foot or ventral side of the enclosed animal is towards the outside in Nautilus, towards the inside in Planorbis. When young the Nautilus lives in a small shell bent like a horn; with growth this is increased spirally, but as the animal periodically draws itself onwards and closes a door behind it, a chambered spiral results, in which the original shell is in the very centre. The successive chambers are all connected, however, by an organic, partially calcareous tube; and all except the outermost, in which the animal

lives, are filled with gas—apparently a mixture of oxygen and nitrogen somewhat different from air. The outside of the shell is covered with a thin

Fig. 1.—Pearly Nautilus (after Owen). Contracted spirit specimen, with the shell in section :

a, dorsal 'hood'—a portion of the 'foot'; b, a portion of the mantle reflected on the shell; c, tentacles; d, eye; e, ventral side of visceral hump; f, funnel; g, a partition between two chambers; h, siphuncle or tube traversing the chambers.

organic layer, beneath which there is a porcelain-like stratum with bands of colour, while internally the lime has the usual mother-of-pearl structure, the lustre of which, often artificially exposed by the use of acids, has earned for the animal its common name of Pearly Nautilus.

Though the Nautilus seems to have been known to Aristotle, and though the shells have always been familiar, our knowledge of the animal itself is almost wholly due to the investigations of Owen, and to some interesting observations (1705) by the Dutch naturalist Rumphius. The rarity of specimens, so evident from the fact that only one was collected on the *Challenger* expedition, is mainly due to its habitat in somewhat deep water. But it must also be noted that the natives of Fiji, the New Hebrides, the Moluccan Islands, &c. catch the animal in lobster-pots and eat it with relish. The Nautilus probably creeps or gently swims along the sea-bottom, feeding on crustaceans and the like; but it is also seen floating on the surface, probably washed up by storms and injured by the waves. The species best known is *Nautilus pompilius*, but there are probably four or five others, while the fossil relatives are reckoned in hundreds.

The *Paper Nautilus* (*Argonauta*) is a very different animal, like an octopus except that the

Fig. 2.—Female Paper Nautilus, showing the two modified arms which make and embrace the shell.

female bears a beautiful, translucent, ribbed shell in which the eggs are sheltered. But this shell is

not in any way comparable to that of the Nautilus or of other molluscs; it is a cradle, not a house; it is secreted and embraced by two broadened dorsal 'arms,' not by the mantle; it is unchambered and peculiar to the females. The Argonaut was credited by Aristotle with the power of lifting its broad arms, and of thus sailing before the wind, but there is no truth in this fancy often reiterated by poets and naturalists. For the Argonaut squirts water from its funnel and swims backwards like any other cuttle-fish, or else creeps along the bottom. At the breeding season it is a pelagic surface swimmer in tropical seas, at other times it seeks the depths. The male measures little more than an inch in length, only about a tenth of the size of his mate, and he is also notable for the modification of one of the arms into a detachable sac of spermatozoa, formerly mistaken for a parasitic worm. Some half-dozen living species are recorded. See CEPHALOPODA, CUTTLE-FISH.

Nauvoo (from Heb. *nāḇār*, 'to be beautiful'), a village of Illinois, on the east bank of the Mississippi River, 14 miles above Keokuk. It was built by the Mormons (q.v.) in 1840, and in a few months contained a population of 15,000. Its principal feature was a great temple of white limestone (1841-45); but it had also mills and factories, and the beginnings of a university, and was for a few years a prosperous and happy town. After the expulsion of the Mormons in 1846, the temple was half destroyed by fire in 1848, and further ruined by a tornado in 1850. The town was afterwards bought and occupied for a while by a French Socialist community.—The *Nauvoo Legion* was a Mormon military organisation, embracing all the males between the ages of sixteen and fifty, founded here in 1840, and reorganised in Utah in 1857. In 1870, when it mustered for the last time, it numbered about 13,000 men.

Naval Cadets. See CADET, MIDSHIPMAN.

Naval Reserve, ROYAL. Is a sort of militia auxiliary to the royal navy. It is a force held in high esteem by naval men, and is considered an extremely valuable reserve of trained men ready to man the fleet in case of emergency. The act under which the force was instituted in 1859 authorises the engagement of 30,000 men, each for a period of five years, and provides that each shall be trained for twenty-eight days in every year to the use of arms and in naval gunnery, either in ships of the navy or on shore. In case of national emergency, these men can, by royal proclamation, be called out for service in the navy in any part of the world, for periods not exceeding five years. While training and while called out for actual service, the men receive the same wages as corresponding ratings in the royal navy; and in addition they receive a retaining fee for every year of training completed, the amount of which is regulated according to the class of the reserve in which they are enrolled; this is £8 a year for men in the first class, and £2, 10s. with a suit of clothes for the second class; boys in the third class receive no retainer, but the fourth class, consisting of stokers, receive £5 a year. On actual service, after three years—whether of uninterrupted service or at broken intervals—the volunteer becomes entitled to twopence extra per diem. The man can terminate his engagement at the end of five years, unless on actual service, when he may be required to complete five years of such service before discharge. During the continuance of his engagement he must not embark on voyages which shall entail a longer absence from the United Kingdom than six months, unless with special permission of the Admiralty. The periods for training are made as

far as practicable to suit the sailor's convenience: he may break the twenty-eight days into shorter periods, none being less than seven days. Penalties are enforced if men fail to attend; and failure after proper notice to come up for actual service is held equivalent to desertion. While training or on duty the men are liable to all the punishments, as they are entitled to all the rights and privileges, of regular seamen. The men considered most desirable are (1) those having fixed residences, and personally known to the registrar or his deputies; and (2) men having regular employment in the coasting trade, or in vessels the business of which brings them back to the same ports at frequent and known intervals. In 1861 the system of the Reserve was extended to officers of the merchant-service, certificated masters and mates being respectively granted commissions in the Naval Reserve as lieutenants and sub-lieutenants. The holders are required to train for twenty-eight days annually on board Her Majesty's ships, and are liable to be called out for actual service when required. The number of these officers allowed by regulation is 130 lieutenants and 270 sub-lieutenants.

The Royal Naval Reserve now contains four classes of men. (1) The first class comprises men under thirty years of age, who must prove at least six years' sea-service within ten years, and of these six years' service two at least as able seamen in foreign-going or coasting vessels, and must declare that it is their intention to follow the sea-service for a period of at least five years. Six months' service as skipper or second hand in first-class fishing-vessels in the English Channel and North Sea may be accepted in lieu of two years' service as able seamen. Men discharged from the navy as able seamen with good characters may be enrolled in the first class up to thirty-five years of age, also men who have previously served in the Royal Naval Reserve. (2) The second class contains men with the proper qualifications between nineteen and thirty years of age, who have been at sea on foreign-going, coasting, or fishing vessels for three years, of which at least six months must have been with the grade of ordinary seaman; and they must sign a declaration that it is their intention to follow the sea for a period of at least five years. Apprentices who have completed their indentures for a term of not less than three years may be enrolled in this class without further proof of service. (3) The third class comprises boys, not under fifteen nor above sixteen and a half years of age, who have been eighteen months under training in a mercantile training-ship, or have been educated at Greenwich Hospital, are under engagement to join a merchant-ship, are physically and mentally qualified, and can show proficiency in navigation and gunnery and seamanship; they must produce certificates of good character from the captain or superintendent. In the case of the Marine Society's ship *Warspite*, boys will be received with nine months' training. They may be promoted to the second class at the age of nineteen after six months' service at sea; and in due time to the first class. (4) The fourth class consists of firemen. A candidate must be over twenty and under thirty-five years of age; he must produce certificates of good character, conduct, and ability as fireman from his last employer, for not less than six months in foreign-going or regular coasting vessels within the twelve months previous to his application. Every enrolment is for five years; and when a man is promoted to a higher class he must re-enrol. The annual training may be accomplished either on board a ship of war or at a Naval Reserve battery. In 1889 the total number of reserve men drilled was 18,869, of which number

8294 were receiving an extra penny a day as trained men. The officers of all ranks now number 558 and the men 19,851, the cost amounting to £293,778.

Besides the Royal Naval Reserve, there are other Naval Reserve forces at command of the Admiralty. Of these the most important are the Coastguard (q.v.); the Royal Naval Artillery Volunteers (see VOLUNTEERS); and a force drawn from amongst the seamen pensioners (see PENSIONS). Petty officers and seamen of the navy, on being pensioned for length of service, may, if under forty-five years of age, be enrolled in the Seaman Pensioner Reserve. They must serve fourteen days annually, and on reaching fifty years of age get the Greenwich Hospital age pension and are exempt from further drill.

Naval Tactics. See TACTICS (NAVAL).

Navan, a market-town in County Meath, situated at the junction of the Boyne and Blackwater, 16 miles W. of Drogheda by rail. Pop. 3873, almost all Catholics.

Navarino (also *Neocastro*, and officially *Pylos*), on a bay on the south-west coast of the Morea in Greece, contains only 2000 inhabitants, but has an excellent deep harbour, the best in Greece. The ancient Pylos, the city of Nestor, stood near. The Bay of Navarino was the scene of a great sea-fight between the Athenians under Cleon and the Spartans (425 B.C.), in which the latter were defeated; and on the 20th October 1827 it saw the annihilation of the Turkish and Egyptian navies by the combined British, French, and Russian fleets under Sir Edward Codrington.

Navarre (Basque *Nava*, *naba*, 'a mountain plain,' and *erri*, 'country'; there is also a Basque word *Nabarra*, 'variegated'), formerly one of the kingdoms which arose in the Pyrenees after the downfall of the Goths, has since 1512 been divided into Spanish Navarra, and French or Basse-Navarre (now Basse Pyréennes). Spanish Navarra, by far the greater, is bounded N. by France, E. by Aragon, S. partly by the Ebro, partly by Castile and Aragon, and W. by Alava and Guipuzcoa. The area is somewhat over 4000 sq. m.; pop. 308,000, or 72 to the square mile. It is one of the most varied provinces of Spain in surface and climate; within sight of the Atlantic at its north-west corner, the rainfall is there one of the heaviest in Europe, while in the south-east the steppes of the Bardenas Reales are almost sterile for want of water, and at Tudela we encounter Moorish modes of irrigation, supplemented by the canal of Charles V. The mountains of the northern frontier range, west to east, from 3000 to 8000 feet of altitude; in the interior they reach occasionally 5000. With the exception of the Bidassoa, which enters the Atlantic at the inner angle of the Bay of Biscay, the numerous other streams flow at right angles to the Pyrenees, and are all affluents of the Ebro; the principal are the Aragon, Argá, and Ega. The mountain-valleys are narrow but fertile. By the energy of the Basques, who do not live like the Spaniards only in towns and villages, cultivation is carried on almost everywhere. The chief productions are maize, wheat, chestnuts, apples, and a strong red wine. Cattle abound, but not many sheep or horses. Minerals are found in the Pyrenees, and mines of argentiferous lead, copper, and iron are worked; rock-salt also is found in the province. The wild animals include the bear, wolf, roe-deer, izard (ibex) in the mountains of the Aragonese frontier; foxes, wild cat, genet, otter, marten, &c. are in sufficient numbers to make commerce of their skins. The population of Navarre (150,000) is bilingual; from a little to the south of Pamplona northwards Basque prevails;

to the south Spanish only is spoken. Until now Spanish has encroached far more on Basque in Navarra than has French in Basse-Navarre.

History.—In Roman times the country now called Navarre was occupied by the Iberian Vascones, who have given their name both to Basques and Gascons. Within historic times there has been a strong Celtic element in the country. The capital, Pamplona (*Pompeopolis*), recalls the Roman Triumvir, but the older native name, Irun (*Irunean*), is often on books printed at Pamplona. The subjection of the Vascones to the Visigoths was nominal only. On the downfall of the latter and the incursion of the Arabs the mountains of Navarre became one of the early centres of resistance and of reconquest. From the native chiefs, or counts, arose the first dynasty of Navarre—García Jimenez (860) to Sancho the Strong (1234). The history of Navarre is full of interest. In 778 the rout of Charlemagne's rear-guard, and the death of Roland at Roncesvalles, furnished a theme for countless poems and romances. With Aragon and Castile Navarre shares the honour of being one of the first countries in which parliamentary rule with representation of towns and commons (*Universidades*) obtained. The Cortes (*Curia*) arose out of the Councils, and there was regular representation of the three orders before the close of the 12th century. During this period Navarra gained its name and modern limits, but under Sancho the Great (1028-35), and again (1109-34) under Alfonso I., it seemed as if the union completed under Ferdinand and Isabel would have taken place three or four centuries earlier. Sancho the Strong left no male heirs, and the future succession of Navarre was singularly broken from the same cause. The crown passed to Thibaut, count of Champagne, through the younger daughter. There were three kings of this house from 1234-84, when the crown passed by marriage to Philippe le Bel of France. Five kings of France (1284-1328) reigned over Navarre, when, through the female succession, it passed to Philippe, count of Evreux; three kings of this line succeeded—Philip III., Charles II. the Bad, and Charles III. Under them Navarre reached its highest prosperity; most of the architectural beauties of Navarre date from this period, 1328-1416. Navarre had been always closely connected with Aragon, and three of its kings had already borne the title of Aragon and Navarre. Blanca, the daughter of Charles III., married first Martin, king of Sicily, and after his death Juan II. of Aragon. Civil war arose between him and his son, Don Carlos, Prince of Viana, one of the most interesting characters of his time. The factions of Beaumont (Don Carlos) and of Agramont (Juan II.) proved the ruin of Navarra. Henceforth her jealous neighbours could always rely on the support of one or other in their encroachments. Leonor, the daughter of Juan II., married Gaston of Foix, and thus Navarre became united to Bearn; her granddaughter, Catharine de Foix, married Jean d'Albret in 1486, and during their reign in 1512 the Duke d'Alba conquered Navarra, which has since been united with the Spanish crown. French Navarre was joined to that of France by the accession of Henri of Navarre in 1589, but the formal union was not completed until 1620 by Louis XIII. After its union Spanish Navarre was governed by a viceroy, and retained its own cortes, mint, style of kings (Carlos III. of Spain was VI. of Navarra, &c.), power of taxation, and *Fueros* (q.v.). These privileges were almost wholly lost by the first Carlist war (1833-39), and were still more diminished by the second (1872-76). Navarra is now one of the forty-nine provinces of Spain, with merely local self-government in minor matters in certain districts. In France Basse

Navarre preserved its *fueros* till 1789, refused to send deputies to the States-general as part of France, and declared that it would only accept the new constitution if it were better than its own. The *fueros* of Navarre are more like those of Aragon than those of the Basque Provinces. In their written form they are probably not older than the 13th century, but many provisions point back to a higher antiquity. The seven *Fazanas* (precedents) are in the form of apologues, animals are considered as morally responsible and guilty of *homicide* towards each other, marriage is a civil right, the children of a concubine (*barragana*) are provided for, compurgation is in full force, and social excommunication is inflicted on those who will not conform to the customs. Toleration is extended to Moors and Jews, and the oath to be taken by the latter is very long and curious. In the Cortes the power of taxation was secured by supplies being withheld until all grievances had been redressed. With consent of the Cortes the king might amend, but could not impair the *fueros*. Navarre was a frontier of the English possessions in south-west France from 1152 to 1453. Richard I. and Henry IV. married princesses of Navarre; had the former had issue, they would have been heirs of Navarre in preference to the counts of Champagne. Charles the Bad was the ally of the Black Prince, who passed through his dominions to Navarrete. Wellington blockaded Pamplona, and marched through Navarre in 1813-14.

See P. J. Moret, *Investigaciones Historicas del reyno de Navarra* (1 vol. 1666) and *Anales del reyno de Navarra* (3 vols. Pamplona, 1684)—both reprinted by E. Lopez of Tolosa in 1890-91; Tanguas, *Diccionario de las Antiquidades de Navarra* (4 vols. Pamplona, 1840-43); *Fuero General de Navarra* (Pamplona, 1869); *La Navarre Française*, par M. G. Paris, 1881); the decisions of the Cortes under title *Quaderno de las Leyes y Agravios Reparados*, &c., vol. vii., and V. de la Fuente, *Estudios Criticos sobre la Historia y el Derecho de Aragon*, vols. i. and ii. (Madrid, 1884-85).

Nave. See CHURCH.

Navew (Fr. *navette*), a garden vegetable much cultivated in France and other parts of the continent of Europe, although little used in Britain. It is by some botanists regarded as a cultivated variety of *Brassica napus*, or Rape (q.v.), whilst others refer it to *B. campestris*, sometimes called Wild Navew, the species which is also supposed to be the original of the Swedish Turnip (q.v.). The part used is the swollen root, which is rather like a carrot in shape. Its colour is white. Its flavour is much stronger than that of the turnip. It succeeds best in a dry, light soil. The seed is sown in spring, and the plants thinned out to 5 inches apart. *Wild Navew* is extensively cultivated in the north of France and Holland for the sake of its seed, which yields Colza oil.

Navicular Disease, in the horse, consists of an inflammation, often of a rheumatic character, of the small bone—the navicular—below which passes the strong flexor tendon of the foot. It is most common amongst the lighter sorts of horses, and especially where they have upright pasterns, out-turned toes, and early severe work on hard roads. It soon gives rise to a short tripping yet cautious gait, undue wear of the toe of the shoe, and projecting or 'pointing' of the affected limb whilst standing. Even when early noticed and in horses with well-formed legs, it is incurable; and when of several weeks' standing it leads to so much inflammation and destruction of the tendon and adjoining parts that soundness and fitness for fast work again are impossible. In order to reduce the pain and inflammation, rest should at once be given, the shoe removed, the toe shortened,

and the foot placed in a large, soft, hot poultice, changed every few hours. Laxative medicine and bran mashes should be ordered, and a soft bed made with old short litter. After a few days, and when the heat and tenderness abate, cold applications should supersede the hot; and after another week a blister may be applied round the coronet, and the animal placed for two months in a good yard or in a grass field, if the ground be soft and moist; or, if sufficiently strong, at slow farm-work on soft land. Division of the nerve going to the foot removes sensation and consequently lameness, and hence is useful in relieving animals intended for slow work. The operation, however, is not to be recommended where fast work is required, for the animal, insensible to pain, uses the limb as if nothing were amiss, and the disease rapidly becomes worse. Navicular disease is very often due to hereditary taint; hence horses suffering from it should never be used for breeding purposes.

Navigation Laws. The importance of the early maritime codes in developing International Law is indicated in that article. Laws restricting foreign trade and supposed to be in favour of native commerce and shipping are of very ancient date. Thus, in England, by a statute of Richard II., in order to augment the navy of England, it was ordained that none of the lieges should ship any merchandise out of the realm except in native ships, though the statute was soon evaded and seldom followed. At length in 1650 an act was passed with a view to stop the gainful trade of the Dutch. It prohibited all ships of foreign nations from trading with any English plantation without a license from the Council of State. In 1651 the prohibition was extended to the mother-country, and no goods were suffered to be imported into England or any of its dependencies in any other than English bottoms, or in the ships of that European nation of which the merchandise was the genuine growth or manufacture. At the Restoration these enactments were repeated and continued by the Navigation Act (12 Char. II. chap. 18), with the further addition that the master and three-fourths of the mariners should also be British subjects. The object of this act was to encourage British shipping, and was long believed to be wise and salutary. Adam Smith, however, perceived that the act was not favourable to foreign commerce or to opulence, and it was only on the ground that defence was more important than opulence that he said it was 'perhaps the wisest of all the commercial regulations of England.' In 1826 the statute 4 Geo. IV. chap. 41 repealed the Navigation Act, and established a new system of regulations, which were further varied by subsequent statutes, till, under the influence of the free-trade doctrines, new statutes were passed which reversed the ancient policy. It was not, however, till 1854 that the English coasting trade was thrown open to foreign vessels. In the United States the coasting trade is reserved exclusively to American vessels. As regards those laws of navigation which affect the property and management of ships, a complete code of regulations is contained in the Merchant Shipping Acts (q.v.).—On navigation, see GEOGRAPHY, LATITUDE and LONGITUDE, GREAT CIRCLE SAILING, &c.; and the handbooks by Inman, Norie, Merrifield, Rosser, and Raper.

Navigators' Islands. See SAMOA.

Navy. The ancient method of naval warfare consisted in great part in the driving of *beaked* vessels against each other; and therefore skill and celerity in manœuvring, so as to strike the enemy at the greatest disadvantage, were of the utmost importance. The victory thus usually remained

with the best sailor. These vessels were propelled by oars, which were arranged in one, two, or three banks, according to size of ship; the oars were manned by men sitting or standing on platforms arranged above each other according to the number of banks; those with three banks of oars were called triremes. The earliest powers having efficient fleets appear to have been the Phœnicians, Carthaginians, Persians, and Greeks; the Greeks had fleets as early as the beginning of the 7th century B.C.—the first sea-fight on record being that between the Corinthians and their colonists of Corcyra, 664 B.C. The earliest great battle in which tactics appear to have distinctly been opposed to superior force, and with success, was that of Salamis (480 B.C.), where Themistocles, taking advantage of the narrows, forced the Persian fleet of Xerxes to combat in such a manner that their line of battle but little exceeded in length the line of the much inferior Athenian fleet. The largest triremes in the Persian fleet were manned by 200 rowers and 30 fighting men; there were 1200 triremes and 3000 smaller vessels, while the Greek fleet consisted of 386 triremes only, with a certain proportion of smaller vessels, yet they succeeded in inflicting a crushing defeat on the Persians. The Peloponnesian war, where 'Greek met Greek,' tended much to develop the art of naval warfare. But the destruction of the Athenian maritime power in the Syracusan expedition of 414 B.C. left Carthage mistress of the Mediterranean. The Roman power, however, gradually asserted itself, and after two centuries became omnipotent by the destruction of Carthage. For several following centuries the only sea-fights were occasioned by the civil wars of the Romans—the greatest that of Actium (q.v.) in 31 B.C. Towards the close of the empire the system of fighting with pointed prows had been discontinued in favour of that which had always co-existed—viz. the running alongside and boarding by armed men, with whom each vessel was crowded. Onagers, ballistæ, &c. were ultimately carried in the ships and used as artillery; but they were little relied on, and it was usual, after a discharge of arrows and javelins, to come to close quarters. A sea-fight was therefore a hand-to-hand struggle on a floating base, in which the vanquished were almost certainly drowned or slain.

The northern invaders of the empire, and subsequently the Moors, seem to have introduced swift-sailing Galleys (q.v.), warring both in small squadrons and singly, and ravaging all civilised coasts for plunder and slaves. This—the break-up of the empire—was the era of piracy, when every nation which had more to win than lose by freebooting sent out its cruisers. Foremost for daring and seamanship were the Norsemen, who penetrated in every direction from the Bosphorus to Newfoundland. Combination being the only security against these marauders, the mediæval navies gradually sprang up; the most conspicuous being, in the Mediterranean, those of Venice, Genoa, Pisa, Aragon, the Knights of Malta, and the Turks; and on the Atlantic seaboard, England and France.

Mediæval Navies.—In the Mediterranean, towards the middle of the 16th century, so powerful and so threatening had the Turkish fleet become that, after the Knights Hospitallers had been driven out of Rhodes by the Sultan Solymán I. in the year 1523, a combination of the Christian powers was formed for self-defence; but it was not until the year 1571 that the celebrated battle of Lepanto was fought, which broke temporarily the naval power of the Turks. The Christian fleet was composed of Venetian, Genoese, Spanish, and papal ships, under the command of Don John of Austria, with six Maltese galleys, and mustered over 200 vessels,

of which six were Venetian galleasses, which were larger and carried a heavier weight of metal than had yet been known in Mediterranean warfare. The ordinary galleys were about 160 feet long, 32 feet wide, and were propelled by some sixty oars; they generally carried a 24-pounder forward and two 8-pounders on the poop. In the galleasses the rowers were covered by a narrow deck on which small guns were mounted. The Turkish fleet consisted of 240 galleys, but they were completely defeated, losing over 224 of their ships, of which 94 were sunk or run aground, and the remainder were captured; 30,000 Turks were slain, and 15,000 Christians serving as galley-slaves in the Ottoman fleet were rescued from captivity. The confederates lost 15 galleys and 8000 men. The Venetian and Maltese fleets subsequently became the great naval powers, although sharing the sovereignty of the Mediterranean with the Turks; but during the close of the 16th and 17th centuries the naval power gradually fell into the hands of the English, French, Dutch, and Spaniards.

Modern Navies.—Dating the modern navies of the world from the 16th century, we find the British navy rising from insignificance by the destruction of the Spanish Armada in 1588, a blow from which Spain only partially recovered, and the weight of which the Dutch, whose naval force had acquired tremendous strength in their struggle for independence, increased by their triumph in 1607, in the Bay of Gibraltar. At this time there was no decisive superiority of the fleet of England over that of France; but each was inferior to the Dutch navy. The Commonwealth and reign of Charles II. were signalised by the struggle for mastery between the English and Dutch, when victory, after many alternations, finally sided with the former. Through the 18th century the English and French were the principal fleets; but Louis XVI. gave a decided superiority to the navy of France, and at the period of the American war the naval power of England was seriously threatened. Spain, Holland, and Russia (now for the first time a naval power) had meanwhile acquired considerable fleets; and the 'armed neutrality' to which the northern powers gave their adherence rendered the British position most critical. However, the slowly roused energy of her government, the invincible courage of her seamen, and the genius of her admirals brought Britain through all her trials. Camperdown broke the Dutch power; many battles weakened the French navy; and at Trafalgar in 1805 it, with the Spanish power, was swept temporarily from the ocean.

The resources of France, however, were so great that in a few years after the signing of peace in 1815 her fleet had again been brought up to its old strength, and it still continues to occupy the second place among the navies of the world. To Napoleon III. belongs the credit of first protecting ships with iron, and *La Gloire*, launched at Toulon in 1859, was the first armoured battleship to be put afloat. Much more uniformity in armament and design is found in the French armoured fleet of the present day than exists in the English. The armour-belt round the water-line of many of their ships is of greater thickness than in corresponding English ships. All the armour is well distributed, the guns are carried high out of the water, and the ships themselves steam well. Many distinguished English naval officers are of opinion that, ship for ship, many of the latest French ships are more than a match for ships of a similar tonnage in the British navy. During the Franco-German war of 1870-71 the French fleet had no opportunities of proving its effectiveness.

Of navies which have sprung recently into exist-

ence two deserve special notice, the German and the Italian. The first named may be said to date its birth from the acquisition of Kiel by Prussia after the war with Denmark in 1864; and, although too weak to make any head in the war with France in 1870 against the French fleet, yet since that date so rapidly has the young fleet grown that the German navy will most certainly play an important part in any future European complications. The ships are good, and the officers and men are probably among the most highly trained of any navy in the world.

The Italian navy dates from the absorption of the kingdom of Naples by Sardinia in 1860. Since the disastrous battle of Lissa (1866), each successive Italian government has devoted large sums and much energy towards building up a powerful navy, and Italy may fairly claim now to rank as a first-class naval power, occupying a position next to France (see ITALY). Among the Italian ironclads may be numbered ten of the largest and most powerful battle-ships afloat—viz. the *Dandolo* and *Duilio* and the *Italia* and her seven sisters. All these ships carry four 110-ton guns in their turrets or barbettes, besides a powerful auxiliary armament, while the engines of the five latest of these ships are far more powerful than those of even the most newly-designed English battle-ships, and are calculated to drive them at a speed of 18 knots an hour.

The Austrians, the victors at Lissa, have since 1840 possessed a small, but probably for its size one of the most efficient of the European navies, officers and men being most carefully and thoroughly trained.

The Turkish navy, once the terror of the whole Mediterranean, has now sunk to a low ebb. In 1827 it sustained at the battle of Navarino a crushing defeat, from which it never recovered. At the outbreak of the war with Russia in 1853 a division of the Turkish fleet was completely destroyed by a superior Russian force at Sinope; but as a result of the restrictions imposed on Russia after the Crimean war, and of the energy infused once more into Turkish naval administration by Admiral Hobart Pasha, when war broke out again between Russia and Turkey in 1877 the Russian fleet was effectually paralysed by the superior Turkish forces, which retained command of the Black Sea during the war. Since then, however, no new ships have been built, and in the present state of the finances of the country it is unlikely that the Turkish navy will play any important rôle again in the future.

The Russian navy was founded by Peter the Great, but, although it soon became a formidable one, it has never as yet distinguished itself or become an important factor in the numerous wars in which Russia has been engaged. After the battle of Sinope in 1853 the bulk of the Black Sea fleet was sunk by order of Prince Menschikoff, governor of Sebastopol, to block the entrance to the harbour, and the remaining ships were burned when the Russians retreated in September 1855. By the abrogation of the Black Sea portion of the treaty of Vienna in 1871 Russia regained a free hand once more in the Black Sea, and she has for some years been making strenuous efforts to resume her place as a naval power. Several formidable ironclads have been built, while others are in course of construction, as well as several cruisers of the most modern type, and she in her turn is once more mistress of the Black Sea.

Simultaneously with the war which followed the declaration of independence the Americans began to build ships, and during that war and the war of 1812 and 1814 their fleet maintained a glorious although unequal struggle with Great

admiral from the fleet conveying Philip II. of Spain off Southampton-water, when the latter was on his way to espouse Queen Mary: this honour was formally yielded by the Dutch in 1673 and the French in 1704, but the custom since the peace of 1815 has fallen into disuse. In the year 1293 a great naval action was fought in mid-channel with the French, when the English captured 250 sail; and Edward III. with the Black Prince at the battle of Sluys in 1340 defeated a greatly superior French fleet.

Henry V. had something of a navy; but Henry VII. seems to have been the first king who thought of providing a naval force which might be at all times ready for the service of the state. He built

Fig. 1.—The Great Harry.

the *Great Harry*, properly speaking the first ship of the royal navy. She cost £15,000, and was accidentally burned in 1553. To Henry VIII., however, belongs the honour of having laid the foundation of the British navy as a distinct service. He constituted the Admiralty and Navy Office, established the Trinity House, and the dockyards of Deptford, Woolwich, and Portsmouth, fixed regular salaries for the admirals, captains, and sailors, and made the sea-service a distinct profession. In 1512, when a fleet was fitted out against France under Sir Edward Howard, Lord High Admiral, the following allowances were made: For his own diet, maintenance, wages, and rewards per diem, 10s.; each captain for his own diet, maintenance, wages, and rewards per diem, 1s. 6d.; every soldier, mariner, and gunner for his wages per lunar month, 5s., and for his victuals, 5s. In 1515 King Henry caused the *Henri Grace-à-Dieu*, of about 1000 tons and carrying 122 guns, to be constructed, in emulation of a somewhat similar ship called the *Caracon*, but only carrying 100 guns, which had lately been built by Francis I. of France. She appears to have been built rather for magnificence than for use; only thirteen of her guns were 9-pounders or upwards, and she is said to have steered badly and rolled heavily. After making one voyage she was disarmed at Bristol and suffered to decay. The French ship was still more unfortunate, being accidentally destroyed by fire at Havre. The ships of this period were high, unwieldy, and narrow, their guns close to the water, and they had lofty poops and forecastles. At the death of Henry VIII. the tonnage of the navy was 12,000 tons; there were some fifty ships manned by 8000 men. Elizabeth increased the fleet greatly. The fleet which met the Spanish Armada numbered 176 ships armed by

14,996 men; but these were not all 'shippes royal,' for she encouraged the merchants to build large ships which were as much fighting ships as traders, and rated at 50 to 100 tons more than they measured. She raised the wages of seamen to 10s. per month. Signals were first used in this reign as means of communication between ships. In the reign of James I. lived the first able and scientific naval architect, Phineas Pett; he introduced a better system of building, and relieved the ships of much of their top-hamper, abolishing the lofty poops and forecastles. In 1610 he laid down the *Prince-Royal*, a two-decker carrying sixty-four guns; and in 1637 from Woolwich he launched the celebrated *Sovereign of the Seas*, the first three-decker and the largest ship hitherto constructed on modern principles. She was 232 feet in length, of 1637 tons, and carried at first 130 pieces of cannon; being found unwieldy, she was cut down, and proved an excellent ship, but was burned in 1696. In this reign the navy was first divided into rates and classes. Cromwell left 154 sail, measuring 57,643 tons, of which one-third were two-deckers. He was the first to lay before parliament annual estimates for the support of the navy, and obtained £400,000 for that purpose. During the Protectorate Peter Pett, son of Phineas, built the *Constant Warwick*, the earliest British frigate, from a French design and pattern. The Duke of York, afterwards James II., assisted by the celebrated Samuel Pepys, as Secretary, did much for the navy. He appointed a new commission when he came to the throne, with which he joined Sir Anthony Deane, the best naval architect of the time, who essentially improved the ships of the line by copying from French models; at this time, and during the 18th century, naval architecture was zealously studied in France, and the English constructors were so sensible of their inferiority that even up to the beginning of the 19th century all our best ships were either captured from the French or copied from them. At the Revolution of 1689 the fleet was in excellent condition, with sea stores complete for eight months for each ship. The force consisted of 184 vessels, carrying 6930 guns, and 42,000 men, whereof nine were first-rates.

William III. added greatly to the navy, which numbered at his death 272 ships of 159,020 tons, the annual charge being £1,056,915. The dockyard at Hamoaze, out of which has since grown the considerable town of Devonport (q.v.), was also established during his reign (see also the article DOCKYARDS, ROYAL).

At the death of Queen Anne in 1714 the number of ships was less, but the tonnage relatively greater, there being 198 ships, carrying 10,600 guns, the tonnage being 158,640. In 1747 a naval uniform was first established. The navy increased rapidly during the reigns of the first two Georges, and at the accession of George III. consisted of 127 ships of the line and 198 of fifty guns and under, measuring 321,104 tons, and manned by 70,000 seamen and marines. The navy was kept in a high state of preparation, and, when in February 1793 the French Republic declared war against England, in a few weeks fifty-four sail of the line and 146 smaller vessels had put to sea completely equipped. The whole fleet in 1793 consisted of 122 ships of the line, 97 frigates, and 102 sloops and smaller vessels, manned by 85,000 seamen and marines. The navy of France had never been so powerful; it amounted to above 200 vessels, of which 82 were of the line, and 71 were in addition ordered to be built. The English had about 115 sail of the line fit for service; but the majority of the French ships were larger and finer and carried heavier guns on their lower or principal battery. The following abstract will

show the losses on both sides up to the peace of Amiens (1802).

	Captured.	Destroyed.
British ships of the line	5	0
Smaller vessels	37	9
Total	42	9
French ships of the line	32	11
Dutch " "	18	0
Spanish " "	6	5
Danish " "	2	0
Total	58	16
French smaller vessels	266	44
Dutch " "	62	6
Spanish " "	57	10
Grand Total	443	76

This estimate does not include 807 privateers, chiefly French, taken and destroyed. Of the above, 50 sail of the line and 94 under that size were added to the British navy.

During the peace of Amiens preparations for war were actively continued on both sides, and when war broke out again in March 1803 the British fleet consisted of 153 ships of the line and 411 under that size, manned by 120,000 seamen and marines. 'In the year 1809,' to quote the words of Alison, 'the British fleet was at the zenith of its power, and Great Britain first appeared in the field on a scale adequate to her mighty strength. With a fleet of near 1100 vessels, including 240 of the line, manned by 140,000 men, she blockaded every hostile harbour in Europe, and still had 37 ships of the line to strike a blow at the Scheldt. With 100,000 regular troops she maintained her immense colonial empire; with 191,000 more she ruled India; with 400,000 militia she guarded the British Isles; while her fleet could convey yet another 100,000, with which she menaced, at once, Antwerp, Madrid, and Naples; while Lord Minto, the Governor-general of India, announced in his despatches with well-founded pride that "from Cape Comorin to Cape Horn a French flag could nowhere be found flying."'

The following abstract shows the losses on each side from 1803 to the end of the war, during which 33 sail of the line and 68 under were added to the British navy.

	Captured.	Destroyed.
British ships of the line	0	0
" " under	83	7
Total	83	7
Enemies' ships of the line	55	14
" " under	79	23
Total	134	37

Since the peace in 1815 the number of vessels has been greatly diminished, although their power has vastly increased.

The progressive augmentation of size in vessels may be judged from the increase in first-rates. In 1677 the largest vessel was from 1500 to 1600 tons; by 1720, 1800 tons had been reached; by 1745, 2000 tons; 1808, 2616 tons; 1853, 4000 tons; 1860, 6959 tons—the *Victoria*, the last three-decker built in England; while the *Warrior*, the first ironclad built in Britain, and launched in 1861, is 9210 tons, and in 1890 ironclads were building of 14,000 tons. We may observe by the way that up to the year 1860 the ships were practically the ships of the last two centuries, improved and developed largely certainly by the introduction of steam, of increased tonnage and of better lines, but still the same ships, and in the matter of armament with but little improvement to record over the beginning of the century. In 1786 the *Victory* was launched; she was at that time the largest three-decker in the English service; she is

186 feet long, has a tonnage of 2100 tons, and carried 100 guns, the bulk of which were long 32-pounders, weighing 56 cwt. In 1859 the flag-ship in the Mediterranean was the screw three-decker, the *Marlborough*; she was 282 feet long, 6100 tons, and carried 121 guns; her lower-deck guns were 65 cwt. 8-inch shell guns throwing a shell with bursting charge inclusive of 56 lb., while her remaining guns were the long 56 cwt. 32-pounders, with which the *Victory* had been armed nearly a century before. But since 1860 a vast revolution has been effected in our naval forces, and it seems almost incredible that in so short a space so great a transformation should have taken place. Masts and sails have disappeared, the wooden walls of old England are things of the past, and, instead of the graceful frigate and stately line-of-battle ship, our battle-ships of the present day are floating castles protected with massive armour, crammed with engines, without which they could neither move, fight their guns, nor be even habitable for their crews, the breathing air below being driven down by fans worked by steam; while the 32-pounders and 10-inch shell guns have given place to 67-ton and 110-ton rifled guns, throwing projectiles of 2000 lb. weight.

The use of steam as a propelling power is the agent by which this change has been effected. From 1841 a gradual substitution of steam for sailing vessels began, which was not completed, however, until 1860—in fact, the last sailing frigate in commission, the *Calypso*, only returned from the Pacific at the latter end of 1861. The first war steamers were all paddle-wheel vessels, and this mode of propulsion brought a change in the armament, or rather in the method of mounting guns. The paddle-wheels being quite exposed, and the machinery also being mostly above the water-line, there was great danger that a lucky shot would soon put a ship out of action, if compelled to fight broadside to broadside, as ships had been accustomed to do formerly. To obviate this danger as far as possible, the few guns these paddle-ships carried were mounted as pivot-guns, by which a far larger arc of training was possible than to a gun mounted on the broadside, thus enabling a ship to fight her guns without exposing her whole broadside to an enemy's fire. A few paddle-frigates, however, of large size, were built, and in their day did good service; of these the well-known *Terrible*, nicknamed during the Russian war of 1854–56 the 'Black-Sea Cat,' was the largest; she was a ship of some 3600 tons, carried sixteen 68-pounders, and had engines of 800 horse-power. At the bombardment of Sebastopol the sailing line-of-battle ships were all towed into their places by the paddle-frigates, which were lashed on their off-sides. But it was the application of the screw as a means of propelling ships which has really revolutionised ships of war. Its vast superiority over the paddle was at once seen, and by the commencement of the Russian war in 1854 many ships of the line, frigates, and smaller vessels had been either converted or built as screw ships. After the conclusion of the war many of the sailing three-deckers were converted into steam two-deckers, being lengthened amidships, and engines being then fitted to them; while during the three and four succeeding years naval architecture seemed to have reached its acme, the line-of-battle ships and frigates which were launched at the time being quite unsurpassed for beauty of their hulls, their size, and their sailing and steaming qualities. Strangely enough, for the first time in history, the new ships at this time were far superior to the French, especially the line-of-battle ships, which all carried their lower deck guns twice as high out of the water as the French ships, and were altogether finer and

handsomer models. But the knell of wooden ships had already sounded, and many of the finest

Fig. 2.—The *Duke of Wellington* screw line-of-battle ship, 131 guns.

line-of-battle ships built at this time were never even commissioned.

To Napoleon III., emperor of the French, belongs the idea of plating ships with iron. The effect of shells on the ships at the first bombardment of Sebastopol showed clearly that unless some means of protection could be devised ships were placed at a terrible disadvantage when attacking heavy shore batteries. The result was the laying down in France and England in the year 1855 of what were called floating batteries, which were, however, completed too late to take any active part in the war. Some ten were built in England; they were 172 feet long, 43 feet beam, about 2500 tons displacement, a draught of water of 7 feet 9 inches, and had engines of 200 horse-power; they were plated with 4 inches of iron on 20 inches of wood backing; they could only steam about 5 knots, and, as they were flat-bottomed with no keels, were very unmanageable; but they were heavily armed, carrying sixteen 68-pounders in their batteries. Three years later, however, the first ironclad frigate was laid down at Toulon, the celebrated *La Gloire*. She was designed by M. Dupuy-de-Lôme, head of the constructive department of the French admiralty, was built of wood and plated entirely with $4\frac{1}{2}$ inch iron plates to 6 feet below the water-line; she was 250 feet long, 55 feet beam, was built with a ram-bow, and could steam about 13.5 knots. She was launched in the early part of 1860, and in December of that year proceeded on a series of trials in company with the *Algeiras*, one of the fastest French line-of-battle ships. She proved herself a good sea-boat, and under all conditions steamed better than the wooden ships. In England they were not idle, and in January 1861 the *Warrior* was launched from the works of the Thames Shipbuilding Company. Designed by Mr Scott Russell, this ship, which, unlike *La Gloire*, is still fit for service, was built entirely of iron. She is, however, only armour-plated for two-thirds of her length, her bow and stern being unprotected; she is 9210 tons, 420 feet over all, with a beam of 59 feet, and her plating $4\frac{1}{2}$ inches thick; while her engines—5770 indicated horse-power—gave her a speed of nearly 15 knots. She was thus nearly double the size and tonnage of *La Gloire*; but, although still a fine vessel and a beautiful model, she has long been obsolete as a fighting ship. She was quickly followed by

others—ships in which the armour was carried completely round the hull; and in order more rapidly to form a large ironclad fleet several of the new line-of-battle ships were cut down, and converted into armoured frigates with ram-bows, and with plating from $4\frac{1}{2}$ to 6 inches in thickness. These ships were, however, only makeshifts, as they had no watertight bulkheads, and the armour soon caused the wooden sides underneath to rot and decay. Still they answered their purpose, and filled a gap until newer and stronger ships, built entirely of iron, could be designed and constructed.

From 1861, when the *Warrior* was launched, up to the present day has been an unceasing era of change in design to meet the ever-increasing requirements of a modern ship of war, brought

Fig. 3.—The *Warrior* armour-plated screw frigate, 32 guns.

about by the production of guns ever growing in size and power, and the corresponding necessity of increased thickness of armour. In Hampton Roads during the American civil war was fought on the 9th of March 1862 the first naval action between armoured ships, which practically sealed the fate of armoured frigates of the earlier type almost before they had in many cases left the stocks. When Norfolk with its dockyard was evacuated by the Federal troops at the outbreak of the war between the Northern and Southern states, the *Merrimac*, a large 50-gun steam-frigate, was set on fire to prevent her falling into the hands of the Confederates. She was, however, only partly burned, and the Confederates found her in all essential respects uninjured. Remembering the many experiments that had been made in Europe to show the value of iron armour for ships, and painfully conscious of their weakness at sea, they appear to have thought there was one grand opportunity open to them, and to have made use of it with characteristic vigour and skill. They built up over her deck and down upon her sides to below the water-line a shot-proof covering formed of sloping plates of railroad iron, and meeting at the top like the roof of a house, through which came her funnel and the only opening for

Fig. 4.—American Turret-ship, *Miantonomah*.

ventilation. She was armed with two 100-pounder Armstrong guns and eight 11-inch guns, and on the 8th of March 1862 she steamed out to attack the blockading Federal squadron, consisting of two

sailing frigates, the *Cumberland* and the *Congress*, and three steam-frigates, which latter, however, were unable to come up in time to take part in the action. The *Cumberland* was sunk and the *Congress* had to surrender, the *Merrimac* herself sustaining no injury, although she sunk the first-named ship by ramming. The next morning she came out to attack the remaining ships, but was met by an antagonist which, although much smaller, proved more than a match for her. This was the celebrated *Monitor*, built and designed by Captain Ericsson (q.v.); and from her have sprung the monster turret-ships of the present day. She was only 210 feet long, with an extreme beam of 45 feet; her deck and low sides were plated, and she carried two 150-pounder Dahlgren guns in a single turret amidships, which was protected with eight 1-inch iron plates screwed together, and was turned by steam; she had no bulwarks, and her deck was barely two feet out of the water, while besides the turret nothing showed on deck except her funnel and an armoured pilot-house at the stern. The result of the fight is well known, and the *Merrimac* had to retreat before her small opponent. Great was the excitement caused when the news of this action reached Europe, and nowhere more than in England, where a demand immediately arose for the conversion of the fleet into turret-ships. Captain Cowper Coles (q.v.) had ever since the Crimean war been urging the Admiralty to build turret-ships in some form or another, but no attention had been

Fig. 5.—Turret-ship, *Royal Sovereign*.

paid to him; he now again came forward with plans for converting some of the wooden ships into *Monitors*, and the Admiralty determined to give his plan a trial. Accordingly a screw three-decker, the *Royal Sovereign*, was cut down, armour plated, and fitted with four turrets, each carrying two 9-ton guns. She had a freeboard of six feet, thus making her a great deal more seaworthy than the American *Monitor*; but, as the ship had not originally been destined for such heavy work, she laboured under some disadvantages. Nevertheless she was considered for a time the most formidable ship in the navy. When once fairly tried the advantages of the turret over the broadside system was evident; the turrets are placed in the centre of the ship, so the weight of the guns and the armour of the ship is more systematically and evenly distributed, and it has become possible to mount the heaviest guns in turrets and barbettes—guns of a size and weight which by no possibility could ever be carried on the broadside. Another advantage which turrets offer is the much greater protection afforded to the guns in them and to their crews, not only from the increased thickness of the armour which can be carried on them, but also from the probability that many projectiles will glance off the rounded surface of the turret instead of penetrating, while, owing to the low freeboard, the mark offered to an enemy is much smaller than in a high freeboard broadside ship.

Turret-ships did not, however, immediately supersede broadside ships, and the controversy as to the respective merits of the two systems raged for some time. Guns and armour were in the meantime growing. In 1866 the *Bellerophon* was completed, a fine broadside ship with a 6-inch belt at the water-line and 5-inch over her battery, in which she carried twelve 12-ton guns.

To Rear-Admiral Scott the country is indebted for the iron carriages and slides, with their patent compressors for checking the recoil, which made the mounting of heavy guns on the broadside possible. But now a new danger to be guarded against had arisen in the shape of that dangerous weapon the torpedo. The word was first applied to everything, no matter what its nature, which was exploded under water against ships; but of late years the word torpedo refers solely to mobile under-water weapons of offence, and more particularly to the fish or Whitehead torpedo, whilst the fixed or stationary torpedoes are now called submarine mines (see TORPEDOES and MINES). To afford as much protection as possible from these enemies, and also to make a ship as unsinkable as possible, not only has a system of building ships with an inner as well as an outer bottom been adopted, but by means of transverse and other bulkheads the whole hull below the water-line is subdivided into a number of watertight compartments, so that if a ship is injured the damage and water admitted is confined to as small a section as possible. Two complete sets of engines, driving each a separate screw, also took the place of the old single screw. This not only gives ships greater turning powers, but if one engine is disabled they are not left quite helpless. In 1869 three large low freeboard mastless turret-ships were laid down, the *Devastation*, *Thunderer*, and *Dreadnought*; the first-named ship was commissioned at the end of 1872, and they have all done good service, and still remain amongst our most formidable ships. They are protected by a belt of 14-inch armour at the water-line; above

Fig. 6.—The *Devastation*.

this, running about two-thirds of the length of the ship, is an armoured breastwork with 12-inch armour which protects the base of the turrets, loading-gear, &c. An armoured deck resting on the top of the belt covers in the whole ship outside the casement, the turrets being placed at each end of this breastwork. The freeboard fore and aft of these ships is extremely low, the deck being barely four feet out of the water, thus necessitating at sea the closing of all apertures by watertight hatches, as the deck is continually under water. A superstructure or hurricane deck is erected in the space between and slightly above the turrets, where

accommodation is found for the boats, chart-house, and armoured conning-tower; the funnels, ventilators, and means of communication with the interior of the ship when the hatches on the upper deck are closed, all lead up through this structure, which is sufficiently spacious to form a small promenade in bad weather. These ships and others of the same type are ventilated below by means of air which is driven down by fans worked by steam. They have only what is called a military mast, the principle use of which is to serve as a support for the derrick used to hoist out the large boats. The original armament of these ships

Fig. 7.—Diagram showing Disposition of Armour in H.M.S. *Devastation* (1872), twin-screw double-turret battle-ship, 1st class, four 29-ton guns in pairs in turrets. 9330 tons, 7000 H.P.

a, a, turrets; b, superstructure; c, upper deck.

consisted of four 35-ton muzzle-loading guns, but since 1890 they have been supplied with 29-ton breech-loading guns of the most modern type, and a full complement of 3- and 6-pounder quick-firing guns, which are mounted on the superstructure. The introduction of this new type of sea-going turret-ship was a bold experiment and the occasion of much controversy; but even in the first venture a large measure of success was achieved. Deficiency of freeboard forward is the fault of the *Devastation* and her sisters, as also of many of the later ships, for with such a form of bow it is difficult, if not impracticable, to maintain a high rate of steaming against a heavy sea. Of course, the object of the bows being kept so low is to offer a smaller target to the enemy and to enable the guns mounted in the fore-turret to command an all-round fire.

Captain Coles was not satisfied with the *Royal Sovereign* or the turret-ships subsequently designed. He believed he could build a turret-ship which, with a low freeboard, should yet be heavily masted and able to keep the sea under sail alone; so the *Captain*, a large ship of over 6000 tons, was built from his designs with a freeboard of only 6 feet; she was heavily masted so as to give her great sail-power; her design was not approved at the Admiralty, her freeboard for a masted-ship being considered dangerously low. So the *Monarch*, a turret-ship of about the same tonnage, but with a freeboard of 14 feet, was built at the same time, embodying the Admiralty idea of what a masted turret-ship ought to be. Both ships carried four 25-ton guns in their turrets. The fate of the unfortunate *Captain* is well known. About an hour after midnight on the morning of the 6th of September 1870, while cruising with the Channel Squadron off Cape Finisterre, she was capsized when under sail in a heavy squall, and went down immediately; 500 officers and men, among whom were her captain, Captain Burgoyne, V.C., and Captain Coles himself, were lost. The *Monarch*, on the other hand, has been continually in commission, and in 1890 was re-engined and provided with new breech-loading guns. After the completion of the *Bellerophon* in 1866 an entire change was made in the arrangement of the guns in the batteries and in the disposition of the armour-plating in the new broadside ships which followed her. The *Bellerophon*, like her predecessors, was armoured all over, the plating extending some 5 feet below the water-line,

while her guns extended along the maindeck as in the old wooden ships. An attempt was now to be made, without materially increasing the size of the ships, to carry yet heavier guns and protect them with thicker plating; at the same time various devices were resorted to to try and combine some of the advantages of the turret-ship with the broadside system of mounting guns, by giving an end-on fire to bow and quarter guns and generally increasing the arc of training.

The result was what are now known as central-battery ships, of which the *Hercules*, *Sultan*, *Téméraire*, and *Alexandra* are very fine specimens. These ships have a complete belt of armour round the water-line tapering from 12 inches to 5 inches in thickness. The armour is carried up over the central portion of the ship and the batteries; athwartship armour bulkheads shut in the batteries fore and aft, forming a complete armoured citadel; before and abaft these bulkheads, above the armour-belt, the sides are unprotected in any way, and here are the quarters for the officers and men. The guns are carried in the batteries, there being an upper and a lower one, the lower being the main or principal battery; the foremost and after ports are recessed so as to give a nearly end-on fire, while in some cases the upper battery is made to overhang, the ship's side being made to fall in, and thus a direct bow and stern fire is obtained. Both the *Alexandra* and *Téméraire*

Fig. 8.—Diagram showing Disposition of Armour in H.M.S. *Alexandra* (1875), twin-screw central-battery broadside battle-ship, 1st class. 9490 tons, 8610 H.P., 18 guns.

a, upper battery, two 25-ton and two 18-ton guns; b, main battery, two 25-ton and six 18-ton guns, six 6-inch guns on upper deck; c, men's quarters; d, officers' quarters; e, poop.

carry 25-ton and 18-ton guns in their batteries; these ships were launched in 1875, and were the last broadside ships to be built, as they are the finest. After the loss of the *Captain*, and in view of the rapidly increasing competition between guns and armour for the mastery, as illustrated by the fact that in ten years progress had been made from 4½ to 14 inch armour, and from 68-pounders to 35-ton guns, the Admiralty appointed a committee of naval officers and architects to consider and report on the best design for the battle-ship of the future. The result of their deliberations was the adoption of what is known as the citadel type of ship, and on this principle, with certain modifications, several battle-ships were built.

In this type of ship the continuous armour-belt round the water-line is done away with, and in its place the armour of great thickness is concentrated round a citadel in the central portion of the ship; the length of the citadel varies from about one-third the length of the ship to nearly a half; the armour extends to a depth of some 5 feet below the water and about 6 feet above; at each extremity rise the turrets in which the guns are mounted. In the *Inflexible*, the first ship of this type built, the armour at the water-line is 24 inches thick, with 17 inches on the turrets; the plates, however, are of iron, while in the later ships they are compound—iron faced with steel. The *Inflexible* carries two 81-ton muzzle-loading guns in each of her turrets, capable of throwing a projectile of 1750 lb. weight a distance of 6½ miles, with an initial velocity of 1800 feet. From the base of

the citadel fore and aft extends the whole remaining length of the ship a watertight turtle-backed armoured deck, from 2½ to 3 inches thick; and below this deck, which is below the water-line and within the citadel, are contained all the vitals of the ship—engines, boilers, magazines, &c.—the only communication from above being down through the citadel. The quarters for the officers and men

Fig. 9.—Diagram showing Disposition of Armour and Armoured Deck in H.M.S. *Colossus* (1882), improved *Inflexible* type, twin-screw double-turret citadel battle-ship, 1st class, with unarmoured end but armoured deck. 9420 tons, 7500 H.P., four 47-ton guns, two in each turret; five 6-inch guns on superstructure.

are mostly provided for in those parts of the ship before and abaft the citadel, and are built up above the armoured deck; the idea being that these unarmoured ends might be destroyed by the enemy's fire, but that the body of the ship would remain intact; the citadel, in fact, resting on an unsinkable inner ship below the surface of the water, there being as many as two hundred different watertight compartments in some of the latest battle-ships, including the compartments of the double bottom.

Since the year 1880 another revolution has been carried out, this time in the armament of ships, steel breech-loading guns being now substituted for the old muzzle-loaders. This change was rendered necessary in order to obtain the increased velocity requisite to penetrate the thicker armour now in use. It was found that the necessary length to obtain this increased velocity could not be given to guns which were loaded at the muzzle, so the authorities found themselves compelled to re-arm our whole fleet anew. The work is not yet completed, but since 1882 all the new battle-ships and cruisers have received the new guns. The introduction of fast-steaming torpedo boats has also rendered it necessary for the heavy armament of battle-ships to be supplemented by a large number of light guns; and to the necessity of meeting the attacks of these swift little vessels, we are indebted for all the rapid-firing guns now in use, of which every ship carries a large complement. It thus again became necessary to carry guns on the broadside, and the design of the citadel ships had to be materially modified. Six battle-ships were laid down, known as the Admiral class,

Fig. 10.—Diagram showing Disposition of Armour in the Admiral class, H.M.S. *Rodney* (1885), twin-screw barbette battle-ship, 1st class. 10,300 tons, 11,500 H.P., four 67-ton guns mounted in pairs in the barbettes (e); six 6-inch guns in central unarmoured battery (a). b, spar-deck with quick-firing guns; c, officers' quarters; d, men's quarters; f, fighting top, armed with two 6-pd. q.-f. guns.

being named after distinguished naval commanders. Much controversy has arisen over these ships, and it is certain that they are deficient in armour-protection; on the other hand, their armament is a formidable one; they carry four 67-ton guns mounted in pairs, *en barbette*, in fixed heavily-armoured redoubts

instead of in turrets. These barbettes are carried at a considerable height above the armoured portion of the hull, and all the hydraulic loading arrangements are protected by them. The ammunition is also brought up from below through armoured tubes. A belt of 18 inches of compound armour protects about 156 feet of the water-line of the ship amidships, and there is in addition a 3-inch steel-armoured deck. Between the barbettes is a long central battery, in which are carried the ten 6-inch guns forming the auxiliary battery, while on the spar-deck above are mounted a due proportion of 3- and 6-pounder quick-firing guns. The advantages claimed for the barbette system, which is in general use by the French, over the turret, is that the guns are carried much higher out of the water; on the other hand, they are much more liable to injury from an enemy's fire, as, except when loading, the whole gun is completely exposed; while the absence of broadside armour for the central secondary battery is a serious defect, leaving the crews, as it does, exposed to destruction by shells charged with melinite or other high explosives, and the hail of fire from the quick-firing guns. These ships are also too low forward, and, although fast ships, they cannot steam at any speed against a heavy head sea.

As the outcome of the popular revulsion against the Admiral type of battle-ship, in consequence of the small amount of armour-protection, and in view of the development of high explosives for use in shells, and the rapid growth in the size of the quick-firing guns, the *Nile* and *Trafalgar* were laid down in the year 1885. For their offensive powers and for

Fig. 11.—Diagram showing Disposition of Armour in H.M.S. *Trafalgar* (1888), twin-screw double-turret battle-ship, 1st class, with armoured central battery. 11,940 tons, 12,000 H.P., four 67-ton guns in turret (b); eight 40-pounder quick-firing guns in central battery (a); twelve 6-pounder quick-firing guns on spar-deck (c); fighting top with two 6-pd. q.-f. guns (d).

the completeness of their armour-protection, as compared with any former ships, they are quite unquestionably the two most formidable battle-ships at present afloat. Although not completely belted all round, they are very nearly so, and may be described as improved *Devastations*, with the addition of a central battery between the turrets for the auxiliary armament, in place of the superstructure of the earlier ships. The main armament consists of four 67-ton guns, while the auxiliary armament consists of eight 4·7-inch 40-pounder quick-firing guns, which are protected by 5-inch steel armour; and in addition they carry sixteen 3-pounder and 6-pounder quick-firing guns, mostly mounted on the spar-deck. In 1889 what is known as the Naval Defence Act was passed, which authorised the construction of ten new battle-ships, forty 1st and 2d class cruisers, and twenty torpedo gunboats. The battle-ships are to be 14,000 tons displacement, with a length of 380 feet, and a beam of 75 feet; their engines of 13,000 horse-power are to drive them at a speed of 18 knots, which is a knot faster than that obtained from the *Nile* and *Trafalgar*. The disposition of the armour is much the same as in the two former ships, and the armour is of the same thickness except at the water-line, where it is two inches less; this water-line belt is

8½ feet broad, extending three-fourths the length of the ship, with a maximum thickness of 18 inches; the belt is terminated by transverse armoured bulkheads; above it is a 3-inch steel deck, while a strong under-water deck completes the protection before and abaft the belt. The broadside above the belt is protected to a height of 9½ feet above water over a considerable portion of the length by 5-inch armour, screen bulkheads similarly armoured enclosing the central battery. The armour on the barbettes is 17 inches thick, while the protection of the guns and crews of the auxiliary armament has been carefully arranged in view of the development of high explosives and quick-firing guns. In eight of these ships the main armament of 13½-inch 67-ton guns is carried in barbettes 23 feet above the water; in the remaining two they are mounted in turrets. The auxiliary armament consists of ten 6-inch 5-ton 100-pounder quick-firing guns, sixteen 16-pounder, and eight 3-pounder quick-firers, together with seven torpedo-tubes, of which two are submerged.

Since 1880 a large number of fast cruisers have

been built. Of these ten are protected by a belt of 10-inch steel armour two-thirds of the length of the ship at the water-line, as well as by an armoured deck; all the remainder are known as 'protected cruisers'—i.e. they have an armoured turtle-backed deck which extends throughout the length of the ship; the thickness varies in the different ships from 6 inches on the slope to 2 inches on the horizontal part. The top of the deck rises to a maximum of about 18 inches above the water-line, but on the side it curves down to join the plating of the skin 6½ feet below the water. In the new cruisers, round the hatchways, funnel casings, &c. protection is given by 5-inch steel armour, while the guns also are protected by casemates plated with 4-inch steel armour, and the ammunition is passed up from the magazines to the guns through armoured tubes. The speed of these ships varies from about 16 knots in the cruisers of 1880 to 19 knots in the more recent ones, and two first-class cruisers, the *Blake* and *Blenheim*, are intended to steam 22 knots. As in the battle-ships, so in the modern cruisers

Fig. 12.—Section of Turret, showing System of Mounting Heavy Guns, and Hydraulic Arrangement for Loading.—H.M.S. *Colossus*.

A, saddle on which the gun is fixed; B, recoil press; S, slide; O, pivot of slide; D, elevating cylinder; E, loading trough; F, rammer; G, hydraulic arrangement for working breech-block; H, ram for raising rammer and shot; L, teak backing; M, 18-inch armour; N, the gun (47-ton breech-loader). The projectile is placed in a trough (E) on the deck; the trough is raised by a ram (H) until it is in the required position (E') for loading; a rammer (F) then passing up the trough forces the projectile into the gun; on the trough being lowered, the cartridge is placed in it and rammed home in a similar manner.

masts and sails have been done away with; and while the battle-ships have what is called a military mast fitted with two armoured tops in which are carried one or more quick-firing guns, the cruisers have only a couple of light poles for signalling purposes. The armament of the cruisers consists generally of two 9-inch 22-ton guns as bow- and stern-chasers, and a proportion of 6-inch or 5-inch guns, according to the size of the ship, with a due complement of quick-firing guns and four or six tubes for discharging Whitehead torpedoes. In these ships which have no vertical armour a certain amount of protection is afforded by the stowage of coal in bunkers above the water-line. Battle-ships and cruisers alike are now lit by electricity, by means of which also the guns are fired and torpedoes discharged; they are also provided with powerful electric search-lights, which will illumine the sea for some 2 miles, while night-signalling is now carried on also by electric light. As a further defence against torpedoes, all large ships are provided with torpedo-nets, which are made of steel wire, with meshes of about 3 inches in diameter, and are rigged out all round the ship by means of booms, which project about 30 feet from the ship's side a little above the water-line; these nets are about 18 feet deep, and when not required for use are stowed inboard.

Ships are further provided with countermines for the purpose of destroying mine-fields defending hostile harbours. See TORPEDOES, MINES.

In England iron plates faced with steel (called compound plates) have been definitively adopted

for heavy armour; while steel plates, from 6 inches to 2 inches in thickness, are used for the armoured decks and the shields for the protection of the light guns; and mild steel is now used instead of iron for the hulls of all ships.

The heaviest guns in use in the royal navy are the 111-ton breech-loaders, which throw a projectile of 1800 lb., with an initial velocity of 2300 feet, from 10 to 11 miles. The charge for this gun is 900 lb. of brown prismatic powder. These guns are only mounted in three ships, the *Victoria* and *Sanspareil*, in which they are mounted in pairs in a single turret forward, and the *Benbow*, which has one mounted in each of her barbettes forward and aft. No more guns of this weight are likely to be mounted on board ship, at least in the English navy, and there is a considerable weight of opinion among naval officers that a 12-inch gun of modern design and about 50 tons in weight would possess sufficient power for most purposes; but, as the 67-ton gun has proved most successful, it was finally adopted in 1889 as the heavy gun for the new battle-ships. The cost of the 110-ton gun is £19,600; of the 67-ton gun, £13,600; of the 22-ton gun, £4816; while a 5-inch 36-cwt. gun costs £568.

In considering the question of guns it is essential to keep in view that the endurance diminishes as the calibre increases; the life of the 111-ton gun is considered to be 95 rounds; that of the 67-ton gun, 127 rounds; and that of the 45-ton gun, 150 rounds. The 67-ton gun throws a projectile of 1250 lb., with a charge of 630 lb. of brown prismatic powder, a distance of 10 miles, and will pierce 30 inches of

armour; but experience shows that armour of this weight cannot be carried on ships of anything like a reasonable size.

Among the lighter ordnance a state of transition exists, due to the unexpected development in what are called quick-firing guns. In the smaller types of these guns the projectile and charge are made up in one cartridge, and by an ingenious arrangement of the breech it can be opened and closed by one man almost instantaneously. The first quick-firing guns were the 3-pounders and 6-pounders invented by Mr Nordenfolt and Mr Hotchkiss: these guns can fire as many as twenty-eight rounds a minute. Since then a 40-pounder quick-firer has been made at Elswick, and has proved most successful. A 100-pounder gun of the same kind is likely to take the place of the 6-inch breech-loader, which also throws a projectile weighing 100 lb. Eighteen rounds in a minute were fired from a 40-pounder quick-firer; and these guns will render an attack by torpedo boats now a very hazardous undertaking (see CANNON, MACHINE GUN). A certain amount of finality would also seem at last to have been arrived at in ships, after thirty years of transition; 18-inch compound or steel plates seem to suffice for all the ordinary protection required, except at very close range from very heavy guns; and ships of 14,000 tons—the size of the new battle-ships—will carry this armour with ease, sufficient to protect their water-line and turrets or barbettes, and will also carry the 67-ton guns and a due complement of smaller ones; while their engines will drive them at a speed of from 16 to 17 knots an hour.

It must be remembered also that these battle-ships now represent a sum of £1,000,000 apiece, and many high authorities seem to incline the scale in favour of types of a less exaggerated cost. Whatever the type, there remains under all circumstances a conspicuous advantage in numbers, and while other nations build these huge ships it unfortunately behoves England to build in return a still larger number. The present classification of ships in the British navy is as follows: Battle-ships, 1st, 2d, and 3d class; belted cruisers, 1st class; protected cruisers, 1st, 2d, and 3d class; sloops; torpedo gunboats; gunboats; torpedo boats; yachts and despatch vessels.

The number of officers and men voted for 1890–91 was 94,563, including 14,000 marines; the amount voted for the same period for the naval service was £16,975,000, of which the principal charges were cost of *personnel* of the fleet, £6,407,408; shipbuilding and repairs, £5,988,232; armament, £1,504,108; victualling and clothing, £1,213,061; and minor votes absorb the remainder. The annual charge in 1880–81 was £10,492,935; of which the cost of *personnel* of fleet was £3,735,038; shipbuilding, &c., £1,780,000; dock and victualling yards, £1,414,745.

In conclusion, it may be interesting to compare the complements of the officers and men of modern battle-ships with those of ships of the line immediately previous to the introduction of ironclads. The flagship in the Mediterranean in 1861 was the screw three-decker *Marlborough*, of 121 guns, and with a crew of 1200 officers and men; she carried a captain, commander, 10 lieutenants, 1 master for navigating duties, 1 paymaster, 2 assistant-paymasters, 3 surgeons, 4 marine officers, 1 chaplain, 1 naval instructor, 1 chief-engineer, 4 assistant-engineers, 4 sub-lieutenants, 24 midshipmen and naval cadets, and 3 warrant officers, besides the vice-admiral commanding and his staff; while the ship's company was composed approximately of 75 petty officers and leading seamen, some 850 seamen and boys, 120 marines, 50 stokers, 30 bandsmen, and the remainder domestics and other non-combatants. The officers and crew of a line-of-battle

ship averaged as a rule from 800 to 950; of a frigate, from 400 to 600; and smaller ships in proportion. A modern battle-ship of the *Colossus* type has a complement of 450 officers and men; a barbette ship of the *Rodney* class, one of 560; and a broadside ship of the *Alexandra* type, one of 750. The first-class battle-ship *Victoria*, the present (1891) flagship in the Mediterranean, has a complement of 600 officers and men, the numbers and ratings being approximately as follows: the vice-admiral and his staff, consisting of his flag-lieutenant, secretary, and 4 secretary's clerks; a captain, commander, staff-commander (for navigating duties), 6 lieutenants, 2 sub-lieutenants, 13 midshipmen, 7 warrant officers, 3 marine officers, a chaplain and naval instructor, 3 surgeons, a paymaster, a chief-engineer, and 5 assistant-engineers. The ship's company is composed approximately of some 40 chief, 1st, and 2d class petty officers and leading seamen, 260 seamen and boys, 90 marines, 15 engine-room artificers, and 120 stokers, the remainder bandsmen and other non-combatants. Not only are the complements of modern ships much smaller than in the old ships, but the proportion of trained seamen is also much smaller in comparison with the rest of the crew. This is due to the increase of the engine-room staffs, and to the large number of stokers now carried in the new ships, amounting sometimes to as many as one-third of the whole complement. As this large number of untrained men seriously affects the fighting efficiency of ships, steps have been taken since 1889 to minimise the danger as much as possible by training the stokers regularly at heavy gun and other drills, so that those not actually required in the stokeholes may be available for use as combatants in action. This step has been rendered the more necessary, as all foreign men-of-war are far more heavily manned than English ships of a similar size. By the Naval Defence Act of 1889, and in the Estimates of 1891, provision is made to carry into effect a large increase of the *personnel* of the navy.

See Derrick, *The British Navy* (1806); W. James, *Naval History of Great Britain* (3d ed. 6 vols. 1847); J. W. King, *War Ships and Navies of the World* (1880); Lieut. F. H. Vesey, U.S.N., *Navies of the World* (1880); W. F. Mitchell, *The Ships of the Royal Navy* (1881); Lord Brassey, *The British Navy* (5 vols. 1882–83), and his *Navy Annual*; Durrassier's *Aide-Mémoire de la Marine*; the works of Guerin and Jurien de la Gravière; and German works by Brommy-Littrow (1878), Pavel (1881), and Werner (1884). For the Royal Naval College, see GREENWICH; see also TRAINING-SHIPS, TACTICS, CADET, MARINES, NAVAL RESERVE, ENGINEERS, MACHINE GUN, &c., the articles on ADMIRAL, CAPTAIN, and other naval officers in this work, and those on the great naval commanders, BLAKE, NELSON, &c.

NAVY AGENT, a banker and attorney for naval officers, who bears some such relation to Admiralty expenditure as the Army Agent (q.v.) to War Office expenditure. By the Act of 1865, each of Her Majesty's ships of war, while in commission, has an agent appointed by the commander, and registered. His duties are to act for the ship in cases of salvage, merchant shipping law, distribution of prize-money, capture of slave-ships, &c. He receives 2½ per cent. as payment in full of his services. See the *Navy List*.

Nawanagar, a seaport of India, and capital of a native state (area, 1379 sq. m.; pop. 316,147), stands on the south shore of the Gulf of Cutch, 310 miles NW. of Bombay. Pop. (1881) 39,668.

Naworth Castle. See LANERCOST.

Naxos, the largest, most beautiful, and most fertile of the Cyclades, is situated in the Ægean, midway between the coasts of Greece and Asia

Minor. It is 20 miles in length, and has a pop. of 14,880. The shores are steep, and the island is traversed by a ridge of mountains, which rise in the highest summit, Dia, to 3289 feet. The wine of Naxos was famous in ancient as it is in modern times, and on this account the island was celebrated in the legends of Dionysus, and especially in those relating to Ariadne (q.v.). It was ravaged by the Persians, 490 B.C., and after the conquest of Constantinople by the Latins became the seat of a dukedom founded by the Venetians. It was Turkish from 1566 till Greece became a kingdom. Naxos, the capital (pop. 2000), is the seat of a Greek bishop and a Latin archbishop. See Tozer's *Islands of the Aegean* (1890).

Nazarenes. See EBIONITES.

Nazareth, the home of Jesus, anciently in the district of Galilee, 21 miles SE. of Acre, is still a small but flourishing town of Palestine. It lies in a hilly tract of country, and is built partly on the sides of some rocky ridges. In the earliest ages of Christianity Nazareth (which is not mentioned in the Old Testament) was quite overlooked by the church; the first Christian pilgrimage to it took place in the 6th century. The principal building is the Latin convent, on the supposed scene of the Annunciation; but the Greeks have also erected on another spot a church in commemoration. The traveller is also shown a Latin chapel, affirmed to be built over the 'workshop of Joseph'; the chapel of 'the Table of Christ' (*Mensa Christi*), a vaulted chamber, containing the veritable table at which our Lord and his disciples ate; and the synagogue out of which he was thrust by his townsmen. The Virgin's Well is just outside the town. The women of the village have long been famous for their beauty. Major Conder says they are more Italian than Arab in feature, and suggests that the blue eyes seen in Syria may be due to an admixture of European blood. The population has been estimated at from 4000 to 10,000. There is here a Protestant mission and orphanage.

Nazarites (properly *Nazirites*, from Heb. *nazar*, 'to separate'), men or women among the Jews who had consecrated themselves to God by certain acts of abstinence, as refraining from using wine, from shaving their heads, as well as from the defilement of contact with the dead. The law in regard to them is laid down in the Book of Numbers (vi. 1-21). The usual term of the vow was thirty days, but examples of vows for life were the cases of Samson, Samuel, and John the Baptist.

Nazianzen. See GREGORY.

Neagh, LOUGH, the largest lake of the British Islands, is situated in the province of Ulster, Ireland, and is surrounded by the counties of Armagh, Tyrone, Londonderry, Antrim, and Down. It is 16 miles in length and 10 miles in average breadth, contains 98,255 acres, is 102 feet in greatest depth, and is 48 feet above sea-level. It receives the waters of numerous streams, of which the principal are the Upper Bann, the Blackwater, and the Callan; and its surplus waters are carried off northward to the North Channel by the Lower Bann. Communication by means of canals subsists between the Lough and Belfast, Newry, and the Tyrone coalfield. The southern shores of the Lough are low and marshy, and dreary in appearance. It is well stocked with fish—lake trout, char, and pullen.

Neal, DANIEL, author of the *History of the Puritans*, was born in London, December 14, 1678. He was educated first at Merchant Taylors' School, and afterwards at Utrecht and Leyden, and in 1706 became minister of an Independent congregation in Aldersgate Street, London. His first work was a *History of New England* (1720), which met with a

very favourable reception in America. But his reputation rests on his laborious and accurate *History of the Puritans* (4 vols. 1732-38; new ed., with *Life* by Joseph Toulmin, Bath, 1793). Neal died at Bath, April 4, 1743.

Neal, JOHN, American author, was born at Falmouth (now Portland, Maine), August 25, 1793. In his youth he was a Quaker, and he began the world at twelve as a shop-boy. In 1816 he failed in business, and turned to the study of law, supporting himself the while by his pen. He was one of the first Americans to write in the greater English magazines, and from 1823 till 1827 he lived in England, part of the time as one of Bentham's students and secretaries. After his return to America he settled in his native town, practised law, edited newspapers, lectured, and found relaxation in practising and teaching boxing, fencing, and gymnastics. He died 21st June 1876. Among his numerous works are a series of novels, *Bentham's Morals and Legislation*, and *Wandering Recollections of a Somewhat Busy Life* (1869).

Neale, JOHN MASON, hymnologist, born in London, January 24, 1818, was educated at Trinity College, Cambridge, became incumbent of Crawley, Sussex, in 1842, and in May 1846 warden of Sackville College, East Grinstead, where he died, August 6, 1866. He belonged to the most advanced section of the High Church party, and was long one of the most misunderstood and unpopular men in England. He was inhibited by his bishop for fourteen years, and burned in effigy in 1857, while throughout life his means were of the smallest. He founded in 1856 the well-known sisterhood of St Margaret. His most important work is his *History of the Holy Eastern Church* (4 vols. 1847-51); others were *Mediaeval Preachers* (1857), *History of the so-called 'Jansenist' Church of Holland* (1858), a preposterous adaptation of *The Pilgrims' Progress* (1853), and a long series of stories for the young, intended to popularise church history, but the value of which is almost exclusively other than historical. But his greatest work was his invaluable contribution to hymnology, both original and translated. His *Hymns for the Sick and Hymns for Children* were followed by his more important volumes of translations: *Mediaeval Hymns and Sequences* (1851), the *Rhythm of Bernard of Morlaix* (1858), and his *Hymns of the Eastern Church* (1863). Many of his translations are cherished by all English-speaking Christendom, as the beautiful hymns, 'O love how deep, how broad,' 'The day is past and over;' and the exquisite series adapted from his translation of Bernard of Morlaix's poem, 'The world is very evil,' 'Brief life is here our portion,' 'For thee, O dear, dear country,' and 'Jerusalem the golden.' There is no modern author to whom hymnology owes a greater debt than to this one inspired writer whose own conscious ecclesiastical sympathies were yet so narrow. A selection from his writings appeared in 1884. See HYMN.

Neander, JOHANN AUGUST WILHELM, the greatest of church historians, was born at Göttingen, 17th January 1789, of Jewish parentage. His name prior to baptism was David Mendel, and by the mother's side he was related to the philosopher Mendelssohn. He received his early education at the Johanneum in Hamburg, and had for companions Varnhagen von Ense and Chamisso the poet. Even while he was a boy, Plato and Plutarch were his favourite books, and he was profoundly stirred by Schleiermacher's famous *Reden über die Religion* (1799). Finally in 1806 he publicly renounced Judaism, and was baptised, adopting the name of Neander ('new man'), and taking his Christian names from several of his friends. His sisters and brothers, and later his mother also,

followed his example. He now proceeded to Halle, where he studied theology under Schleiermacher, and concluded his academic course at Göttingen. In 1811 he took up his residence at Heidelberg as a *privat-docent*; in 1812 he was appointed there extra-ordinary professor of Theology; and in the following year he was called to the newly-established university of Berlin as professor of Church History. Here he laboured till his death, July 14, 1850. Students flocked to him not only from all parts of Germany, but from the most distant Protestant countries. And his sweetness of character was no less attractive than his genius. Profoundly devotional, sympathetic, glad-hearted, profusely benevolent, and without a shadow of selfishness, he inspired universal reverence, and was himself by the simplicity and sanctity of his life a more powerful argument on behalf of Christianity than even his writings. He used to give the poorer students free admission to his lectures, and to supply them with clothes and money. The greater portion of what he made by his books he bestowed upon missionary, Bible, and other societies, and upon hospitals.

Neander is believed to have contributed more than any other single Christian scholar to the overthrow, on the one side, of that anti-historical Rationalism, and on the other of that dead Lutheran formalism, from both of which the religious life of Germany had so long suffered. To the delineation of the development of historical Christianity he brought a generous and sympathetic, yet broad and impartial intellect. To him Christianity was a permeating force more than a series of dogmas, and the history of the church was throughout but the history of the divine life of Christ pervading humanity, to be understood only in proportion to the student's personal experience of the significance of the life of Christ. This is the meaning of Neander's famous aphorism—'*Pectus est quod facit theologum.*' The most striking characteristic of his great work is its objectivity in the portrayal of persons and the movement of events; its greatest merit is the admirable biographical skill with which the figures are made to pass before the reader; its one defect, the weakness with which the outstanding separate figures are fitted into their relation to the general movement of the history.

Neander's works, in the order of time, are monographs on Julian and his times (1812), St Bernard (1813), the Gnostics (1818), St Chrysostom (1822); *Denkwürdigkeiten aus der Geschichte des Christenthums und des Christlichen Lebens* (1822; 3d ed. 1845-46); *Antignosticus* (1826); the great *Allgemeine Geschichte der Christlichen Religion und Kirche* (6 vols. 1825-52); *Geschichte der Pflanzung und Leitung der Kirche durch die Apostel* (2 vols. 1833; 4th ed. 1847); *Das Leben Jesu Christi*, written as a reply to Strauss's work (1837; 5th ed. 1853); *Wissenschaftliche Abhandlungen* (1851); *Geschichte der Christlichen Dogmen* (1856). Most of these works are accessible in good English translations. See the studies by Hagenbach (1851), Otto Kraabe (1852), J. L. Jacobi (1882), and Adelbert Weigand, the last with a good bibliography appended (1889).

Neanderthal, a wildly romantic valley between Düsseldorf and Elberfeld in Rhenish Prussia. In a limestone cave in this valley was found in 1857 the skeleton of a prehistoric man, and the peculiar formation of the skull induced several archaeologists to regard it as typical of a separate race of ancient cave-dwellers. Other authorities explain the abnormality as caused by disease during the lifetime of the individual.

Neap-tides. See TIDES.

Nearchus, an officer of Alexander the Great, was a native of Crete, who settled in Amphipolis during the reign of Philip, and became the companion and friend of the young prince Alexander.

In 330 he was governor of Lycia and other provinces in Asia Minor. In 329 B.C. he joined Alexander in Bactria with a body of Greek mercenaries, and took part in the Indian campaigns. Having built a fleet on the Hydaspes, Alexander gave Nearchus the command of it. He left the Indus towards the end of November 325, and, skirting the coast all the way, arrived at Susa, in Persia, in February 324. His own narrative of his voyage has been preserved in the *Indica* of Arrian, the best edition of which is printed in C. Müller's *Geographi Græci Minores* (Paris, 1855).

Nearctic. See GEOGRAPHICAL DISTRIBUTION.

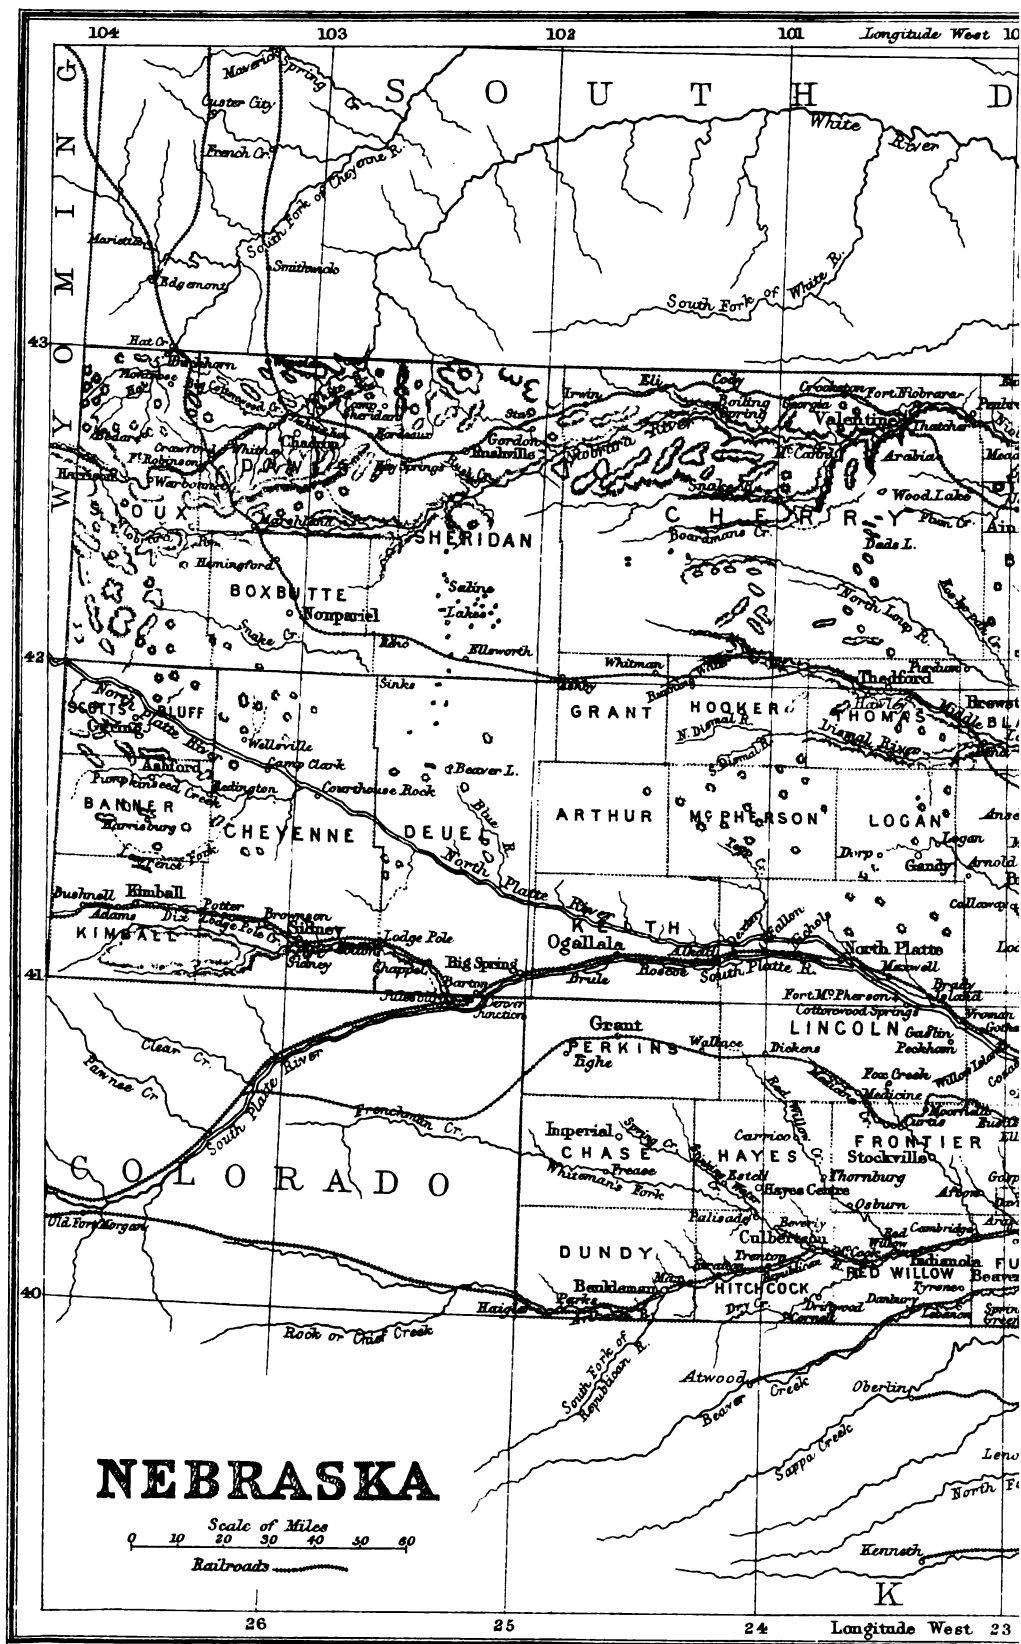

Neath, a parliamentary and municipal borough and river-port of Glamorgan, South Wales, on a navigable river of the same name, 8 miles ENE. of Swansea by rail. It is believed to stand on the site of the Roman station *Nidum*; and near it are the remains of an ancient castle, burned in 1231, and ruins of Neath Abbey, described by Leland as 'the fairest abbey in all Wales,' but now sadly decayed and begrimed by smoke and coal-dust. There are at Neath, which is one of the Swansea boroughs, extensive copper and tin-plate works and iron-foundries, and chemicals are manufactured. Neath is one of the Swansea district boroughs. Pop. (1851) 5831; (1881) 10,447; (1891) 11,157.

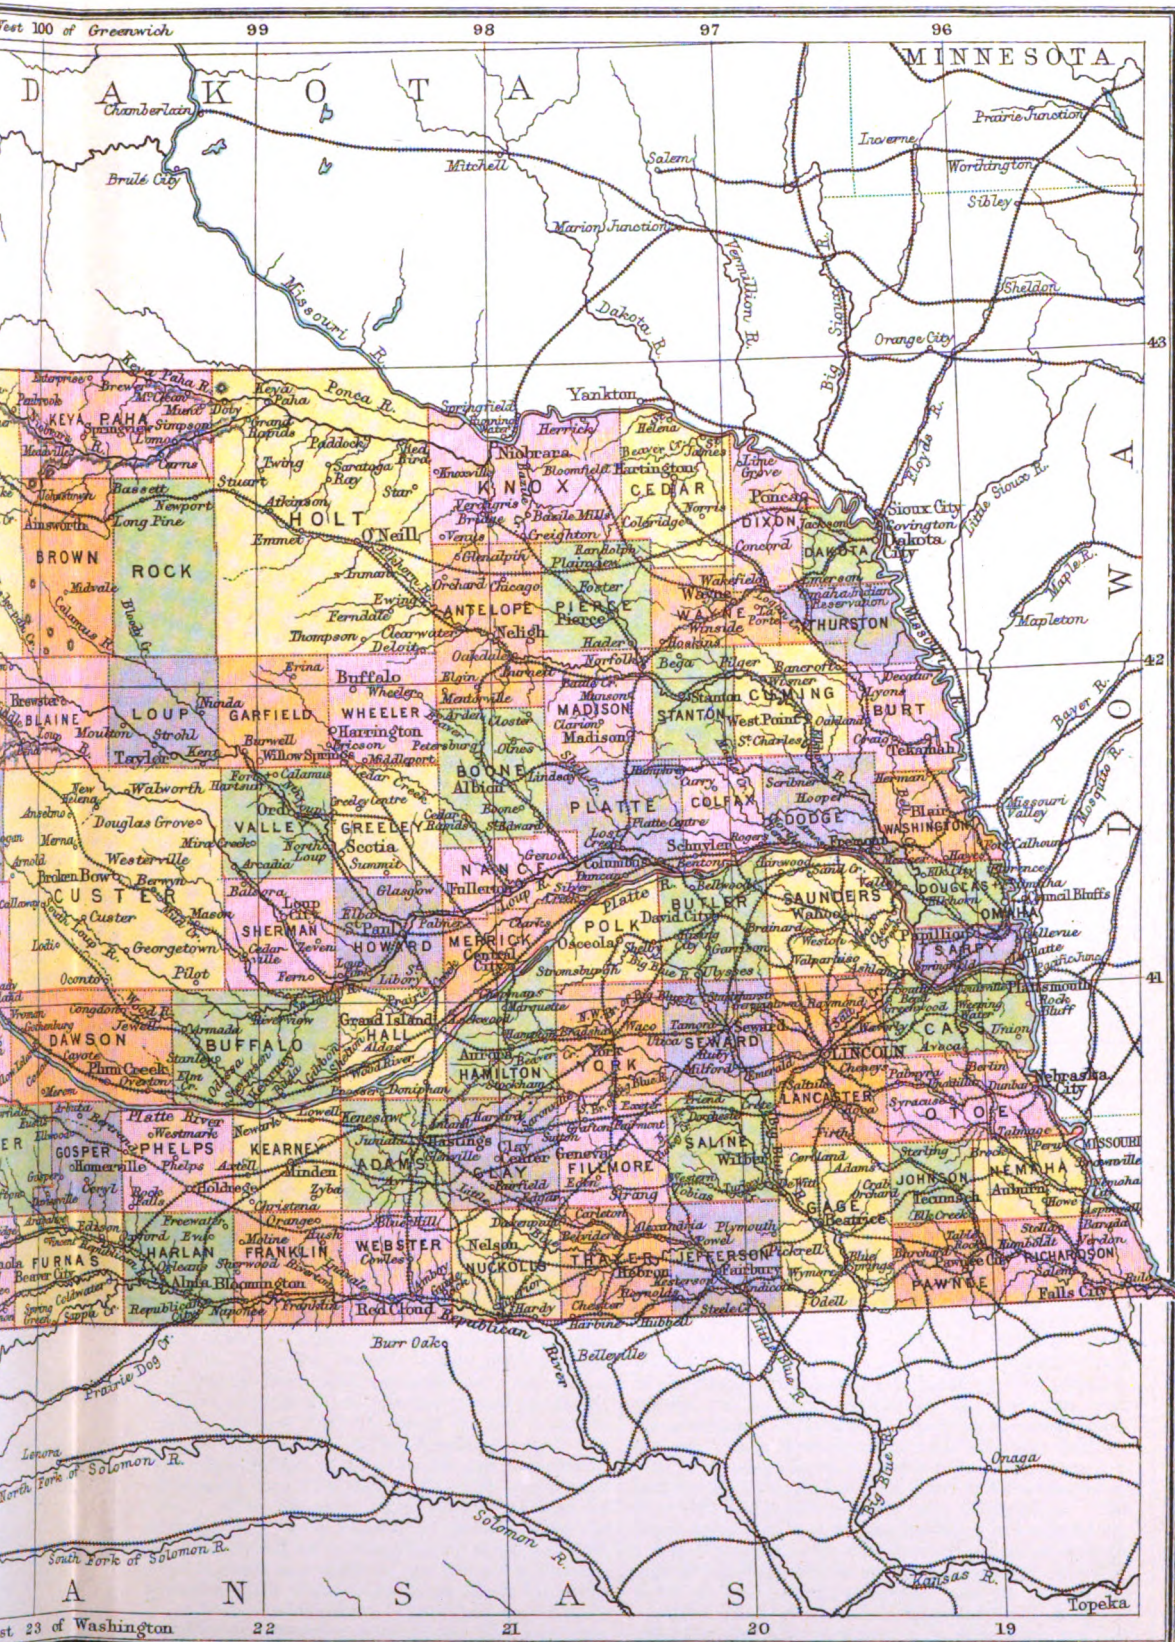

Neat's-foot Oil is, as the name implies, an oil obtained from the feet of the common ox, either by splitting them up and boiling them over an open fire, or by treating them with superheated steam in a closed cylinder. See OILS.

Nebo. See ABARIM.

Nebraska, one of the central states of the American Union, and the eleventh in area, lies between 40° and 43° N. lat., and Copyright 1891 in U.S. by J. B. Lippincott Company. in 95° 23'—104° W. long., and is bounded by South Dakota, Iowa (separated by the Missouri River), Kansas, Colorado, and Wyoming. Area, 76,855 sq. m., of which one-fifth is in improved farms. The surface is chiefly an elevated, undulating prairie; it is very level in the eastern and southern portions, but in the north and west the 'Bad Lands' extend into the state, while to the north of the Niobrara River there are great sandhills, composed of pebbles, gravel, and sand, covered for the most part with a sparse vegetation. The average elevation of the state rises from about 1200 feet in the east to 6000 feet towards the western border. The principal rivers are the Platte, Niobrara, and Republican, all flowing east. The atmosphere is dry and invigorating, and, though great extremes of heat and cold are sometimes experienced, they are not usual. There are few swamps and marshes. The total rainfall in 1889 was 21.83 inches, the mean temperature 51.25° (range, from 94° above to 17° below zero). Buffalo and antelope are still, though seldom, seen; but the coyote, large timber wolf, fox, skunk, rabbits, &c. abound.

The soil of Nebraska, except in the Bad Lands and sandhills, is mostly a rich black mould, 2 to 8 feet in depth. The staple crop is maize, of which enormous quantities are grown. Tobacco and the sugar-beet also are cultivated successfully; of the latter the first very large crop was raised in 1890, but already there are a number of factories established for the manufacture of beet-sugar, one at Grand Island turning out 250 barrels a day. The returns of agricultural products in 1889 show (in bushels): maize (3,945,500 acres), 144,217,000; oats, 38,951,434; wheat, 14,508,000; rye, 6,966,625; barley, 4,074,925; flax, 610,371; potatoes, 11,372,941; while 34,000 acres were under buckwheat, and 54,556 under miscellaneous crops. The uncultivated lands yield great quantities of hay, and Nebraska holds a good place among the stock-

raising states; in 1889 it had, besides sheep, horses, and mules, 1,677,343 of cattle and 1,802,897 hogs.

While there are numerous factories in the eastern and southern parts of the state (there are nearly 200 in Omaha, and 120 in Lincoln), the manufacturing industry is of much less importance than agriculture. The articles produced include agricultural implements, vitrified brick for paving, woollen clothing, soap, and the beet-sugar already referred to; while in a dozen towns canning factories are in operation. The ever-changing current and dangerous sand-bars of the Missouri do not encourage commercial intercourse by river; but the trade by rail (5000 miles open in 1890) is very heavy. Omaha and Lincoln are ports of entry.

Nebraska has forty universities, colleges, and academies; and the public schools (6020 in 1890, with 240,300 pupils in attendance, and 9029 teachers) are liberally provided for. The state and private charitable institutions also are numerous. The state receipts for 1888 were \$4,236,525, the expenditure \$4,244,583. The assessed valuation of real property in 1890 was \$115,360,973 in lands and \$31,553,144 in railroads. Pop. (1860) 28,841; (1880) 452,402; (1890) 1,058,910. The principal cities are Omaha (140,452 in 1890), Lincoln, the capital (55,154), Beatrice, Hastings, and Nebraska City.

History.—Nebraska was included in the Louisiana Purchase, and was for many years a part of the North-west Territory. The way was prepared for settlers by the overland emigration to California in 1849. Nebraska territory was organised in 1854, with an area of 351,558 sq. m.; it extended north of British America, and west to the Rocky Mountains. But of this vast area great portions were afterwards carved out for Colorado, Dakota, and Idaho. Nebraska became a state in 1867.

Nebraska City, capital of Otoe county, Nebraska, is on the west bank of the Missouri River, 74 miles below Omaha (44 by rail). It contains the Nebraska College (Episcopal, 1863), the Academy of the Annunciation, an elevator, and a number of mills and factories. Pop. (1890) 11,494.

Nebraska River. See PLATTE.

Nebuchadnezzar. See BABYLONIA, I. 634.

Nebulæ are cloudy patches of light in the heavens. Some, as those in Andromeda and Orion, are visible to the naked eye, but the greater number can only be seen in telescopes of considerable power. Before the invention of the Spectroscope (q.v.) they were for a time all considered to be star-clusters. This instrument has shown that these clusters, which appear as nebulae in small telescopes, are totally different in constitution from nebulae proper (see STARS). Halley in 1716 gave a small list of 6 nebulae, but the chief workers in this field are Messier, who in 1784 catalogued 103; Sir W. Herschel, who alone discovered more than 2500; and Sir J. Herschel, who added to them more than 2000. These lists, however, include many star-clusters. Nebulae proper have been classified as (1) annular, (2) elliptic, (3) spiral, (4) planetary, and (5) nebulous stars. These various forms do not indicate *specific* differences, but rather result from (1) the various presentation of their edges and surfaces to the spectator, and (2) their differently condensed material. For example, the elliptic nebula in Andromeda has been shown by photography to consist of a spiral, or a congeries of rings, exhibiting thus in itself the marks of the first three classes. Planetary nebulae show faint discs, often bluish in colour, whose structureless appearance is probably only due to our imperfect telescopes. The spectrum of nebulae consists usually of a few bright lines indicating their gaseous structure. To what gases

these lines belong is still uncertain, although they have been attributed to nitrogen, hydrogen, and magnesium vapour. In a few cases, as in a small nebula in Taurus and the great one in Orion, their light certainly varies in intensity, and they are sometimes associated with variable or temporary stars. They form, according to the theory of Laplace and Sir W. Herschel, the earliest stage in the formation of stars and planets. Though certainly not yet proved, this *nebular theory* is very generally accepted, and has been greatly strengthened by Lockyer's recent spectroscopic researches.

Necessaries. See INFANT.

Necessity may be *natural*, according to the laws of nature; *logical* or *mathematical*, according to the laws of human intelligence; *moral*, according to moral law. See CAUSALITY, LOGIC, ETHICS, KANT, EMPIRICISM. Necessity, Necessitarianism, or Necessarianism, is also a name for the view that denies the freedom of the will. See WILL.

Neches River rises in eastern Texas, and flows about 350 miles SSE. to Sabine Lake, its waters passing thence by Sabine Pass into the Gulf of Mexico.

Neck. See SPINAL COLUMN, THROAT.—Of diseases of the neck, STIFF-NECK is the term commonly applied to a condition of the neck in which lateral movement of the head causes great pain, and which is due to rheumatism of the muscles lying on the side of the neck, especially the sternomastoid. In the great majority of cases only one side of the neck is affected, the head being drawn more or less obliquely towards that side; but occasionally both sides are equally attacked, in which case the head is kept stiffly erect and looking straight forwards. As long as the head is allowed to remain at rest there is merely a feeling of discomfort; but every movement is extremely painful. This affection is usually caused either by exposure of the part affected to a current of cold air, or by wearing wet or damp clothes round the neck (see RHEUMATISM).—*Derbyshire Neck* is a synonym for Goitre (q.v.).—For Necks in geology, see IGNEOUS ROCKS.

Neckar, one of the largest tributaries of the Rhine, and the principal river of Württemberg, rises on the eastern declivity of the Black Forest, near the village of Schwenningen. It has a winding course of 250 miles, and joins the Rhine at Mannheim—the other towns on its banks being Tübingen, Heilbronn, and Heidelberg. From Cannstadt, about midway in its course, the Neckar is navigable. Fair wines are grown on its banks.

Necker, JACQUES, a famous financier and minister of France, was born 30th September 1732, at Geneva, where his father, a native of Küstrin in Pomerania, had become professor of Public Law. At fifteen he went to Paris as a clerk to the banker Vernet, and in 1762 established the famous London and Paris bank of Thelluson and Necker. His public career commenced with his becoming a syndic of the French East India Company, as well as minister for the republic of Geneva at Paris, and with his marriage (1764) to the charming, accomplished, and ambitious Suzanne Curchod, who was born in 1737, the daughter of a pastor near Lausanne, and had loved Gibbon for five years with a constancy of which his colder temper was not worthy. The rich banker had first wooed Madame de Verméneux, a wealthy young widow, who scrupled at her suitor's lack of nobility, but he easily transferred his affections to her young protégée, and he proved till death an affectionate and faithful husband. She was religious and above reproach in character, yet her *salon* became a centre of all the intellect of Paris, and her Fridays drew together such celebrities

as Grimm, Diderot, the aged Buffon, Marmontel, Thomas, D'Alembert, and the Abbé Galiani. In 1773 Necker gained the prize of the French Academy for an *éloge* on Colbert, and in 1775 he distinguished himself still further by his *Essai sur le Commerce des Grains*, in answer to the free-trade policy of the great Turgot, in which he claims for the state the right of fixing the price of grain and, if necessary, of prohibiting its exportation. Already also he had lent money to the needy government when in 1776, Protestant as he was, he was made Director of the Treasury and next year Director-general of Finance. He devoted five years of hard work to his hopeless task, and, if he showed no great statesmanlike foresight, he proved himself an honest, prudent, and sagacious minister. Indeed, some of his remedial measures were a real boon to suffering France, as his more equitable adjustment of taxes, his establishment of state-guaranteed annuities and *monts de pitié*. But his most ambitious scheme—the establishment of provincial assemblies over all France, one of the functions of which should be the apportionment of taxes, proved a disastrous failure. His retrenchments were hateful to the queen, and the publication in 1781 of his famous *Compte Rendu*, a plain statement of the financial state of France, was promptly made the occasion for his dismissal. He retired to Geneva, carrying with him the respect of all Frenchmen; and here he busied himself with writing, and married his only daughter in 1786 to the Swedish Baron von Staël-Holstein. In 1787 he returned to Paris, and when M. de Calonne at the opening of the Assembly of Notables in that year cast a doubt on the truth of the *Compte Rendu*, he published a justificatory minute, which drew upon him the king's displeasure and his banishment to a distance of forty leagues from Paris.

He was recalled to his former office in September 1788, and quickly made himself the popular hero of the hour by recommending the summons of the States-general. But the successful banker was infatuated with his popularity, and quickly proved himself unfit to steer the ship of state amid the storms of revolution, while his constitutional irresolution in the hour of danger drew the well-meaning king into the fatal error of being forced into recognising the union of the three estates, instead of taking the lead in freely granting what was inevitable. On the 11th July, while sitting at dinner, he received the royal command to leave France at once, but the fall of the Bastille three days later frightened the king into recalling him amid the wildest popular enthusiasm. But now his incompetence for greater matters than accounts was at length fully discovered, and after with fatal obstinacy spurning the help of Lafayette and Mirabeau, and leading the king to surrender his suspensive veto and the Assembly to stultify itself by a self-denying ordinance that ministers should not be chosen from its members, which made a really responsible parliamentary government in France impossible, he finally laid down his office unnoticed and without regret, after the carrying of Mirabeau's scheme for relieving immediate financial distress by the issue of *assignats*, September 1790. He retired to his estate of Coppet near Geneva, and here his wife died, 6th May 1794, while he himself, after publishing books which had no longer any importance, followed her on 9th April 1804.

The only other works that need be named are *De l'Administration des Finances de la France* (3 vols. 1784), *Sur l'Administration de M. Necker, par lui-même* (1791), *Du Pouvoir exécutif dans les Grands États* (2 vols. 1792), *De la Révolution Française* (last ed. 4 vols. 1797), and *Dernières Vues de Politique et de Finance* (1802). A collected edition was edited by his grandson (15 vols. 1820-21). See also the *Manuscrits de*

M. Necker, published by his daughter in 1804; and for his life, her work, *La Vie privée de M. Necker* (1804), and his grandson's *Notice sur la Vie de M. Necker*, prefixed to the collected edition of his works. Five volumes of *Mélanges* from his wife's journals and papers were printed (1798-1802). The story of her life is charmingly told, from the papers preserved at Coppet, in the Comte D'Haussonville's work, *Le Salon de Madame Necker* (2 vols. 1882; Eng. trans. 1882).

Necklace, DIAMOND. See DIAMOND NECKLACE.

Necromancy, an ancient mode of divination by conjuring up the spirits of the dead to give answers about the future. A classical example is the Old Testament story of the witch of Endor. The eleventh book of Homer's *Odyssey* bears the title of *Nekromanteia*, and in it the shade of Tiresias is brought up and consulted by Ulysses. In most parts of Greece necromancy was practised by priests or consecrated persons in the temples; in Thessaly it was the profession of a distinct class of persons called Psychagogoi. See DIVINATION, and MAGIC.

Necropolis, a Greek term, meaning 'the city of the dead,' and applied to the cemeteries in the vicinity of ancient cities. It occurs in classical antiquity only as applied to a suburb of Alexandria, lying to the west of that city, where the corpses were received and embalmed. Here Cleopatra applied the asp to her breast. See CEMETERY.

Necrosis (Gr. *nekros*, 'dead') is a term employed to denote the death or mortification of bone, but often restricted to the cases in which a considerable part of the shaft of a long bone dies, either directly from injury or from violent inflammation, and is enclosed by a layer of new bone; the death of a thin superficial layer which is not enclosed in a shell of new bone being usually termed *exfoliation*, and the more gradual destruction of cancellous tissue *Caries* (q.v.). The bones of the lower extremity—the femur and tibia—are those which are most frequently affected by necrosis, but any bone may be the seat of the process. The jawbones, however, very often suffer from it in persons engaged in making lucifer matches, the disease being induced by the pernicious action of the vapour of phosphorus. The more general use of red or amorphous phosphorus for this purpose has rendered necrosis of the jaws much less common. The dead bone, known as the *sequestrum*, presents a rough appearance, as if worm-eaten. If the membrane investing the bone (the periosteum) remain healthy, it deposits lymph, which speedily ossifies, forming a shell of healthy bone, which completely invests the dead portion. The essential point in the treatment is the removal of the *sequestrum*, which is too purely a surgical operation to be described in these pages.

Nectar, the name given by Homer, Hesiod, Pindar, and the Greek poets generally, and by the Romans, to the beverage of the gods, their food being called *Ambrosia* (q.v.). But Sappho and Alcman make nectar the food of the gods and ambrosia their drink. Homer describes nectar as resembling red wine, and represents its continued use as causing immortality. By the later poets nectar and ambrosia are represented as of most delicious odour; and sprinkling with nectar, or anointing with ambrosia, is spoken of as conferring perpetual youth, and they are assumed as the symbols of everything most delightful to the taste.

Nectarine. See PEACH.

Nectary, in Botany, an organ in the flowers of many phanerogamous plants, devoted either to the secretion or the reception of honey. Of the former kind are nectariferous glands, scales, and pores; of the latter, tubes, cavities, &c.

Need-fire. See FIRE, Vol. IV. p. 630.

Needle-gun. See BREECH-LOADING, RIFLE.

Needles. The sewing-needle must be one of the oldest implements used by man. Bone needles with eyes are found in the reindeer-caves of France, and among the finds on the sites of the prehistoric lake-dwellings of central Europe there are numerous 'eyed' needles of bone and of bronze, but as yet only a single one of iron appears to have been discovered. Ancient bronze needles, $3\frac{1}{2}$ inches long, have been found in Egypt, and there are surgeon's needles and thimbles which have been used in sewing with ordinary needles from Pompeii in the Naples museum. Savage races use needles of various materials, such as bone, ivory, wood, and metal. Some tribes do their sewing with awls of bone or of thorns with which they make holes, and then by pushing and pulling work the thread or string through them in the same manner as a shoemaker does. The Fuegians in sewing skins even make a tie at every hole. The Kaffirs make needles of iron or steel, with a constriction under the pin-like head, round which the end of the thread is tied instead of being passed through an eye.

Steel needles were made in 1370 at Nuremberg, at which early time its artisans were skilled in working metals, including the drawing of wire in iron, steel, and brass. Previous to 1563 the wire used for making needles in England was imported from Spain and Germany, but in England the manufacture was not of much importance till about 1650. The early-made needles were all square-eyed. The seat of the needle-manufacture in Great Britain is at Redditch near Birmingham, where in the best factories considerable improvements have in recent years been effected by the adoption of new mechanical appliances, and especially of automatic machines in some of the processes.

In the system of processes, about twenty-two in number, by which needles are now made, the first is the cutting of the coils of wire into two-needle lengths by a guillotine shearing-machine. The wire is of the best crucible steel, and requires to be very carefully gauged to size. After being cut, the lengths of wire are raised to a dull red heat and placed in loose bundles inside iron rings to be straightened by rolling each bundle backwards and forwards on a face plate with a slightly curved bar,

Fig. 1.

through which the rings project (see fig. 1). The wires are next pointed at both ends, which was formerly entirely done by hand on a grindstone with a concave surface. An arrangement is now in use by which the wires are withdrawn—one closely following another—from a hopper by a pulley revolving at right angles to the grindstone, the wires being held to the face of the pulley by an india-rubber band. In their passage between the pulley and the grindstone the wires (double-needle blanks) revolve on their axes and become pointed at one end, and the process is repeated for the pointing at the other end. The fine steel dust formerly so injurious to the health of the hand-grinders has for some years been drawn away from the operative by the suction of a strong current of air. The stamping of these two-length blanks in the middle by the hand-worked

stamping-machine so as to produce the flat of the eyes and the mark for the holes (fig. 2), as well as the punching of the holes by a screw press, can now be accomplished by more expeditious machines.

Fig. 2.

By the newer method the wire blanks are automatically fed into a quick-running belt-driven machine, in which a punch and dies form the prints or flats for the eyes. The next operation consists in punching two oval holes through the two prints of each blank by a vertical belt-driven punching-machine. After being eyed the still double blanks—they are now rather double needles joined at the heads by thin fins—are 'spitted' through their eyes on two wires flattened at one end to retain them. The burr made by the punch and die (stamping) is now removed by filing the spitted needles on both sides, and after being broken in two between the heads, which are then also smoothed by filing; a row of single needles is left on each spit, as shown in fig. 3.

Fig. 3.

In the tempering process which the needles undergo at this stage, they are first hardened by being laid on a plate and raised to a red heat in a furnace, after which they are dipped in cod-oil, kept cool by running off a portion as it gets warm and replacing it by an equal quantity of cold oil. The needles being now hard and easily broken, are made less brittle by placing them on a continuous band of wire gauze which travels slowly over gas flames. The next step is to roll the needles one by one under the finger on a smooth stone, and thus weed out those that are bent. In parcels of 50,000 they are next washed and scoured with soap to remove any of the oil used in tempering which still adheres, and the eyes are afterwards 'blued' to soften them. In the case of needles of fine quality the eyes are gilt. By one method the eyes are polished by threading them loosely on wires carried by standards fixed to a tray or platform which is moved rapidly with a reciprocating motion in a horizontal plane. In about one hour, with the assistance of a little fine emery and oil, the constant swinging of the needles on the wire smooths their eyes so as not to cut the thread. But the eyes of the best needles are hand-polished with fine emery on flax threads. The next step is to grind the heads and set the points by hand on a rapidly-revolving stone of fine texture.

An ingenious machine is employed for the final polishing of the shanks. The needles are fed in a longitudinal direction, in rows one deep, between transverse leather-covered rollers, with holding rollers above them. Besides turning on their own axes, a lateral as well as a backward and forward motion is given to the rollers, which produces a high polish on the needles. The older method of polishing needles is to put many thousands of them along with putty powder and oil in a canvas bundle wound round with a cord. A number of these rolls or bundles are then placed between two wooden slabs—the upper one heavily weighted—and made to roll backwards and forwards in a polishing-machine for several hours. When taken out of the canvas and the polishing material adhering to

them removed with soap and water, the needles have a bright polish. It should be said that by this process, before the needles are thus rolled with putty powder and oil, they are previously rolled in a similar way with sand and emery-powder. After receiving a high polish the needles are not touched again by hand before leaving the factory, in order to prevent rust.

The needles now require to be laid with their heads in one direction. A gun-metal disc revolving vertically takes up each needle by a groove in its periphery, and lets it fall on an inclined glass plate. Owing to the taper form of the pointed ends of the needles they describe an arc in revolving, so that those with the points in one direction roll to the right and the others fall round to the left. The finished needles, although intended to be of the same size, always differ to some extent in their lengths, so that those of exactly one size require to be separated from other lengths by the sorting process, in which gauges are used. Lastly, the needles are papered either by being spitted on cloth pasted to paper, or by being made up into small packets, in which case the bits of paper are cut and folded in a machine like that used for envelope-making.

It is estimated that about 50 millions of needles and articles akin to them are made weekly in the Redditch district. These are of many sorts and sizes, including large needles for sewing canvas and such special kinds as are used for upholstery, surgical, and some other purposes. Recently a grooving machine has been used in the manufacture of sewing-machine needles instead of the old stamping process. See the *Engineer*, vol. lxii. p. 224 (1886); and the volume on the Birmingham trades in Bevan's *British Manufacturing Industries*.

Needles. See WIGHT (ISLE OF).

Needlework. See BAYEUX TAPESTRY, EMBROIDERY, LACE, and TAPESTRY.

Neerwinden, a small village in the north-west corner of the Belgian province of Liège, is noted for the victory gained by the French under Luxembourg over the English under William III. (29th July 1693), and also for the defeat of the French under Dumouriez by the allies under the Prince of Coburg (18th March 1793).

Ne Exeat Regno is the title of a writ issued by a superior court to prevent an individual leaving the kingdom, unless he gives security to abide a decree of the court.

Neff, FELIX, a Protestant pastor, born at Geneva, 8th October 1798, was in his twenty-sixth year ordained, in England, to minister to the neglected inhabitants of the lofty Alpine valleys in the east of the department of Hautes Alpes. His parish was a most difficult one to minister to, owing to its mountainous nature and great extent (80 miles long), and the uncivilised character of the people. But with unwearied devotion and simple piety Neff laboured amongst them like his chosen model, Oberlin (q.v.), until his death, 12th April 1829. See Memoir by W. S. Gilly (1832), and *Letters and Biography* (trans. from French of Bost, 1843).

Negapatam, a seaport of British India, on the Coromandel coast, 180 miles S. by W. of Madras city. Originally a Portuguese settlement, it was taken by the Dutch in 1660, and by the English in 1781. The port trades in cottons, live-stock, ghi (exported), and spices, piece-goods, coal, gunny bags (imported), to the total annual value of £904,400, chiefly with Burma, the Straits Settlements, and Ceylon. Pop. (1881) 53,855.

Negligence. See LIABILITY OF EMPLOYERS.

Negritos is the name given by the Spaniards to certain Negro-like tribes inhabiting the interior

of some of the Philippine Islands, and differing both in features and manners from the Malay inhabitants of the Eastern Archipelago. They seem to be more closely akin to the Andaman Islanders than to either Papuans or any other stock; and are also known as Aëtas or Itas (see PHILIPPINE ISLANDS). The name is also used in a wider sense for the Papuans and all the Melanesian peoples of Polynesia (q.v.). For certain negroid African peoples, see ETHNOLOGY.

Negroes. The negro and negroid people at home are dealt with at AFRICA and ETHNOLOGY. In America the word negroes is Copyright 1891 in U.S. used for all of African descent, by J. B. Lippincott whether of the true negro or of Company.

Bantu stock. The total number of negroes of pure or mixed blood in America has been recently estimated as somewhat above twenty millions, of whom about one-third are in the area of the United States. Their importation has been going on steadily since the early years of the 16th century, when it was begun by the Spaniards, even the good Las Casas recommending it in the interest of the native Indians. Both Queen Elizabeth and King James I. issued patents to English slave-trading companies operating between the coast of Guinea and the American colonies. England, by the treaty of Utrecht (1713), engaged to carry out the contract of the old French Guinea Company, and to import into the New World 130,000 slaves in the course of the next thirty years, and is said to have more than made good the engagement. In the United States the traffic was open and active until the passage of the Act of 1794 prohibiting the importation of slaves into any of the federal ports. Long after this it continued to be a brisk business in the West Indies and South America. As late as 1840 there were seventy-five ships plying constantly between Brazilian ports and the African coast, bringing cargoes of 300 or 400 slaves at each trip. The principal points at which the slaves were obtained were along the coast of Guinea, especially on what was known as the Slave Coast, between the rivers Lagos and Assinie, where were the crowded marts of Waidah and Anamaboe, and again along the Angola coast, from 8° to 18° S. lat. In these two regions the traders encountered two quite different branches of the African race, and their human wares in America show that they were derived from different sources. Along the Guinea coast, whence most of the slaves brought to the United States were derived, the population belongs to the true negro type. As most of the coast tribes enriched by the traffic did not sell their own members, but obtained the slaves from the interior by capture or purchase, we do not find traces of the Fans, Ashantis, or Dahomis in the negro population of our country, but well-marked characteristics, both linguistic and anthropologic, of the interior tribes, especially of the extensive Mande or Mandingo stock. Such words as *Juba* and *Obi* are traced to this stock, and a method of counting in use among the negroes of Maryland about the beginning of the 19th century proved to be derived from the Mandingo numerals. In Brazil and other parts of South America the preponderance of importations was from the negroid stock south of the equator, whose dialects and physical traits are allied to those of the Kaffirs and Zulus of the east coast (Bantus). The slaves in all parts, however, being from mixed stocks, their descendants do not present any well-marked anthropologic peculiarities inside those of the race. As a rule, they are in strength equal to the whites, and in endurance of exposure and labour under a tropical sun are superior to all other immigrants. The experiment was officially tried in British Guiana to ascertain

the relative working powers in field labour of negroes, Chinese, and East Indian coolies. The negroes performed twice as much labour as the coolies and a third more than the Chinese, although the latter were the most intelligent in their work. It is usually held that the negro is not naturally industrious; but this seems to some extent answered by the severe field labour of many tribes, both men and women, in their native continent, and by the official reports of the United States government showing a greater acreage of land under cultivation in the former slave states and a larger crop of cotton than before the civil war. When under the control of a strong social organisation, and with obvious motives for industry and economy before his eyes, the American negro is both industrious and provident, and the instances are numerous where members of the race have accumulated fortunes of respectable size. Their viability appears on the whole to be about the same as the whites, except in the more northern states, where it is unquestionably much less. Thus, according to the census of the United States in 1880, the total average annual mortality of the white male population was 15·08, while that of the black population was 17·19, a showing which might fairly be attributed to difference of social position and consequent more careful observance of hygienic laws by the whites; but in the northern states of the Union there was a contrast which could not be so explained, but must be attributed to an inability of the African to withstand the cold of a high latitude. The proportion of deaths per thousand was as follows:

	Whites.	Negroes.
Connecticut.....	15	22·41
Dakota.....	8·8	25·89
Massachusetts.....	19·06	24·41
New Hampshire.....	16·23	26·5

Apart from this official testimony, it has long been matter of common observation that in New England and Canada the negroes gradually but surely perish. The diseases to which they are especially subject are those connected with the organs of respiration, as pneumonia, tuberculosis, pleuritic affections, and bronchitis. On the other hand, in the south they are less subject to malarial diseases, to yellow fever, to hepatic derangement, and to sunstroke than the white population. It is generally conceded that they are not so liable to acute alcoholism (delirium tremens) as the whites, which may be attributed to the inferior susceptibility of their nervous systems. The special senses are usually acute and correct: colour blindness is four times commoner among whites than with negroes, and the vocal powers of the latter are perceptibly greater. From a number of autopsies of adult males carried out during the civil war, it results that the lungs are relatively smaller and the liver larger than in the whites. The assertion has been made that the average weight of the brain in the negroes of the United States is greater than that of the true African negro; but repeated dissections tend to disprove this statement. No change whatever has been observed in the colour of the African in any part of America so long as the blood has been unmixed. Observations conducted in Guiana, however, would seem to show that the hair may undergo some alteration, rendering it slightly less woolly; and it is stated positively that the odour peculiar to the negro is not found in the wild negroes of that country who have for generations lived apart in the woods. This is certainly not the case in the negroes of the United States, and it is likely that the Guiana tribes are descendants of negrooids from Angola, who have little or none of the odour of the true negro of the Soudan. There is a prevalent opinion that in-

stances of uncommon longevity are more frequent among the coloured than the white population; and according to some statistics which have been published, the number of centenarians of this race in the southern United States in proportion to its membership is a hundred times that of the French! The explanation of this is simply that old negroes very rarely know their own age and love to magnify it; in other words, no dependence is to be placed on the statistics. There is no evidence of exceptional longevity among them.

The change from one continent to another does not appear to have reduced the fecundity of the race, which, it is well known, stands at a high mark in Africa. It has been calculated that in the United States at present the white race increases annually at the rate of 2·9 per cent., while the coloured population, including all shades, increases 3·4 per cent. This preponderance much more than makes up for the slightly higher death-rate. It is, however, not directly attributable to a greater natural fertility, but to the fact that a coloured woman very rarely remains unmarried, and does not avoid offspring.

The disposition of the negro is usually pacific and cheerful. He is not easily depressed by poverty or thoughts of the future. Content that his immediate wants are provided for, he rarely prepares for a distant contingency. Eminently gregarious in his instincts, he is usually to be found in certain streets and quarters of the town exclusively occupied by members of his own race. His interest in the past is weak, and few or no reminiscences of his ancestral languages, traditions, superstitions, or usages have been retained. His religion is emotional, and exerts but a moderate influence on his morality. Frequently it is associated with superstitious beliefs and rites known as Voodoo or Obi mysteries. It is believed by some that these are relics of the fetichistic worships of equatorial Africa, but the connection has never been demonstrated; on the contrary, the tales of the sacrifice of children, of ritual cannibalism, and of obscene ceremonies alleged to prevail in Hayti, and to a less degree among the negroes of other parts of America, have been shown by W. W. Newell to rest on very doubtful authority, and, if they occur at all, are the actions of a very few superstitious fanatics. The word *Voodoo*, or, as usually pronounced in the United States, *Hoodoo*, is a Creole form of the French *Vaudois*, and is etymologically derived from the period of the persecution of the Vaudois or Waldenses, who were represented by their opponents as sorcerers and necromancers, whence the name *Vaudois* came to be synonymous with 'witch' or 'wizard.' By a similar Creole French corruption the word *Wanga*, which among the negroes of Louisiana and Hayti means a philter or charm, and as a verb, 'to bewitch,' is, in spite of its African physiognomy, the French *Onquent*, an ointment or salve, such preparations being currently believed to possess magic powers. It is argued, therefore, that both the words and practices are of European origin. Nevertheless, it is unquestionably true that among the negroes both of the West Indies and the United States there is a widespread faith in charms, philters, and fetiches. In the latter country the employment of these means to cast an evil spell upon, or, as it is called, 'to cunjer' (to conjure), a person is familiar to every one at all acquainted with the folklore of the coloured people. The maleficent influence can be exerted by obtaining something belonging to the victim and doing some injury to it, or by securing a little of his blood, or by burying certain roots in the path where he is accustomed to walk, or by scattering brown paper before the door of his

house, or in many other ways. In the West Indies an Obi bottle is often hidden in the house or goods of an enemy. It is filled with pins, rags, pebbles, small sticks, leaves of certain plants, &c. The result is often successful; for a negro who believes himself 'cunjer'd' will refuse food, and sink into the profoundest dejection, resulting occasionally in death. That a serpent or snake plays any prominent part in these Obi rites, as has often been stated, does not appear confirmed. Nor is it a prominent figure in the stories and folk-tales of the race in America. These fictitious narratives are very numerous, the negro being a tireless talker and raconteur. Many of them reveal a high stage of the art of story-telling, as the Georgia tales collected by J. C. Harris and Colonel C. C. Jones, and numerous others from the southern states by various writers. Many of them belong to the class of 'beast-fables,' similar to some which have been collected among the American Indians and the natives of the African continent, and such as were favourite staples of amusement in Europe during the middle ages. One of the principal figures is the rabbit (the 'brer rabbit' of the 'Uncle Remus' tales). He figures conspicuously not only in the southern United States, but in the West Indies and on the Amazon (Hartt), and as *tio conejo* ('uncle rabbit') in the folklore of the Venezuelan negroes (Dr Ernst). This unimportant animal also plays a leading part in the mythology of various American-Indian nations, as the Algonquins and Mexicans (Aztecs); and it appears not unlikely that its prominence in negro-American folklore was a loan from this source. Along with story-telling, singing and music are favourite diversions of the coloured population. This tendency is a direct inheritance from their African ancestry, as throughout that continent the natives are passionately fond of these diversions. In Central America the negroes still employ the *marimba*, a native African instrument with wooden keys placed over jars or gourds, the keys being struck with a stick. In the United States the violin, the fife, and the guitar are used, but the favourite is the 'banjo,' an instrument of African derivation, modified from the guitars with grass strings still in use on the Guinea coast. With these simple means they produce music of pleasant though not artistic character. In individual instances (as Blind Tom, born in Georgia in 1849) members of the race have attained remarkable skill on the piano and organ, rendering the most difficult compositions with spirit. No negro composer, however, has attained celebrity. Their songs are numerous, many of them of a religious character, others turning on the incidents of daily life. They are generally defective in prosody and without merit, being often little more than words strung together to carry an air.

The negro is ambitious for education, but unwilling to make the necessary mental effort to obtain it. In the public schools of the United States, where they are on the same footing as the white children, their progress is about equal up to the age of puberty. But after that important physical change there supervenes a visible ascendency of the appetites and emotions over the intellect, and an increasing indisposition to mental labour. The consequence is that in the higher education they fall notably behind the whites, and it is a rare exception for one of them to undertake the studies requisite for a profession; and when one does, he is content with what is barely sufficient for its remunerative practice. The social position of the members of the race in some parts of South America is little different from that of the whites. This is also theoretically the case in the United States since the civil war; but the natural sense of inequality between the two races is making itself

felt in the latter country, and they are probably now farther asunder in sympathies than they were at the close of the war, both in the northern and southern states. Many thoughtful and learned men see in the increasing coloured population a standing menace to the institutions and culture of their country, and the project has been seriously urged to deport the whole negro stock back to Africa, and prevent others from coming to the country.

See SLAVERY, UNITED STATES, BRAZIL, JAMAICA, &c.; G. W. Williams, *History of the Negro Race in America* (2 vols. New York, 1882; Lond. 1883); Blyden, *Christianity, Islam, and the Negro Race* (1887); H. J. Bell, *Witchcraft in the West Indies* (1890); W. L. Clowes, *Black America* (Times letters; Lond. 1891); and many articles in the *American Folk-lore Journal*.

Negroponte. See EUBŒA.

Negus, a compound of either port or sherry and hot water sweetened with sugar and flavoured with lemon-peel and spices. It is a favourite beverage in England, and derives its name from a Colonel Francis Negus (t. George I.).

Negus. See ABYSSINIA.

Nehemiah, who, next to Ezra, among all the men whose names have been handed down, had the most important share in the making of post-exilic Judaism, comes before us principally in certain fragments of autobiography imbedded in the canonical book that now bears his name. From these we learn that he was a Jew who had for some time held the post of cupbearer to Artaxerxes Longimanus ('King of Babylon,' xiii. 6), when, at the winter-palace of Shushan or Susa, towards the end of the year 445, he was surprised and saddened with unexpected tidings of the very unprosperous state of Jerusalem. How or when the events now for the first time reported to him had happened is not related, but the result had been to leave the city impoverished and defenceless. In the following spring (444), having obtained leave of absence from court for a limited time, and full powers to act as governor-extraordinary of Judæa, he set out without delay for the city of his fathers. The first necessity was to have the walls rebuilt; on his arrival no time was lost in taking the necessary steps, and the entire structure was completed, in the face of much opposition, within fifty-two days from its commencement (vi. 15). His next care was to reinforce the population of the depleted capital by drafts from the surrounding districts, and in particular, it would seem, to bring back to town the Levites who, through non-payment of dues, had been compelled to abandon service at the temple and give themselves to field labour throughout Judæa. Arrangements having been made for the regular support of the sacred offices, the feast of the dedication of the walls was now gone about with great pomp and joy. It is to be presumed that Nehemiah returned soon afterwards to his duties at the Persian court. We read (xiii. 6; cf. v. 14) of a second visit of Nehemiah to Jerusalem, twelve years afterwards, on which occasion he either initiated or renewed and completed certain reforms which henceforth were among the most characteristic features of post-exilic Judaism. One of the most marked of these was the crusade against mixed marriages and the separation of the Jews of pure descent from the 'mixed multitude' (xiii. 3). His cleansing of the temple, and expulsion of Tobiah from its precincts, ultimately led, it would seem, to the formation of the Samaritan community as a separate religious organisation. Another of Nehemiah's reforms was the stringent enforcement of a strict law of Sabbath observance. Others are to be found in the arrangements he made for the permanent maintenance of the temple

worship and the support of the priests and Levites. In this connection, and as bearing on the criticism of the Pentateuch, Neh. x. 32 [33] ought to be compared with Ex. xxx. 13, Neh. x. 33 [34] with Ex. xxix. 38, 39, and Num. xxviii. 3, 4; also Neh. x. 37 [38] with Lev. xxvii. 32, and Neh. x. 36 [37] with Num. iii. 12, 13. How long Nehemiah's second visit to Jerusalem lasted we are not told, nor does authentic history record the time or place of his death. In the late apocryphal book of 2 Maccabees a spurious letter, purporting to date from the year 124 B.C., is preserved, where wonderful things are told as to Nehemiah's rekindling of the sacred altar-fire by means of 'naphthar,' and it is also said (2 Macc. ii. 13) that he founded a library in which he 'gathered together the acts of the kings, and the prophets, and of David, and the epistles of the kings concerning the holy gifts.' This last statement can only be used with great caution as bearing on the history of the canon.

The canonical Book of Nehemiah originally formed the closing chapters of the undivided work, *Chronicles-Ezra-Nehemiah* (see *CHRONICLES*), for which two of the most important original sources were the highly characteristic memoirs of Ezra and Nehemiah. These have been preserved, however, only in so fragmentary and dislocated form that it is exceedingly difficult now to gather from them the true order of the events to which they relate. The book in its present shape begins (Neh. i. 1-vii. 5) with Nehemiah's account of the building of the wall and the difficulties he had to encounter. The depleted state of the city had suggested to him a census of Judæa, and in this connection is given the list of those who had come up with Zerubbabel nearly a century before (vii. 6-73 a); this list, apart from very numerous and considerable textual variations, is identical with that in Ezra ii. The reader might now expect to find a corresponding census for Nehemiah's own time, but instead of this the next three chapters give an account of the reading of the law by Ezra, the celebration of the feast of tabernacles, the fast and repentance of the people, and the solemn sealing of the covenant to observe the law. These chapters are continuous with Ezra x. In Neh. xi. the interrupted narrative is resumed, or rather the place of narrative is taken by a series of name lists (inhabitants of Jerusalem, heads of houses in Judah and Benjamin, priests, and Levites). Chapter xii. 27-43 then gives Nehemiah's description of the dedication of the walls, and the rest of the book (xii. 44-xiii. 31) consists of the account of the reforms he effected in the spirit of the covenant as contained in x. 30-39. It would seem as if the editor of *Chronicles-Ezra-Nehemiah* had before him two distinct documents relating to Ezra and Nehemiah respectively, but that into the first of these between Ezra x. 44 and Neh. vii. 73 b (originally continuous) he judged it expedient to introduce from the second a section of Nehemiah's memoirs (Neh. i. 1-vii. 5) in order to prepare the way for the mention of Nehemiah in Neh. viii. 9 and x. 1 [2]. The work mentions Jaddua, who was high priest in the days of Alexander the Great, and also Darius, the last of the Persian kings (xii. 22). It cannot, therefore, have been compiled earlier than 333 B.C., and probably it ought to be dated at least half a century later. In the gradual compilation of the Jewish canon, the Ezra-Nehemiah section of the larger book was first added to the list of authoritative writings, some account of the times subsequent to the captivity being plainly required. The need for a second history, parallel with that contained in the 'former prophets,' was not so obvious; *Chronicles*, therefore, the remaining portion of the work, was the very last to take a place among the Old Testament Scriptures.

For Nehemiah's place in the Old Testament dispensation, see the histories of Israel by Ewald, Stanley, Hitzig, Kuenen, Wellhausen, and others. Compare Reuss, *Geschichte der heiligen Schriften Alten Testaments* (2d ed. 1890); and Sayce, *Introduction to Ezra, Nehemiah, and Esther* (3d ed. 1889). The best commentary on the Book of Nehemiah is that of Bertheau-Ryssel (1887). See also Keil (Eng. trans. 1873), and Rawlinson in *Speaker's Commentary*. All three works contain references to earlier authorities.

Neilgherry Hills (properly *Nilgiri*; Sansk. *nila*, 'blue,' and *giri*, 'mountain'), a mountainous district in the south of India, rising abruptly from the plains to the height of 6000 feet, though individual peaks shoot up to 8760 feet. The mass is entirely isolated, with the exception that a precipitous granite ridge leaves its western face and connects it with the Western Ghâts. The surface consists of grassy uplands with large groves of forest trees; but the lower slopes are heavily timbered. The Neilgherry Hills are inhabited by five distinct tribes, of whom the Todas are the most interesting. They speak a Dravidian dialect and practice polyandry; in 1881 there were only 675. The men are tall and athletic, with Roman noses, black bushy beards and eyebrows, but they are dirty in their habits. Their sole occupation is tending cattle. Owing to their great elevation, the Neilgherry Hills have a delightfully cool climate, and are much resorted to on this account by invalided Europeans, the principal station being Ootacamund (q.v.). See H. B. Grigg's *Manual of the Nilgiri District* (1880).

Neisse, a town of Prussian Silesia, and an important fortress of the second rank, is situated in a broad valley on the Neisse, an affluent of the Oder, 50 miles SE. of Breslau. It manufactures arms, linen, and chemicals, and has great wool-markets. Pop. 20,507. Neisse was formerly the chief town of a principality, and residence of a prince-bishop.

Nejd. See ARABIA, WAHABIS.

Nekrasoff, NIKOLAI ALEXIEVITCH, a Russian lyrical poet, was born in Podolia in 1821, entered the army, but soon devoted himself to literature, editing a newspaper and a monthly magazine. He died 7th January 1878. Belonging to the realistic school, he gave powerful expression to the popular aspirations and social tendencies of his race in a series of poems that have been often re-edited.

Nélaton, AUGUSTE, surgeon, was born at Paris, 18th June 1807, studied there, and, after serving as surgeon in various hospitals and lecturing at the faculty of medicine, became in 1851 professor of Clinical Surgery, and in 1866 surgeon to the emperor. He became a member of the senate in 1868, and died 21st September 1873. Besides his great *Éléments de Pathologie Chirurgicale* (5 vols. 1844-60), he wrote on tumours of the breast, and the operation for cataract.

Nellore, a town of Madras Presidency, capital of a district of the same name, situated on the right bank of the Pennar, 107 miles N. of Madras. It was formerly an important fortress. In 1787 a pot filled with Roman gold coins and medals—chiefly of Trajan, Hadrian, and Faustina—was found under the ruins of a small Hindu temple here. Pop. 27,505.

Nelson, the capital of a provincial district in New Zealand, is situated at the north end of South Island, at the mouth of the Maitai, a small river at the head of Blind Bay. The situation is very beautiful, on a flat, hemmed in by rugged hills and amidst almost tropical luxuriance. The harbour is sheltered, and there is regular steam communication with Sydney and Melbourne. The city was founded in 1841, is now lighted with gas, and the

water-supply is good. There is a cathedral, a literary institute, and museum, public hospital, and asylum. The manufactures of the town comprise cloth, leather, soap, and jam. Pop. (1889) 7733; with suburbs, over 10,000.

Nelson, HORATIO, VISCOUNT NELSON, English admiral, was born on 29th September 1758, at Burnham Thorpe in Norfolk, of which parish his father was rector. His mother, daughter of Dr Suckling, prebendary of Westminster, was related to the Walpoles. He entered the navy in 1770, under the patronage of his uncle, Captain Maurice Suckling; made a voyage to the West Indies in a merchant-ship; served in the Arctic expedition of 1773, and was afterwards sent to the East Indies in the *Seahorse*. Two years of the climate severely tried his constitution, never very strong, and he came home, invalided, in September 1776. In April 1777 he passed his examination, and by the interest of his mother's family was at once promoted to be lieutenant of the *Lowestoft* frigate, with Captain Locker. In her he went to Jamaica, where he was taken by the admiral into the flag-ship, and on 8th December 1778 was promoted to command the *Badger* brig, from which, six months later, he was posted to the *Hinchinbrook* frigate.

In January 1780 he commanded the naval force in the expedition against San Juan; in the heavy boat-work up the pestilential river his health broke down, and he returned to England in an apparently dying condition. A few months' rest and careful treatment, however, restored him; and in August 1781 he commissioned the *Albemarle*, in which, after a winter in the North Sea, he went to North America, where he joined the squadron under Lord Hood, and made the acquaintance of Prince William Henry, afterwards William IV., with whom he always maintained the most cordial relations. In the spring of 1784 he was appointed to the *Boreas* frigate, again for service in the West Indies, where, by enforcing the Navigation Act against the Americans, he roused the ill-will of the merchants, which took effect in numerous actions for damages. The law, however, was clear on the point, and Nelson's proceedings were sustained, though not without causing him much trouble and annoyance.

Whilst on this station he married Mrs Nisbet, the widow of a Dr Nisbet of Nevis, niece of Mr Herbert, the president of the island; and on the *Boreas* being paid off, in December 1787, he with his wife retired to Burnham Thorpe, where he lived for the next five years. His frequent applications for employment were unsuccessful, till, on the imminence of war with France in January 1793, he was appointed to the *Agamemnon* of sixty-four guns, in which he accompanied Lord Hood to the Mediterranean. When Toulon was given up to the allies Nelson was ordered to Naples to urge the necessity of troops being sent at once to their assistance; on his return he was employed in the blockade of Corsica, and in the following spring commanded the naval brigade which largely conduced to the reduction of Bastia and of Calvi, where an unlucky blow from a bit of gravel, scattered by a shot, destroyed the sight of his right eye. In 1795 he was with the fleet in the two actions fought by Admiral Hotham outside Toulon. In both the French were defeated with some loss, but they were allowed to escape, and Nelson in his private letters expressed an angry opinion that more might and ought to have been done.

In the autumn of 1795 Hotham was succeeded by Sir John Jervis, and during the whole of 1796 the strictest blockade of Toulon was enforced, Nelson being for the most part, as in preceding years, with a small squadron in the Gulf of

Genoa, where he put a stop to all coasting traffic, and commanded the road along the shore so completely as to warrant his assertion that, had he had an adequate force, the invasion of Italy would have been impossible. Towards the close of the year Spain concluded a treaty of alliance with France, and sent her fleet into the Mediterranean to co-operate with the French. Jervis thus found himself opposed by very superior forces; and, with Spain and Italy both in hostile hands, his position was no longer tenable. He withdrew the troops from Corsica, and retired to Gibraltar, and afterwards to Lisbon. He was, however, determined that the Spanish fleet, which had been instructed to join the French at Brest, should not pass; and, on its endeavouring to do so, met it off Cape St Vincent on 14th February 1797, and inflicted on it a signal defeat. This was rendered more decisive by the action of Nelson, who, having been appointed commodore, with his broad pennant on board the *Captain*, was in the rear of the line, and, interpreting a manœuvre of the Spanish admiral as an attempt to reunite the two divisions of his fleet, which Jervis had separated, wore out of the line to meet him, and for nearly half an hour withstood, single-handed, the attack of the whole Spanish van. When support arrived and the Spaniards fled, the *Captain* had suffered severely; and Nelson, being unable to join in the pursuit, let his ship fall foul of the Spanish *San Nicolas*, which he boarded and took possession of, and, leading his men across her deck to the *San Josef*, took possession of her also.

Nelson's conduct on this occasion deservedly won for him the cross of the Bath; and, being promoted in due course to be rear-admiral, he continued with the fleet off Cadiz till, in July 1797, he was sent with a small squadron to seize a richly-laden Spanish ship which had taken refuge at Santa Cruz. He was instructed to levy a heavy contribution on the town if the treasure was not given up; but the troops which he had asked for were not granted, the ships were powerless, and the landing force at his disposal was quite inadequate. With it, such as it was, however, the attack was made on the night of 21st July; but in the darkness the boats missed the mole, and landing irregularly were repulsed with severe loss. Nelson himself had his right elbow shattered by a grape-shot. He was carried on board his ship, where the arm was amputated, but on rejoining the fleet he was compelled to return to England.

In the following March, 1798, he hoisted his flag on board the *Vanguard* of seventy-four guns, and sailed from St Helens to rejoin the fleet off Cadiz. He was immediately sent into the Mediterranean in command of a small squadron, with orders to ascertain the object of the French armament at Toulon. The secret was, however, too well kept; and the *Vanguard*, being dismantled in a violent gale, was obliged to put into San Pietro off Sardinia to refit, while the French expedition sailed on its way to Egypt. On 7th June Nelson was reinforced by ten sail of the line; but his frigates had all parted company, and, under some misapprehension of orders, did not rejoin him. He was thus left without means of learning anything about the French further than that they had sailed from Toulon. His hope to get news at Naples proved vain, and it was only when he arrived off Messina that he heard that the French had captured Malta, but had sailed again some days before. Their destination was unknown; he conjectured that it might be Egypt, and he hastened thither, only to find that there was no trace of them. He had in fact passed within a few leagues of them, but without seeing them. He returned by the coast of Asia, put into Syracuse, where he

watered, and was meditating going up the Archipelago to Constantinople, when he at last learned that, after all, they had gone to Egypt. Thither he immediately followed, and on the evening of 1st August found their fleet lying at anchor in Aboukir Bay. His plans had long before been formed and discussed with the several captains under his orders, everything was ready, and no explanatory signals were needed. His fleet was numerically inferior to that of the French, and became still more so by the accident of the *Culloden* getting aground and being unable to take any part in the battle; but the wind was blowing along the French line, and, by concentrating his attack on the weather end of it, it was crushed by superior force, while the leeward-most ships were unable to render any assistance; and thus, creeping gradually down the line, he captured or destroyed the whole, with the exception of the two rear-most ships, and two of the frigates, which fled.

Never, in recent times, had there been a victory so complete, so overwhelming; and when Nelson with his shattered fleet returned to Naples he was the object of an enthusiastic adoration which knew no bounds. The queen, in her intense hatred of the murderers of her sister, welcomed their conqueror with all the ardour of a passionate nature, and Lady Hamilton (q.v.), the wife of the English ambassador, fell on his breast in a paroxysm of hysterical rapture. A woman of extreme beauty, winning manners, and shady antecedents, first the mistress and then the wife of Sir William Hamilton, she enslaved Nelson by her charms, and the two became bound by a liaison which death only severed. At home Nelson was raised to the peerage by the title of Baron Nelson of the Nile; parliament voted him a pension of £2000 a year, and the East India Company awarded him a sum of £10,000. Turkey and Russia sent him handsome and costly presents, and the king of Naples conferred on him the title of Duke of Bronte, in Sicily, with an estate valued at £3000 a year, though during Nelson's life its revenues seem to have been in abeyance.

The government of Naples had already concluded an alliance with Austria and declared war against France; but the French army swept away the Neapolitan troops almost without resistance, and the Neapolitan Jacobins received their French brethren with open arms. For the king and his court safety was only in flight, and Nelson conducted them to Palermo. Afterwards, returning as the king's representative, he sternly annulled the convention which Cardinal Ruffo, contrary to the king's express orders, had made with the rebels; he forced the traitors to surrender at discretion, and he promptly hanged Caracciolo (q.v.), one of their leaders, who had added perjury to treason, and having accepted a command as commodore in the king's navy had betrayed his trust, and waged war against the authority he was pledged to maintain.

The affairs of Naples were not yet regulated, the outposts held by the French and their sympathisers were not yet all reduced, when, on July 19, 1799, Nelson received an order from Lord Keith, the commander-in-chief in the Mediterranean, to bring or send the greater part of his force to Minorca, which he conceived to be threatened by a joint attack of France and Spain. Nelson refused to obey the order; and when it was repeated in still more positive terms, he contented himself with sending Sir John Duckworth, his second in command, while he himself remained at Naples or Palermo, and controlled the blockade of Malta which was carried on unremittingly during the whole time. The Admiralty censured him for his disobedience; and indeed it can scarcely be main-

tained that the affairs of Naples were of such paramount importance as to justify this extraordinary breach of discipline, the motives of which have been much discussed. Perhaps the true explanation of his conduct is that a severe wound in the head, which he had received at the Nile, had seriously affected his general health, and caused a depression of spirits which it needed some violent stimulus to overcome. Happy at last in the capture of the two ships which had escaped from Aboukir Bay, he obtained leave to resign his command, which the state of his health rendered irksome, and made his way home overland, by way of Vienna and Dresden, in company with Lady Hamilton and her husband, for whom he professed and appears to have truly entertained a real affection and esteem. He arrived in England in November 1800. The four months spent on the journey had done much to re-establish his health, and he immediately volunteered for active service. His meeting with his wife could not possibly be a happy one; and after an angry interview they parted never to see each other again.

On 1st January 1801 Nelson was promoted to be vice-admiral, and a few days later was appointed second in command of the expedition ordered to the Baltic, under Sir Hyde Parker. He hoisted his flag in the *St George*, but that ship being too large for the approaches to Copenhagen, he moved into the *Elephant* when the attack was determined on. The whole conduct of this attack was entrusted to Nelson, with the smaller ships of the fleet, Parker, with the others, remaining at anchor some miles distant. After a furious combat of from three to four hours' duration, the enemy's ships were subdued. The shore batteries still continued to fire, till Nelson sent a flag of truce on shore to point out that the worst sufferers from the continued engagement were the crews of the beaten ships, which received a great part of the fire of both parties. A suspension of hostilities was agreed on to permit of the prisoners being removed; and this led to an armistice, which the news of the czar's death shortly afterwards converted into a peace. Nelson, who was raised a step in the peerage and became a viscount, succeeded Parker as commander-in-chief; but, his health having given way, he was permitted to return to England. He arrived in the beginning of July, and was at once ordered to undertake the defence of the coast, in view of the preparations for invasion which were being made in France; and though he failed in an attempt to destroy the flotilla collected in Boulogne, his watch was so vigilant that the boats never ventured from under the protection of their chains and batteries.

On the renewal of the war Nelson was at once sent out to the Mediterranean, where, with his flag in the *Victory*, he cruised for more than eighteen months in front of Toulon, drawing back occasionally to Madalena for water and refreshment. During one of these absences, in March 1805, the French fleet put to sea under the command of Vice-admiral Villeneuve, and got clear away to Gibraltar, to Cadiz, and to Martinique, where they expected to be joined by the fleet from Brest. Nelson, however, though delayed for six weeks by his ignorance of where Villeneuve had gone, was only twenty days behind him; and Villeneuve, deceived as to the English numbers, and unwilling to risk an engagement which might frustrate his ulterior object, hastily returned to Europe. Nelson again followed, again outtailed his enemy, and arrived off Cadiz some days before the French approached the shores of Europe. Then, conceiving that Villeneuve's aim might be to overpower the fleet off Brest, he went north and reinforced it with most of his ships, returning himself to England. It was but for a few weeks. Within a

fortnight it was known that Villeneuve had gone to Cadiz, and Nelson was ordered to resume the command. He did so on 25th September, and for the next month kept a close watch on the port, while his fleet was being gradually increased in numbers. He was especially desirous that he should have sufficient force. What he wanted was not merely an honourable victory gained by an inferior fleet, but the annihilation of the enemy. Villeneuve was meantime urged by positive and repeated orders to put to sea, and on 20th October, having learned that some of the English ships had gone to Gibraltar, he reluctantly came out. Of French and Spanish ships combined there were with him thirty-three; with Nelson there were twenty-seven.

At daybreak on the 21st the two fleets were in presence of each other off Cape Trafalgar, and Nelson, who several days before had given out and explained his plan of attack, at once made the signal to bear up towards the enemy. The wind was very light, and it was noon before the lee division of the fleet, under Collingwood in the *Royal Sovereign*, broke through the rear of the Franco-Spanish line. Nelson, with the other division, had reserved to himself the duty of overawing the van, till, convinced that they had no immediate intention of turning to support their rear, he bore up and threw himself on their centre. As the *Victory* passed astern of Villeneuve's flagship, she fell foul of the *Redoutable* of seventy-four guns, and her quarter-deck became exposed to the musketry fire from the *Redoutable's* tops. Nelson, while standing speaking to Captain Hardy, fell mortally wounded by a shot on the left shoulder, which, striking obliquely downwards, passed through the spine. He was carried below, and died some three hours later, just as the battle ended in the decisive victory of the English. The enemy's fleet was annihilated.

Nelson's body was brought home, and, after lying in state at Greenwich, was interred with much pomp in the crypt of St Paul's. In the cathedral above a gorgeous monument has been erected to his memory, and numerous others throughout the land bear witness to the deep feeling which his splendid services awakened.

His *Life* by Clarke and M'Arthur (2 vols. 1809) is written with more credulity than critical accuracy. Southey's famous *Life* (2 vols.) dates from 1828. The best record of Nelson's services is his *Dispatches and Letters*, edited by Sir N. Harris Nicolas (7 vols. 8vo, 1844-46); there is a selection from the *Letters and Dispatches* by the author of the present article (1886). His relations with the queen of Naples and Lady Hamilton are related in very full detail in J. C. Jeaffreson's *The Queen of Naples and Lord Nelson* (2 vols. 1889), and *Lady Hamilton and Lord Nelson* (2 vols. 1888).

Nelson, ROBERT, was born in London on 22d June 1758, a rich Turkey merchant's son, and, after a brief space at St Paul's school, removed with his widowed mother to Dryfield in Gloucestershire, where he was brought up by Dr George Bull. In 1780, the year of his election to the Royal Society, he set out with Halley on a twenty months' tour in France and Italy, returning from Italy with Lady Theophila Lucy (1754-1795), a widow, and daughter to the Earl of Berkeley, who in 1783 became his wife, and who soon after was converted to Catholicism by Cardinal Howard and Bossuet. Her ill-health had taken them again to Italy at the time of the Revolution; but Nelson was from the first a (passive) Jacobite, and on his return to England in 1791 he joined the Nonjurors. He was received back into the Established Church in 1710, though he still would not join in the prayers for Queen Anne; and he died at Kensington on 16th January 1714. A man whose whole life was

devoted to doing good, one of the earliest members of both the S.P.C.K. and S.P.G., the 'pious' Robert Nelson was the author of five devotional works, of one of which, the *Festivals and Fasts* (1703), 10,000 copies were sold in four and a half years.

See the *Lives* by W. H. Teale (2 vols. 1840-46) and C. F. Secretan (1860); also Abbey's *English Church in the Eighteenth Century* (new ed. 1887).

Nelson River issues from the north end of Lake Winnipeg in Canada, and, after a north-easterly course of 400 miles through Keewatin, falls into Hudson Bay. It discharges an enormous quantity of water, and is navigable for 127 miles from its mouth, though only some 70 or 80 miles for large steamers. For the railway from Winnipeg, see HUDSON BAY.

Nelumbo (*Nelumbium*), a genus of aquatic plants included by some botanists in the natural order Nymphæacæ (q.v.); but by others constituted into an order, Nelumbiaceæ, differing in the want of albumen in the seed, and in the distinct carpels, which are buried in the cavities of a large fleshy receptacle. The flowers and leaves are very similar to those of water-lilies. The species are few, and are found in the warm parts of Asia, in the north of Africa, and in North America. They are all distinguished by the beauty of their flowers. *N. speciosum* is the Egyptian Bean of Pythagoras, the *Lotus* and *Tamara* of the Hindus, and the *Lien-Hoa* of the Chinese. By the ancients it was regarded as the emblem of fertility; with it the Egyptians decorated the heads of their idols Isis and Osiris. The Hindus hold it sacred, and with them it is the floating shell of Vishnu and the throne of Brahma. The Tibetans embellished their temples and altars with it. It is also much esteemed and cultivated in China and elsewhere in the East for its seeds, roots, leaf-stalks, and flower-stalks, all of which are eaten. It has been used as food by the Egyptians from remote antiquity. The seeds are in size and shape like acorns, with a taste more delicate than that of almonds. The root contains much starch, and a kind of arrowroot may be obtained from it; and powdered it makes excellent soup with milk or water. Great quantities are pickled with salt and vinegar, and eaten with rice. The flowers are generally rose-coloured, seldom white. The ancient Egyptian mode of sowing this plant, by enclosing each seed in a ball of clay and throwing it into the water, is practised at the present day in India.—*N. luteum* is a North American species, with yellow flowers, extending almost as far north as Philadelphia. The farinaceous roots are agreeable when boiled.

Nelumbium luteum.

The flowers are generally rose-coloured, seldom white. The ancient Egyptian mode of sowing this plant, by enclosing each seed in a ball of clay and throwing it into the water, is practised at the present day in India.—*N. luteum* is a North American species, with yellow flowers, extending almost as far north as Philadelphia. The farinaceous roots are agreeable when boiled.

Nemathelmla, or NEMATHELMINTHES (Gr. *nēma*, 'a thread,' and *helmins*, 'an intestinal worm'), a general name applied to the thread-worms or nematodes, such as *Ascaris* (q.v.), *Guinea-worm* (q.v.), *Trichina* (q.v.), to the somewhat distinct

Gordiidae or *hair-eels*, and to the more remotely allied *Acanthocephala* or *Echinorhynchus* (q.v.). The more important parasitic threadworms will be noted under that title.

Nemea, anciently the name of a deep and well-watered valley of Argolis, in the Peloponnesus, between Cleonæ and Phlius. It lies north and south, and is from two to three miles long and more than half a mile broad. It possessed a sacred grove, with a magnificent temple of Zeus, and was celebrated for the games called the *Nemean Games*, one of the great national festivals of the Greeks. See ATHLETIC SPORTS.

Nemertea, an important class of 'worms,' the members of which are mostly marine. They are unsegmented, covered with cilia, and often brightly coloured. Their habitat is usually in sand or mud, but many are able to swim, while a few are parasitic. In diet they seem to be mainly, if not wholly, carnivorous. The body is very extensible, and in *Lineus maximus* may measure 15 feet in length. Most of them break readily and even spontaneously, the fragments being in some cases able to form a fresh head and body. Among their remarkable characters may be noted the presence of a long protrusible offensive proboscis which lies quite apart from the gut in a special sheath along the back, and the occurrence of two curious ciliated pits, perhaps respiratory in function, opening on the sides of the head, and sometimes reaching as far inwards as the brain. Two nerve cords extend from the brain along the sides of the body, occasionally approaching one another ventrally or even dorsally. The sexes are separate, and there is frequently a remarkable metamorphosis in development. According to Professor Hubrecht, the nemerteans exhibit in the proboscis, its sheath, and the two head-slits distinct affinities with vertebrates.

Nemesis, according to Hesiod, the daughter of Night, was originally the personification of the moral feeling of right and a just horror of criminal actions—in other words, of the conscience. Afterwards, when an enlarged experience convinced men that a divine will found room for its activity amid the little occurrences of human life, Nemesis came to be regarded as the power who constantly preserves or restores the moral equilibrium of earthly affairs—preventing mortals from reaching that excessive prosperity which would lead them to forget the reverence due to the immortal gods, or visiting them with wholesome calamities in the midst of their happiness. Hence originated the latest and loftiest conception of Nemesis, as the being to whom was entrusted the execution of the decrees of a strict retributive providence—the awful and mysterious avenger of wrong, who punishes and humbles haughty evil-doers in particular. Nemesis was thus regarded as allied to Atë (q.v.) and the Eumenides (q.v.). She was represented in the older times as a young virgin, resembling Venus; in later times, as clothed with the tunic and peplos, sometimes with swords in her hands and a wheel at her foot, a griffin also having his right paw upon the wheel; sometimes in a chariot drawn by griffins. There was a famous temple of Nemesis at Rhamnus in Africa, where important fragments of the statue of Nemesis by Phidias were discovered in 1890.

Nemi, LAKE OF, an extinct crater, 20 miles S. of Rome, accounted for its beauty the gem of the Alban Mountains. There was here a famous temple of Diana, portions of which have been recently excavated. Renan's *Prêtre de Nemi* (1885) gives the place additional interest.

Nemophila, a genus of herbaceous annuals belonging to the Hydrophyllaceæ, with pinnatifid

leaves and conspicuous flowers. Natives of North America, they are cultivated in European gardens, the *N. insignis* being prized as a border plant on account of its showy flowers, blue with a white centre. Other species are *N. atomaria* and *N. maculata*.

Nemours, an ancient town of 4268 inhabitants in the French department of Seine-et-Marne, 40 miles SE. of Paris by rail, gives a ducal title to the second son of Louis-Philippe, born in 1814.

Nenagh, a market-town of County Tipperary, 28 miles NE. of Limerick by rail. The ancient Norman keep, called Nenagh Round, is a striking object. Pop. 5422.

Nennius, the reputed author of a *Historia Britonum*, evidently of Cymric origin. It gives the mythical account of the origin of the Britons, the Roman occupation, the settlement of the Saxons, and closes with the twelve victorious battles of King Arthur. The writer is extremely credulous and feeble in judgment, but he has preserved valuable fragments of earlier treatises. The name of Nennius occurs in two prologues extant, but these are suspiciously superior in style to the poor Latinity of the history itself. The text was edited by the Rev. Joseph Stevenson for the English Historical Society in 1838. See the criticism in De la Borderie's *L'Historia Britonum* (Paris, 1883), besides works by Skene and Rhys.

Neocomian. See CRETACEOUS SYSTEM.

Neolithic. See FLINT IMPLEMENTS.

Neophyte (Gr. *neophutos*, from *neos*, 'new,' and *phuo*, 'I grow'), the name given in early ecclesiastical language to persons recently converted to Christianity. The word is used in this sense by St Paul (1 Tim. iii. 6). The name neophyte is also applied in Roman usage to newly-ordained priests, and sometimes, though more rarely, to the novices of a religious order.

Neoplatonism, the last form of Hellenic philosophy, the system of an illustrious succession of ancient philosophers who claimed to found their doctrines and speculations on those of Plato. Strictly speaking, however, the Platonic philosophy expired with Plato's immediate disciples, Speusippus and Xenocrates. Neoplatonism is an attempt to combine Plato's doctrine of the Ideas, developed by Aristotle, and supplemented with an ethical system akin to that of the Stoics, with the oriental doctrine of Emanation; it does for Hellenism something like what Philo did for Judaism. Such amalgamation came about most naturally in Alexandria. Placed at the junction of two continents, Asia and Africa, and close to the most cultivated and intellectual regions of Europe, that celebrated city naturally became a focus for the chief religious and philosophies of the ancient world. Here the East and the West, Greek culture and oriental enthusiasm, met and mingled; and here Christianity sought a home, and by the liberality of its sympathies strove to quell the myriad discords of Paganism.

Authorities have differed as to how much should be included under the term Neoplatonism. By some it is used to designate the whole new intellectual movement proceeding from Alexandria, comprising, in this broad view, the philosophy of Philo-Judeus and of Numenius the Syrian; of Christian Fathers like Clemens Alexandrinus and Origen; of the Gnostics; and of Ammonius Saccas and his successors. But the best authorities restrict the application of the term to the fourth of these series. Plotinus, its real founder, resuscitated Plato; Proclus gave the world another Aristotle; in the person of Julian the Apostate Neoplatonism became master of the world, and for three centuries it was a formidable rival to Christianity. The

Neoplatonists aimed at constructing a religion on a basis of dialectics. They strove to attain a knowledge of the Highest, and the way in which they endeavoured to accomplish this was by assuming the existence of a capacity in man for passing beyond the limit of his empirical knowledge, and acquiring an intuitive knowledge of the absolute, the true—that which is beyond and above the fluctuations and dubieties of 'opinion.' This impersonal faculty is called *Ecstasy*. By means of it man—ceasing, however, to be individual man—can identify himself with the Absolute (or Infinite). Plotinus, in fact, set out from the belief that 'philosophy' is only possible through the identity of the thinker, or rather of the subjective thought, with the thing thought of, or the objective thought. This intuitive grasp or 'vision' of the Absolute is not constant; we can neither force nor retain it by an effort of will; it springs from a divine inspiration and enthusiasm higher and purer than that of poet or prophet, and is the choicest 'gift of God.'

The god of Plotinus and the other Alexandrians is a mystical Trinity. The Divine Nature contains within it three Hypostases (Substances); its basis, if we may so speak, is Unity or Primitive Light. This Unity is not itself any *thing*, but the principle of all things; it is absolute good, absolute perfection; and, though it is utterly incapable of being conceived by the understanding, there is that in man which assures him that it—the incomprehensible, the ineffable—is. From Unity, as the primordial source of all things, emanates Pure Intelligence (*Nous*), its reflection and image, that by which it is intuitively apprehended; from Pure Intelligence, in turn, emanates the 'Soul of the World,' whose creative activity produces the souls of men and animals, and 'Nature'; and finally, from Nature proceeds 'Matter,' which, however, is subjected by Plotinus to such refinement of definition that it loses all its grossness—though he is no dualist, and glories in the beauty of the world. Unity, Pure Intelligence, and the World-Soul thus constitute the Plotinian Triad, with which is connected, as we have seen, the doctrine of an eternal Emanation. Human souls, whose source is the Pure Intelligence, are—by some mysterious fate—imprisoned here in perishable bodies, and the higher sort are ever striving to reascend to their original home.

The most distinguished pupil of Plotinus was Porphyry, who mainly devoted himself to expounding and qualifying the philosophy of his master. In him we see for the first time the presence of a distinctively anti-Christian tendency. Neoplatonism, which can only be properly understood when we regard it as an attempt to place Paganism on a philosophical basis—to make the Greek religion philosophical, and Greek philosophy religious—did not *consciously* set out as the antagonist of Christianity. Neither Ammonius Saccas nor Plotinus assailed the new faith; but as the latter continued to grow, and to attract many of the most powerful intellects of the age into its service, this latent antipathy began to show itself. Porphyry wrote against Christianity; Iamblichus, the most noted of his pupils, did the same. The latter also introduced a theurgic or 'magical' element into Neoplatonism, teaching, among other things, that certain mystical exercises and symbols exercised a supernatural influence over the divinities. Magic and spiritualism are always popular, and it is therefore not wonderful that Iamblichus should have had numerous followers. Aedesius succeeded to his master's chair. From the school of one of his disciples, Maximus, came the Emperor Julian, whose patronage for a moment shed a gleam of splendour over Neoplatonism, and seemed to promise it a universal victory.

After a succession of able but not always consistent teachers, among whom is to be reckoned the noble Hypatia, we reach Proclus, the last great Neoplatonist, who belongs to the 5th century, a man of prodigious learning, and of an enthusiastic temperament, in whom the pagan-religious, and consequently anti-Christian, tendency of the Neoplatonic philosophy culminated. His ontology was based on the Triad of Plotinus, but was considerably modified in detail; he exalted 'Faith' above 'Science' as a means of reaching the Absolute Unity; was a believer in Theurgy, and so naturally laid great stress upon the ancient Chaldean oracles, Orphic hymns, mysteries, &c., which he regarded as divine revelations, and of which he considered himself—as, indeed, he was—the last great 'interpreter.' His hostility to the Christian religion was keen; in its success he saw only the triumph of a vulgar popular superstition over the refined and beautiful theories of philosophy; it was as if he beheld a horde of barbarians defacing the statues and records of the Pantheon. The disciples of Proclus were numerous, but not remarkable for talent. Perhaps the ablest of his successors was Damascius, in whose time the Emperor Justinian, by an arbitrary decree, closed the schools of the heathen philosophers. Neoplatonism soon ceased to exist as a system; but it served as a schoolmaster to bring the mediæval thinkers to Plato and Aristotle, it served as the nurse of Christian mysticism, and it had helped to mould the mind of Augustine. From a scientific point of view it was retrogressive, perverse, absurd; yet in the moral and religious sphere it maintained a high and holy ideal, and fostered a firm belief in that which is above the empirical.

See Zeller's *History of Greek Philosophy*; Ueberweg and the other historians of philosophy; Herzog-Plitt's *Realencyklopädie*; the church histories; Kingsley's *Alexandria and her Schools*, and his *Hypatia*; Bigg's *Christian Platonists of Alexandria* (1885); Simon, *Histoire de l'École d'Alexandrie* (1845); Vacherot, *Histoire critique de l'École d'Alexandrie* (1851); and the articles herein on PLATO, STOICISM, PHILO, ORIGEN, GNOSTICISM, PLOTINUS, PORPHYRY, IAMBlichus, PROCLUS.

Neo-Pythagoreanism stood to Pythagoras somewhat as Neoplatonism did to Plato, and was an Alexandrian development under oriental influences. It originated in the first half of the century before Christ, and was accordingly the predecessor of Neoplatonism. Neo-Pythagoreans may be divided into two groups, according as their aims were mainly practical—the purification and ennobling of life by asceticism, including theurgy, or more modestly metaphysical—basing their views on the Pythagorean theory of numbers (see PYTHAGORAS). Of the former school Apollonius (q.v.) of Tyana is the most conspicuous example; of the latter, Moderatus of Gades, Nicomachus of Gerasa (2d century A.D.), Archytas (q.v.), and Sextius. See the works cited at NEOPLATONISM.

Neozoic (Gr., 'new life'), a term introduced by Edward Forbes to include all the strata from the Trias to the most recent deposits. Few geologists have adopted the term; the systems in question being generally divided into the groups of Secondary or Mesozoic, Tertiary or Cainozoic, and Quaternary or Post-Tertiary.

Nepal, an independent kingdom of India, lying on the southern face of the Himalayas, is bounded on the N. by Tibet, on the S. and W. by Bengal, and on the E. by Sikkim, a protected state. Long. 80° 6'—88° 14' E. It is 512 miles in length, by 70 to 150 in breadth. Area, 64,000 sq. m.; pop. estimated by native authorities at more than 5,500,000, though probably half that number is nearer the mark. The northern parts of the state embrace the main range of the Himalayas (q.v.),

with its offset spurs, on which stand the great peaks of Everest, Diwalagiri, &c. On the south of the state lies the Terai. The intervening territory consists of mountain-ridges, embracing several valleys drained by the Kurnali, Gandak, Kosi, and other rivers. The climate of course varies greatly according to the altitude; the principal valley, in which stands the capital Khatmandu (q.v.), has a climate like that of southern Europe. The soil is very fertile, in some districts producing three crops in the year. The hillsides are terraced and the land is irrigated. Rice, opium, rape, linseed, tobacco, and various cereals and pulses are the more important products. Several minerals, as copper, iron, sulphur, and others exist, but are little worked. The forests contain valuable timber trees. Nepal has extensive trading relations with the provinces of British India, reaching the annual average value of £2,000,000, and with Tibet, the details of which are not known. The valleys are inhabited by numerous different hill-tribes, partly aboriginal, partly of Mongolian or Chinese descent; but the dominant race are the Goorkhas (q.v.), whose ancestors came to the Himalayan slopes from Rajputana in the 12th century, though it was not until 1769 that they made themselves masters of Nepal. They rapidly subdued the hill-valleys to east and west of them, and, after a war with China (1789-92), on account of Tibet, in which the Goorkhas were worsted, and a period of great internal disorder, Nepal came into conflict with the Indian government. War followed; in 1815 Sir David Ochterlony defeated the Goorkha armies in the west, and peace was agreed to; but, the treaty not having been signed by the king of Nepal, a British force, 33,000 strong, advanced in the succeeding year to within three days' march of Khatmandu, and compelled the Goorkhas to sign the treaty. Since that they have ceased their encroachments on British territory, and during the Mutiny voluntarily sent to the assistance of the British a force which rendered useful service in the reduction of Oudh. The real ruler of the country is the prime-minister; Sir Jang Bahadur held this office from 1846 to his death in 1877, and was succeeded by his son. But he was slain and supplanted by the head of a rival faction in 1885.

Nepenthes. See INSECTIVOROUS PLANTS.

Nepheline (Gr. *nephelē*, 'a cloud;' in allusion to the mineral becoming cloudy when immersed in a strong acid), a rock-forming mineral of some importance. It is colourless, white or yellowish, and usually crystallises in hexagonal prisms with various modifications. It has a hardness of $5\frac{1}{2}$ to 6, and sp. gr. of $2\frac{1}{2}$ or thereabouts. It occurs in various volcanic rocks, as in certain basalts (nepheline-basalts), in which it plays the part of felspar in ordinary basalt (plagioclase-basalt). In these fine-grained rocks the crystalline granules of nepheline are of microscopic size; in the more coarsely crystalline nepheline-basalts (nephelinites) the crystals are readily seen by the naked eye. Fine crystals often occur in drusy cavities in such rocks. Elaeolite (Gr. *elaion*, 'oil') is a variety of nepheline with a greasy lustre, which seldom assumes a crystalline form. It is dark greenish, gray, or brown in colour, and appears to occur only in plutonic rocks, as in the syenites of Frederiksværn and Laurvig in Norway.

Nephelium. See LITCHI.

Nephrite, a mineral usually called Jade (q.v.), and known also as Beilstein, or Awestone. It is a hard, tough mineral found in Turkestan, in Siberia, in Bhutan, in New Caledonia, in the Marquesas, in British Columbia, and in Alaska. It is a composition of silicate of calcium and magnesium, with lime, alumina, sodium, and protoxide of iron. The

bright green of some of the more highly-prized specimens is probably due to oxide of nickel. Some specimens in India (where it is not native) strike fire with steel, and are therefore not pure nephrite. What is most generally known as oriental jade is a pale-greenish nephrite, more or less opaque, very hard, but with a peculiar greasy feeling to the touch. This quality is more often seen in vases, &c., the finer and rarer colours being used for personal ornaments. Much of what is called Oceanic jade, because found in the South Sea Islands and New Zealand, is not true nephrite, but is nevertheless a beautiful and valuable mineral. Nephrite (Greek *nephros*, 'kidney') was supposed to be a charm against nephritic diseases, and had many other virtues ascribed to it; in China to this day jade ornaments are believed to afford protection from lightning. The old Aryan belief in this may account for the wide distribution of jade ornaments although deposits of the mineral are so limited. The specimens of nephrite obtained from prehistoric 'finds' in Europe were believed to have been imported from Asia. But recently the mineral has been discovered in place at Jordansmühl in Silesia; and the water-worn fragments found at Neuenburger See have probably been derived from some local source not yet detected.

Nephritis (Gr. *nephros*, 'kidney'), inflammation of the Kidneys (q.v.).

Nepomuk (or POMUK), JOHN OF, the patron saint of Bohemia, who is honoured as a martyr of the seal of confession, was born at Pomuk, a few miles SE. from Pilsen, about 1330. Having studied at the university of Prague and taken holy orders, he held various ecclesiastical offices in Prague, and was appointed confessor to Sophia, wife of King Wenceslaus IV. For refusing to betray to this monarch the confession of the queen John was put to the torture, then tied hand and foot, and flung into the Moldau, in March 1383. His memory was cherished with peculiar affection by the Bohemian people, and in 1729 he was canonised by Pope Benedict XIII. His memory is celebrated on 16th May. By some historians two distinct personages of the same name are enumerated—one, the martyr of the confessional, the other, a victim to the simoniacal tyranny of Wenceslaus; but the identity of the two is sustained by Palacky, *Geschichte von Böhmen*, iii. 62. In 1855 Abel tried to prove that John of Nepomuk was a merely Catholic transformation of the people's darling, the heretical John Huss. See Wratislaw's *Life, Legend, and Canonisation of St John Nepomucen* (1873).

Nepos, CORNELIUS, a Roman historical writer, was a native of Pavia, as Mommsen thinks, of Hostilia (now Ostiglia), as its citizens believed they proved by erecting a statue in 1868. He was the contemporary and friend of Cicero, Atticus, and Catullus, and was probably still alive in 25 or 24 B.C. The ancients ascribed to him the following works: *Chronica*, *Exemplorum Libri*, *Lives of Cato and Cicero*, and *De Viris Illustribus*. The last is supposed to have consisted of sixteen books, but only twenty-five brief biographies of warriors and statesmen, mostly Greeks, have survived. These biographies are untrustworthy as history, but are written in a clear and elegant style, although affected archaisms and euphuistic mannerisms are not unfrequent. Until the middle of the 16th century they were generally ascribed to Æmilius Probus (4th century); but in 1569 the famous Dionysius Lambinus claimed them as part of the lost work of Cornelius Nepos. Other good editions are those of Cellarius (1689) and, in modern days, Nipperdey (2d ed. 1879). See Freudenberg, *Quæstiones historice in C. Nepotis vitas* (1839).

Nepotism (Ital. *nepote*, 'a nephew'), a word used to signify the system or custom practised by several popes subsequent to Innocent VIII. of granting high honours, dignities, offices, pensions, and the like to their family relations, generally their nephews, altogether irrespective of merit.

Neptune, the Italian god of the sea. Attempts have been made to show that his worship goes back to Aryan times, by identifying his name with the Sanskrit and Iranian Apām Napāt, 'offspring of the water.' But this is one of those unfortunate identifications which show that comparative mythologists are not always comparative philologists. Further, as there is nothing whatever to make it in the least probable that Neptune was ever anything but a sea-god, and as the primitive Aryans were not acquainted with the sea, it is evident that he cannot have been an Aryan deity. Indeed, as it was not until after the Italians had entered Italy that they became at all familiar with the sea, it was probably not until after they had settled in Italy that they made acquaintance with Neptune. Nor in all probability was he their own invention. We may conjecture that he was borrowed by them from the Etruscans, a maritime nation, who worshipped as their sea-god Nethuns or Nethunus. Had the Italians never come in contact in historical times with the Greeks, Nethunus or Neptunus would have remained a mere abstraction, like all other Italian deities, who were rather *numina* than personal beings. But communication with Greece resulted in the Italians identifying their god of the sea with Poseidon (q.v.), the Greeks' god of the sea.—For the planet Neptune, see PLANETS; for the Neptunist theory, see GEOLOGY, Vol. V. p. 148.

Nerbudda (more correctly NARBADA), a river of India, rises on the Amarkantak plateau, 3493 feet above sea-level, in 22° 41' N. lat., 81° 49' E. long., and flows west, through the Central Provinces, past Jabalpur (190 miles from its source), through the great depression between the Vindhya Mountains on the north and the Satpura Mountains on the south, known as the Valley of the Nerbudda, and reaches the Gulf of Cambay half-way between Baroda and Surat. It has a total length of 800 miles, and drains 36,400 sq. m. It is navigable as far as Broach, 30 miles from its mouth, and is joined from the left by the Kaveri (Cauvery). The river ranks as a sacred stream in the eyes of the Hindus. It is regarded as a meritorious act to walk from the sea to its source and back again alongside the river.

Nerchinsk. See NERTCHINSK.

Nereid. See NYMPH.

Nereis, a common genus of marine worms or Chaetopods, the members of which live in the sand or more freely in the sea. See CHÆTOPODS, and WORMS.

Neri, PHILIP, the founder of the Congregation of the Oratory and a canonised saint of the Roman Catholic Church, was born at Florence, July 21, 1515, and was the youngest son of Francesco Neri, an attorney in that city. His singular modesty, his piety, and affectionate heart won for him in his boyhood the name of the 'Good Pippo.' Philip's uncle, a prosperous merchant, wished to make him his heir; but the youth, with the view of abandoning all worldly pursuits, left his family and betook himself in his eighteenth year to Rome. Here for many years he lived as a layman a humble and retired life. A Florentine gentleman gave him a small room as a lodging and a daily allowance of meal. Philip spent most of his time in visiting the sick, in instructing the poor and ignorant, and in solitary prayer in the catacombs. It was not till

1551, when he was thirty-six years of age, that he was persuaded to become a priest. He now took up his quarters in the little church of S. Girolamo, and gathering round him a number of disciples, some of whom were men of good family and high attainments, he started the exercises of devotion which made his name famous. At first these simple services or prayer-meetings were held with a few young men in his own room. In 1558 they were transferred to an oratory which he was permitted to build over the nave of the church. These daily services, which were a great novelty at the time, consisted of three sermons of about half an hour's duration, delivered in a familiar style, and interspersed with vernacular hymns, reading, and prayers. The preachers were for the most part laymen. During the day Philip took many of his penitents round the hospitals. His object was to make religion attractive, especially to the young. At the carnival or in holiday seasons he instituted musical entertainments and the acting of religious dramas, the origin of the modern oratorio. At other times he took numbers of men in procession through the streets on a pilgrimage to the seven churches, alternately singing hymns and praying in silence, and would take refreshment and recreation in the vineyard or garden of some wealthy friend. It is said that before Philip's death the number of these pilgrims rose to two thousand.

In 1564 Philip had some of his companions ordained priests, and established among them a community life at a church given to him by the Florentines. One of these priests was Cesare Baronio, the historian of the church, and afterwards cardinal. Ten years later the community, now much increased in number, moved to S. Maria in Vallicella, on the site of which Philip built a larger church, known as the Chiesa Nuova, or New Church. Here the institute of the Oratory received the formal approbation of the pope, and here Philip died, May 25, 1595.

The saint was not an orator or a learned man, and although he was the favourite of popes and cardinals, as he was of the poor, he never received any ecclesiastical office or dignity. He never meddled with politics or public affairs. But his gentle and joyous nature, his tender charity, and the example of his innocent life were among the most potent of the influences which brought about the revival of ecclesiastical piety and the reformation of morals in Rome during the later half of the 16th century, and which earned for him his title of 'the Apostle of Rome.' Many miracles were attributed to the saint, even the raising of the dead. A notable phenomenon connected with his life is one which is to Philip what the stigmata were to Francis of Assisi—a strange palpitation of the heart and fracture of the ribs attributed to the supernatural effects of divine love—which came upon him suddenly one day at prayer in the catacombs. Philip was canonised with Ignatius Loyola and others in 1622.

Philip's literary remains consist of a few letters (8vo, Padua, 1751) and some sonnets printed in the collection of the *Rime Oneste*. The best life of the saint was written by one of the fathers of the congregation, Giacomo Bacci, in 1622, just before Philip's canonisation. Compare *Vita beati P. Phil. Nerii in annos digesta*, by Ant. Gallonio (1600). An English translation, made from a later edition of Bacci, appeared under the editorship of F. W. Faber in 1849. A popular biography has been written by Mrs Hope (Burns and Oates, 1859); and see also the Life by Archbishop Capececiatro (Eng. trans. 1882).

Néris-les-Bains. See MONTLUÇON.

Nero, the last of the Cæsars and the mystic antichrist of primitive Christian tradition, Roman emperor from 54 to 68 A.D., was born at Antium, on the coast of Latium, 15th December

37, and was the son of Cn. Domitius Ahenobarbus and of the younger Agrippina, the daughter of Germanicus Caesar, and sister of Caligula. His mother became the wife of the Emperor Claudius, who adopted him (50), his name, originally L. Domitius Ahenobarbus, being changed to Nero Claudius Caesar Drusus Germanicus. After the death of Claudius (54) the Prætorian Guards, at the instigation of Afranius Burrus, their prefect, declared him emperor, instead of Claudius's son Britannicus, and their choice was acknowledged both by the senate and by the provinces. His reign began with the semblance of moderation and good promise, under the guidance of Burrus and his tutor Seneca the philosopher; but the baleful influence of his mother, together with his own moral weakness and sensuality, frustrated their efforts, and he soon plunged headlong into debauchery, extravagance, and tyranny. He caused the young Britannicus, the son of Claudius, to be treacherously poisoned, and afterwards (59) his own mother Agrippina to be murdered, in order to please his infamous and ambitious mistress Poppæa Sabina. To marry her he divorced and put to death his neglected wife Octavia, the sister of Britannicus. The Roman senate showed the depth of its degradation by presenting an address congratulating the hateful matricide on the death of Agrippina, but Nero himself was ever haunted by the ghost of a murdered mother. The affairs of the empire were at this time far from tranquil. In 61 an insurrection broke out in Britain under Queen Boadicea, which was suppressed by Suetonius Paulinus. Next year saw an unsuccessful war against the Parthians in Armenia. At home the emperor was lampooned in verse; Burrus, a valuable friend, died; and even Seneca, though no rigid moralist out of his books, thought it only decent to remove from court. In July 64 occurred a great conflagration in Rome, by which two-thirds of the city was reduced to ashes. Nero himself is stated by all authorities later than Tacitus to have been the incendiary; and we are told that he admired the spectacle from a distance, reciting verses about the burning of Troy. But he found a convenient scapegoat in the mysterious sect of the Christians, many of whom were put to death with unheard-of cruelties, such as being wrapped in cloth steeped with pitch, and set on fire in the imperial gardens. Moreover, he rebuilt the city with great magnificence, and reared for himself on the Palatine Hill a splendid palace, the famous 'golden house,' and in order to provide for this expenditure and for the gratification of the Roman populace by spectacles and distributions of corn Italy and the provinces were plundered without ruth. A conspiracy against Nero in the year 65 failed, and Seneca and the poet Lucan fell victims to his vengeance. In a fit of passion he murdered his wife Poppæa, by kicking her when she was pregnant. He then offered his hand to Antonia, the daughter of Claudius, but was refused, whereupon he caused the too fastidious lady to be put to death, and married Statilia Messallina, after putting her husband to death. He also executed or banished many persons highly distinguished for integrity and virtue. His undignified vanity led him to seek distinction as a poet, a philosopher, an actor, a musician, and even a charioteer, and he received sycophantic applause, not only in Italy, but in Greece, to which, upon invitation of the Greek cities, he made a visit in 67. But in 68 the Gallic and Spanish legions, and after them the Prætorian Guards, rose against him to make Galba emperor, and Nero fled from Rome to the house of a freedman, Phaon, about four miles distant. The senate now declared him an enemy of his country, and the trembling tyrant saved himself from execution by suicide, 11th June 68.

His last words throw light on his pitiful vanity and on the cruel irony of fate that placed him on a throne—'What an artist is lost in me.' See the articles *ROME*, *SENECA*, *ANTICHRIST*, *APOCALYPTIC NUMBER*, &c.; W. Wolfe Capes, *Early Roman Empire*, and Merivale's *History of the Romans under the Empire*.

Neroli, OIL OF. See *ORANGE*.

Nertchinsk, a town of eastern Siberia, in the Trans-Baikal Territory, on the Nertcha, a tributary of the Shilka (which is a head-stream of the Amur), 875 miles E. of Irkutsk. The district of which it is the centre yields silver, lead, zinc, tin, and gold; and the town is a trading centre for Russians, Mongols, Turcomans, and Tunguses, exchanging tea, gunpowder, and furs. Pop. 3750. See the *Century Magazine*, October 1889.—Another Nertchinsk, *NERTCHINSKIY-ZAVOD*, stands 180 miles SE., on a tributary of the Argun, and is also a great mining centre. The silver-mines and gold-mines are largely worked by convict labour, and the pop. of the town, with the mines, is about 5000. The soil in the vicinity is fertile, and the climate mild and agreeable.

Nerthus. See *HERTHA*.

Neruda, MADAME. See *HALLÉ*.

Nerva, M. COCCEIUS, a Roman emperor, elected by the senate after the murder of Domitian, 18th September 96 A.D. He was born in 32, of a family belonging to Narnia, in Umbria, and twice held the honour of consulship before his election to the dignity of emperor. He displayed great wisdom and moderation, rectified the administration of justice, and diminished the taxes; but finding himself, on account of his advanced age, not vigorous enough to repress the insolence of the Prætorian Guards, he adopted M. Ulpius Trajanus, then at the head of the army of Germany, who succeeded him on his death, 27th January 98.

Nerval, GÉRARD DE, the adopted name of Gérard Labrunie, one of the most attractive but ill-starred figures among the French Romanticists, was born at Paris, May 21, 1808, son of an officer in the Grand Army. He was educated along with Gautier at the Lycée Charlemagne, and early took to letters, publishing at twenty a translation of *Faust* which pleased Goethe, and gave his choruses to Berlioz. Desultory work, a love-affair cut short by death, fits of restless travel, of dissipation, and of gloom that at times deepened into mental darkness, and at last death, almost certainly by his own hand, 25th January 1855, sum up the wretched story of his life. He moved in a romantic dream-world all his days, squandered money when he had it prodigally upon *bric-à-brac*, read deeply in Greek, Italian, German, English, and Arabic, and wandered carelessly over Italy, Germany, Greece, Syria, Palestine, and Egypt. Gérard de Nerval wrote admirably alike in prose and verse, his style ever delicate, natural, and original, informed with a subtle personal charm of a quite remarkable character. But his travels, criticism, plays, and poems, good literature as they are, are far less interesting than his *Aurélien, ou le Rêve et la Vie* (1855), an experience of his own madness. 'This strange work,' says Andrew Lang, 'does for insanity what the *Dream of Gerontius* has done for death.' In *Les Illuminés, ou les Précurseurs du Socialisme* (1852), he discusses the mysticism of certain highly endowed men in its relation to mental alienation. But his most delightful work will be found in his fantastic short tales, which have an exquisiteness of their own that approaches near perfection. These are the *Contes et Facéties* (1852), and the semi-autobiographic series of *Filles de Feu*, containing *Sylvie*, *Angélique*, *Jenny*,

Octavie, Isis, Emilie, Corilla (1856). Another book of singular interest is the *mélange* entitled *La Bohème Galante*. Some of his most charming poems are graceful adaptations of French peasants' folk-songs, the beauty of which he had ears to hear.

His *Œuvres complètes* were collected in 5 vols. in 1868. See Andrew Lang in *Fraser's Magazine*, May 1873.

Nervii, a powerful and warlike people of the ancient Gallia Belgica, whose territory stretched from the Sambre to the ocean, not subdued by Cæsar without an obstinate resistance.

Nervous Diseases. See articles in this work on Alcoholism, Aphasia, Apoplexy, Appetite, Brain, Chorea, Cretinism, Delirium, Delirium Tremens, Epilepsy, Headache, Hydrocephalus, Hypochondriasis, Hysteria, Insanity, Locomotor Ataxia, Meningitis, Myelitis, Neuralgia, Paralysis, Sciatica, Spinal Cord, Sunstroke, Tetanus, &c.

NERVOUSNESS is a term somewhat vaguely used, both popularly and by medical men, to express an unduly excitable condition of the nervous system, manifested by unusually ready manifestation of emotion—e.g. starting at slight causes—by morbid sensitiveness, by unreasonable apprehension, by trembling of muscles, and in many other ways. The condition may be natural, or produced by ill-health or acute disease. It is more common in children than in adults, and in the female sex than the male. Care should be taken to improve the general health by good nutrition, regulation of the bowels, open-air exercise, bathing, change of air and scene, and the ordinary tonic remedies; stimulants and drugs should be avoided save under the special direction of a medical man.

Nervous System, the mechanism by which an animal acquires a knowledge of the external world, and by means of which the great functions of the absorption of food, the elimination of waste products from the body, the respiration, circulation, and muscular action, are regulated and controlled. In its simplest form, in some of the lowest animals, it consists merely of nerve-fibres going to and from a small group of nerve-cells; but from this elementary condition there is an ever-increasing degree of complexity till its highest development is reached in man, which alone is included in the following description. In the articles on Birds, Fishes, Reptiles, Mollusca, &c. will be found paragraphs on the nervous systems of the various classes of animals.

The nervous system is composed of a series of organs—nerve-cells, nerve-fibres, and nerve end-organs. The nerve-cells are situated for the most part in the brain and spinal cord, but also in other parts of the nervous system. Their function is either to receive, to send out, or to modify as they transmit, nervous impulses. The nerve-fibres transmit nerve impulses to and from the nerve-cells. For this reason groups of nerve-cells are often conveniently spoken of as nerve centres; their relation to the nerve-fibres being analogous to that of a telegraph-office to the wires connected with it. The end-organs are the special structures for receiving impressions, such as the various organs of special sense, smell, sight, hearing, taste, touch (see NOSE, EYE, EAR, TASTE, TOUCH), and for transforming outgoing impulses into muscular contractions or secretion, &c. The nerve-fibres thus connect either an end-organ with a nerve centre, or two nerve centres with each other. These three sets of organs, nerve centres, fibres, and end-organs, are grouped into two great systems—the *cerebro-spinal* (fig. 1) and the *sympathetic* (fig. 10) system. The former is composed of the brain, spinal cord, and the cranial and spinal nerves respectively connected with them. The sympathetic system is formed by a double chain

of small swellings, called ganglia, on either side of the front of the spinal column, and connected with each other, with the spinal nerves, and the internal organs by fine nerve-fibres (figs. 7 and 10).

Fig. 1.

a, cerebrum; b, cerebellum; c, medulla oblongata; d, spinal cord, from which the spinal nerves arise; e, brachial plexus; f, sciatic nerve.

The nerves are whitish cords varying greatly in size. They are composed of nerve-fibres which are bound together by fibrous tissue. This forms a sheath on the outside (the *perineurium*), and sends processes inwards between the individual nerve-fibres (fig. 4 shows a transverse section of part of a nerve, with the bundles of connective tissue passing inward). In the spinal cord and brain the nerve-fibres are held together by a special kind of connective tissue, called *neuroglia*.

Structure of Nerve-fibres.—A fibre from a spinal nerve has the following structure. In the centre is a very fine fibre or thread called the *axis cylinder*. This runs without any interruption along the whole length of the nerve. It can be traced into a nerve-cell at one extremity, and into an end-organ at the other; and there is reason to believe that it is really an outgrowth from a nerve-cell. It is the essential constituent of a nerve, that namely along which the nervous impulse travels. The axis cylinder is in its turn composed of still finer fibrillæ, which may break up into finer nerve-fibres. Except at its origin and termination, the axis cylinder is covered by a tubular membrane called the *medullary sheath*, or the white substance of Schwann, a whitish substance of a peculiar fatty nature. This is interrupted at intervals of about $\frac{1}{4}$ th of an inch by constrictions which (fig. 2) pass completely through its thickness. When a nerve is stained with nitrate of silver, a black colour is formed at the intersections, and for a short distance along the axis cylinder (see fig. 3, where two are represented). These interruptions

are called nodes of Ranvier, after their discoverer, and are supposed to allow of the percolation of lymph to nourish the axis cylinder. When a nerve

Fig. 2.
Small part of a nerve-fibre with axis cylinder, surrounded by medullary sheath. The primitive sheath passes over the constriction in the medullary sheath.

Fig. 3.
Nerve-fibres, stained with nitrate of silver, showing two nodes of Ranvier.

is divided transversely, and stained appropriately, the axis cylinder appears as a small point surrounded by a ring of the whitish medullary sheath

Fig. 4.

(fig. 4). This sheath is enclosed by a continuous investment, the *primitive sheath*. This is colourless, and very delicate, and has a nucleus on its inner side corresponding to each segment of the medullary sheath. In the sympathetic system the medullary sheath is absent; while the fibres of the brain and spinal cord retain the medullary sheath,

Fig. 5.—Nerve-cells :

A, from sympathetic ganglion; B, from cerebrum; C, from spinal cord; a.p., axis cylinder process.

but want the primitive membrane. The sympathetic fibres are often called gray or non-medullated; the others, white or medullated. The nerve-fibres in the limbs are about $\frac{1}{1000}$ th of an

inch in diameter; in the brain they may be nearly ten times finer.

The nerve-cells vary greatly in size and in form. Many of them, especially in certain regions of the cortex of the brain, have the shape of an elongated pyramid (fig. 5, B), with fine processes coming off at various points, others are very irregular in outline, but also with numerous processes, one of which can frequently be traced into continuity with a medullated nerve, and hence is called the *axis cylinder process*, while the others form a fine network before entering another cell or fibre. Such cells are called multipolar (fig. 5, A and C), and are seen best in the anterior horns of the gray matter of the spinal cord. Many cells, again, are bipolar—i.e. they have only two fibres, one at each pole, in connection with them.

The various end-organs are described under the

Fig. 6.

special sections. Fig. 6 shows the manner in which the fibres of a nerve end in a muscle.

The nerves arising from the brain are arranged in twelve pairs. The first, or olfactory, is the nerve of smell. The second, or optic, is the nerve of sight. It arises from the retina, meets with its fellow in the optic chiasma, and is distributed half to each side of the brain, terminating partly in the corpora quadrigemina (for the reflex movements of the eye), and partly in the optic thalamus, passing thence to the occipital lobe of the cerebrum (for the sense of sight). The third or oculo-motor nerve arises under the corpora quadrigemina, and passes to all the muscles of the eye except two, which are supplied by the fourth and sixth pairs. The fourth nerve, arising immediately behind the third nerve, supplies the superior oblique muscle of the eye; while the sixth pair, arising from a nucleus near the middle of the floor of the fourth ventricle, supplies the external rectus muscle of the eye. The fifth pair has a very long origin from a point at the level of the third nerve down to the upper part of the spinal cord. It is the motor nerve to the muscles of mastication, and the sensory nerve to the face, front of the head, teeth, tongue, and is the nerve of taste of the anterior part of the tongue. It is this nerve which is concerned in neuralgia of the head and face and teeth. The seventh pair arises from the lower part of the pons Varolii (see BRAIN), and is the motor nerve to the facial muscles of expression. Injury to or disease of this nerve causes facial palsy, or Bell's paralysis. The eighth pair, or auditory nerve, supplies the internal ear. It is divided into two parts, one of which supplies the cochlea, and is the nerve of hearing proper, while the other supplies the semi-circular canals, and is concerned in the maintenance of the equilibrium of the body. The nerve arises from the lateral and posterior part of the pons Varolii and medulla oblongata. The ninth pair, or glosso-pharyngeal nerve, is the special nerve of taste, and supplies the hinder third of the tongue, with the taste bulbs of which it is connected. The tenth pair, or pneumogastric nerve, has a very wide area of distribution to the lungs, heart, stomach, &c.; it is partly motor and partly sensory in function. The eleventh pair, or spinal accessory nerve, is the motor nerve to the larynx, and to certain muscles in the upper part of the neck. These three nerves arise from a groove in the side of the medulla oblongata and

upper part of the spinal cord. The twelfth pair, or hypoglossal nerve, is the motor nerve of the tongue. Its origin is near the floor of the fourth ventricle, close to the middle line, and it emerges from the anterior surface of the medulla oblongata in a shallow groove between the anterior pyramids and the inferior olivary body (see BRAIN).

Fig. 7.

The spinal nerves arise from the spinal cord in pairs, thirty-one in number, and are named according to their relation to the vertebrae—cervical, dorsal, lumbar, and sacral. Their mode of origin will be understood from fig. 7, which represents diagrammatically the first part of their course, and on one side their relations with the sympathetic system—C 1-8 represents the eight pairs of cervical nerves; D 1-12, the twelve dorsal pairs; L 1-5, the five lumbar pairs; and S 1-6, the six sacral pairs of nerves. Each spinal nerve arises by two roots, an anterior and a posterior (fig. 8, *a* and *p*; see also SPINAL CORD). These roots pass outwards, and unite before they leave the spinal canal. Before their union a small oval swelling is found on the posterior root, and is called its *ganglion*, *g*. The united nerve leaves the spinal canal by a small aperture between adjacent vertebrae. It almost immediately gives off a fine medullated nerve to its corresponding sympathetic ganglion, a branch which can be traced into one of the internal organs. It also receives from the ganglion a non-medullated or gray fibre, which is distributed to the muscular coat of the blood-vessels, especially the arteries. The nerve thus altered passes outwards, dividing as it goes to send its ultimate branches into the fibres of the muscles, into the cells of the skin and connective tissues, tendons, and bones. In the dorsal region each nerve passes to its distribution without entering into connection with its neighbours, but in the cervical, lumbar,

Fig. 8.

and sacral regions the nerves split up and form new junctions with each other, or *plexuses* as they are called. (These are indicated in fig. 1, and on the right-hand side of fig. 7, but the detailed description of them is impossible within the limits of this article.)

Functions of the Spinal Nerves.—Sir Charles Bell discovered that division of the anterior roots was followed by loss of power of voluntary motion, and that division of the posterior roots destroyed the power of sensation. He termed the anterior root motor, and the posterior sensory. It has since been ascertained that the anterior roots carry outwards other impulses that do not result in motion,

and that the posterior roots carry inwards impulses which may not result in sensation. Therefore, it is more correct to term these roots respectively *efferent* and *afferent*. If the anterior root be divided between the point of its origin from the cells of the anterior horn of the spinal cord and its junction with the posterior root, the part unconnected with the cord will waste along the whole length of the nerve, and the muscles which it supplies will waste also. The cells in connection with the anterior roots, therefore, not only send out motor impulses, but exert a nutritive or *trophic* influence on the nerve and muscle. Division of the posterior root beyond its ganglion is followed by wasting of the corresponding fibres of the nerve to their ultimate termination. If the root be cut between the ganglion and the spinal cord, the part attached to the ganglion remains unaltered, while that connected with the spinal cord wastes. This shows that the ganglion of the posterior root exerts a trophic influence on the fibres connected with it. If the nerve be divided after the junction of the two roots, the whole of the nerve farthest from the spinal cord will waste.

The afferent nerve impulses which pass along the posterior roots comprise those which give rise to the sense of touch, pain, and temperature, and to reflex movements of various kinds without necessarily exciting our consciousness, such as those concerned with the maintenance of the equilibrium of the body, and with the functions of the internal organs.

Reflex Action.—By this we mean an action brought about directly by the influence of an afferent impulse quite independently of voluntary control. For such an action four elements are necessary: (1) afferent fibres, (2) nerve cells or centres, (3) efferent fibres, (4) muscle fibres. The impulse travels up the afferent fibres and stimulates the nerve-cells to send an impulse along the efferent fibre to the muscles. If any of these four factors is absent, the reflex action cannot take place. A familiar example is the moving of the foot as the result of tickling the sole. The afferent impulse passes up the nerves to the nerve centres in the spinal cord, which send outwards direct to the muscles motor impulses, which often cannot be controlled by the will.

Automatic Action.—When movement is brought about by an impulse originated in a nerve centre itself, without the influence of an afferent stimulus, it is called automatic or spontaneous. Such actions are apt to occur rhythmically, such as the action of the heart.

Voluntary Actions.—In these the outgoing impulses originate in the nerve-cells in the motor area of the brain, and pass down the opposite side of the spinal cord to the nerve-cells in its anterior horn. From thence they are transmitted by the efferent nerves to the muscles. Fig. 9 will explain the relation of voluntary to reflex action: *c* is a nerve-cell in the brain; *n*, the nerve-fibre in the spinal cord which transmits the nerve impulse originating in *c* to *s*, a cell in the anterior horn of the spinal cord which forwards it through a nerve, *e*, to a muscle, *m*. The reflex arc is represented by *o*, an end-organ; *a*, an afferent nerve; *s*, a nerve-cell; *e*, an efferent fibre; *m*, a muscle. If *c* or *n*, or both, be destroyed by disease, the power of voluntary

Fig. 9.

motion will be lost, but the reflex arc, *o*, *a*, *s*, *e*, *m*, remains intact. We can sometimes control or

Fig. 10.—The Sympathetic Nerve; the right lateral walls of the chest and abdomen, and the stomach, intestines, liver, spleen, and pancreas being removed to bring it in view:

1, 2, 3, the superior, middle, and inferior cervical ganglia;

4, the two lines from this figure include the twelve dorsal ganglia; 5, include the four lumbar ganglia; 6, include the five sacral ganglia; 7, the ganglion impar; 8, cardiac plexus; 9, solar plexus; 10, aortic plexus; 11, hypogastric plexus; *a*, the larynx; *b*, the trachea; *c*, arch of the aorta; *c'*, external carotid; *c''*, internal carotid; *d*, the heart; *e*, *e'*, the diaphragm; *f*, the cardiac end of the oesophagus; *g*, thoracic, and *g'*, abdominal aorta; *h*, the kidney; *i*, the supra-renal capsule; *k*, the sacrum; *l*, the section of base of the skull; *m*, the bladder; *n*, the lower portion of the rectum.

repress a reflex action voluntarily. The cell *c* in the brain can so act on the cell *s* as to hinder or inhibit its ordinary response to a stimulus, and when the cell in the brain is destroyed the cell *s* is more easily stimulated reflexly, apparently because some restraining influence is removed. Such a restraining action is exerted on the heart by the pneumogastric nerve, which, when stimulated, slows or stops its movements; and in the same way the secretion of glands may be interfered with by abnormal stimulation of their nerve centres. This influence is termed inhibitory action, and is one of great importance.

Secretory Nerves.—The nerves which induce the various acts of secretion leave by the motor cranial nerves, or by the anterior roots of the spinal nerves; but the description of their distribution, &c. must be relegated to the article SECRETION.

The *sympathetic* system is, as already stated, composed of a series of ganglia situated on either side of the spinal column along its whole length. In the dorsal, lumbar, and sacral regions the ganglia correspond in number to the vertebrae; but in the cervical region there are only three, of such large size, however, that they are generally supposed to represent the fusion of a number of ganglia. Below, the two chains unite in front of the coccyx in a single ganglion. These ganglia are formed of multipolar nerve-cells (fig. 5, A), and are united with each other by gray nerve-fibres. Each ganglion gives to its corresponding spinal (or cranial) nerve a gray non-medullated nerve, and receives from it a fine white medullated nerve. The fibres of distribution may be studied in fig. 10. They pass to the blood-vessels and to the mucous membranes and muscular coats of the various internal viscera, and become united with each other in fine networks or plexuses, on many of which nerve-cells or ganglia are situated.

The sympathetic chain is continued upwards as a fine plexus of nerves on the internal carotid artery, on the various branches of which it is distributed. From the superior cervical ganglion also fibres pass to the various arteries in the neck and face, and to form, along with the pneumogastric and glosso-pharyngeal nerves, the pharyngeal plexus on the muscles and mucous membrane of the pharynx.

From some of the cervical and upper thoracic ganglia fibres pass into the chest, to form also, along with the pneumogastric nerve, two important plexuses, named pulmonary and cardiac, from which branches pass to the lungs and heart, and undoubtedly influence their functions. From the thoracic ganglia also arise the three splanchnic nerves which pass into the abdomen to enter the solar or epigastric and the renal plexus. The solar plexus is situated at the pit of the stomach, and is connected with two large semilunar ganglia, which send branches to all the blood-vessels and to all the organs within the abdomen. It is owing to the relations and functions of the solar plexus that blows in this region are so dangerous. The hypogastric plexus arises from the lumbar ganglia, and sends branches to the blood-vessels and to the organs in the lower part of the abdominal cavity, more especially the organs of generation, the lower bowel, and the bladder.

The functions of the sympathetic system are still

imperfectly understood. It supplies fibres to the muscles of blood-vessels to regulate their calibre; hence these fibres are called *vaso-motor*. The vaso-motor centre is situated, not in the sympathetic system, but in the medulla oblongata. The path for the fibres passes down the spinal cord, which it leaves by the anterior roots at various levels to pass along the white communicating branches into the sympathetic ganglia. From these ganglia the vaso-motor nerves for the internal organs pass into the various plexuses just described, while those for the vessels of the limbs and trunk return to the spinal nerve by the gray communicating nerve. Further, the muscular movements and secretions of all the internal organs are regulated through the sympathetic system.

Of the nature of nerve energy we know little. The nervous impulse travels along a nerve in man at a rate of about 34 yards per second, and it is accompanied by certain electrical changes in the nerve, but nerve energy is not identical with electrical energy. It is probably accompanied by molecular changes in the structure of the nerve as yet inaccessible to our means of investigation. In like manner the origination or discharge of nerve impulse in a cell is probably induced by similar but more active changes in its substance.

See Quain's *Anatomy*, Foster's *Physiology*, Landois and Stirling's *Physiology*, and Obersteiner's *Anatomy of the Central Nervous System* (translated by Hill).

Nesle, TOUR DE. The ancient castle of the noble family Nesle stood, with its gate and tower, at an angle of the city wall of Paris, on the south bank of the Seine, where now stands the palace of the Institute. It came into the hands of the crown, was the scene of events recorded by Brantôme, and was bought by Cardinal Mazarin as the site for his college.

Ness, LOCH, a long, narrow lake of Inverness-shire, the second largest in Scotland, $6\frac{1}{2}$ miles SW. of Inverness. Lying 50 feet above sea-level, it extends $22\frac{1}{2}$ miles north-north-eastward, and has an average breadth of 1 mile, with an area of 19 sq. m. It receives the Morriston, Oich, Foyers (q.v.), and other streams, and sends off the river Ness to the Moray Firth. It lies in the valley of Glenmore, on the line of the Caledonian Canal (q.v.), and is enclosed by steep mountains—the highest, Mealfourvie (2284 feet). Owing to its great depth (in places 780 feet) it never freezes to any considerable extent. See FORT AUGUSTUS.

Nesselrode, KARL ROBERT, COUNT, Russian diplomatist, was born on the 14th December 1780, at Lisbon, where his father, a descendant of an ancient noble family on the lower Rhine, was then Russian ambassador. He gained in a high degree the esteem and confidence of the Emperor Alexander, and in 1814 he accompanied the Russian emperor to France, where he took a principal part in all the negotiations which ended in the peace of Paris; and he was one of the most prominent of the plenipotentiaries in the Congress of Vienna, and one of the most active diplomatists of the Holy Alliance. The Emperor Nicholas reposed in him the same confidence, and amidst the European convulsions of 1848 and 1849 Russia, under his guidance, refrained from interference, till an opportunity occurred of dealing a deadly blow to the revolutionary cause in Hungary. Being one of the chiefs of the moderate party in Russia, Nesselrode exerted himself to preserve peace with the Western Powers; and after the war had broken out in 1854 he undoubtedly strove for the re-establishment of peace. After the accession of Alexander II. he retired from the direction of foreign affairs, and was succeeded by Prince Alexander Gortschakoff, but retained the

dignity of chancellor of the empire. He died 23d March 1862, and his autobiography appeared at Berlin in 1866.

Nessus. See HERCULES.

Nestor, according to ancient Greek legend, the son of Neleus and Chloris, born in the Messenian Pylos, escaped destruction when Hercules slew all his brothers. He married Eurydice, by whom he became the father of a numerous family. In his youth he was distinguished for valour in wars with the Arcadians, Eleians, and the Centaurs, and in his advanced age for wisdom. Although he was an old man when the expedition against Troy was undertaken, he joined it with his Pylians in sixty ships. Homer makes him the great counsellor of the Greek chiefs, and extols his eloquence as superior even to that of Ulysses. Nestor returned in safety to his own dominions after the fall of Troy, and continued for long to rule over the people of Pylos.—For the birds called Nestor, see KEA.

Nestorius, a native of Germanicia, a city of northern Syria, in the patriarchate of Antioch, was probably a disciple of the celebrated Theodore of Mopsuestia. Having received priest's orders at Antioch, he became so eminent for his zeal, ascetic life, and eloquence in preaching that he was selected by the emperor as patriarch of Constantinople (April 428). Soon after his consecration a controversy arose as to the divine and human natures of our Lord, in which Nestorius took a leading part. The presbyter Anastasius, having in a sermon denied that the Virgin Mary could be truly called the Mother of God (*θεοτόκος*), it being not God the Logos but only the human nature which had a mother and suffered pain and death, Nestorius warmly defended Anastasius, and elaborated his view into the theory which has since been known by his name. He held that Mary was the Mother of Christ (*χαριστοτόκος*), or the Receptive Organ of God (*θεοδόχος*), and that, while the divinity of the Logos is to be distinguished from the temple of his flesh, yet there remained but one person in the God-man. By his antagonists he was accused of exaggerating the distinction of two natures into a co-existence of two persons (*προσώπων ἑσσοις*)—the human person of Christ and the Divine Person of the Word. A vigorous controversy ensued, which extended from Constantinople to the other patriarchates, and drew from Cyril of Alexandria a formal condemnation of the doctrine of Nestorius in twelve anathemas, and a similar condemnation, accompanied by a threat of deposition and excommunication, from Celestine, Bishop of Rome, unless he would withdraw the obnoxious doctrine. Nestorius remaining firm in his opinions, a general council was convened at Ephesus in 431, at which Cyril took the most active and prominent part, and in which, notwithstanding the absence of John the Patriarch of Antioch and his bishops, Nestorius was condemned and deposed. Considerable opposition was offered to this judgment for a time, but ultimately the emperor was led to side with Cyril, and Nestorius was confined in a monastery near Constantinople, whence, after four years, he was banished to Petra in Arabia. He next found shelter in the Greater Oasis in Upper Egypt, and, after several changes of his place of confinement, died in exile, time and place alike unknown.

See Walch's *Hist. d. Ketzereien*; Dorner's *History of the Doctrine of the Person of Christ*; and the church histories of Gieseler and Neander.

The sect of the NESTORIANS, formed in the 5th century, was, after its exclusion from the Roman empire, extended into Persia, India, and even China. The teachers who were driven out of Edessa settled at Nisibis, which soon became an active centre

of learning and missionary enterprise throughout Persia. Babæus, Bishop of Seleucia (498-503), assumed the title of patriarch, and openly professed Nestorianism, and under his successors the sect grew rapidly and produced many learned theologians and philosophers, and physicians like Hippocrates and Galen. Under the rule of the califs the Nestorians enjoyed toleration, and spread in Arabia, Syria, and Palestine, and even to Samarcand, Herat, and China. The Prester John (q.v.) of romance was a Christian of this colour, and there is a tradition that Mohammed learned what he knew of Christianity from Sergius, a Nestorian monk. In the middle of the 13th century as many as twenty-five metropolitans owned the jurisdiction of the Nestorian patriarch, but after the persecutions of Tamerlane they dwindled away. Meantime the Roman Catholic Church had been active in missionary labours amongst them, and already in the 14th century the pope was nominally at least acknowledged as the head shepherd of all Christendom. In the 16th century a great schism took place, a portion renouncing their distinctive doctrine, and placing themselves under the jurisdiction of the Roman pontiff, to whom, under the title of Chaldean Christians, they have since remained faithful. Their patriarchs still bear the traditional name of Joseph. The others to the present day maintain their old creed and their ancient organisation. Their chief seat is in the mountain-ranges of Kurdistan. They are at present a poor and illiterate race, and were carefully estimated in 1833 to number 70,000 souls. Their patriarch since the close of the 17th century has borne the name of Simeon. The bishops are bound to observe celibacy, but marriage is permitted to the priests and inferior clergy. Their liturgical books recognise seven sacraments, but confession is infrequent, if not altogether disused. Marriage is dissoluble by the sentence of the patriarch; communion is administered in both kinds; and although the language of the liturgy plainly implies the belief in transubstantiation, yet, according to Layard, that doctrine is not popularly held among them. The fasts are strict, and of very long duration, amounting to very nearly one-half of the entire year. They pray for the dead, but are said to reject the notion of purgatory, and the only sacred symbol which they use or reverence is the cross. The Nestorians of Kurdistan, like the Christians of the Lebanon, have suffered much from time to time through the fanaticism of the wild tribes among whom they reside. In a massacre in 1843, and again in 1846, as many as six thousand perished, and even still they owe much of their security to the influence exercised in their favour by the foreign representatives at the Turkish and Persian courts. There has been among them since 1834 an active American mission, which has translated the Bible into their speech—a dialect of the old Aramaic.

There is another body of Nestorians who have existed in India from the period of the early migrations of the sect, and who are called by the name of Syrian Christians. Their chief seat is in Travancore, where they number about 100,000.

(vol. iii. of Clark's trans.); Petermann's article in Herzog's *Real-Encyclop.*; Perkins's *Residence of Eight Years in Persia among the Nestorian Christians* (Andover, 1843); Badger's *Nestorians and their Rituals* (1852); Anderson's *Oriental Churches* (1872); Dean Stanley's *History of the Eastern Church*; and Professor Legge's *Nestorian Monument of Hsi-an Fu, rel. Christ. in China* (1888).

Nests are prepared for egg-laying, brooding, and nursing purposes. How widely they may

vary according to surroundings, the skill of the builder, and the needs of the young is best illustrated by birds, which excel all other animals in the art of cradling. It is not always possible to distinguish between a nest and a home, as the same structure may serve both purposes, but it is interesting to notice that the latter seems sometimes to have been evolved out of the former, as in the case of bees, where the complex hive has grown round about a simple nest. Referring to special articles, and above all to BIRD, we shall simply mention, in illustration, the squirrel's large and lofty shelter, and the minute cradle of the harvest-mice among the reeds; the æsthetic honeymoon-bower of the bower-bird, and the beautiful hanging-nests of the weavers; the holes prepared by the alligator and some other reptiles; the beautiful grassy structure woven and glued together by the stickleback, and the seaweed nest of the black goby; and finally, the social nests of ants, bees, and wasps. See ANT, BEE, EDIBLE BIRDS'-NEST, FISH, &c.; J. G. Wood's *Wonderful Nests* (1887); and F. Houssay, *Les Industries des Animaux* (Paris, 1890).

Netherlands, the north-west corner of the great north European plain, a triangular region between France, Germany, and the sea, lying mainly in the basins of the Scheldt, the Meuse, and the lower Rhine, is now divided into nearly equal parts between the kingdoms of Holland and Belgium. The official designation of Netherlands is retained by what we commonly call Holland (q.v.), and under that head the early history common to the two is discussed; while the history of the 'Spanish Netherlands' falls mainly under the head of Flanders (q.v.) and Belgium (q.v.). The history of the Dutch and Flemish language and literature will be found under HOLLAND.

Netherlands Trading Company. See JAVA.

Netley, a place on the east side of Southampton Water, 3 miles SE. of Southampton, with a ruined Cistercian abbey, founded in the time of Henry III., and the Royal Victoria Hospital. The latter superb building is for the reception of invalids from the army on foreign service, and from among the troops serving in the adjoining military districts. It nominally has accommodation for 878 patients, but for a few months during the trooping season room has usually to be found for over 1000. The medical staff consists of a surgeon-general as principal medical officer, a registrar and secretary, and medical officers of various ranks. The invaliding dépôt attached consists of a colonel on the staff ranking as an assistant-adjutant-general, a paymaster, and a quartermaster. The total cost of the construction of this hospital, whose foundation-stone was laid by Queen Victoria on 19th May 1856, was about £350,000. Attached is the Medical School for candidates for the army medical staff (see MILITARY SCHOOLS). Netley is also the headquarters of the female nurses of the army. A direct line from Portsmouth, the port of disembarkation of invalids, has been opened, and they can now be brought to this hospital in thirty minutes.

Nets. A net is a kind of trap formed of string worked into open meshes and used for capturing fishes, birds, and other animals. The cord or string is knotted at the intersections so as to keep the meshes of their original size. As there is evidence that nets were used in prehistoric times, and since they are almost everywhere made by savage tribes, it is probable that they were among the earliest implements constructed by primitive man for procuring animal food.

Remains of nets belonging to the stone age have been found at Robenhausen and Vinelz in Switzer-

land. Not only do the paintings on ancient Egyptian monuments show that in the days when these were executed nets were in common use, but portions of actual nets of great age have been obtained in Egypt. They are also represented on the monuments of ancient Greece. The Eskimo and Tchuktohis make nets of twisted sinew or of strips of seal-skin, and the Chinese construct fine nets from the cocoons of the wild silkworm, which are soaked in oil so as to render them barely visible. Silk nets also are used in Greece. In some parts of the world nets are made of the fibres of plants but little known; but in civilised countries the chief materials used in their construction are hemp and cotton, and to a less extent flax. More nets are now made of cotton than of hemp, because, although the former are less durable, they are of lighter weight, more easily managed, and a smaller number of corks and bungs suffices to float them.

The making of nets by hand is an extremely simple operation. Only two instruments are required—viz. a netting-needle like *a* in the figure, for meshes above one-half inch in width, or one like

b for meshes under this size, and *a* mesh-pin, which is simply a straight piece of wood of oval section and a few inches long, upon which the loops are formed. If the meshes are to be one inch from knot to knot, then the circumference of the mesh-pin requires to be two inches. There are two ways of forming the knots on hand-made nets (see KNOTS, figs. 11 and 13), but both are equally simple, and the whole process can be learned in a few minutes by seeing an operator at work. In some countries nets are still largely made by hand.

Netting-machines are now extensively used for the manufacture of nets. The looms are of complicated construction, and it would require a considerable number of illustrations and detailed descriptions to give even a general idea of how they perform their work. One of the most successful of these is known as the Paterson net-loom. It was invented by Mr James Paterson, and subsequently (1835) brought into a more practical shape by Mr Walter Ritchie, both of Musselburgh. (The knot made by this loom is the same as fig. 13 of KNOTS.) It works by a peculiar arrangement of hooks, needles, and sinkers. Since the middle of the century Messrs J. & W. Stuart, who then took up Mr Paterson's business, have made some further improvements upon his loom. An improved form of a net-loom, on a different principle, invented by a Frenchman named Pecqueur, in 1840, was subsequently patented in England. The designers of the later and more perfect form of this loom, which does its work well, are MM. Baudouin and Jouannin. Their English patent is taken out in the name of W. Clark, agent, and the specification, which contains a number of explanatory lithographs, is dated 19th September 1861 (No. 2340).

A variety of nets are used by fishermen, but the principal kinds are the *seine*, the *drift-net*, the *moored-net*, and the *trawl* (see FISHERIES). The net used for taking the tunny in the Mediterranean is often nearly a mile long, and some Russian hand-made nets are 3000 feet in length. Means

are adopted to increase the durability of cotton and hemp nets, especially of the former. One plan is to tar them; but, although this to some extent prevents the injurious action of sea-water upon them, it has the disadvantage of hiding faulty parts. They are, however, much more frequently 'barked' in an infusion of cutch (see CATECHU), which like tar lessens the action of salt water upon them and at the same time admits of the state of the meshes being better seen. A solution of alum is also useful in preserving the fibre of the string of which nets are made.

One or two kinds of nets are made for catching birds, such as *fly-nets* for waders frequenting the seashore, and *clap-nets* for small birds (see WILDFOWL). Fine nets are used to capture insects, and by the inhabitants of some countries as a protection from mosquitoes. Other kinds are employed to protect fruit and blossoms, for articles required on board ship, for mess-cooking, and for domestic purposes.

Nettle (*Urtica*), a genus of plants of the natural order Urticaceæ, having unisexual flowers, the male and female on the same or separate plants; the male flowers with a 4-parted perianth and four stamens; the female flowers with a 2-parted perianth and a tufted stigma; the fruit an achenium. The species are herbaceous plants, shrubs, or even trees, many of them covered with stinging Hairs (q.v.), which pierce the skin when touched, and emit an acrid juice, often causing much inflammation and pain. When a nettle is grasped in such a way as to press the hairs to the stem no stinging ensues; but the slightest inadvertent touch of some of the species produces very severe pain. The acidity which is characteristic of all nettles, more or less, is by some said to be due to bicarbonate of ammonia, or according to others free formic acid being present in the limpid juice secreted by the glandular hairs of the leaves and stems. The stinging of the native nettles of Europe is trifling in comparison with that of some East Indian species. *U. crenulata* is particularly notable for the severity of the pain which it produces, without either pustules or apparent inflammation. The first sensation is merely a slight tingling, but within an hour violent pain is felt, as if a red-hot iron were continually applied, and the pain extends far from the original spot, continues for about twenty-four hours and then abates, but is ready to return in its original intensity on the application of cold water, and does not cease for fully eight days. Cold water has a similar effect in increasing or renewing the pain of all kinds of nettles. Still more formidable than this species is *U. urentissima*, the *Devil's Leaf* of Timor. Of British species the most venomous, but the most rare, is the Roman Nettle (*U. pilulifera*); next to it is the Small Nettle (*U. urens*), frequent about towns and villages, and in waste and cultivated ground; whilst the least venomous is the most common and only perennial species, the Great Nettle (*U. dioica*), everywhere abundant, but particularly near human habitations, or their former sites, the desolation of which it may be said to proclaim. The roots of nettles, boiled with alum, afford a yellow dye; and the juice of the stalks and leaves has been used to dye woollen stuffs of a beautiful and permanent green. The young shoots of *U. dioica* have been much used in some parts of Scotland and other countries as greens, and their peculiar flavour is much relished by some, although, in general, the use of them is confined to the poor. They are valuable as anti-scorbutics, but are gritty to the taste from the quantity of crystals (Cystolithes) contained. Whatever it is that gives nettles their stinging power is dissipated by boiling and drying. The high

value of nettles as food for swine is well known to the peasantry of many countries; the great nettle is cultivated in Sweden for fodder of domestic animals; and nettles are also highly esteemed as food for poultry, particularly for turkeys. The seeds are extremely nutritious to poultry, and are given to horses by jockeys, in order to make them lively when they are to be offered for sale. The stalks and leaves of nettles are employed in some parts of England for the manufacture of a light kind of beer, called *Nettle Beer*. The bast-fibre of nettles is useful for textile purposes. Yarn and cloth, both of the coarsest and finest descriptions, can be made of it. The fibre of *U. dioica* was used by the ancient Egyptians, and is still used in Piedmont and other countries. When wanted for fibre the plant is cut in the middle of summer, and treated like hemp. *Nettle-cloth*, or *Grass-cloth*, is a beautiful fabric made from rhea fibre (see *BEHMERIA*). The fibre of *U. cannabina*, a native of the south of Siberia, central Asia, is much used; and from that of *U. whitlavi* both fine lace and strong ropes can be manufactured. The fibre of *U. japonica* is much used in Japan, and that of *U. argentea* in the South Sea Islands; that of *U. canadensis* is used in Canada; and that of *U. heterophylla*, a widely-diffused Indian species, described by Roxburgh to be the most ferocious-looking plant he ever saw, is of very glossy silky appearance, and is manufactured into cloth in Assam. The seeds and herbage of *U. membranacea* are used in Egypt as emmenagogue and aphrodisiac; and somewhat similar properties are ascribed to *U. dioica*. *U. tuberosa* produces tubers, which are nutritious, and are eaten in India raw, boiled, or roasted. Australia produces a magnificent tree-nettle, *U. gigas*, abundant in some parts of New South Wales, ordinarily from 25 to 50 feet high, but sometimes 120 or 140 feet, with trunk of great thickness, and very large green leaves, which when young sting violently.—The Dead-nettle (q.v.) is quite a distinct plant; so is the Nettle-tree (q.v.).

Nettlerash, or *URTICARIA* (Lat. *urtica*, 'a nettle'), is the term applied to a common form of eruption on the skin. The eruption consists of wheals, or little solid eminences of irregular outline, and either white or red, or most commonly both red and white, there being a white centre with a red margin. The rash is accompanied with great heat, itching, and irritation, but is always aggravated by scratching; the appearance on the skin and the sensation being very much like the appearance and feeling produced by the stinging of nettles; and hence the origin of its names. The eruption is characterised by the extreme rapidity with which it appears and disappears; the whole duration of the attack may be a few hours or even less; but it is extremely apt to recur at regular or irregular intervals: it is very rare for the wheals to persist more than a day.

The disease may be either acute or chronic. In the acute form feverishness may precede the rash by a few hours, or may be altogether absent. The disorder is often connected with some derangement of the digestive organs, and may be traced to the imperfect digestion of special articles of food, such as oatmeal, the kernels of fruit, strawberries, cucumbers, mushrooms, and especially oysters, mussels, and crabs, which are eaten with perfect impunity by most persons. It may be brought on also by local causes of irritation, and frequently complicates other irritable diseases of the skin.

The chronic form is often very troublesome, and frequently comes on periodically in the evening. Cases are reported in which persons have been afflicted for ten years continuously by this form of

the disease. It is characterised by constant recurrence during long periods, not by persistence of a single outbreak of the eruption. In the treatment of the acute form local causes of irritation must first be looked for and removed. Where it is brought on by some article of diet relief is often obtained by taking a teaspoonful of bicarbonate of soda (baking soda); but it may be necessary to administer emetics and purgatives, if vomiting and diarrhoea do not occur spontaneously. In the chronic form the patient should, in the first place, determine whether the rash is caused by any particular article of diet, and if this seems not to be the case an attempt must be made to improve the state of the digestive organs. A few grains of rhubarb taken daily, just before breakfast and before dinner, will sometimes effect a cure. Numerous other remedies have been recommended; perhaps the most generally useful is a draught containing a scruple each of the carbonates of magnesia and soda with five drops of tincture of nux vomica. Although external applications are usually of little avail, dusting the itching surface with flour sometimes affords temporary relief; and a still more useful application is a lotion composed of a drachm of the carbonate of ammonia, a drachm of the acetate of lead, half an ounce of laudanum, and eight ounces of rose-water.

Nettle-tree (*Celtis*), a genus of deciduous trees of the natural order *Ulmaceæ*, with simple and generally serrated leaves, considerably resembling those of the Common Nettle, but not stinging. The genus is distinguished chiefly by its fruit, which is a fleshy, globose, or sub-globose 1-celled drupe. The Common or European Nettle-tree (*C. australis*) is a native of the south of Europe, the west of Asia, and the north of Africa. It grows to a height of 30 to 40 feet, and is a very handsome tree, often planted along public walks in the south of France and north of Italy. The wood is very compact, very durable, and takes a high polish. It was formerly much imported into Britain for the use of coachmakers, and is used in Italy by musical-instrument makers for flutes and pipes. The flowers are inconspicuous, axillary, and solitary; the fruit black, resembling a small wild cherry, not eatable till after the first frosts, and then very sweet. The kernel yields a useful fixed oil. The tree succeeds well in the south of England. *C. occidentalis* is a native of North America from Canada to Texas, and is also called the Nettle-tree, Sugar Berry, Hackberry or Hagberry, and Hoop Ash. Its leaves are much broader than those of *C. australis*, its fruit very similar. It is a much larger tree, attaining a height of 60 to 80 feet. There are several varieties, which are sometimes but needlessly classified as distinct species. The inner bark of *C. orientalis*, consisting of reticulated fibres, forms a kind of natural cloth, used by some tribes of India. A number of other species are natives of the warm parts of America and of Asia.

Neu-Brandenburg, a town of Mecklenburg-Strelitz, is situated on Lake Tollens, 20 miles NNE. of Neu-Strelitz by rail. Pop. 9134.

Neuburg, an ancient town of Bavaria, picturesquely situated on the right bank of the Danube, 29 miles NNE. of Augsburg. It has an old ducal schloss in the Renaissance style. Pop. (1880) 7485.

Neuchâtel, or NEUFCHÂTEL (Ger. *Neuenburg*), a canton in the west of Switzerland, between Lake Neuchâtel and the French frontier. Neuchâtel lies in the midst of the Jura Mountains, four chains of which, running from north-east to south-west, traverse the canton, and are separated by elevated longitudinal valleys. The greater number of the

numerous streams which water the canton flow into the Rhine; several are feeders of the Lake of Neuchâtel, which, lying 1420 feet above sea-level, and 472 feet deep, is 25 miles long by from 3 to 6 wide. The Thiele serves as its outlet, and carries its waters into the neighbouring lake of Bienne, and thence into the river Aar. Pop. of the canton (1870) 97,284; (1888) 108,153, of whom three-fourths speak French, and four-fifths are Protestants. Asphalt and absinthe are exported; good wine and lace are made; but the speciality of the canton is watch-making, which occupies from 18,000 to 20,000 persons, and is prosecuted mainly in the homes of the work-people. The history of Neuchâtel was identical with that of Burgundy till the 11th century; and after the principality had been for a time incorporated with the territories of the Counts of Chalons, to whom it had been granted in 1288 by Rudolph of Hapsburg, it passed to the House of Longueville. In 1707, on the extinction of the Neuchâtel branch of the latter family, some fifteen claimants came forward to advance more or less valid pretensions to the Neuchâtel territory. Frederick I. of Prussia, who based his claim to the principality of Neuchâtel on the ground of his descent from the first Prince of Orange, a descendant of the House of Chalons, was the successful candidate; and from his time it continued associated with Prussia till 1806, when Napoleon bestowed it upon General Berthier; but in 1814 it was restored to the House of Brandenburg. A republican constitution was adopted in 1848, in spite of Prussian protest; and there was civil war in 1856. The connection with Prussia was wholly dissolved in 1857, and Neuchâtel is now a member of the Swiss Confederation. See SWITZERLAND.

NEUCHÂTEL, chief town of the canton, occupies a magnificent site on the north-west shore of the Lake of Neuchâtel, 85 miles by rail NNE. of Geneva. It is noted for its many charitable, educational, and artistic institutions, and has a château (restored 1866), a college (1828), a statue of Farel (1875), &c. There are manufactures of watches, jewellery, &c. Pop. (1870) 13,321; (1888) 16,504.—The famous Neuchâtel cream-cheeses are made, not here, but at Neuchâtel-en-Bray, a small Norman town, 25 miles SE. of Dieppe by rail.

Neuilly, or NEUILLY-SUR-SEINE, a town in the French department of Seine, immediately to the north of the Bois de Boulogne, and practically a suburb of Paris. Here, near the Seine, and in a large and beautiful park, formerly stood the Château de Neuilly, built by Louis XV., and the favourite residence of Louis-Philippe, which was burned at the revolution in 1848. When Louis-Philippe took refuge in England he assumed the title of Count de Neuilly. Pop. (1886) 25,596.

Neumünster, a prosperous manufacturing town of Holstein, on the Schwale, a head-water of the Stör, 20 miles by rail S. by W. of Kiel. It has large cloth-mills, dye-works, breweries, &c. Pop. (1875) 10,124; (1885) 13,659.

Neu-Pommern. See NEW BRITAIN.

Neuralgia (Gr. *neuron*, 'nerve;' *algos*, 'pain') is a term employed to designate pain of a purely nervous character, usually unaccompanied by inflammation, fever, or any appreciable change of structure in the affected part. The pain, which occurs in paroxysms, usually followed by complete remissions, is of every possible degree and character, being described in different cases as piercing, tearing, burning, &c. These paroxysms may occur at intervals of a few seconds only, or they may take place daily or on alternate days, or they may be separated by much longer intervals, which are often, but by no means always, of a regular length. The

pain is usually felt not only at the place where the nerves terminate, but along their course. It is usually confined to one side of the body, and is very rarely, if ever, quite symmetrical. In prolonged cases 'tender points' are developed along the course of the affected nerves. After the pain has subsided the painful parts are usually tender to the touch. Very frequently the sensibility of the skin supplied by the affected nerve is somewhat diminished. With the pain there is frequently spasmodic twitching of the adjacent muscles. The duration of the disease is very uncertain. The patient may have only a single attack, or he may be liable to recurring attacks for months, years, or even for his whole life; it is, however, very seldom that the disease occurs but once. Death scarcely ever results directly from this affection, but the pain may, by its severity and persistence, gradually undermine the constitution.

The disease may attack any part of the body where there are nerves; but in no part does it occur so frequently as in the face, its seat being in the facial branches of the fifth pair of nerves (the trifacial nerves; see NERVOUS SYSTEM). The most severe form of facial neuralgia, happily rare, is known as *tic douloureux*. 'The absolute suddenness with which the pain comes on is one of its most remarkable characters. The patient is perhaps sitting quietly reading, when he jumps up from his seat, and rushes up and down the room with his hand forcibly pressed against his cheek. Or he may rock himself backwards and forwards in his chair, crying out or uttering deep groans. In ten or twenty seconds, or a minute at the longest, the paroxysm is over. It ceases as abruptly as it began.' 'The paroxysms may return every few minutes.' 'Sometimes remissions occur, the patient remaining free from the disease for several days together, or even for months. But presently it returns, and is as severe as ever.' 'A patient who suffers under *tic douloureux* acquires an expression of intense distress and suffering; his countenance is worn and wrinkled, and looks like that of a much older person' (Fagge, *Practice of Medicine*).

'The paroxysms of suffering in this frightful disease are apt to be brought on by apparently trivial causes—by a slight touch, by a current of air blowing upon the face, by a sudden jar or shake of the bed on which the patient is lying, by a knock at the door, or even by directing the patient's attention to his malady, by speaking of it or asking him questions about it. The necessary movements of the face in speaking or eating are often sufficient to provoke or renew the paroxysm. At the same time, firm pressure made upon the painful part frequently gives relief, and causes a sense of numbness to take the place of the previous agony' (Sir J. Watson).

Facial neuralgia of a less severe type than *tic douloureux* is very much more common, in fact it is by far the most frequent form of the disease; the reason probably being that the trifacial nerve, lying superficially, and being distributed over a part of the surface which is usually unprotected by any artificial covering, is very liable, for that reason, to be affected by exposure to atmospheric influences, which are undoubtedly to be included among the exciting causes of this disease. Amongst other seats of neuralgia may be mentioned the arm, especially the forearm, the spaces between the ribs, especially between the sixth and ninth, and the lower extremity, where it most frequently affects the sciatic nerve, giving rise to the affection known as *Sciatica*, which, however, not always being pure neuralgia, will be noticed in a separate article. The internal organs may also be the seat of neuralgia—e.g. the heart (some cases of *Angina Pectoris*, q.v.), stomach, or kidney.

The causes of neuralgia are various. Excluding inflammation of the nervous trunk or *neuritis*, the pain may be excited by a tumour pressing on the nerve or originating in its substance, or by roughness of a bony surface with which the nerve may be in contact, as when it passes through a foramen. Sometimes, again, irritation applied to *one* branch of a nerve will give rise to pain at the extremity of *another* branch of the same nerve, the sensation being reflected along the branch which is not directly exposed to the irritation. Thus, facial neuralgia very frequently depends upon diseased conditions of the teeth, even if they themselves are not painful. In this way we may explain the pain in the shoulder which often accompanies disease of the liver; the pain in the thigh, which is often associated with irritation of the kidney; the pain in the left arm, which is often coincident with disease of the heart, &c. Persons suffering from debility, anæmia, and a gouty or rheumatic constitution are so especially liable to neuralgia that these conditions, as also exposure to malarious influences, must be placed among the predisposing causes. Amongst the exciting causes exposure to cold and wet, or to a cold dry east wind, is the most frequent; but fatigue, strong mental emotions, the abuse of tea, coffee, tobacco, and alcoholic drinks, a wound or bruise, the retrocession of gout, rheumatism, or cutaneous eruptions, &c. occasionally suffice to excite the disease.

The resources of the *materia medica* have been exhausted in searching for remedies for this cruel disease. But, in the first place, a careful search must be made for any possible local source of irritation; and next, 'hygienic conditions must be very carefully attended to; fresh air, regular bodily exercise, freedom from worry and overstrain of mind, plenty of sleep, an abundant supply of wholesome nourishment, are each essential' (Fagge). Fatty food, as cod-liver oil, butter, cream, is of especial importance.

Of drugs which give immediate relief to the pain, morphia, especially when administered hypodermically (q.v.), holds the first place. But it must be used with great caution, and not entrusted to the patient himself, lest a 'morphia habit' become established. Antipyrin and exalgin, coal-tar derivatives recently introduced into medicine, sometimes take the place of morphia, and are free from some of its disadvantages. Croton-chloral and gelsemium are often useful in facial neuralgia. Relief from the suffering is often the first step towards recovery.

But in most cases some treatment is necessary to remove the constitutional state on which the neuralgia depends. Iron, quinine (especially when the pain recurs at regular intervals), arsenic, phosphorus, chloride of ammonium, are the medicines most generally useful. But the treatment must of course be adapted to the disorders, frequently digestive, present in each particular case.

Local applications can be of no permanent service in cases where the pain results from organic change, or from general constitutional causes; they will, however, often give considerable temporary relief. Amongst the most important local applications may be mentioned laudanum, tincture of aconite or aconitina ointment, belladonna-plaster, and chloroform (which should be applied upon a piece of linen saturated with it, and covered with oiled silk to prevent evaporation), mustard leaves or poultices, and small fly-blisters. Galvanism is also valuable.

Lastly, neuralgia, being a purely nervous affection, is often influenced by means calculated to make a strong impression on the mind of the patient; and hence it is that galvanic rings, electric chains, mesmeric passes, and other applications which, like these, act more upon the mind than

upon the body of the patient, occasionally effect a cure.

In cases which have resisted all other modes of treatment, surgical measures are sometimes necessary—viz. acupuncture, nerve-stretching (see under *SCIATICA*), or, in the last resort, removal of a portion of the affected nerve.

Neuritis, a term applied to inflammation of the nerves. The disease is not very common, and not very well defined. The symptoms are those of neuralgia, with impairment of sensation, or localised paralysis, according as sensory or motor nerves are affected.

Neuroptera. See *INSECTS*.

Neusatz, a town in the Hungarian province of Bács, on the left bank of the Danube, opposite Peterwardein (q.v.). Pop. 21,381.

Neusiedler Lake, a small lake on the north-west frontier of Hungary, 22 miles S.E. of Vienna. It is shallow (13 feet), and has lost much of its former area (133 sq. m.) by the draining of the adjoining marshes—from 1865 to 1870 it was dry. Its brackish waters are valuable as medicinal baths.

Neuss, an ancient manufacturing town of Rhenish Prussia, near the left bank of the Rhine, 4 miles W. of Düsseldorf by rail. Its church of St Quirinus, a notable specimen of the transition from the round to the pointed style, was founded in 1209. Neuss has flourishing ironworks, foundries, flour and iron mills, and manufactures of cottons, woollens, leather, paper, chicory, &c. Pop. (1875) 15,563; (1885) 20,036.

Neustadt, a town of Prussian Silesia, 25 miles SW. of Oppeln. It is the seat of considerable industry, woollen and linen fabrics and carpets being the staple manufactures. Pop. (1875) 12,515; (1885) 16,093.

Neustadt, or **WIENER-NEUSTADT**, one of the most beautiful towns of Lower Austria, is situated 32 miles S. of Vienna by rail. The town is overlooked by the large old castle of the Dukes of Babenberg, now a military academy. The castle contains a fine Gothic chapel (1460), rich in painted windows; it is the burial-place of the Emperor Maximilian I. The old church dates from 1230, and was restored in 1890; a Cistercian abbey (1444) and a town-house are notable buildings. Locomotives and machinery, wire, bells, pottery, starch, leather, and ribbons are amongst the manufactures. The city, called 'the Ever-faithful,' was founded in 1192, and was rebuilt after a great fire in 1834. Pop. 23,735.

Neustadt-an-der-Hardt, a town of Rhenish Bavaria, at the foot of the Hardt Mountains, 20 miles W. of Spire. Its church, with several curious monuments, dates from the 14th century. It manufactures paper, cloth, soap, wine, brandy, &c. Pop. (1875) 10,224; (1885) 12,255.

Neustrelitz, capital of the grand-duchy of Mecklenburg-Strelitz, pleasantly situated in a hilly district, between two lakes, 62 miles NNW. of Berlin. Founded in 1733, it is built in the form of an eight-rayed star, and contains the ducal palace, with magnificent gardens. Pop. 9366.

Neustria, the name given in the times of the Merovingians and Carolingians to the western portion of the Frank empire, after the quadruple division of it which took place in 511. Neustria contained three of these divisions. It extended originally from the mouth of the Scheldt to the Loire, and was bounded by Aquitania on the S., and by Burgundy and Austrasia (*Francia Orientalis*) on the E. The principal cities were Soissons, Paris, Orleans, and Tours. See the historical maps at *EUROPE*.

Neutral Salts. See SALTS.

Neutrality. Neutrals are states which in time of war take no part in the contest, but continue pacific intercourse with both belligerents. The aim of the doctrine of neutrality is to reconcile the right of belligerents to carry on their warlike operations with the no less undeniable right of other nations to pursue peacefully their ordinary business. For many years after the rise of modern international law the conduct of warfare was discussed only with reference to belligerents, and no intermediate relation between an ally and an enemy was recognised. Not, indeed, till the middle of the 18th century did the terms 'neutral' and 'neutrality' come into general use; for not till then was a systematic effort made to regulate the relations of belligerents to nations standing aloof from the war, or to define their reciprocal rights and duties.

As between belligerent states and neutral states, the principles whence spring the complicated rules of modern neutrality are in themselves extremely simple. On the one hand, the neutral, being neither judge nor party, must show absolute impartiality in his dealings with both belligerents; on the other hand, the belligerent must pay scrupulous respect to the sovereignty of his neutral neighbours. Accordingly, throughout a war, neutrals continue diplomatic intercourse with both belligerents. A neutral state is not permitted to give armed assistance to either belligerent, even though such aid may have been promised before the war; nor to lend money to either side or guarantee such loan; nor to allow the passage of belligerent troops through its territory. A neutral is bound to prevent and cancel all acts of hostility, either in the neutral territory itself or in the adjacent waters, and to prohibit the exercise of any belligerent jurisdiction therein. So, if an attempt be made by troops of either belligerent country to traverse neutral territory, the neutral state is bound to disarm and intern such troops, and to set at liberty all prisoners of war found within its borders. Should a neutral state deviate from its duty in any of these particulars, the state injured is entitled to treat such deviation as a just cause of war. On the other hand, a belligerent is not permitted to carry on hostilities within neutral territory; nor to use neutral harbours for the purpose of fitting out expeditions against his enemy. He must scrupulously observe all the regulations of neutral states regarding the admission of cruisers or prizes into their ports.

The relations of belligerent states to the private citizens of neutral states involve greater difficulties. On land the property of neutral individuals is, of course, protected from belligerent attack; to this rule an exception is furnished by the Right of Angary (Low Lat. *angaria*, 'forced service'), under which a belligerent may seize the property of a neutral found in the territory of the other belligerent, and make use of it for the purpose of warlike operations, subject to his paying compensation. At sea, however, the commercial interests of belligerent and neutral merchants are so interwoven that it is difficult to separate them and strike at an enemy without injuring a friend; hence ever and again have arisen bitter controversies regarding the extent of a belligerent's power over the property of neutral citizens at sea. Two distinct principles for regulating the maritime capture of neutral property have at different times prevailed. By the one principle, the nationality of the ship determined liability to capture, so that neutral goods on hostile ships were liable to confiscation, while hostile goods on neutral ships went free. By the other principle, the nationality of the

property determined its liability, so that neutral goods went free even though found on hostile ships, and hostile goods were liable to seizure even though found on neutral ships. In 1856 the Declaration of Paris finally settled the question by providing (1) that the neutral flag should cover an enemy's goods, except contraband of war; (2) that neutral goods, except contraband of war, should not be liable to capture even under the enemy's flag. The law, as thus settled, is the old rule, 'Free ship, free goods,' without the corollary, 'Hostile ship, hostile goods.' Attempts had frequently been made at an earlier period, particularly by Prussia in the Silesian Loan controversy and by the Armed Neutralities of 1780 and 1800, to incorporate the rule into international law; it was, indeed, mainly through the opposition of Great Britain that its final acceptance was postponed till 1856.

To the general rule of maritime capture, as thus determined, several important exceptions must be noted. Belligerents continue to have the right of intercepting, even on board of neutral vessels, such articles as are deemed contraband of war. The test to be taken in deciding what goods are contraband has been much discussed and is now quite unsettled (see CONTRABAND). The vessel, too, carrying the goods may be condemned along with its contraband cargo, where both belong to the same owner, or where false papers are found, or any other fraudulent device is resorted to. Another instance in which a belligerent is entitled to interfere with the ships and property of neutral individuals is furnished by the law of blockade (see BLOCKADE). Again, if during a war ships belonging to neutral citizens perform certain classes of services on behalf of one of the belligerents, the other belligerent is entitled to confiscate these ships. Among such hostile services, against which a belligerent is entitled to protect himself, are reckoned the transmission of naval signals or messages, the carriage of military and naval despatches, and the transportation of belligerent officers or troops. Where a citizen of a neutral state engages in any forbidden ventures—whether it be carrying contraband goods, running a blockade, or doing other un-neutral service—the aggrieved belligerent does not complain to the neutral state, but strikes at the neutral citizen directly by capturing his property and condemning it in his own prize court. The neutral state does not appear in the matter at all, unless the penalty imposed by the prize court be such as is not warranted by international law; in this case the neutral state claims reparation for its injured subject from the offending belligerent.

The most unsettled part of the modern law of neutrality is that dealing with the obligations, imposed on a neutral state, of restraining the conduct of its own citizens and of enforcing the due observance of neutrality on all persons within its jurisdiction. In recent times the tendency has been towards a large extension of the duties of neutral states in this respect. The movement was commenced by the Neutrality Act of the United States, passed in 1794, and re-enacted, with additions, in 1818. The principles of these American statutes have been closely followed in the series of British Foreign Enlistment Acts, passed with a view of arming the British government with sufficient power to enable it to fulfil the extended obligations of neutrality. Among the more important offences against neutrality which are now struck at by the municipal law of most states are such acts as the following: To leave the neutral territory in considerable numbers for the purpose of enlisting in the service of a belligerent; to accept letters of marque from a belligerent; to fit out within its

territory armed expeditions against a belligerent, or increase therein the warlike force of any belligerent ship or expedition. At the same time a neutral state is not bound to restrain its subjects from trade in arms and munitions of war. The extent of the responsibility of neutral states for the building and fitting out of ships within their territory appears still to be uncertain. Till lately the English idea seems to have been that the neutral government was under no obligation to stop such proceedings, unless the vessel was ready to commence hostilities at the moment of its leaving neutral waters. But the events connected with the escape of the *Alabama* (see ALABAMA) and her sister-cruisers during the American civil war showed the inadequacy of this view. The treaty of Washington, 1871, by which all these questions were referred to arbitration, directed the arbitrators to apply, in addition to the ordinary rules of the law of nations, three new rules, known as the Rules of Washington. These rules, owing to their loose phraseology, have raised more questions than they have solved, but their general effect is immensely to extend the duties of neutral states.

See Hall, *International Law* (2d ed. 1884) and *The Rights and Duties of Neutrals* (1874); Wheaton, *International Law* (Eng. ed. by A. C. Boyd; 3d ed. 1889). For the history of the growth of the law of neutrality, see Manning, *Law of Nations*. See also the *Letters of Historians*, and the works cited at ENEMY.

Neuville, ALPHONSE MARIE DE, the most popular of the youngest school of French painters of battle-scenes, was born at St Omer on 31st May 1836, and after studying under Delacroix painted a series of successful pictures illustrative of French exploits in the Crimean war, Italy, and Mexico. Then came the war with Germany. Neuville fought in the ranks and learned something of real warfare from actual experience. This knowledge imparted additional power to his next and last series of works, depicting incidents of that war. The attack at Rorke's Drift and that at Tel-el-Kebir were also chosen by him as subjects for pictures. Neuville excelled moreover as an illustrator of books, his best work in this line being the designs for Guizot's *Histoire de France*. He died in Paris, 20th May 1885.

Neuwied, a town of Prussia, on the right bank of the Rhine, 8 miles below Coblenz, was capital of the mediatised principality of Wied; the castle of the princes has a beautiful garden, in which are many Roman antiquities discovered here. The town contains an important institute of the Moravian Brethren, and there are some minor manufactures. Pop. 9656.

Neva, a river of Russia, flows westward from the south-west corner of Lake Ladoga to the Bay of Cronstadt, in the Gulf of Finland, passing through St Petersburg, and carries to the sea an enormous volume of water (greater than that of the Rhine) from the lakes Ladoga, Onega, Ilmen, and others. Its total length, with windings, is about 40 miles; in places it is over 4000 feet wide, elsewhere the channel is narrowed to 180 feet; and in one or two places the navigation is embarrassed by reefs and rapids. It is frozen on an average from November 25 to April 21. By the Ladoga Canal the Neva communicates with the vast water-system of the Volga, and thus it may be said to join the Baltic with the Caspian Sea.

Nevada, one of the Pacific states of the American Union, is bounded N. by Oregon and Idaho, E. by Utah and Arizona, and S. and W. by California. Its greatest length from north to south is a little less than 500 miles, and its greatest width

from east to west is more than 300 miles. In area (110,700 sq. m.) it is the fourth largest state of the Union; in population it is the lowest of all the states and territories—(1870) 42,491; (1880) 62,266; (1890) 45,781. Nearly the whole of Nevada is included in the Great Basin (q.v.), once occupied by a great inland sea, and afterwards by several great lakes which have also disappeared. Some of the deepest depressions of such a body of water are yet marked by Walker, Humboldt, Carson, Pyramid, and Winnemucca lakes, and by other 'sinks' and *playas*. The ancient shore-lines are clearly visible in certain places, and the climate, now arid and nearly rainless, was once moist. The soil of the Great Basin at some time produced an abundant vegetation, whereas it is now almost totally unfit for agriculture, frowned upon by barren treeless mountains, and traversed by regions of nearly absolute desert. At present Nevada is a high plateau with an average altitude of 4000 feet, crossed by numerous ranges of mountains which as a rule are parallel and separated by valleys from 5 to 20 miles in width. Some of these valleys are barren and desolate; others, through which the rivers flow, have areas of arable land. The mountains contain rocks of every geological period; many of them are volcanic, and there are striking exhibitions of metamorphic and trap rocks. In the valleys lie the sedimentary deposits of ages mixed with cinders and other volcanic products which fell in many cases on the surface of the extinct lake, and at the mouths of the cañons are vast moraines. The mineral production of Nevada, especially of silver, has been enormous (see COM-STOCK LODGE). Though the high grades of ore appear to have been largely exhausted, the production was at first so great as to materially change the value of the precious metals, and to promote Nevada hastily from an uninhabited desert to a state of the Union. Mining is still the chief interest. A small area in the north is drained by the Owyhee River, a tributary of the Snake, and another portion of the state in the south belongs to the Colorado valley. Otherwise Nevada lies wholly in the great basin of interior drainage, where none of the water reaches the sea. The streams disappear in the sand or flow into 'sinks,' salt or brackish lakes, or *playas*, which are shallow mud lakes that evaporate when the supply of water fails. The Humboldt River pursues a winding course of 350 miles. There are numerous hot springs, many of which are surrounded with incrustations of tufa often in weird and fantastic forms. Some of the lakes are nearly saturated solutions of borax and salts of sodium and potassium, and in the valleys are tracts of glistening alkaline deposits, which mark the beds of extinct lakes.

The atmosphere is dry, remarkably clear in winter, but filled in summer with minute particles of dust, which produce endless and extraordinary effects of colour on the sunlight. The temperature is subject to extremes, and the rainfall is exceedingly light. It nowhere exceeds 15 inches, and scarcely averages more than 5 inches. Some sections receive no rain for several successive years. Sage-brush and other desert plants capable of enduring drought form the native vegetation. It has been estimated that with careful irrigation about three per cent. of the land may be successfully cultivated. The Mormons established a few temporary camps in 1848, and in 1850 a settlement was made at Genoa; but the real history of the state begins with the discovery of silver in 1859. Nevada was separated from Utah territory in 1861, and in 1864 was admitted to the Union as a state. There are thirteen counties in the state, and the most important towns are Virginia City and Gold Hill,

which are contiguous and situated on the Comstock lode, and Carson, the capital. Within the state there are over 900 miles of railway. The public schools are under the control of a state board of education, and there is a state university at Reno. There are nearly 9500 Indians in the state, mostly Pah-Utes and Shoshones, and the schools on the reservations are well attended.

Nevers, the capital now of the French department of Nièvre, and formerly of the province of Nivernais, is picturesquely seated on a hillside, 600 feet above sea-level, at the influx of the Nièvre to the Loire, 159 miles by rail SSE. of Paris. The *Noviodunum* of Caesar, it has been the seat of a bishop since 506; its beautiful cathedral, restored in 1879, belongs mainly to the 13th century. The stately *palais-de-justice*, dating from 1475, was formerly the castle of the Dukes of Nevers; and there are also a fine public garden, a bridge of fourteen arches over the Loire, a mediæval gateway, and a triumphal arch (1746) commemorating Fontenoy. The industries comprise the manufacture of cannon, iron cables and chains, porcelain (introduced by Italians about 1565), &c. Pop. (1872) 22,276; (1886) 23,610.

Neviansk, a town of Russia, in the government of Perm, 50 miles N. of Ekaterinburg by rail, stands on the Siberian side of the Ural Mountains, and on a tributary of the Tobol. The district around Neviansk is famous for its mineral wealth, particularly gold and iron. Pop. 16,066.

Neville's Cross. See DAVID II.

Nevis, an island of the West Indies, belonging to Great Britain, forms one of the Leeward Islands, and lies 2 miles SE. of St Christopher, with which it has been since 1882 administratively connected, sending three (unofficial) members to the common legislative council. It is circular in form, rises in the centre to a wooded ancient crater (3200 feet), and has an area of 50 sq. m. The lower slopes are cultivated, the sugar-cane being the principal crop, though limes and oranges are grown to a small extent. Statistics are given under St Christopher (q.v.) Pop. (1881) 11,864. The capital is the port of Charlestown (pop. 1500). Nevis was discovered by Columbus in 1498 and colonised by England in 1628. As long as the slave-trade lasted it was one of the principal marts for slaves in the West Indies. The island has suffered much at various times from hurricanes and earthquakes.

Nevis, BEN. See BEN NEVIS.

New Albany, capital of Floyd county, Indiana, is on the north bank of the Ohio River, nearly opposite Louisville. By rail it is 317 miles S. by E. of Chicago and 267 miles E. of St Louis. The city is well built, and is the principal manufacturing town in the state. It contains iron and brass foundries, rolling-mills, potteries and brick-yards, flour, woollen, cotton, and planing mills, &c.; while its plate-glass works are the largest in the United States. Pop. (1880) 16,423; (1890) 21,059.

New Almaden. See ALMADEN.

New Amsterdam. See NEW YORK.

Newark, (1) a port of entry and the capital of Essex county, New Jersey, is on the Passaic River, 9 miles by rail W. of New York. It is a handsome city, with several beautiful little parks and wide streets shaded with lines of elms. It has a city hall, court-house, public library, and nearly 150 churches, but is mainly noteworthy for its manufactures. There are altogether 400 industrial establishments in Newark, producing brass and iron work, hardware and machinery, carriages, trunks, saddlery, boots and shoes, hats, clothing, jewellery, &c. Four railways provide frequent communication with New York, which is maintained

also by river-steamers; the line of docks is over a mile long. Newark was settled in 1666 by a colony from Connecticut, and received a city charter in 1836. Pop. (1850) 38,983; (1870) 105,059; (1890) 181,830.—(2) Capital of Licking county, Ohio, on the Licking River (here crossed by four iron bridges), 33 miles by rail E. by N. of Columbus. Stoves and furnaces, boilers, machinery, wagons, flour, woollens, and glass-ware are among its manufactures. Pop. (1880) 9600; (1890) 14,270.

Newark-upon-Trent, a town of Notts, on a navigable branch of the river Trent, 18 miles by rail NE. of Nottingham and 120 N. by W. of London. It is approached from the north by a causeway, $1\frac{1}{2}$ mile long, constructed by Smeaton in 1770, and carried over the flat island formed by the Trent on the west and the Newark branch on the east. The fine parish church, built mainly between 1350 and 1489, has an octagonal spire 223 feet high, and contains a good brass of 1361. Other edifices are the town-hall (1805), corn exchange (1848), hospital (1881), coffee-palace (1882), free library (1882), and grammar-school, founded by Archdeacon Magnus in 1529. Newark has a very important corn-market and great malting industries, besides iron and brass foundries, manufactures of boilers and agricultural implements, and plaster of Paris works. Incorporated by Edward VI., it returned two members to parliament till 1885. Pop. (1881) 14,018; (1891) 14,457. A British town and Roman station, Newark in Saxon times became the seat of a castle, which was rebuilt in 1125 by Alexander, Bishop of Lincoln (hence the name *New Wark*), and which long bore the name of the 'key of the north.' King John died in it (1216); and in the Great Rebellion it stood three sieges, in the second of which it was relieved by Prince Rupert (1644), whilst in the third it was surrendered to the Scots by order of Charles I., who had just delivered himself up (5th May 1646). It was then dismantled, and is now represented only by a very picturesque ruin, round which a public garden is maintained by the corporation. See works by Shilton (1820) and Cornelius Brown (1879).

New Bedford, a city and port of entry of Massachusetts, is on the Acushnet estuary (here crossed by a bridge 4000 feet long), 3 miles N. of Buzzard's Bay and 56 miles by rail S. of Boston. Many of its private residences are very handsome, while the public buildings include a city hall of granite, a custom-house, 30 churches, a public library, and a fine high school (\$126,000). There is a broad drive (4 miles) round Clark's Point, at the extremity of which there is a strong granite fort. For a century (1755-1854) New Bedford was the chief centre of the American whale-fisheries, sending out more than 400 whaling-vessels, and receiving 60,000 barrels of sperm and 120,000 of whale oil in a year; but this industry has since declined, till now only some 80 whaling-vessels belong to the port, and the people have turned their attention mainly to manufactures. Besides several great cotton-mills (nearly 500,000 spindles), the city contains foundries, oil-refineries, and manufacturing of drills, cordage, boots and shoes, flour, glass, plated ware, carriages, candles, &c. Pop. (1880) 26,845; (1890) 40,733.

Newbern, a city and port of entry, capital of Craven county, North Carolina, is situated at the junction of the navigable Neuse and the Trent (here crossed by a long bridge), 107 miles by rail SE. of Raleigh. It exports tar, turpentine, and lumber, and early vegetables for the North. It manufactures railroad-cars and cotton-seed oil, and has also a wood-pulp factory, sawmills, and an oyster-canning establishment. Pop. (1890) 7832.

Newberry, JOHN, a London bookseller, intimately associated with Dr Johnson, Goldsmith, Christopher Smart, Smollett, and many other men of letters, was descended from an old bookselling family, and born a farmer's son, in the Berkshire parish of Waltham St Lawrence, about midsummer 1713. He had first a shop for general wares at Reading, and about 1744 settled in London as a vendor of books and such medicines as Dr James's Powder—the panacea of Horace Walpole as of Goldsmith. He was the first to publish little books for children such as have ever since been popular, and he was himself, in conjunction with Giles and Griffith Jones (1722–86), and perhaps Goldsmith, part author of some of the best of the series, as the histories of Goody Two-Shoes and Giles Gingerbread and the Travels of Tommy Trip. He published many books of a more useful character, a complete list of which is given in Mr Welsh's careful volume. In 1758, he started the *Universal Chronicle, or Weekly Gazette*, in the numbers of which the celebrated *Idler* was first printed. The *Public Ledger*, commenced in 1760, has continued to our own day—in its early numbers appeared Goldsmith's *Chinese Letters*, later reprinted as *The Citizen of the World*. His death took place 22d December 1767. He had a genius for advertising, even to an ingenious method of bringing in allusions to his books and wares in the text of his stories. Johnson sketched him humorously as 'Jack Whirler' in No. 19 of the *Idler*. It was to Francis Newberry (1743–1818), his nephew and ultimate successor, that Boswell tells us Dr Johnson told him he sold for sixty pounds the manuscript of Goldsmith's *Vicar of Wakefield*, in which John Newberry has been immortalised as 'the philanthropic bookseller in St Paul's Churchyard, who has written so many little books for children. He called himself their friend, but he was the friend of all mankind.' This transaction has occasioned much difficulty, as Boswell himself gives no date, while the accounts of Mrs Piozzi and Hawkins differ very materially, and Mr Welsh has discovered that B. Collins of Salisbury on October 28, 1762, paid Goldsmith £21 as one-third price of the book. Boswell describes the book as then 'ready for the press'; Mrs Piozzi says Johnson procured the distressed author 'some immediate relief'; Hawkins says the price that Johnson brought him was £40. The year of the sale by Dr Johnson was most likely 1762, when the greater part of the book was written; and it is most probable that Johnson did not mean that he brought the whole sum, but only an instalment of it. See Charles Knight's *Shadows of the Old Booksellers* (1865); and *A Bookseller of Last Century*, by Charles Welsh (1885).

New Brighton, a post-village of New York, beautifully situated on the north-east shore of Staten Island, 6 miles SW. of New York city. Its houses are mostly villa residences, though it possesses dye-works, a paper-factory, &c. Steamers run hourly to the metropolis. Pop. (1890) 16,423.

New Britain, a manufacturing town of Connecticut, 9 miles by rail SW. of Hartford, engaged in the production of hardware, cutlery, locks, jewellery, hooks and eyes, hosiery, &c. It is a pleasant city, with two large parks, and contains the state armoury and normal school. The water-supply is from a reservoir of 175 acres. Pop. (1880) 11,800; (1890) 19,007.

New Britain, by Germans called NEU-POMMERN, an island of the Western Pacific, separated from the north-east coast of New Guinea by the Dampier Strait. The interior is almost wholly unknown. In the forest-clad interior there are several volcanoes, active and quiescent, the highest being the Father (3900 feet). The climate is hot and

moist. Cocoa-nuts, yams, bananas, bread-fruit, betel-nuts, and similar fruits are the chief products. Fish are caught in great numbers. The natives, cannibals, of the Melanesian division, are warlike, but suspicious and crafty. They make handsome canoes, with sails and outriggers, earthenware vessels, baskets, mats, &c. The sling, stone axe, and spear are their favourite weapons. They worship good and evil spirits. Area, 9600 sq. m. The population of the several islands is not known.

See Romilly, *The Western Pacific and New Guinea* (1886); Powell, *Wanderings in a Wild Country* (1883); and Parkinson, *Im Bismarck-Archipel* (1887). For map, see NEW GUINEA.

New Brunswick, a province of the Dominion of Canada, is bounded on the N. and NW. by the province of Quebec, from which it is separated by the river Restigouche; on the N. by the Chaleur Bay; E. by the Gulf of St Lawrence and Northumberland Straits—the latter separating it from Prince Edward Island; S. by the Bay of Fundy and part of Nova Scotia; and on the W. by the state of Maine, the boundary with the latter being the St Croix and St John rivers. It has an area of 28,200 sq. m.—rather smaller than Scotland. Its coast-line is 500 miles in length, interrupted only at the point of juncture with Nova Scotia, where an isthmus not more than 11 miles broad connects the two provinces, and divides the waters of Northumberland Straits from those of the Bay of Fundy, across which isthmus is the Chignecto Ship-railway (1892). The surface of the country is generally undulating. There are low hills skirting the Bay of Fundy and the rivers of St John and Restigouche. A feature of the coast-line is the number of fine harbours, which have been of great value as a means for exporting the timber for which the country is famous.

Several important rivers traverse the province; among the principal is the St John, 450 miles in length, and navigable for vessels of 100 tons to Fredericton, the capital of the province, 90 miles from the sea. Above this point smaller vessels and steamboats ascend for 125 miles. The country drained by the St John and its tributaries comprises about nine million acres in New Brunswick, as well as eight million in Quebec and the state of Maine. The Miramichi River, 220 miles long and 7 miles wide at its mouth, is also navigable for some distance. The Restigouche is 3 miles wide at its entrance into the Chaleur Bay, and over 200 miles in length. The lakes are numerous, but of small extent, the largest being Grand Lake, 30 miles long and 3 to 7 miles wide, communicating with the St John River, 50 miles from the sea.

The population of the province in 1881 was 321,129; in 1891 321,270. In 1891 there were 115,961 Catholics, 79,649 Baptists, 43,095 Church of England, 40,639 Presbyterians, and 35,504 Methodists. The population in 1881 included 93,387 persons of English origin; 101,284 Irish; 49,829 Scotch; 1401 Indian; 6310 German; French, 56,335. The principal cities and towns are St John (including Portland), (44,000), Fredericton, the capital (6700), Moncton (6000). The provincial government is administered by a lieutenant-governor, assisted by an executive council, a legislative council of eighteen, and a legislative assembly of forty-one members, elected by the people. The province sends ten members to the senate, and sixteen to the Dominion House of Commons.

Like that of many other parts of Canada, the climate of New Brunswick is subject to extremes of heat and cold. The mean temperature for the year 1885 was 40.3° F. at St John; the highest and lowest temperatures for the year being 81° and -15° respectively. If, however, the climate of a country is to be judged by its effects on animal

life, that of New Brunswick may be pronounced one of the best in the world.

The revenue is largely made up of subsidies from the Dominion government and from what is called 'territorial revenue,' including the proceeds of land and timber sales. The educational institutions supported by law are the Provincial University, the training or normal school for teachers, and a complete system of free common schools.

The imports of New Brunswick for the year ending June 1889 were valued at \$6,577,037, of which \$2,420,885 came from Great Britain and \$3,266,449 from the United States; the exports for the same year were \$6,700,898, including \$1,204,578 not the produce of New Brunswick. Timber was the principal item.

Agriculture is the chief industry in New Brunswick. Except in a portion of country adjacent to the coast of the Bay of Fundy, the soil is very fertile, and every kind of grain and roots produced in England is grown, as well as others. Attention has been paid to live-stock both by the government and private breeders; and recently the government has established a stock farm. The province, owing to its cheap coal and proximity to the markets of the world, has also many advantages as a manufacturing country. The principal articles manufactured are sawn lumber, leather, cotton and woollen goods, wooden-ware, paper, iron-castings, nails, and mill machinery, bolts and nuts, railway engines and carriages. There are indications of considerable mineral wealth, and a number of mines are being successfully worked. Shipbuilding is still extensively prosecuted, although it has been much interfered with by the substitution of iron and steel for wooden vessels.

Land may be obtained in the province by settlers on reasonable terms—in fact, practically free, if the conditions of settlement are carried out, requiring the improvement of the land to a small extent, reasonable cultivation, and residence for three years. Land is also put up to auction at an upset price of \$1 per acre. Improved farms can be had in most parts of the province at reasonable prices; many farmers having moved to Manitoba and the North-west, as they can there start their families with less capital.

There is plenty of sport of all kinds in the province, and some of the finest trout and salmon fishing in the world is to be had. Close times for animals and birds are strictly observed.

It is generally held that New Brunswick, as a part of Nova Scotia, was ceded by France to Great Britain by the treaty of Utrecht in 1713. The boundaries of Nova Scotia, however, were not well defined at that time, and the country along the St John River remained a subject of dispute which was not finally settled until the treaty of Paris in 1763 conceding and guaranteeing to Great Britain, in full right, Canada with all its dependencies. When in 1755 the memorable expulsion of the Acadians from Nova Scotia took place many of these people retired to what is now known as New Brunswick, and settled along the upper St John River, the Miramichi, and in the eastern parts of the province. The first British settlers in the province emigrated from Scotland to the Miramichi district in 1764; and in 1783, at the close of the American revolution, when the exodus of the loyalists from the United States took place, a large body settled near the present city of St John and along the St John River. For the map, see CANADA.

New Brunswick, capital of Middlesex county, New Jersey, is at the head of navigation on the Raritan River, 31 miles by rail SW. of New York, and is the terminus of the Delaware and Raritan Canal. It contains a Roman Catholic cathedral,

and nearly a score of other churches, and is the seat of Rutgers College (1771), connected with which is the theological seminary of the Dutch Reformed Church, as well as an observatory and a state agricultural college and model farm. New Brunswick is noted for its great india-rubber factories, and has also iron and brass foundries, and manufactories of hosiery, lamps, needles, paperhangings, &c. Pop. (1890) 18,603.

Newburgh, a royal burgh of Fife, near the Firth of Tay, 11 miles ESE. of Perth. It arose in connection with the neighbouring Benedictine abbey of Lindores (c. 1196); and in its vicinity also is the famous Cross Macduff. Pop. 2374. See A. Laing's *Lindores and Newburgh* (1876).

Newburgh, capital of Orange county, New York, is on the west bank of the Hudson (here 1½ mile wide), 57 miles by rail N. of New York, amid the grand scenery of the Highlands. Its handsome edifices, villas, and gardens, rising 300 feet from the river, command a noble prospect. The city has, besides foundries, boiler-works, shipyards, and powder-mills, manufactures of woollen and cotton goods and carpets, leather, flour, soap, oil-cloth, brushes, paints, plaster, tiles, &c. Large quantities of butter, grain, flour, and coal are shipped here. Newburgh was the scene of the disbandment of the American army, 23d June 1783; and 'Washington's Headquarters' is preserved as the property of the state. Pop. (1890) 23,087.

Newbury, a thriving market-town of Berkshire, on the 'swift' Kennet, 17 miles W. by S. of Reading and 55 from London. Its gray old church, restored in 1867 at a cost of £15,000, is a fine Perpendicular edifice, with a noble tower added in 1510 by John Winchcombe or Smallwoode, otherwise 'Jack of Newbury,' a famous clothier, who sent a hundred of his own men to fight at Flodden. The large Italian corn exchange was built in 1862, in which year was started a great yearly wool-market; and still more recent are the handsome municipal offices and the new grammar-school, though this claims King John for its founder (1216). Newbury—'new' only as distinguished from the old Roman station of *Spinæ* (now Spoen)—besides has many ancient and wealthy charities. It was incorporated by Elizabeth in 1596, and the borough boundary was extended in 1878. Pop. (1851) 6574; (1881) 10,144; (1891) 11,002. Two hard-fought battles took place here in the Great Rebellion—the one between Charles and Essex, on 20th September 1643; the other between Charles and Manchester, on 27th October 1644. The advantage of the first was, on the whole, on the side of the king, but it cost the lives of Lords Falkland (q.v.), Carnarvon, and Sunderland, to whom a memorial was erected in 1878. The second would have been a decisive royalist defeat but for Manchester's hesitancy.

See the *History of Newbury* (1839), a work on the two battles by W. Money (1881), and his *History of the Ancient Town of Newbury* (Oxford, 1887).

Newburyport, a city and port of entry of Massachusetts, on the south bank of the Merrimack, 3 miles from its mouth, and 37 miles by rail NE. of Boston. A long, shady High Street, with a pond of six acres, is its chief ornament. Shipbuilding is carried on, and there are a number of large cotton and shoe factories, besides manufactories of combs, hats, pumps, &c. Here Whitefield, who died in 1770, is buried. Pop. (1890) 13,947.

New Caledonia, an island of the South Pacific Ocean, belonging to France, and lying midway between the Fiji Islands and the east coast of Queensland. The Loyalty Islands, Isle of Pines, and some others, with a total area of 1250 sq. m., are politically dependent upon New

Caledonia. This principal island is about 240 miles in length, 25 in average breadth, and has an area of 6450 sq. m. The long axis runs from north-west to south-east; the interior is greatly broken by irregular mountain-chains (highest point, Mount Humboldt, 5380 feet); and the entire island is surrounded by coral-reefs. There are good harbours on the east coast, but the only one used is Noumea, the capital (4601 inhabitants), on the south-west coast. In the valleys the soil is fruitful, producing the cocoa-nut, coffee, maize, tobacco, fruits, &c. But the most valuable natural products are minerals, especially nickel, with copper, cobalt, antimony, chrome, &c. There are several useful timber-trees. Promising attempts have been made to introduce wheat, the vine, and the silkworm. Turtle and fish are abundant. Locusts frequently devastate the crops. Besides the smelting of the minerals, meat is preserved and sent to France, and some soap and tapioca are manufactured. Wines and spirits, flour, drapery, groceries, ironmongery, machinery, coal, &c. are imported to the annual value of £333,800, and nickel, cobalt, and other metals, silver coins, preserved meat, copra, coffee, &c. exported to the average value of £154,800. Every year about 123 vessels of 92,400 tons visit the island, one-half being British. The total population in 1885 numbered 58,463, thus made up—aborigines (Canagues), 35,650; French colonists, 6437; convicts, 7544; liberated convicts and political prisoners, 3814; officials and others, 3018. The island was discovered by Captain Cook in 1774, and was annexed by France in 1853. She began to use it as a convict station, and after 1871 sent out great numbers of political prisoners, mostly Communists. The aborigines are a mixture of two types, one resembling the Polynesians, the other the Papuans. They were formerly cannibals, and delighted in war, yet were hospitable, and skilful tillers of the soil. They live now chiefly on vegetable food. Leprosy is a scourge amongst them. See the French works on New Caledonia by Lemire (1878 and 1884), Rivière (1880), Chartier (1884), Cordeil (1885), and Moncelon (1886).

New Castle, capital of Lawrence county, Pennsylvania, on the Shenango River, 50 miles by rail NNW. of Pittsburg, contains a college, large rolling-mills, foundries, and manufactories of nails, furnaces, and flour. Pop. (1890) 11,600.

Newcastle, a port of New South Wales, 75 miles NE. of Sydney by rail, at the mouth of the Hunter River. It is the chief port of the north coast, its shipping nearly equalling that of Sydney; coal and wool are the main exports. The harbour, which is defended by a fort, is dangerous during storms from the ESE. Pop. (1881) 15,595; (1890) 20,000.

Newcastle, DUKES OF. See CAVENDISH and PELHAM.

Newcastle-under-Lyme, a parliamentary and municipal borough of Staffordshire, on the Lyme brook, 16 miles NNW. of Stafford and 147 by rail NW. by N. of London. Pop. (1881) 17,493; (1891) 18,452. The aspect of the town has of late years been much improved by the widening of the main thoroughfares, and the erection of new public buildings, notably the town-hall (1890) and the high school (1876). The latter was reconstructed under a new scheme in 1874 from the amalgamation of various ancient charities (the earliest founded 1602); its distinctive features are the study of natural science and modern languages. The parish church, partly Early English and partly Decorated, was rebuilt in 1876 from designs of Sir Gilbert Scott, and has a quaint old square tower of red sandstone with pinnacles, and a fine peal of bells. The manu-

facture of hats was formerly a speciality of the town, but has of late years been discontinued; brewing, malting, and the making of paper and army clothing are now the principal industries, whilst the surrounding district is noted for its potteries, and numerous coal-mines are worked. Of the castle, from which the town derives its name, all traces have entirely disappeared; it was built by Edmund, Earl of Lancaster, the youngest son of Henry III. Newcastle, which confers the title of duke upon the family of Clinton, returned two members to parliament from 1353 to 1885, since which time it has only had one representative.

Newcastle-upon-Tyne, a city and county of itself, seated on the north bank of the Tyne, 275 miles from London, 117 from Edinburgh, and 10 from the German Ocean. It is the seat of a bishopric founded in 1882. The city is governed by a corporation consisting of a mayor, 16 aldermen, and 48 town-councillors, and it returns two members to parliament. Pop. (1801) 28,294; (1841) 71,850; (1881) 145,359; (1891) 186,345.

During the Roman occupation of Britain the high ground overlooking the river in the neighbourhood of the castle was the site of the military station of Pons Ælii. The 'Roman wall' would probably form its northern boundary. Soon after the abandonment of Pons Ælii by the Romans, the Angles took possession of it. Subsequently it appears to have been a monastic settlement, and at the time of the Conquest was known as Monkchester. Pandon, which until 1299 was a vill quite distinct from Newcastle, is supposed to have been the place where, about 653, Peada, son of Penda, king of the Mid Angles, and Sigebert, king of the East Angles, were baptised by Bishop Finan. When the Conqueror arrived at Monkchester in 1072 there was nothing to be seen of the bridge above water, and the town was too small or impoverished to victual his army. Robert Curthose, on his return from an expedition against Malcolm in 1080, constructed a fortress here, which was named the New Castle. The south postern is probably a fragment of his work. William Rufus is stated—on doubtful authority—to have rebuilt the castle, and to have granted to the inhabitants of the growing town many privileges and immunities. He besieged the castle in 1095. The present keep—one of the most perfect examples of a Norman stronghold in the kingdom—was built between 1172 and 1177 at a cost of £911, 10s. 9d., and the Great Gate of the castle—the Black Gate as it is now called—in 1247, at a cost of £514, 15s. 11d.

In the time of the first three Edwards the town was enclosed by a wall, 8 feet thick and over 12 feet high, which embraced in its circuit the monasteries of the Black, the White, and the Grey Friars, the Benedictine nunnery of St Bartholomew, together with the vill of Pandon. The levies for the Scottish wars were usually directed to assemble at Newcastle. In 1644 Newcastle, which had declared for the king, was besieged for ten months by the Scots under General Leslie. This loyal resistance of the town to the forces of the parliament is commemorated in the motto which it bears on its coat of arms 'Fortiter Defendit Triumphans.' Events of tragic importance in the annals of the town were the visitations of the Asiatic cholera in 1831 and 1853, and the great fire which destroyed so much of the old town in 1854.

The city occupies a striking and picturesque site, being built for the most part on steep slopes and gently rising ground. It abounds in contrasts, such as the grim old keep and the High Level Bridge; the modern Grey Street and the ancient Side; the stately stone buildings erected by Grainger and the half-timbered Elizabethan houses with projecting stories and latticed casements; the Elswick Works, a mile in extent, and Jesmond

Dene, one of the loveliest ravines in the country; the closely-packed hillsides and the rolling expanse of common called the Town Moor.

The principal remains of antiquity in Newcastle are the Norman keep; the Black Gate; the cathedral of St Nicholas; the churches of St John and St Andrew; portions of the Edwardian walls, with the Durham, Heber, Mordaunt, and Plummer towers, and the Sally-port Gate; part of the Black Friars Monastery; fragments of the houses of the Austin Friars and the Friars of the Sac; and several mansions of the 16th and 17th centuries. The church of St Nicholas, now the cathedral, is said to have been founded by Osmund, Bishop of Salisbury, in 1091. This early structure was destroyed by fire in 1216. The present building belongs to the Decorated and Perpendicular periods; the nave and transepts dating from 1359, the chancel from 1368, and the tower with its beautiful architectural crown from about 1435. All that remains of the previous edifice is some masonry above the arcades, together with an Early English pillar built up in the north-east pier. The reredos, erected in 1888, is of fine unpolished Utoxeter alabaster with splayed screens of Caen stone. In canopied niches around the central figure of Christ are statues of Northumbrian saints and the four evangelists. St John's Church, built in the latter part of Henry I.'s reign, contains much of the original Norman work, with Early English, Decorated, and Perpendicular additions. St Andrew's Church dates from about 1175 to 1185, and retains some interesting Transitional features. All-Saints' Church was rebuilt in 1786-90 on the site of the church of All-Hallows, founded in the 12th century. There are twenty-one other places of worship in the city connected with the Established Church; the Roman Catholics have four churches, one being the cathedral of St Mary, erected in 1844 from the designs of Pugin; and the various other religious bodies are represented by about sixty chapels and meeting-houses.

The central part of Newcastle with its stately and ornate buildings is a monument to the genius of Richard Grainger (1798-1861), a man of lowly origin, who, by his vast building schemes, quite changed the appearance of his native town. Grey Street and Grainger Street, built in 1834-38, are the finest thoroughfares in the city. Monuments have been erected to Earl Grey (1838) and George Stephenson (1862). The town-hall, built in 1863, stands near the cathedral. Associated with it are the corporation offices and the corn-market. Other public buildings are the guildhall and exchange on the Sandhill, the former (which occupies the site of the hospital of St Catharine) dating from 1658, the Moot Hall (1810), the general post-office (1876), the central police-courts (1874), the gaol (1823-28), the Wood Memorial Hall (1870), the Trinity House (chapel, c. 1651; hall, 1721; almshouse, &c., 1782-95), the Central Exchange Newsroom and Art Gallery (1838), the Assembly Rooms (1774-76), the (branch) Bank of England (1834), the Royal Arcade (1831-32), the Butchers' Market (1835), covering an area of 13,906 sq. yd., and the barracks (1806). There are two theatres in Newcastle. The museum of the Natural History Society was erected in 1883-84 at a cost of £42,000. It contains valuable collections of British birds, fossils from the coal-measures, and a unique series of Bewick's drawings. The Literary and Philosophical Society (1793) has a library of about 40,000 volumes. The public library (1881) contains over 68,000 volumes.

There are two useful collegiate institutions in Newcastle affiliated to the university of Durham—the College of Medicine (1851) and the College of Science (1871): the College buildings were opened

in 1888 and 1889. The Royal Free Grammar-school, founded in 1525, has since 1870 occupied new premises off Westmoreland Road. Among the various benevolent institutions in Newcastle are the Royal Infirmary (1751), the Jesus Hospital (1681), the Keelmen's Hospital (1701), the Trinity Almshouses (incorporated 1492), the Northern Counties Institution for the Deaf and Dumb (1861), the Fleming Memorial Hospital (1887), and the Northern Counties Orphan Institution (1876).

The Central Railway Station in Neville Street (1850) is the terminus for all the trains entering Newcastle, with the exception of those on the Blyth and Tyne section of the North-Eastern Railway, which run to New Bridge Street Station. Tramways have been laid from the centre of the city to the chief suburbs. The public pleasure-grounds of Newcastle are the Town Moor (987 acres), Castle Leazes, and Nuns Moor, the Leazes, Elswick, Brandling, Heaton, and Armstrong Parks, the Cruddas recreation-ground, and Jesmond Dene. For the Armstrong Park and Jesmond Dene, Newcastle is indebted to the munificence of Lord Armstrong.

Newcastle is connected with Gateshead by three bridges: (1) the High Level Bridge, erected in 1846-49 from the plans of Robert Stephenson and T. E. Harrison, at a cost, with the site and approaches, of £491,153. It is 1337 feet long, and consists of six cast-iron arches, which, springing from piers of solid masonry, support a railway at a height of 112 feet and a roadway at a height of 83 feet above high-water (see Vol. II. p. 440). (2) The Swing Bridge, erected 1868-76, at a cost of £233,000, on the site of the Roman, mediæval, and 18th-century bridges. The movable portion, which weighs 1450 tons and is 281 feet long, is worked by hydraulic machinery, and can be swung round in 90 seconds. (3) The Redheugh Suspension Bridge, erected 1868-71, at a cost of £35,000, is 1453 feet in length, its height from high-water mark to the under side of the arch being 87 feet. Newcastle is well supplied with water. Hay and cattle markets are held on Tuesdays, corn-markets on Tuesdays and Saturdays. The port of Newcastle is a very ancient and important one. Since 1840 between 70 and 80 million tons of stuff have been dredged from the bed of the river, which is now navigable by large vessels to Elswick. Since the river came under the jurisdiction of the Tyne Commissioners improvements on a large scale have been made. The total number of vessels using the port during the year 1889 was 14,757, of a net register tonnage of 6,914,392. The quay, the great terminus of the river-traffic of the port, is about 1540 yards in length, and, as the depth of the river there at low-water is 20 to 22 feet, vessels of large size can be moored in safety. Since the 13th century the chief trade of Newcastle has been in coal. A charter was granted by Edward III. to the burgesses to dig for coal outside the walls in 1350. The output of the northern coalfield, of which Newcastle is the centre, in 1889 was 39,101,182 tons. During this period the number of persons employed in the collieries, &c. was 115,440. In 1889 10,529,401 tons of coal and coke were shipped from the port of Newcastle. One of the principal industries of Newcastle is shipbuilding, the river Tyne being second in order of production to the Clyde. In 1889 281,710 tons of shipping were launched on the river.

The principal manufactures of Newcastle are locomotive and marine engines, machinery, heavy ordnance, carriages and harness, white and red lead, sheet and pipe lead, glass of various kinds, earthenware, chemical manures, alkali, cement, bricks, tiles, and fireclay goods, colours, shovels, grindstones, wire rope, nails, sails, &c. The most important works at Newcastle are those of Sir

W. G. Armstrong, Mitchell & Co., Limited, founded in 1847. They comprise blast-furnaces, engine-shops, foundries, and steel-works. Since the amalgamation of the original firm with that of C. Mitchell & Co., shipbuilders, at Walker, in 1882, several ships of war with their armaments have been completed at Elswick, the largest being H.M.S. *Victoria* of 10,000 tons. From the engine-works of R. Stephenson & Co. (founded by George Stephenson in 1824), and R. W. Hawthorn, Leslie & Co., locomotive and marine engines have been sent to all parts of the world. Newcastle is the birthplace of Lords Eldon and Collingwood, Mark Akenside, Charles Hutton the mathematician, and Lord Armstrong.

See Gray's *Chorographia* (1649); and the histories of the town by Bourne (1736), Brand (1789), an anonymous writer—supposed to be the Rev. John Baillie (1801), E. Mackenzie (1827), Welford (3 vols. 1884-87), R. J. Charleton (1885), and J. R. Boyle (1890).

New-chwang, a city of China, the principal port of the province of Manchuria, stands on the river Liao, 20 miles from its mouth and 120 from Mukden, the capital of Manchuria. By the treaty of Tientsin (1858) New-chwang was opened to foreign trade. But the accumulation of alluvial soil in the lower reaches of the river prevents vessels ascending it; they are obliged to load and discharge at Ying-tzu, at its mouth. It is there the Europeans are settled, and they call Ying-tzu by the name of the treaty-port New-chwang. This last is now a greatly decayed place. Ying-tzu imports cotton, woollen, and silk goods, sugar, paper, metals, opium, tobacco, &c., to the annual value of £577,700 (average of three years ending with 1889), and exports beans, silk, ginseng, skins, and horns to the annual value of £1,381,500. The import of Indian opium has fallen from £572,000 in 1866 to £9135 in 1889; the people now consume native Manchurian opium. The port is closed four or five months from November with ice. Large quantities of salt are manufactured in the vicinity. Since 1872 Scottish Presbyterian missionaries have been working here; there is also a Roman Catholic mission. Pop. 60,000.

Newcomb, SIMON, astronomer, was born at Wallace, Nova Scotia, 12th March 1835, graduated in 1858 at the Lawrence Scientific School, at Harvard, and in 1861 became a professor of Mathematics in the United States navy. He was appointed at once to the naval observatory at Washington, and in 1877 was placed at the head of the office of the official *American Ephemeris and Nautical Almanac*. He organised the government expedition to observe the transit of Venus in 1874, and in 1882 observed the transit of the same planet at the Cape of Good Hope; he had already been sent to Saskatchewan (1860) and to Gibraltar (1870-71) to observe eclipses of the sun. In 1884 he undertook, in addition, the duties of the chair of Mathematics and Astronomy in the Johns Hopkins University. His writings embrace over a hundred papers and memoirs, and include especially most exact tables of the motions of the planets. He has also published several volumes on political economy. Professor Newcomb has received doctorates from Columbian University (at Washington), Yale, Harvard, Columbia, Leyden, and Heidelberg, and numerous other honours, both in America and in Europe.

Newcomen, THOMAS, the inventor of a Steam-engine (q.v.), was born at Dartmouth in the later half of the 17th century, and died in London in August 1729. In 1705, along with Cawley, a Dartmouth glazier, and Savary, the manager of a Cornish mine, he obtained a patent for what is now known as the atmospheric steam-engine.

Some six years later his invention was brought into use for pumping water out of mines.

Newdigate, SIR ROGER (1719-1806), was born and died at Arbury in Warwickshire, having sat for many years in parliament as member for Middlesex and the university of Oxford. He was a great antiquary, but now is chiefly remembered as the endower of the Newdigate prize poem at Oxford, winners of which have been Heber (1803), John Wilson (1806), Milman (1812), Hawker (1827), Lord Selborne (1832), Faber (1836), Stanley (1837), Ruskin (1839), Shairp (1842), M. Arnold (1843), Sir E. Arnold (1852), J. A. Symonds (1860), W. J. Courthope (1864), and W. H. Mallock (1871).

New England, a collective name given to the six Eastern States of the United States of America—Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut—embracing an area of 65,000 sq. m. The people, distinctively known as Yankees, are celebrated for industry and enterprise. The joint population in 1890 was 4,692,904; this is more than one-thirteenth of the entire population of the republic, while the area of New England is less than one-fiftieth of the total area of the United States. For the influence of the Puritans who settled here, see Fiske, *The Beginnings of New England* (1889).

Newent, an old market-town 8 miles NW. of Gloucester. Pop. of parish, 2889.

New Forest, a triangular district of south-west Hampshire, 9 miles SW. of Southampton, bounded W. by the river Avon, S. by the Solent and English Channel, and NE. by Southampton Water. It measures about 14 by 16 miles, and has an extreme area of 144 sq. m., or 92,365 acres, of which, however, only 64,232 belong to the crown demesnes. The district seems to have been wooded from the earliest times; its present name dates from 1079, when the Conqueror here made a 'mickle deer-frith,' and cleared away several hamlets. This afforestation, enforced by the savage 'Forest laws,' was regarded as an act of the greatest cruelty; and the violent deaths met by two of his sons, Richard and William Rufus, of whom one was killed here by a stag, and the other by an arrow, were looked on as special judgments. The deer were removed under an act of parliament (1851); and under another of 1877 the New Forest now is managed by the court of Verderers as a public pleasure-ground and cattle-farm. Enclosed plantations occupy about one-fourth of the entire area, the remainder being open woodland, bog, and heath. The principal trees are oaks and beech. The former were once much used as timber for the navy; the mast of the latter still feeds large herds of swine. There is also a herd of small, rough-coated ponies. The hollies, the rhododendrons, and therewith the general absence of underwood, give a beautiful park-like aspect to the forest, points within which or on whose verge are Lyndhurst, Beaulieu, and Lymington.

See Gilpin's *Forest Scenery* (ed. by F. G. Heath, 1879); Blackmore's *Cradock Nowell* (1866); and J. R. Wise's *The New Forest* (1863; 4th or 'Artist's' edition, 1883), the last with W. J. Linton's sixty-three engravings of woodland views by Walter Crane, and twelve etchings by Heywood Sumner.

Newfoundland (*Newfundland'*), an island and British colony in North America, not yet incorporated with the Dominion of Canada, lies at the mouth of the Gulf of St Lawrence, separated from Labrador on the north by the Straits of Belle Isle (q.v., 11 miles broad), and extending in lat. from 46° 38' to 51° 37' N., and in long. from 52° 44' to 59° 30' W. In shape it resembles an equilateral triangle, of which Cape Bauld on the north, Cape Race on the south-east, and Cape Ray on the

south-west from the angles. It is 370 miles in length, 290 miles in breadth, and has an area of 40,200 sq. m.—a fifth less than England. Pop. (1874) 168,958; (1884) 193,124. 'The coast of Labrador from the entrance of Hudson Strait to a line to be drawn due north and south, from Anse Sablon on the said coast to the fifty-second degree of north latitude, and all the islands adjacent to that part of the said coast of Labrador,' is claimed as constituting a dependency of Newfoundland. During the fishing season in each year about 30,000 inhabitants of Newfoundland visit Labrador, and live about its harbours, either on shore or in their vessels, for about three months in each year. The population of Newfoundland and Labrador amounted in 1884 to 197,335, of whom 75,354 were Roman Catholics, 69,000 members of the Church of England, and 48,767 Wesleyan Methodists. The able-bodied fishermen numbered 33,000, and about 21,000 women and children were also engaged in curing fish.

The island, as seen from the sea, presents a wild and sterile appearance. Its surface is diversified by mountains, ponds, and lakes. The mountains in the Avalon Peninsula (stretching south-east from the main portion of the island, and connected with it by an isthmus of only about 3 miles in width) rise in some cases to over 2000 feet above sea-level. The number of the lakes and 'ponds' is remarkable, and it has been estimated that about one-third of the whole surface is covered with fresh water. The coast-line is everywhere deeply indented with bays and estuaries. These bays vary in length from 25 to 70 miles, are of great breadth, and are lined—as indeed the whole coast is—with excellent harbours. The rivers are narrow and winding. Much of the soil is productive, and there is considerable cultivation along the seaboard of the settled districts, but careful exploration has shown that the best land and timber are in the river-valleys and upon the west coast. Large tracts of very good timber, chiefly pine and spruce, exist in several parts of the island. The great body of the people being employed either in the fisheries or in establishments connected with them, little attention used to be paid to the culture of the soil. In 1845 the only crops raised were oats and hay; but within recent years large supplies of grain, vegetable, and garden seeds have been imported; and now about 1,000,000 bushels of potatoes are produced annually, and turnips, hay, carrots, clover, barley, and oats are cultivated with success. The island possesses many minerals. The chief seat of copper-mining is around the shore of Notre Dame Bay. The ore is found in connection with the serpentine rocks, which are spread over an area of 5000 sq. m. Up to 1879 the value of copper and nickel ore exported was \$4,629,889, or nearly £1,000,000 sterling. Gold has been found. Rich deposits of lead ore exist in several places. Gypsum has also been discovered in immense quantities, and marbles on both eastern and western shores. Roofing-slate is found in abundance. Coal and iron exist side by side near the west coast, but their development is unfortunately hampered by claims set up by the French to a right to use the strand for drying fish 'free from interruption' by the colonists. The same claims have seriously impeded mining operations in several parts of the island.

A great variety of valuable fish is found in the waters of the colony and its dependencies, but cod, herring, and salmon are the most important. The capture of seals and the canning of lobsters also add to the resources of the Newfoundlanders. About 250,000 seals are annually taken and their skins sent to Great Britain for manufacturing purposes; the 'fat' is made into seal-oil, which is

used in manufacturing and for lubricating purposes. The industry of canning lobsters, though commenced since 1880, has an annual value of about \$500,000. Several factories for canning lobsters have been erected by the French upon the coasts of Newfoundland over which they have certain rights, but the legality of this action is contested by the colonists, upon the ground that the lobster is not a 'fish' but a crustacean, and that canning lobsters is not 'drying fish.' The average annual value of the herrings exported and consumed in the country is about \$800,000, and that of the salmon exported about \$100,000.

The people chiefly depend for a livelihood upon the product of the cod-fisheries, of which there are three distinct branches—namely, the Labrador fishery, the shore fishery, and the bank fishery. The average annual value of the cod-fishery is \$6,034,242. This calculation includes the dried cod-fish exported, the quantity consumed by the population, and the oil extracted from the fish. From 25,000 to 35,000 people and 1200 vessels engage in the Labrador fishery, and the annual export is valued at about \$1,500,000. The shore fishery is prosecuted along the whole coast-line in Newfoundland, and is the mainstay of the very large portion of the population who from poverty, age, or disinclination refrain from going either to the Labrador or bank fishery, or divide their time between farming and fishing. The bank fishery is prosecuted upon the 'Banks,' so called, which lie to the southwards of Newfoundland. These 'Banks' are submarine plateaus extending over a tract averaging about 600 miles in length and 200 miles in breadth. The depth of water over the 'Banks' varies from 100 to 600 feet, and the most productive ground is known as the 'Grand Bank.' American, Canadian, and French fishermen also resort to these 'Banks' to fish, the French using their islands, St Pierre and Miquelon, as a base of operations. But it is necessary to procure fresh supplies of herring, caplin, and squid at frequent intervals for use as bait upon the 'Banks,' and this can only be obtained, at the seasons when most wanted, and without great delay and expense, in the southern bays of Newfoundland, chiefly in Fortune and Placentia bays. Newfoundland does not now allow the bait-fishes to be exported for bait except under licenses, for which a large fee has to be paid, and the result has been a considerable decrease of the catch upon the banks by foreign fishermen.

The revenue of the colony for the year 1888 was \$1,730,029, and the expenditure \$1,831,441, while the public debt was \$3,335,589. In the same year the colony imported goods to the value of \$7,420,400, of which Great Britain contributed \$3,265,229, Canada \$2,041,144, and the United States \$1,660,000. The exports were valued at \$6,523,137.

In 1882 a contract was made with a company for the construction of a railway from St John's to Hall's Bay, a distance of about 250 miles. After 85 miles of the railway—from St John's to Harbour Grace—had been completed the work of construction was suspended. In 1886 the government of the colony commenced, and in 1887 completed, a branch-line to Placentia. A contract was afterwards entered into with another company to complete the railway to Hall's Bay by 1895, and a project to construct a line from the east to the west side of the island has been revived. The Atlantic cables of the Anglo-American Cable Company land at Heart's Content, on the eastern side of Newfoundland, and at Placentia, on the western side. There are about 800 miles of telegraph in the colony.

The early history of Newfoundland is involved in obscurity. It was discovered 24th June 1497,

in the reign of Henry VII., by John Cabot, and the event is noticed by the following entry in the accounts of the privy-purse expenditure: '1497, Aug. 10. To hym that found the New Isle, £10.' It was visited by the Portuguese navigator, Gaspar de Cortereal, in 1500; and within two years after that time regular fisheries were established on its shores by the Portuguese, Biscayans, and French. In 1578, 400 vessels, of which fifty were English, were engaged in the fishery. Sir Humphrey Gilbert (q.v.), with his ill-fated expedition, arrived in St John's Harbour, August 1583, and formally took possession of the island in the name of Queen Elizabeth. In the return voyage the expedition was scattered by a storm, and the commander lost. In 1621 Sir George Calvert (afterwards Lord Baltimore) settled in the great peninsula in the south-east, and named it the Province of Avalon. The history of the island during the 17th and part of the 18th centuries is little more than a record of rivalries and feuds between the English and French fishermen; but by the treaty of Utrecht (1713) the island was ceded wholly to England, the French, however, retaining certain privileges in connection with the catching and drying of fish on the coast extending from Cape Bonavista on the east to Point Riche on the west. By the treaty of Versailles (1783) the boundaries were so changed as to extend from Cape John on the east to Cape Ray on the west, and at the same time the French were promised 'freedom from interruption by the competition of the British.' This promise the French construe and urge so as to prevent the development of the resources of the interior adjacent to coasts over which their rights extend, and much friction consequently exists between the French and the people of Newfoundland. A governor was appointed in 1728. The present form of government, established in 1855, consists of the governor, an executive council, or cabinet of seven members, a legislative council of fifteen members (appointed by the crown), and a general assembly of thirty-six members (elected by the people). Every man of twenty-one years of age, a British subject and two years a resident in the colony, is entitled to vote at elections.

See L. A. Auspach, *The History of the Island of Newfoundland* (1827); Little, *The Government of Newfoundland* (1855); W. Fraser Rae, *Newfoundland to Manitoba* (1881); Murray and Howley, *Geological Survey of Newfoundland* (1881); Hatton and M. Harvey, *Newfoundland, the Oldest British Colony* (1883); Howley, *Ecclesiastical History of Newfoundland* (1888), and *French Treaty Rights in Newfoundland: the Case for the Colony* (1890). For the map, see CANADA.

Newfoundland, a breed of dogs originally introduced into England from the island of Newfoundland, where they were used for draught purposes. As the mastiff at that time was scarce, and the St Bernard had not yet appeared in England, the Newfoundland became exceedingly common, but has been eclipsed in popularity of late years by the other two breeds mentioned. In general appearance the Newfoundland is a large and imposing dog, mild in expression, but showing great strength. The head should be large, with ears falling close; neck long, if possible; loins strong and well ribbed up, a point seldom seen in this breed; tail long and powerful, as it is used greatly when swimming; coat, long and wiry; colour, black without any white markings. Much discussion was caused by Sir E. Landseer's well-known picture of a black and white dog entitled 'A Distinguished Member of the Humane Society' (1838). An attempt was made to prove that the black and white dog was the true Newfoundland; but it is now generally regarded as a cross from the black. The black and white variety, now known as the Land-

seer Newfoundland, has been kept pure for many generations; it is now almost as pure, and certainly as handsome, as the original variety. The Newfoundland is a splendid water-dog, and takes to the sea at an early age. He is also a natural

Newfoundland Dog—Bismarck, 1890.

retriever, and, though himself too heavy for field work, has been extensively used to found the ordinary retriever. From his formidable appearance, combined with docility and intelligence, he makes a capital watch-dog, for which purpose he is extensively used.

Newgate, a celebrated London prison, stands at the western extremity of Newgate Street, opposite the Old Bailey. The exterior presents high dark stone walls, without windows. It was long the chief criminal prison of city and county, but is no longer used for prisoners to be tried at the Central Court, and is in the hands of the Court of Aldermen. The earliest prison here was in the portal of the *new gate* of the city as early as 1218; and hence the name. About two centuries afterwards it was rebuilt by the executors of Sir Richard Whittington, whose statue with a cat stood in a niche, till its destruction by the great fire of London in 1666. The present edifice was erected in 1780, but the new buildings were greatly damaged by fire in the Gordon Riots of that year (see Boswell's *Johnson* under that date), when 300 prisoners, felons as well as debtors, were released and let loose upon the public. This awful scene is described by Dickens in *Barnaby Rudge*. After the passing of the Prisons Bill in 1877 Newgate, being considered a very costly and redundant establishment, was gradually disused, and is now, except during sessions or when the gallows is in requisition, practically closed. The *Newgate Calendar* contains biographical notices of the most notorious murderers, burglars, thieves, and forgers who have been confined within its walls. See Griffiths, *Chronicles of Newgate* (1884).

New Granada. See COLOMBIA.

New Guinea, an island of Australasia, the largest in the world except the Australian continent, from which it is separated by the shallow island-studded Torres Strait, 80 to 90 miles wide at its narrowest part, about the meridian of the York Peninsula. There is now no doubt that the two regions at one time, probably during the Miocene epoch, formed continuous land, and an upheaval of less than sixty fathoms would suffice again to unite them. The hundred-fathom line, as determined by Wallace, would also include the insular groups of Jobi, Biak, Suk, Mafor

(Nufor), and Amberpoca in Geelvink Bay; Aru, near the south-west coast; Mysol, Salwatty, Batanta, and Waiju at the north-western, and the Louisiade and D'Entrecasteaux Archipelagoes at the south-eastern extremity of New Guinea. But elsewhere the mainland is washed by deep waters, ranging from 500 to 1300 fathoms on the south-eastern and northern seaboard. It is disposed in the direction from north-west to south-east, stretching from Cape Goede Hoop ('Good Hope'), just south of the equator ($0^{\circ} 19' S.$ and $132^{\circ} 30' E.$), for about 1500 miles to South Cape, over 700 miles below the equator ($10^{\circ} 34' S.$ and $150^{\circ} 48' E.$). But owing to its extremely irregular shape, somewhat resembling a huge saurian, the width varies from under 20 miles at the narrowest parts of both extremities to 480 miles at the broadest part, about $141^{\circ} E.$ long., giving a total area roughly estimated at 320,000 sq. m., or six times as large as England. The island thus forms three somewhat distinct geographical divisions—a large central mass from which two peninsulas project south-east and north-west. The south-east peninsula is defined by Huon and Papua Gulfs on

the north and south coasts, while the north-west peninsula is decomposed into two secondary members by the MacLuer Inlet, which penetrates from the south-west side to within 20 miles of Geelvink Bay on the north-west coast.

Most of the interior is still a *terra incognita*; but the more salient physical features of the island have already been roughly determined. It is essentially a mountainous and even an alpine region, being traversed in its entire length by lofty ranges, by far the highest in the Oceanic world, and in some places rising 2000 or 3000 feet above the snow-line. These ranges, which in the two peninsular regions form single continuous systems, develop in the broader central parts two or more parallel chains with a general south-easterly trend, at many points approaching close to the coast-line, and elsewhere enclosing extensive rugged plateaus. Thus, the Arfak Hills of the north-west peninsula (10,000 feet) are continued in the central region by the Charles-Louis range, which for nearly 300 miles appears to maintain an altitude of over 14,000 feet, with many peaks towering to heights of 18,000 and even 20,000 feet. Parallel with this chain runs the

northern coast range, known as the Finisterre Mountains (11,500 feet), which terminate eastwards in an imposing headland projecting in the direction of New Britain, and enclosing Huon Gulf on the north side. Between these two chains run the Bismarck and Krätke ranges (10,000 feet), the latter discovered in 1887 by Dr H. Zöller. About the same time Count Pfeil, administrator of German New Guinea, penetrated from the north coast still farther inland in search of expansive tablelands suitable for settlement; but he found the whole surface broken into a confused mass of steep mountains composed mostly of old sedimentary rocks—together 'a rugged, hopeless region' intersected by deep gorges, but few open river-valleys.

All these mountain-ranges converge in the south-east peninsula in a single lofty chain which traverses the whole of British New Guinea, but the various sections of which take the names of the Albert Victor, Yule, Owen Stanley, and Lorne ranges, in their order from west to east. But the nomenclature is still far from settled, and much confusion has been caused by recent travellers renaming peaks and crests and even rivers already

determined by previous explorers. The prevailing formations appear to be very old plutonic and sedimentary rocks. Gneiss and granites crop out in the Arfak highlands; elsewhere stratified clays and old limestones abound, containing shells identical with those of south-east Australia; quartz and greenstones occur on the south-east coast resembling those of the auriferous region in New South Wales, and there are numerous other indications of the presence of gold in many districts. Earthquakes are frequent in some places, but no active volcanoes appear to exist, although there are several comparatively recent craters on the spurs of the Owen Stanley range, while pumice and scoræ cover the flanks of the Finisterre Mountains.

One result of the explorations has been the discovery of a surprising number of considerable rivers in every part of New Guinea. The three largest appear to be the Amberno (Mamberan, or 'Great River') in Dutch, the Empress Augusta in German, and the Fly in British territory. The Amberno (the Rochussen of Dutch geographers) descends from the Charles-Louis range to the east

side of Geelvink Bay, where it develops an extensive delta. The Empress Augusta flows from the unexplored central water-parting north-eastwards to the coast at Cape della Torre in 4° S. and $144^{\circ} 30'$ E., entering the sea in a broad, deep channel without any delta. In the rainy season it is navigable for many miles by large vessels, and both the main stream and several tributaries are accessible for a long way to river-steamers. But the largest of all New Guinea rivers is certainly the Fly, which rises on the southern slope of the central water-parting and flows mainly south-east to a delta of vast extent on the west side of the Gulf of Papua. The Baxter (Mia Kasa), which enters the sea farther west, opposite Cape York, is an independent stream unconnected with the Fly. This great estuary, which was discovered in 1845 by Blackwood and named after his vessel the Fly, was ascended in 1876 by D'Albertis for 500 miles in a steam-launch, and again in 1889 for over 600 miles by Sir W. Macgregor. The tides ascend the Fly for 150 miles, and 90 miles higher up it is joined on its left bank by the Strickland. Farther east several other copious streams flowing from the main range through British territory to the Gulf of Papua have also been either recently discovered or for the first time surveyed. Such are the Douglas, Centenary, Stanhope, and Queen's Jubilee, all of which converge in an almost continuous common delta about the head of the gulf. But here again the terminology is much confused, the Douglas and Jubilee being respectively Blackwood's Aird and the already partly-surveyed Aivei. Mr Bevan's Philip also is merely the upper course of the Aird, of which the Centenary appears to be an eastern and the Newbery a western branch. The east side of Papua Gulf is joined by other navigable streams from the Owen Stanley range, the more important of which are the St Joseph, flowing from Mount Yule to Hall Sound; the Vanapa, draining the southern slopes to Redscar Bay, and followed by Sir W. Macgregor on his expedition to Mount Victoria (Owen Stanley) in 1889; the Kemp Welch, flowing to Hood Bay; and the Davadava and Hadava, reaching the coast at Milne Bay. In German territory also, besides the Empress Augusta, no less than nine new rivers have recently been discovered, one of which, the Markham, gives easy access a long way into the interior.

The whole of New Guinea lies within the track of the south-east trade-winds, which prevail from March to October, and which are charged with much moisture from the Pacific. These are followed for the rest of the year by the north-west monsoons, whose rain-bearing clouds are condensed on the cold alpine slopes of the island. The consequence is that the rain or snow fall is considerable in every part of the country, and this, combined with an average high temperature of from 85° to 90° F., results in a hot, moist climate on all the low-lying coast-lands and fluvial valleys. So excessive is the moisture in some places that 'boots put aside for a day or two grow a crop of mildew nearly half an inch in thickness' (Guilleminard). Hence fever is endemic, not only in the lowlands, but to a considerable height above sea-level, the malarious exhalations being carried upwards by the atmospheric currents, as on the Central African plateaus. At the same time its action is most capricious, and its true character still but little understood. 'It may be very troublesome where weather, soil, and other conditions should be favourable to health, and perhaps almost absent under the opposite conditions' (Courtis Trotter). Exactly similar phenomena have been observed in tropical Africa, and it may be inferred that New Guinea, as a whole, is as unsuitable as that continent for European

settlement. But some of the uplands beyond the fever zone may be found adapted, if not for permanent colonisation, at least for the establishment of health-resorts for officials, traders, and missionaries.

Thanks to its abundant rainfall, varying altitudes, high temperature, and position intermediate between the Asiatic and Australian botanical areas, New Guinea is almost everywhere clothed with a rich and highly diversified flora. The vegetable zones appear to be even superimposed as in Mexico, and Sir W. Macgregor's party, after passing successively through the domains of tropical plants, such as the cocoa-nut, sago, banana, mango, taro, and sugar-cane, and of such temperate or sub-tropical growths as the cedar, oak, fig, acacia, pine, and tree-fern, were gladdened on the higher slopes by the sight of the wild strawberry, forget-me-not, daisy, buttercup, and other familiar British plants. Towards the summits these were succeeded by a true Alpine flora, in which Himalayan, Bornean (Kinibalu), New Zealand, and sub-antarctic forms were all numerously represented. In general, arboreal vegetation ceases at about 11,000 feet, and shrubs at 12,000, the latter being overlapped by the Alpine zone. In New Guinea the Asiatic and Malayan floras are far more richly represented than the Australian, as shown by the absence or rarity of the eucalyptus, of which as many as fifty varieties are found in the southern continent. Indigenous forms are numerous, and include many species of palm.

On the other hand, the New Guinea fauna is much more closely related to that of the Austral than to that of the northern hemisphere. This is seen in the almost total absence of placental mammals and the presence of over thirty species of marsupials, such as the cuscus and kangaroo, as well as the bower-bird, of which two new species were discovered on the Owen Stanley range. Here also were found the European lark and black-bird in curious association with the bird of Paradise, of which typical New Guinea bird many varieties occur. Scarcely any birds of prey are found, a circumstance which may explain the presence of so many forms—parrots, cockatoos, pigeons, &c.—remarkable for their gorgeous plumage. Reptiles are numerous, and include a remarkable python (*Chondropython pulcher*), intermediate between the Asiatic python and American boa. A still more remarkable intermediate form, supplying a link between reptiles and mammals, is the spiny anteater, which is allied to the Australian echidna, and like it oviparous. There are three species of this anteater, while the placental mammals are represented only by some bats and mice, besides the pig and dingo, both probably introduced in comparatively recent times.

Man also would seem to have invaded the island after its separation from Australia, for the inhabitants of the two regions belong to fundamentally distinct stocks. Between the Australians and Papuans, who form the great bulk of the New Guinea population, there is little in common except the dark colour, considerably darker, however, in the latter than in the former. But the New Guinea natives are far from a homogeneous people, and the descriptions of travellers in different parts of the island differ so greatly that many anthropologists have doubted or even denied the existence of any Papuan type. These discrepancies are due to the presence and intermingling of at least four ethnical elements: *Papuan* proper, diffused over the whole region; *Negrito* (Karons and others in the north-west peninsula and probably also in the central highlands); *Eastern Polynesian*, such as the Motu of the south-east coast; lastly, *Malay*, along the north-western seaboard and around the shores of

Geelvink Bay. The mingling of these elements in different proportions has brought about much diversity in the physical appearance, speech, usages, and general culture of the natives, who are everywhere broken into small tribal groups speaking a surprising number of distinct languages, some of which are members of the widespread Malayo-Polynesian family, while others, especially in the interior, seem to have no connection with that or any other known forms of speech. The tribal organisation is extremely loose, hereditary rulers being nowhere recognised, and the so-called chiefs depending for their prestige either on personal, social, or religious influences (S. Forbes). Cannibalism is very prevalent, though by no means universal; and some tribes, such as the Togaris of the south coast, are predatory, living entirely by plundering expeditions amongst the surrounding populations. But many others are peaceful, industrious, and keen traders, displaying remarkable skill, especially in the arts of pottery, wood-carving, and husbandry.

New Guinea appears to have been first sighted by A. D'Abreu in 1511, and first visited by De Meneses about 1526, and Alvaro de Saaverda in 1528. It received its present name in 1546 from Ortiz de Retez (Roda), who was struck by the resemblance of its inhabitants to those of the Guinea coast in West Africa. During the flourishing period of the empire of Tidor, the Malay sultans of that state extended their sway over the so-called *Raja Ampat* or 'Four Kingdoms' of Waijitu, Salwatty, Mysol, and Waigamma, including large tracts on the adjacent mainland. In 1793 the East India Company occupied the island of Manassari in Geelvink Bay; but the British troops were soon withdrawn, and in 1814 the English government admitted the claims of Holland to the *Raja Ampat* as suzerain of the sultan of Tidor. In 1848 the Dutch proclaimed their sovereignty over the western half of the island as far as 141° E. long., and this meridian was accordingly taken as the western boundary of the eastern half in 1884, when that section was divided between Great Britain and Germany. The boundary between the northern or German and the southern or British division coincides with the crest of the main water-parting. Subjoined is a roughly estimated table of the areas and populations of the territories assigned to these three states:

	Area in sq. miles.	Population.
Dutch New Guinea.....	158,000	200,000
British ".....	90,000	135,000
German ".....	70,000	100,000
Total.....	318,000	435,000

In the Dutch section, which is attached to the Residency of Ternate, there are no towns or administrative centres, Dorey, at the north-west side of Geelvink Bay, being merely a missionary station chiefly noted as the starting-point of many expeditions to the interior. No effort has ever been made by the Dutch government or by private enterprise to develop the resources of the country. German New Guinea, officially known as Kaiser Wilhelm's Land, is a protectorate administered by the German New Guinea Company, which has stations at Astrolabe Bay, Finschhafen, Konstantinshafen, and Hatzfeldhafen. It yields for export tobacco, areca, sago, bamboo, ebony, and other woods. British New Guinea, which includes the D'Entrecasteaux and Louisiade Archipelagoes, was administered as a protectorate by a Commissioner till 1888, when the sovereignty of the Queen was proclaimed, the government being placed under Sir William Macgregor as administrator. New South Wales, Victoria, and Queensland each contribute £5000 towards the expenses

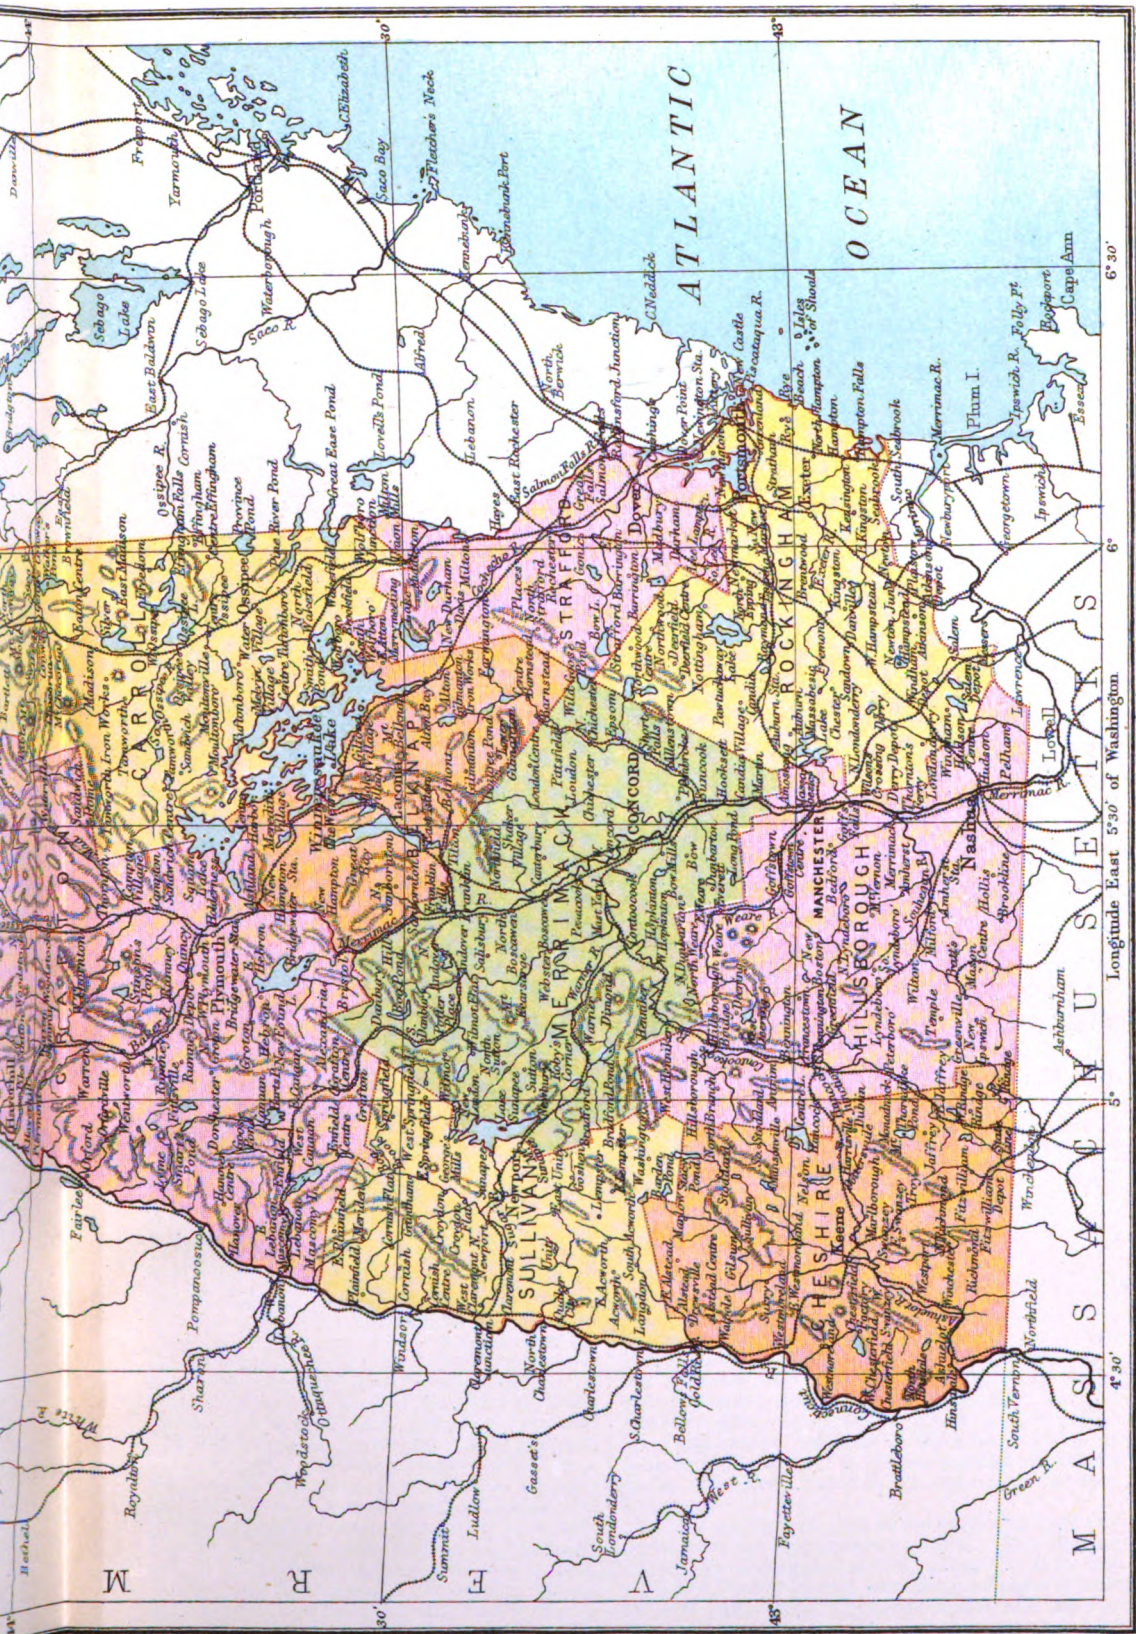

of administration. The territory is divided into a western, central, and eastern division, under deputy-commissioners, the chief station being Port Moresby. The revenue already exceeds the expenditure, and the exports, chiefly gold, pearls, shells, bêche-de-mer, and copra, exceeded £24,000 in 1889.

See works on New Guinea and accounts of voyages thither by Th. Forrest (1774-76), Modera (Dutch, 1830) in the *Journ. Roy. Geog. Soc.* xxviii., Dumont d'Urville (1839), Marsden in *Trans. Roy. Asiatic Soc.* 1831, G. W. Earl (1835) in *Logan's Journal*, vi. (1852), J. MacGillivray (1850), O. Finsch (German, 1865), Miklukho Maclay (in *Petermann*, 1873), Rev. Wyatt Gill (1874), Moresby (1876 and 1877), Octavus Stone (1880), Lawer (1880 and 1883), D'Albertis (1880), Powell in *Proc. Roy. Geog. Soc.* 1883, Countess Trotter in the same, 1883, 1884, and 1890, Prince Roland Bonaparte in the *Bulletin of the French Geog. Soc.* 1884, Rye (bibliography of over 1000 entries) in supplementary papers of the *Roy. Geog. Soc.* 1884, Rev. J. Chalmers (1885 and 1887), Ch. Lyne (1886), Romilly (1886 and 1889), H. O. Forbes in *Scott. Geog. Mag.* 1888, Rev. S. M'Farlane (1888), Sir W. Macgregor in *Proc. Roy. Geog. Soc.* 1890, Bevan (1890); besides A. R. Wallace's *Malay Archipelago* (1869), and A. H. Keane's *Eastern Geography* (1887).

New Hampshire, the 'Granite State,' the most northerly of the thirteen original United States of North America, lies Copyright 1881 in U.S. between 42° 40' and 45° 18' N. by J. B. Lippincott lat., and is bounded N. by the Company. province of Quebec, E. by Maine and (for 18 miles) the Atlantic Ocean, S. by Massachusetts, and W. by the right bank of the Connecticut River. Area, 9305 sq. m.—a fourth larger than Wales. The average elevation of the state is about 1200 feet, the general slope being towards the south. The highest point is Mount Washington (6293 feet), in the White Mountains, which include more than a hundred peaks of note, mainly in the northernmost county; among the peaks over 5000 feet high are those bearing the names of the successive presidents, Adams, Jefferson, Madison, and Monroe. Geologically they consist of early metamorphic rocks; immense masses of granite and gneiss constitute the bare peaks that make the name of the range as appropriate in summer as in winter. The largest lake is Winnipiseogee (72 sq. m.); the principal rivers are the Connecticut, Merrimac, and Piscataqua. From Dover Point to its mouth the Piscataqua is about half a mile wide; and the volume and swiftness of its current at ebb-tide prevent the freezing of the water in Portsmouth harbour during the coldest winters. The Merrimac is said to turn more spindles and propel more shuttles than any other river in the world. The state is noted for its salubrious climate and grandly picturesque natural scenery. The mean annual temperature at Concord is 46° F.

The principal agricultural products are hay, potatoes, maize, and oats. There are still over a million acres of forest in the state, which have an average value per acre of about double that of the cleared land. Agricultural interests had steadily declined for a number of years, but of late New Hampshire has become very popular as a summer-resort, and the farmers, who owing to the rough and sterile soil could not compete in the great markets with those of the West, now find a new and important market brought to their very doors. But the manufacturing is the leading industry in New Hampshire, the chief centres being Manchester (the largest city), Nashua, and Dover. The total value of property in the state is about \$350,000,000.

New Hampshire embraces ten counties, and returns two members to congress. The governor is elected biennially, and by him the judiciary are appointed until seventy years of age. The public

John Bartholomew & Co., Ltd.

PHILADELPHIA: J. B. LIPPINCOTT COMPANY.

schools are efficient, and the state possesses one college—Dartmouth, founded at Hanover in 1769 as a school for the instruction of Indians; it has well-appointed academic, scientific, medical, and agricultural departments, with libraries aggregating 67,000 volumes. There is also a state normal school at Plymouth.

History.—The earliest settlements were made in 1623 near Dover and Portsmouth. In 1641–79, 1689–92, and 1699–1741 New Hampshire was joined to the Massachusetts colony, but during the intervening dates and until 1775 it was under royal governors of its own. The people took an active part in the revolution. A provisional government was formed in 1776, a state constitution adopted in 1784; and New Hampshire was the ninth state (June 21, 1788) to ratify the national constitution. Among the eminent men born here have been—besides one president, Franklin Pierce—Daniel Webster, Lewis Cass, Salmon P. Chase, and Horace Greeley. Pop. (1790) 141,899; (1840) 284,574; (1880) 346,991; (1890) 376,530.

New Hanover, one of the Bismarck Archipelago, lying off the north-east coast of New Guinea, with an area of 570 sq. m. Its physical characteristics resemble those of New Britain (q.v.).

New Harmony, a village (pop. 1095) of Indiana, 28 miles by rail NW. of Evansville, was first settled in 1815 by a German community of religious socialists, called Harmonists, under the leadership of George Rapp (q.v.). In 1824 the village and domain was purchased by Robert Owen, for an experimental community on his system; but this failed after a test of nearly three years.

Newhaven, a seaport of Sussex, at the mouth of the Ouse, $8\frac{1}{2}$ miles E. of Brighton and 56 S. of London. It has risen into importance through its steamboat traffic, particularly to Dieppe ($5\frac{1}{2}$ hours), and has a large fort (1864–69) and a little Norman 12th-century church, with an east tower and small semicircular apse, curiously like that of Yainville-sur-Seine. Pop. (1881) 4421; (1891) 4955.

Newhaven, a fishing-village of Midlothian, on the south shore of the Firth of Forth, 1 mile WNW. of Leith, and 2 miles N. of Edinburgh. Dating from about 1490, it has a tidal harbour, reconstructed in 1876–77 at a cost of £10,000, and is famous for its fish dinners and fishwives. Pop. of parish (1841) 2103; (1881) 4694. See Charles Reade's *Christie Johnstone* (1853), and Mrs Cupples' *Newhaven, its Origin and History* (1888).

New Haven, the chief city and seaport of Connecticut, and capital of New Haven county, at the head of New Haven Bay, 4 miles from Long Island Sound, and 73 miles by rail ENE. of New York. Its broad streets are shaded with elms, and the public squares, parks, and gardens, with its handsome public and private edifices, make it one of the most beautiful of American cities. It is the seat of Yale College (q.v.), and contains also the Sheffield scientific school, the Hopkins grammar-school (1660), and thirty-four public schools. Its other public buildings include the former state-house, the city hall, United States government building, and about sixty churches. The harbour has a jetty and a breakwater surmounted by a lighthouse, and the port has a large coasting trade. But New Haven is of more consequence as a manufacturing town, employing many thousands of hands in its large works, and producing hardware, wire, locks, clocks, cutlery, firearms, corsets, india-rubber goods, carriages, furniture, paper, matches, musical instruments, &c. New Haven was settled in 1636 by a company from London, and the colony was not united to that of Connecticut until 1662; and till 1873 it was recognised

as, jointly with Hartford, the capital of the state. It was incorporated as a town about 1665, and chartered as a city in 1784; and it retains a town as well as a city administration, choosing selectmen, &c., besides a mayor, aldermen, and council. Pop. (1850) 22,529; (1880) 62,882; (1890) 85,981.

New Hebrides, a chain of islands in the Western Pacific, extending NNW. to SSE., and lying W. of Fiji and NE. of New Caledonia. There are in all some thirty islands (area, 5110 sq. m.), of which twenty are inhabited, the people, mostly of the Melanesian race, numbering about 70,000. They are of volcanic origin, some—e.g. Ambrym, Tanna, and Povei—having active volcanoes, but rest upon a coral foundation. The larger islands are Espiritu Santo (70 miles long by 40 wide), Mallicolo (56 miles by 20), Ambrym (22 miles by 17), Vati or Sandwich (30 miles by 15), Erromango (30 miles by 22), Tanna (18 miles by 10), and Aneityum (35 miles in circumference). All are wooded, and some lofty, reaching 3000 feet. The climate is moist, but clear and healthy, the thermometer ranging from 60° to 90° F. The usual tropical plants and products are grown—yam, taro, banana, bread-fruit, sugar-cane, arrowroot, and cocoa-nut. Sandalwood, at one time common, is now almost extinct. The seas swarm with fish, some of them poisonous, and whales are taken near by. The people are savage cannibals of a low type, and are decreasing in number. They speak a great number of dialects, many being unintelligible to the others. The southern islanders (Erromango to Aneityum) have been civilised by English and Scottish missionaries. This chain was discovered by the Portuguese navigator Quiros in 1606, and was thoroughly explored by Captain Cook in 1773. They are claimed by the British, though nothing is done to occupy them. The French have more than once cast covetous eyes upon the group, but their attempts to annex it have encountered the strenuous opposition of the Australian colonists. Since 1863 the natives of these islands have been every year carried away to serve as labourers on the plantations in Queensland, Fiji, and New Caledonia, and many barbarities have been perpetrated in connection with the traffic. See Dr J. Inglis, *In the New Hebrides* (1887) and the Memoir of J. G. Paton (1889).

New Holland. See AUSTRALIA.

New Ireland, now called NEU-MECKLENBURG, a long narrow island in the Pacific Ocean, lying to the north-east of New Guinea. Area, 4900 sq. m.; length, 300 miles; width, 15 miles. The hills rise to 6500 feet, and they and the whole of the interior are richly wooded. The climate, products, and inhabitants resemble those of New Britain (q.v.).

New Jersey, one of the thirteen original states of the American Union, is bounded on the N. by the state of New York; Copyright 1901 in U.S. E. by the Hudson River, Staten by J. B. Lippincott Island Sound, Raritan Bay, and Company. by the Atlantic; SW. by Delaware Bay; and W. by the Delaware River, which separates it from Pennsylvania. Its greatest length is 167 miles; its width varies from 32 to 59 miles. It has an area of 7577 sq. m.; it is the smallest of all the states save three, but it ranks eighteenth in population.

In the north-west part of the state there are two portions of the Appalachian system. The Blue or Kittatinny Mountains extend along the Delaware from the Water Gap up, attaining a height of 1400 to 1800 feet. The highlands south and east of these consist of many ridges, their greatest height 1488 feet. In this part of the state are many small lakes. The Palisades, the Orange Mountains,

and other hills are in the red sandstone region, which extends from the north-east to the central part of New Jersey. The Navesink highlands, south of Sandy Hook, reach a height of 282 feet, support two lighthouses, and are the only considerable elevation on the Atlantic coast south of New England. The central portion of the state is generally level and fertile; the southern part is in large measure sandy, covered with pine-woods, and marshy near the coast. The state is abundantly watered; its chief rivers, the Passaic, Raritan, Little and Great Egg Harbor, flow south-east into bays. The coast from Sandy Hook to Cape May is generally protected by peninsula or island beaches; the only considerable exception to this rule being the strip of mainland, about 18 miles long, between Monmouth and Squan beaches.

In agriculture the state occupies a prominent position in proportion to its area. The farms comprise some 3,000,000 acres, more than three-fourths under tillage; the value of farm lands approaches \$200,000,000, and that of farm products is about \$30,000,000 annually. The chief products are maize, oats, wheat, rye, hay, potatoes and sweet potatoes, cattle, butter, and milk. The leading mineral products are iron ore, limestone of various kinds, zinc, and slate. Glass, pottery, machinery, leather, silk, and sugar are among the chief manufactures.

New Jersey returns seven members to congress. The state legislature meets at the capital, Trenton, in January; a senator is chosen from each of the twenty-one counties (one-third each year) for three years; the assembly has about sixty members, who serve one year. The annual taxes are about \$3,000,000, of which full half is devoted to education. There are (besides seven county asylums) two large lunatic asylums near Trenton and Morristown, the latter accounted a model; an institution for the deaf and dumb, an industrial school for girls, and a large state-prison, at or near Trenton; a reform school for boys near Jamesburg; and a home for disabled soldiers at Newark. There are 1400 school districts. In the cities over 100,000 pupils are enrolled, and some 240,000 in the rural districts. The state normal school is at Trenton, and its preparatory school at Beverly; and the state agricultural and scientific school is connected with Rutgers' College, at New Brunswick. The College of New Jersey, founded in 1746 at Princeton (q.v.), is the most famous institution in the state.

New Jersey has two canals, the Morris and the Raritan, and some fifty railroads, with nearly 3000 miles of length. The position of the state, between the two great eastern cities and bordering upon both, has powerfully stimulated travel, industry, and population. Its south-west portion has Philadelphia for a market; its north-east section, including its two largest towns, is a suburb of New York. Its coast from Navesink to Squan is covered with villas, cottages, and hotels. Cape May and Long Branch for half a century, and Atlantic City for twenty years or more, have been noted seaside resorts. Asbury Park, Ocean Grove, Seabright, &c. are now growing places, crowded in summer. Newark and Jersey City are by far the largest cities; next come Paterson, Camden, Hoboken, Trenton, Elizabeth, New Brunswick, and Orange. Pop. (1800) 211,149; (1840) 373,306; (1880) 1,131,116; (1890) 1,444,933.

History.—In 1617 the Dutch settled at Bergen, near New York. In 1623 Cornelius May ascended the Delaware and built a fort four miles below the site of Camden. Some English colonists in that region were driven away in 1638 by the Swedes, who were conquered in 1655 by Peter Stuyvesant. In 1664 the territory was granted by Charles II. to

the Duke of York, and by him to Lord John Berkeley and Sir George Carteret, with full power of government to them and their assignees. There was no trouble with the Indians, whose titles were peacefully purchased. The proprietors soon divided the territory into East and West Jersey. In 1674 Berkeley sold West Jersey to two Quakers, who settled Salem and Burlington; and in 1682 a society under Penn bought the Carteret rights in East Jersey. In 1702 the proprietors surrendered their power of government to the crown, and the two provinces were reunited; and from 1738 New Jersey had its own royal governors, always at issue with the assembly and the people. New Jersey bore its part in the colonial wars, contributed 10,726 men to the Continental army, besides militia, and spent over \$5,000,000 in the cause of liberty. It suffered heavily during the revolution, and was the scene of several important campaigns and battles. The state sent nearly 7000 men to the war of 1812, and for the civil war thirty-seven regiments of infantry, three of cavalry, and five batteries. See the *History of New Jersey*, by Raum (1880).

New London, a port of entry of Connecticut, is on the right bank of the river Thames, 3 miles from Long Island Sound, 51 by rail E. of New Haven, and 126 NNE. of New York, with which it has a daily steamboat communication. It has a court-house, a brown-stone city hall, and a granite custom-house. The manufactures include woollens, sewing-silk, agricultural machinery, hardware, and crackers (*Anglice*, biscuits); fruit-canning also is carried on. The harbour (30 feet deep) is one of the best in the United States, and many vessels engaged in the coasting trade, and in sealing or fishing, are owned here. On the left bank of the river is a United States navy yard; and there are two forts here, though no longer effective. New London was settled in 1645, and in 1781 was burned by Benedict Arnold. Pop. (1850) 8991; (1890) 13,759.

Newman, JOHN HENRY, CARDINAL (1801–90), the leader of the Oxford Tractarian movement of 1833 in the Church of England, who joined the Roman Catholic Church in 1845, and was made a cardinal by Leo XIII. in 1879. He was born in London on the 21st February 1801. His father was John Newman, a member of the banking firm of Ramsbottom, Newman, & Co. His mother was the child of an old Huguenot family which had settled in London as paper-manufacturers. She was a moderate Calvinist, and taught her children to love the school of Scott, Romaine, Newton, and Milner. Her children learned early to take great delight in the Bible, and Newman has always ascribed the utmost influence over his early religious views to his mother's teaching. From Scott, the commentator on the Bible, he learned two principles which may be traced in all his subsequent career. The first was to prize 'holiness before peace'; the second was that 'growth' is 'the only evidence of life.' From his reading of Law's *Serious Call* he dates his firm inward assent to the doctrine of eternal punishment, which he always held as taught by our Lord himself; a doctrine, however, of which he often endeavoured to attenuate the mystery—notably in *Callista* (chap. xix.). Milner's *Church History* first attracted Newman to the writings of the early Fathers. Yet at the same time he derived from Newton's book on the prophecies a belief which more or less biased his mind long

after he had ceased to accept it as a truth—that Rome is Antichrist. In the autumn of 1816 a belief took possession of him, as he tells us in his *Apologia*, that he was to lead a life of celibacy; and this belief held its ground, with certain brief intervals of 'a month now and a month then,' up to the age of twenty-eight, after which it remained absolutely fixed. Newman went to a private school at Ealing. The stoppage of his father's bank compelled him to take his degree at Oxford as early as possible without taking full time to read for honours, and he actually took it (from Trinity College) in 1820, when he was only nineteen, but overwork resulted in a partial failure. In 1821 he wrote jointly with a friend two cantos of a poem on St Bartholomew's Eve, but the fragment has never been republished. It should be added that Newman was always passionately fond of music, and showed delicacy and skill as a violinist.

In 1822 Newman was elected to a fellowship in Oriel College, then the most distinguished in the university; and it was here that, after a period of some loneliness, he formed his close intimacy with Dr Pusey, and subsequently with Hurrell Froude, whose dash and genius exerted a great influence over Newman, and who had a great share in starting the Tractarian movement of 1833. In 1823, too, Newman first read Butler's *Analogy*, from which he tells us that he learned to interpret the less certain aspects of natural religion in the sense of revealed religion, and especially to interpret natural phenomena in the sense of the sacramental system—i.e. as conveying mystical spiritual influences of which there is no external sign. Keble's *Christian Year* (1827) fell in exactly with this impression of the mystery at the heart of apparently purely physical influences. From Bishop Butler Newman also derived the principle that 'probability is the guide of life,' which, however, he more or less modified when he became a Roman Catholic, holding thenceforward that in all matters of first-rate religious importance certitude can be attained and not merely probability. At Oriel Newman formed cordial relations with Dr Hawkins, afterwards the provost of the college, and Whately, afterwards Archbishop of Dublin. Both of them exercised great influence over him by teaching him to define his thoughts clearly; and he afterwards expressed surprise that the casuistry of the Roman Church should have been credited with those habits of subtle discrimination which he had really gained from his Oxford colleagues.

Newman's first book, completed in 1832, but not published till 1833, was that on *The Arians of the Fourth Century*. It was a very careful and scholarly production, intended to show that the Arian heresy was not, as had been supposed, of Alexandrian origin, but was one of the Judaizing heresies which sprang up in Antioch. The book is a powerful vindication of the Athanasian doctrine of the divine nature of Jesus Christ from the imputation of being arbitrary, or in any way an unauthorised ecclesiastical addition to the essence of the Pauline and Johannine theology. Newman insists on the dogmatic definition of the Son as being 'of one substance' with the Father, and not merely 'of like substance,' as the only escape from either creature-worship on the one hand or the impossible assertion of the voluntary self-sacrifice of an eternal creator on man's account on the other.

In the late autumn of 1832 Newman accompanied Hurrell Froude and his father in a Mediterranean tour undertaken in the hope of restoring the health of the former. It was on this tour that the fire gradually kindled which was to bear fruit in the Anglican movement of 1833. Most of Newman's smaller poems were written on this

voyage, and were soon afterwards published with the signature δ in the *Lyra Apostolica*, a volume of verse the object of which was to reassert for the Church of England her spiritual authority and mission with something of the ease and buoyancy of poetic license. It was on this tour that Newman first saw Monsignore (afterwards Cardinal) Wiseman in Rome, and told him gravely in reply to the expression of a courteous wish that Hurrell Froude and he might revisit Rome, 'We have a work to do in England.' At Rome Newman left his friends to go alone to Sicily, where he fell ill of malarial fever. His mind was deeply possessed during this illness by the idea of the work he had to do in England, and the delay in finding passage to England was very trying to him. He spent much of his time in the Roman Catholic churches, which he had up to this period refrained from visiting, and speaks with great feeling in one of his poems of the good offices of that church, though a 'foe,' in ministering to his sickness, like the good Samaritan to the wounded Jew. At last he got passage on an orange boat to Marseilles. Becalmed in the Straits of Bonifacio, he wrote the best known of all his poems, 'Lead, kindly Light.' From Marseilles he travelled straight to England, reaching home in time to be present at Keble's Oxford assize sermon on National Apostasy, which he always regarded as the date at which the Tractarian movement began. It was preached on July 14, 1833.

Into the series of *Tracts for the Times* which now commenced Newman threw himself with great energy; indeed he himself composed a considerable number of them. In the very first page of the first tract, which was his own, he told the bishops that 'black event though it would be for the country, yet we could not wish them a more blessed termination of their career than the spoiling of their goods and martyrdom.' The tracts which now began to pour forth were all intended to assert the authority of the Anglican Church, to claim apostolical descent for the Anglican episcopate, to advocate the restoration of a stricter discipline and the maintenance of a stricter orthodoxy, to insist on the primary importance of the sacraments, and the duty of loyalty to the church—Newman persuaded a friend to stay away from the marriage of a sister who had seceded from the Anglican Church—and in general to preserve the dogmatic purity of the church as well as to guard her divine ritual. But while he was full of confidence in these principles, which he held in common with Rome, what puzzled him was to justify adequately the strong anti-Romanist language of the greater Anglican divines; and a great part of his time was given during the Tractarian movement to laying down clearly the doctrine of the *via media* or midway course between popular Protestantism and Roman Catholicism, 'which he claimed that the Anglican divines of the 17th century had taken up. Up to nearly the end of his Anglican period he disapproved strongly the cultus of the Virgin Mary and the saints as interfering with the true worship of God. In 1837 he made an attempt to distinguish the Anglican *via media* from the doctrine of the Church of Rome in a course of lectures on 'The Prophetic Office of the Church viewed relatively to Romanism and Popular Protestantism.' In these lectures he contrasted the attitude of the Anglican and Roman churches in reference to the use and abuse of private judgment, their attitude towards the principle of infallibility, their very different use of Scripture, and their view of the fortunes of the church. But while defending and defining as far as possible the *via media* of Anglicanism,

Newman frankly admitted that it had never been practically enforced, and that it was a theoretic line on which no actual ecclesiastical policy had been founded. This it was which it remained for the Tractarians to do.

In 1838 Newman followed up his discussion of the *via media* so far as it affects authority with a volume on the *via media* in its relation to the doctrine of justification by faith. Again he taught that the Anglican Church takes a middle course between the Roman Catholic Church and popular Protestantism in maintaining that justification by faith—or the *imputation* without the *reality* of righteousness—must precede sanctification, which gives the reality, though sanctification must necessarily follow; while the Roman Catholic theology regarded sanctification as the whole substance of justification.

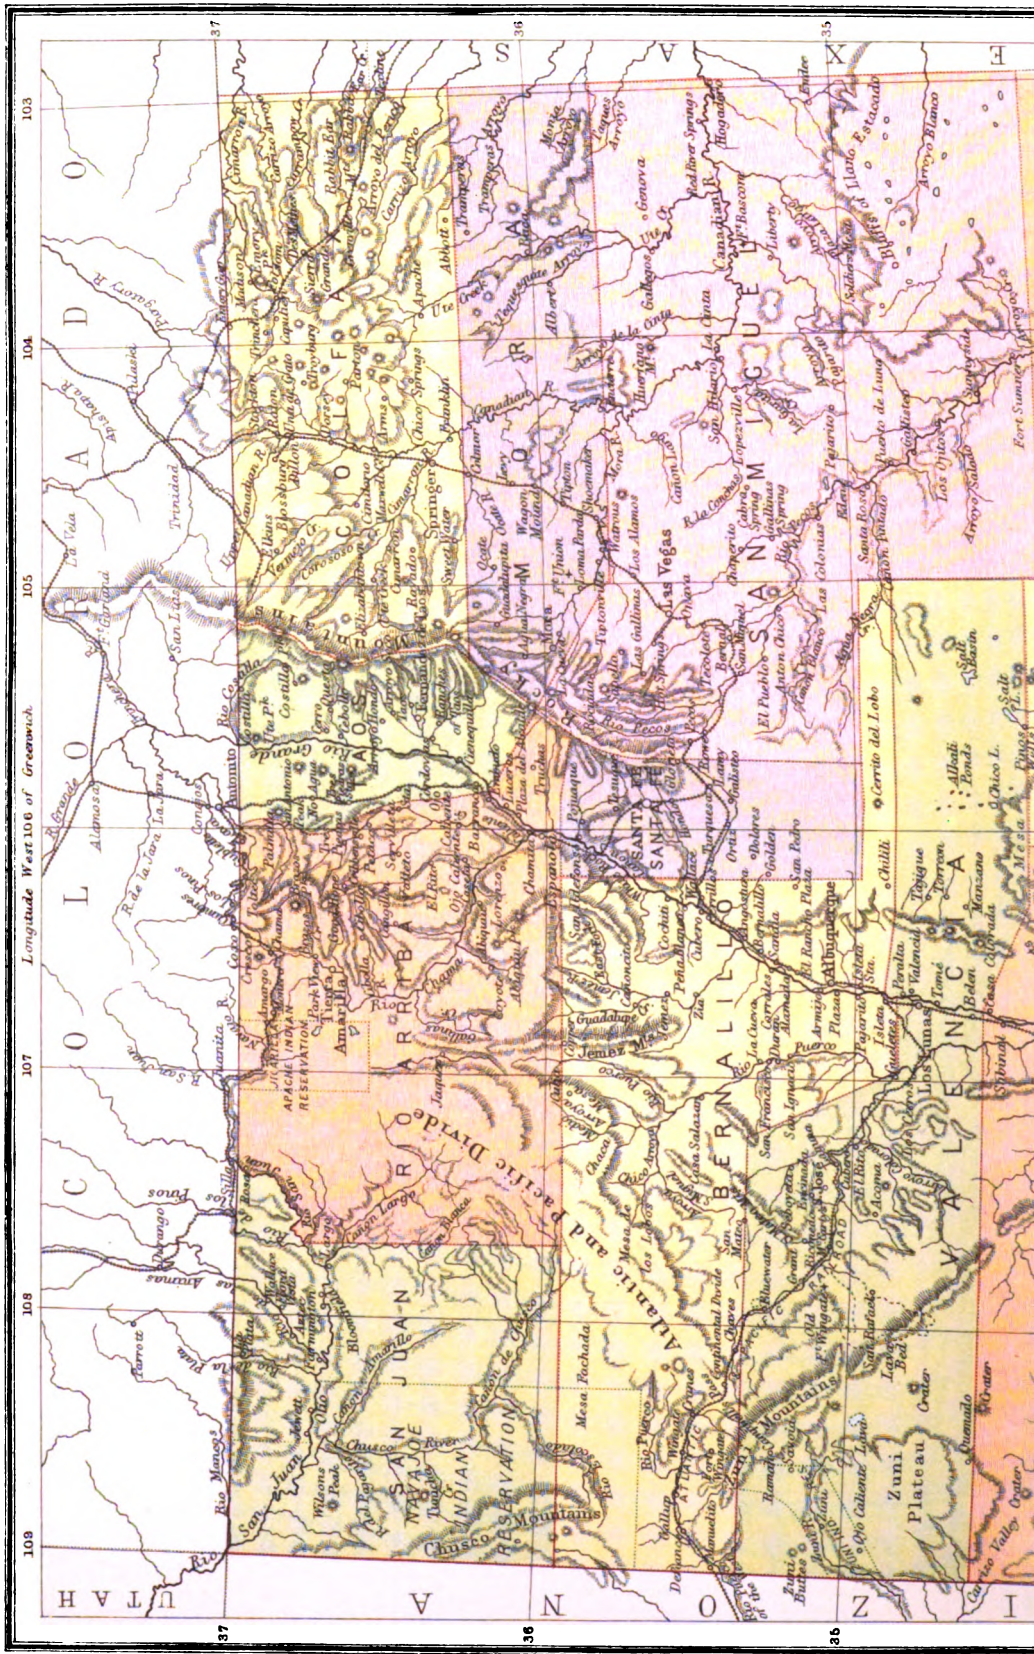

In Tract 85, which was also published in 1838, Newman made an effort to apply the theology of the *via media* to the interpretation of Scripture. He held that the Roman Catholic Church takes a view too independent of Scripture, while the Anglican Church is right in asserting that all revealed doctrine is to be found in Scripture, though it could not be found on the mere *surface* of Scripture, since it needs the guidance of the church's traditions to help us to find it there. He admitted most fully that the stress which one might expect to be laid is not laid in Scripture on baptism, on confession, on absolution, nor even on public worship itself, and that we can only find these doctrines in Scripture by attaching the importance which tradition teaches us to attach to the hints and *obiter dicta* of Scripture. Scripture, he held, *verifies* the teaching of the church rather than systematically inculcates it. Tract 85 was one of the most careful and characteristic of all Newman's essays as a Tractarian.

Tract 90, which appeared early in 1841, and which gave rise to so much agitation in Oxford, was the most famous, but certainly one of the least interesting of the tracts. The right wing of the Tractarian party, headed by William George Ward (q.v.), was at this time urging Newman to reconcile his High Church doctrines with the Thirty-nine Articles. This Newman thought a comparatively easy matter. The Articles recognise the teaching of the Books of Homilies as 'godly and wholesome,' and Newman contended that there was therefore ample evidence that the intention of the Articles was Catholic in spirit, and that they were aimed at the supremacy of the pope and the popular abuses of the Catholic Church in practice, and not at Catholic doctrine. The Homilies regard the first seven hundred years of the Catholic Church as quite pure, recognise six councils as received by all Christians, and speak of many of the Fathers as inspired by the Holy Ghost. Clearly therefore, in Newman's opinion, they were meant to gain over the moderate Romanists; and clearly they were not directed against the Council of Trent, for when the Articles were promulgated the council was not over. But in spite of this really substantial defence for the Anglican view of the Articles, Tract 90 provoked an explosion which was the end of the Tractarian movement, and brought on the conversion to Rome of those of the Tractarians who were most logical as well as most in earnest. The tract was repudiated by those in authority; the bishops almost all declared against the movement; Newman struggled for two years longer to think his position tenable, but in 1843 resigned the vicarage of St Mary's, which he had held since 1828, and retired to Littlemore (q.v.). The magnificent university sermon on 'Development in Christian Doctrine,' which was the preliminary stage of his *Essay on Development*, was

the last which he preached in the university pulpit—viz. on the 2d February 1843. During his life at Littlemore he was a man suspected of all sorts of disloyalty to his church—for example, of being a Roman Catholic already, who only concealed his change of faith in order to exert more influence over other Anglicans—a course of which he was quite incapable. On the 8th October 1845 he invited the Passionist Father Dominic to his house at Littlemore in order that he might be received into the Roman Catholic Church, and on the following day he was received; and within a few months he had left Oxford, which he never saw again for thirty years.

Of Newman's life as a Roman Catholic it is necessary to speak only briefly. It was, however, in a literary point of view much more free and natural than his somewhat repressed and severely reined-in life as an Anglican. He first went to Oscott to be confirmed; then he went to Rome for a year and a half; and on his return in 1848 he published *Loss and Gain*, the story of an Oxford conversion very different from his own, but full of happy and delicate sketches of Oxford life and manners. Shortly afterwards he began, but did not at that time conclude, *Callista*, the story of a martyr in Africa of the 3d century. The little book is full of literary genius as well as of religious devotion, and it contains a most vivid picture of the devastation worked by the locusts in that country, as well as a still more impressive picture of Newman's conception of the phenomenon of demoniacal possession. In 1849 Newman established a branch of the brotherhood of St Philip Neri (q.v.) in England (see ORATORY). Newman established himself at Edghaston, a suburb of Birmingham; and here he did a great deal of hard work, devoting himself to the sufferers from cholera in 1849 with the utmost zeal. The lectures on *Anglican Difficulties*, intended to show that Tractarian principles could only issue in submission to Rome on the part of any Tractarian who had a logical perception of what the movement meant, was the first book which drew public attention to Newman's great power of irony and the singular delicacy of his literary style. These lectures were delivered and published in 1850, and were followed in 1851 by the Lectures on 'Catholicism in England,' in which the Protestant prejudices and prepossessions about Roman Catholics were painted with a great power of ridicule and even caricature. This was the book which gave occasion to Dr Achilli's action for libel against Newman, tried by Lord Campbell, in which the verdict went against Dr Newman so far as this, that the jury thought that he had not succeeded in justifying the libel, and awarded damages of £100 against him, while the costs of the case are said to have amounted to £10,000. Lord Campbell's charge was deemed very one-sided even by Protestants.

Newman will probably be longer remembered as a great preacher than in any other capacity. His long series of Oxford sermons contain some of the finest ever preached from an Anglican pulpit, and his Roman Catholic volumes—*Sermons addressed to Mixed Congregations* (1849) and *Sermons on Various Occasions* (1857)—though less remarkable for their pathos, are even fuller of fine rhetoric, and show the rarest finish. In 1864 a casual remark by Canon Kingsley in *Macmillan's Magazine* on the indifference of the Roman Church to the virtue of truthfulness, an indifference which he asserted that Dr Newman approved, led to a correspondence which resulted in the publication of the remarkable *Apologetica pro Vita Sua*, afterwards slightly recast as *A History of My Religious Opinions*. In this book Dr Newman gave us much the most fresh and effective religious autobiography of the 19th century,

and completely vindicated the simplicity and candour of his own theological career. It is perhaps the most fascinating of his many works, as it is of course the most personal. In 1865 Newman wrote a poem of singular beauty, giving his view of a good Roman Catholic's experience in death, called *The Dream of Gerontius*. It is a poem of marvellous subtlety and pathos, as unique in treatment as it is in subject, and is now republished in the volume of *Verses on Various Occasions* (1874), which contains also all the pieces originally published in the *Lyra Apostolica*. In 1870 he published his *Grammar of Assent*, a book on the philosophy of faith, based on the view that a believing and even credulous attitude of mind clears itself much more easily of false beliefs than a sceptical attitude of mind clears itself of false denials. In the controversies which led to the Vatican Council Newman sided with the Inopportunist. He believed that the decree of the pope's personal infallibility in putting forth *ex cathedra* definitions on theology or morals intended to teach the church would alienate many Anglicans from the Roman Church, and he thought the doctrine, though true, not ripe for definition, nor pressed upon the attention of the church by any heresy. He was at this time in vehement opposition to the Ultramontanes under Archbishop Manning and William George Ward, and the bitterness between the two parties ran very high. Nothing seemed less likely at that time than that Newman should ever become a Cardinal; but after the death of Pío Nono and the election of Leo XIII. the policy of the church altered, and the new pope was very anxious to show his sympathy with the moderates in various countries, and especially with the English Catholic moderates, of whom Dr Newman was much the most distinguished. Accordingly in 1879 Newman was summoned to Rome to receive the Cardinal's hat, which was conferred on him in a secret consistory on the 12th May in that year. In acknowledging the congratulations which flowed in upon him on that event he renewed his protest against liberalism in religion, by which he meant the depreciation of revealed dogma, and the popular view that one creed, honestly held and practised, is as good as another. For the last eleven years of his life Cardinal Newman seldom broke silence, and his chief contribution to the religious controversy of the day was an essay in attenuation of the difficulty of treating Scripture as plenary inspired, its tendency being to suggest that inspiration does not necessarily include mere matters of detail in history, unless these are of the nature of what are called 'dogmatic facts'—i.e. facts which lie at the basis of revealed truths, such as the supernatural birth of Christ. Cardinal Newman died on the 11th August 1890, after a very short illness, of pneumonia.

See a work on Newman by the author of this article (1890); and Cardinal Newman's *Letters and Correspondence*, edited by Miss Mozley (1891).

Newman, FRANCIS WILLIAM, brother of the preceding, was born in London in 1805, and educated at a private school at Ealing. Thence he passed to Worcester College, Oxford, where he obtained first-class honours in classics and mathematics in 1826, and, in the same year, a fellowship in Balliol College. This fellowship, however, he resigned; and he withdrew from the university in 1830, at the approach of the time for taking the degree of M.A., declining the subscription to the Thirty-nine Articles, which was required from candidates for the degree. After a three years' stay in the East, he was appointed classical tutor in Bristol College, 1834. In 1840 he accepted a similar professorship in Manchester New College, and in 1846 his reputation led to his being appointed to the

chair of Latin in University College, London, which he held till 1863; meanwhile he was an active contributor to numerous literary and scientific periodicals, and to various branches of ancient and modern literature. In controversies on religion he took a part directly opposite to that chosen by his elder brother, being no less eager for a religion in his view more world-wide, and including whatever is best in the historical religions. *Phases of Faith* is by far the most widely diffused of his works, simply because it was mainly negative; but it was preceded by a book called *The Soul* (1849), which aimed to show a solid ground for divine aspirations in the human heart. His smaller moral and religious essays are now collected in a single volume (ii.) of *Miscellanies*. Vol. I. of *Miscellanies* (1869) was followed by the above vol. ii. (1887), vol. iii., *Politica* (1889), and vol. iv., *Economica* (1890). Other works were a *History of the Hebrew Monarchy* (1847); a *Dictionary of Modern Arabic*, in Romanised type (2 vols. 1871); a *Handbook of Modern Arabic* (1866), giving the dialect now used by literary men in all Arab-speaking regions; and a *Libyan Vocabulary* (1882), in which, cutting out the Arabic, he tried to reproduce the old Numidian, Mauretanian, and Gætulan. He also published two mathematical volumes, one on Elliptic Integrals (1888-89); and a small book on the earlier life of his brother, Cardinal Newman (1891).

Newmarket, the 'racing capital of England,' lies on the border of Suffolk and Cambridgeshire, 14 miles ENE. of Cambridge and 69 NNE. of London. Twice almost destroyed by fire, in 1683 and 1700, it chiefly consists of one long street, and contains an unusual number of hotels and fine private houses, belonging to the great patrons of the turf. Principal edifices are the Jockey Club (1773); the adjoining Subscription Rooms (1844); the Proprietary Club (1882); the Rous Memorial Hospital (1883), with almshouses for eight jockeys and trainers or their widows; St Mary's Church, Perpendicular in style; and All Saints (1877). The town owes its prosperity to its horse-races, as old at least as 1605; and nearly half the male population are jockeys, trainers, or stablemen (Holcroft the dramatist was once one of their number). The race-ground, on Newmarket Heath, to the west, which is traversed by the Devil's Dyke (see CAMBRIDGESHIRE), is owned partly by the Jockey Club, partly by the Duke of Rutland, and, with its soft elastic turf, is one of the very finest in the world. Of its ten courses, the longest is $4\frac{1}{2}$ miles in circuit. The training-ground bears a like character for excellence; and 400 horses are constantly in training. There are seven annual meetings, the principal events being the Two Thousand at Easter and the Cesarewitch in October. Pop. (1851) 3356; (1881) 5093; (1891) 6213. See HORSE-RACING; and J. P. Hore's *History of Newmarket and Annals of the Turf* (3 vols. 1886).

New Mexico, a territory in the south-western part of the United States, is bounded N. by Colorado, E. by Oklahoma and Copyright 1901 in U.S. Texas, S. by Texas and Mexico, by J. B. Lippincott and W. by Arizona. The area is Company.
122,580 sq. m.—larger than that of Great Britain and Ireland—and the pop. (1880) 119,565; (1890) 153,593. New Mexico is thus the fourth in area and the forty-third in population of the states and territories of the Union.

The surface of New Mexico belongs to the great plateau upon which rests the Rocky Mountain system. From an altitude of 6000 to 6500 feet in the north it descends gradually to about 4000 feet along the Mexican border, and sinks to 3000 or 3500 in the Llano Estacado of the south-east. Except in the east the whole region is traversed

by broken ranges of mountains having in general a north and south trend. In the northern central part the Santa Fé, Las Vegas, and Taos ranges form part of the main axis of the Rocky Mountains, with a number of peaks over 12,000 feet high. Farther south, and east of the Rio Grande, are numerous broken ranges; and west of the Rio Grande the Sierra Madre rise above the level of the *mesa* (plateau) in various ranges. These mountains and the intervening *mesas* are cut by deep cañons. In the north-west a number of chains cross the Arizona boundary, and the San Juan Mountains enter the territory from Colorado. Among the mountains, especially in the north-east, are many 'parks' noted for their beauty and fertile soils. The surface rocks belong mainly to the Cretaceous period, with belts of Triassic formation. The mountain-chains and great part of the Sierra Madre plateau are much older. There are many tracts of metamorphic rock and lava overflows, some of which appear to be of comparatively recent date.

The precious metals are found in almost all parts of the territory. Some of the most important mines are in the south-west near Silver City, Deming, and Lordsburg, others in the central region in the vicinity of Socorro, and farther north near Santa Fé. There are also valuable mines in the San Juan country. Some of these mines were rudely worked by the early Spaniards, who compelled the Pueblos to labour like slaves. In several places old shafts have been discovered which were filled by the Indians when they successfully revolted from this tyranny. Copper and iron occur in valuable deposits, and near Santa Fé are the famous turquoise mines. There are also fields of both bituminous and anthracite coal. Mineral and hot springs are numerous.

The great mountain-divide causes the drainage of New Mexico to flow south to the Gulf of Mexico, and west to the Pacific Ocean. The Rio Grande traverses the central part of the territory and receives many tributaries. The Rio Pecos which joins it in Texas drains the south-eastern part. In the north-east are streams which unite to form the Canadian River, and in the west are the head-waters of the San Juan, Little Colorado, and Gila, all affluents of the Colorado. In the river-valleys the soil is fertile and produces excellent crops; and many acres in other sections may be successfully cultivated by irrigation. The climate is healthful, and on the whole remarkably uniform, and the atmosphere is very pure and dry. The death-rate from pulmonary diseases is the lowest in the country. The rainy season occurs between the middle of July and the middle of September, lasting about a month. There are extensive forests on the mountains, and in the hilly regions of the western part of the territory, and on the pastoral plains nutritious grasses which support great numbers of cattle and sheep. The yucca and cactus are characteristic forms of vegetation, especially in the Llano Estacado. Stock-raising is one of the leading industries. The flocks and herds need no housing in the winter, but of late years more attention has been given to improvement of the breeds, and the stock, instead of roaming at will, is often confined within enclosed ranges.

Though one of the most recently settled portions of the Union, New Mexico was among the earliest regions occupied by the white man, and Santa Fé, originally an Indian pueblo, claims the title of the oldest town in the country. When the Spaniards first visited this region they found a people living in communities with substantial dwellings, and marking the decay of a civilisation which had flourished in previous centuries. In 1822 the people of New Mexico, in common with the other inhabitants of Mexico, of which it then formed a part, threw off

the Spanish yoke. By the treaty of Guadalupe Hidalgo in 1848, after the war between Mexico and the United States, part of the territory was acquired by the latter nation. Additions were made by a later purchase from Mexico and by a cession from Texas. The population still includes about 100,000 Mexicans, as well as nearly 40,000 Indians. The territory when originally organised in 1850 included Arizona and parts of Colorado and California. The construction of railroads, begun in 1878, had a marked influence in its development. There are now about 1400 miles of railroad, connecting with either ocean and with all parts of the Union.

There are fourteen counties in New Mexico, and the principal cities and towns are Santa Fé (the capital), Albuquerque, Las Vegas, Fernandez de Taos, and Socorro. The educational system is not developed, though public schools have been established wherever it has been expedient, and there are a number of private and denominational institutions. An act was passed in 1889 authorising a state university at Albuquerque, an agricultural college at Las Vegas, and a school of mines at Socorro.

Newnham College, just outside Cambridge, but within ten minutes' walk of the centre of the town, may be said to have commenced in 1871, when the Newnham Hall Company opened a house for five resident women students. The numbers steadily increased, and in 1875 Newnham Hall was built, providing rooms for the principal, a lecturer, and twenty-six students. Scholarships were given by the London Companies and private friends, the library grew, a chemical laboratory and gymnasium were added, and the whole machinery of the college became more and more complete till, in 1879, the Newnham Hall Company was amalgamated with the Association for the Promotion of the Higher Education of Women. Additional land was acquired, and a second, and finally a third hall was added. These three halls, Old Hall, Sidgwick Hall, and Clough Hall, now form Newnham College, where at the present time 147 students, under the charge of a principal, two vice-principals, and five lecturers, receive instruction, partly by lectures delivered at Newnham, partly by such lectures of the university and colleges of the university as are open to them. In the year 1881 the university of Cambridge opened to students of Newnham and Girton its tripos and previous exams, and in 1889, out of thirty-five students of Newnham who entered for the tripos exam., six took a first-class, sixteen a second-class, and nine a third-class; while in 1890 Miss Fawcett was placed above the senior wrangler. Careful superintendence is here combined with a large amount of liberty and responsibility. The greater number of students work for tripos and stay for three or four years, but special courses of work can be taken without examination. The fees are 75 guineas a year.

New Orleans, the chief city of Louisiana, and one of the most important commercial cities in the United States, is situated on both sides of the Mississippi River—the greater portion on the east bank—107 miles from its mouth. Its corporate area is 187 sq. m., but a large portion of this is market-gardens, forest, and swamp, and only 48 sq. m. are built over, fronting on the Mississippi, and running back from half a mile to 13 miles. The city proper has a river frontage of 13 miles, and its western district, 'Algiers,' of 3 miles. The Mississippi makes two bends here, giving the old city a crescent-shaped front, whence its former title, 'The Crescent City,' but it is

now the shape of the letter S. The river is from 600 to 1000 yards wide, and 60 to 240 feet deep. The bar at its mouth was removed in 1874-79 by the Eads jetties in South Pass, and vessels of 30 feet now easily reach New Orleans. The commerce of the city is large (\$550,493,315 in 1890), and it is second in the United States in exports. New Orleans is the terminus of three canals, and of six large railroads (total mileage, 17,842) and three local lines, while twenty lines of steamships connect it with other American and foreign ports. Since 1875 it has made great progress in manufactures, particularly in cotton goods, cotton-seed oil, machinery, lumber, furniture, fertilisers, sugar-refining, rice-milling, beer, cigars, &c. Its factories increased from 554 in 1870 to 898 in 1880, and 2100 in 1890; and their product from \$8,450,439 to \$44,500,000.

The land upon which New Orleans is built is perfectly flat, and lies from 3 to 6 feet below the level of the Mississippi at high-water, and is protected from overflow by levees or dykes of earth. Similar levees in the rear keep out the waters of Lake Pontchartrain. The soil is saturated with water, and cellars are impossible. The climate is warm and damp, the mean temperature for the year being 69° F. The summer is tempered by winds from the Gulf, and is not oppressively warm. On account of its situation, the city is badly drained. It is without sewers; open gutters carry the rain-water into canals, and thence into Lake Pontchartrain, but they are insufficient, and the streets are frequently flooded after a heavy rainfall. The health of the city, however, has greatly improved within recent years; the death-rate has been reduced from 59 per 1000 in 1860 to 24.80 in 1890.

While it possesses few imposing buildings, New Orleans is a picturesque city. There are several parks little improved, but with handsome monuments or statues of Jackson, Lee, Franklin, and others. The custom-house of granite cost \$4,500,000, and is the largest and most imposing building in the city. The cathedral of St Louis, a Gothic church erected in 1794, is a good sample of the Creole-Spanish architecture. The archiepiscopal palace (1737) is the oldest building in the city. Other noteworthy structures are the cotton exchange, United States mint, St Charles Hotel, and Christ and St Patrick's churches. There are 188 churches, and 78 public schools, with 430 teachers and 21,136 pupils enrolled. Tulane University (known as the University of Louisiana from 1834 to 1883) has 59 professors and 683 students. Under its control is the Sophie Newcomb Memorial College (1887), for the higher education of girls. The College of the Immaculate Conception (under the Jesuits) has 228 students. There are 4 colleges for negroes, males and females, with 1860 students. The Howard Memorial (1888), Tulane, and Louisiana state libraries, all free, contain together 120,000 volumes. The Charity Hospital (1784) is the largest institution of its kind in the United States, with accommodation for 800 to 1000 persons; and there are 54 other hospitals, asylums, &c.

The site of New Orleans was first visited in 1699 by Bienville, who in 1718 laid the foundations of the city, and in 1726 made it the capital. In 1763 it was ceded to Spain by France, with the rest of Louisiana; but when in 1765 the Spanish governor, Ulloa, attempted to take possession, he was driven out, and the people established a government of their own. In 1769 New Orleans was occupied by the Spanish, and the leaders in the late movement were shot. It was ceded to France in 1802, and transferred to the United States a few days later. Incorporated as a city in 1804, it was divided in 1836 into three separate municipalities,

in consequence of the jealousies between the Creoles and the Americans; but the three were again consolidated into one in 1852. Since then New Orleans has annexed the neighbouring towns of Lafayette, Jefferson, Carrollton, and Algiers. Other outstanding events in the history of the city have been the battle of New Orleans (see JACKSON) in 1815; its capture in 1862 by the Federal fleet under Admiral Farragut (q.v.); serious political troubles in 1874 and 1877, resulting in 1874 in a battle on the levee between the citizens and the police and militia, in which 46 persons were killed and 216 wounded; and the lynching in 1891 of 11 Italian *mafiosi*. In 1880 the capital of Louisiana was removed from New Orleans to Baton Rouge.

Pop. (1769, when it was transferred to Spain) 3190; (1802, when it became American) 10,508; (1840) 102,193; (1880) 216,190; (1890) 242,039. The city is very cosmopolitan in race and language. Only 19 per cent. of the population is of American or English descent, 17 of Creole or French descent, 14 German, 12 Irish, 8 Italian, 5 Spanish, Scandinavian, Jewish, &c., 16 negroes, and 9 of mixed races, Indians, Chinese, and Malays.

New Plymouth, the chief town of the provincial district of Taranaki, New Zealand, 220 miles NW. of Wellington by rail. Two miles from the town extensive harbour-works are in progress. Pop. (1886) 3093.

Newport, a thriving town of Monmouthshire, and a parliamentary and municipal borough (the former conjointly with Monmouth and Usk), is seated on the river Usk, about 4 miles from its mouth, 24 miles SSW. of Monmouth and 145 W. of London. Being one of the principal outlets for the produce of the extensive collieries and iron and steel works in the vicinity (in 1889 upwards of 3,000,000 tons of coal were exported, and 28,900 tons of iron pyrites and manganese ore imported), its shipping trade has of late years greatly increased (1889: imports £873,156, exports £2,072,155), and with it, as a result, its dock accommodation, which now covers more than 80 acres. It has, too, many fine public buildings, prominent amongst them being the town-hall (1885), erected at a cost of £30,000, and St Woollos' Church, occupying an elevated site, and in style partly Norman and partly Perpendicular. Besides its shipping trade, Newport has manufactures of india-rubber, gutta-percha, and railway and telegraph plant and wagons, whilst several important brass and iron foundries are in operation, as well as breweries and pottery-works. On 4th November 1839 the town was the centre of a Chartist outbreak, which resulted in the death of ten persons, and the wounding of many more. Pop. (1801) 1087; (1881) 38,427 (of whom 35,313 were within the municipal limits); (1891) 54,695.

Newport, a market-town of Shropshire, on the Shrewsbury Canal, 11 miles WSW. of Stafford. Chartered by Henry I., and burned in 1665, it has a 15th-century church, a grammar-school (1656), and manufactures of machinery and agricultural implements. Pop. of parish (1881) 3044; (1891) 2675.

Newport, the capital of the Isle of Wight, on the navigable Medina, near the centre of the island, 4½ miles S. of Cowes and 10 SW. of Ryde. The church, rebuilt in 1854-56 on the site of one nearly 700 years old, is a fine Decorated edifice, and contains Marochetti's beautiful monument, erected by Queen Victoria in memory of the Princess Elizabeth, who died at Carisbrooke Castle (q.v.) on 8th September 1650. Newport besides has a town-hall (1810); a free grammar-school (1612), the scene in 1648 of the protracted but fruitless negotiations between the parliamentary commissioners and Charles I., to whose secret 'engagement' a

year before with the Presbyterian Scots the town also gave name; a girls' endowed school (1761); a diocesan school (1860); and a literary institute and museum. To the north-west are a reformatory (1838) and barracks (1798). A municipal borough, Newport returned two members till 1867, and then one till 1885. Pop. (1881) 9357; (1891) 10,216.

Newport, a town of Fife, on the Firth of Tay, $1\frac{1}{2}$ mile by water SSE. of Dundee. It has a small harbour designed by Telford (1822), and municipal buildings (1890). Pop. (1881) 2311; (1891) 2545.

Newport, (1) capital of Campbell county, Kentucky, is on the Ohio, opposite Cincinnati, and at the mouth of the Licking River, which separates it from Covington; both rivers are crossed by bridges, and there is also a steam-ferry to Cincinnati. The city contains large rolling-mills, a foundry, bolt-works, tile-works, and several steam-mills. Pop. (1880) 15,693; (1890) 24,918.—(2) A port of entry and one of the capitals of Rhode Island, on the west shore of the island of Rhode Island, in Narragansett Bay, 5 miles from the ocean, and 69 miles by rail S. by W. of Boston. It has a deep, excellent harbour, defended by Fort Adams; and there is a United States torpedo station on an island in the harbour. It contains a brick state-house, a custom-house, a city hall, the Redwood Library, many palatial villas, and large hotels; it is noted for fine scenery and sea-bathing, and is one of the most fashionable watering-places in America. In Touro Park stands the 'Round Tower,' or 'Old Stone Mill,' which suggested Longfellow's poem, 'The Skeleton in Armour.' The city also contains cotton-mills, a brass-foundry, lead and fish-oil works, &c. It was settled in 1638 by eighteen adherents of Roger Williams, and was an important commercial town prior to the Revolution, which effected its ruin and transferred its trade to New York. Newport was for a time the residence of Bishop Berkeley. Pop. (1880) 15,693; (1890) 19,457.

Newport-Pagnell, a market-town of Buckinghamshire, at the influx of the Ouse to the Ouse, 56 miles by rail NNW. of London. Named from the Paganaels, who owned the manor in the days of Rufus, it was taken by Essex in 1643, and held two years later by Sir Samuel Luke, the prototype of Butler's 'Hudibras.' The fine parish church, restored by Street in 1858, is the principal edifice; lace-making has declined. Pop. of parish, 3686. See its *History* by Staines (1842).

New Red Sandstone, the name formerly given to the great series of red sandstones which occur between the Carboniferous and Jurassic Systems. The sandstones are now divided into two groups, the lower of which is assigned to the Palæozoic (see PERMIAN SYSTEM) and the upper to the Mesozoic System (see TRIASSIC SYSTEM). The term New Red Sandstone is used as synonymous in England with the Trias.

New River, an artificial cut, running 38 miles southward from Chadswell Springs in Hertfordshire into reservoirs at Hornsey and Stoke Newington. It was designed for the water-supply of London, and completed (1609-20) at a cost of £500,000 by Sir Hugh Myddelton, goldsmith, who died poor on 10th December 1631. The seventy-five original shares, sold for £100 apiece, sell now at the rate of from £85,200 to £94,500.

New Ross, a market-town and river-port of Leinster, Ireland, situated on the Barrow, partly in the county of Kilkenny, but chiefly in that of Wexford, 92 miles S. by W. of Dublin and 15 NE. of Waterford. The two portions of the town are connected by an iron swing-bridge (1869). Before the union New Ross—Old Ross lies 5 miles to the east—returned two members to parliament,

and down to 1885 one. It was founded by the daughter of Strongbow, and was formerly fortified. The port can be entered at spring-tides by ships of 800 tons, and at all times by vessels of 200 tons; and there is communication by river and canal with Dublin and with Limerick. Pop. (1851) 7941; (1881) 6670.

Newry, a seaport and parliamentary borough, mainly in County Down, but partly in Armagh, on the Newry River, 38 miles SSW. of Belfast by rail. A canal connects it with Carlingford Lough and with Lough Neagh. The town is handsomely and compactly built, and the port does a large trade with Glasgow and Liverpool in cattle and other agricultural produce. Flax spinning and weaving, with rope and sail making, tanning, and granite-polishing, are the industries. The place dates from 1131; its castle was taken by Edward Bruce in 1318. Newry returns one member to parliament. Pop. (1851) 13,191; (1881) 15,590; (1891) 13,605.

New Shoreham. See SHOREHAM.

New Siberia, a group of uninhabited islands in the Arctic Ocean, lying off the coast of Siberia between the mouth of the Lena and the mouth of the Indigirka. The principal are Kotelnoi (the largest), Liakhov, Fadéyeff, and New Siberia. The coasts are rocky, and ice-bound all the year round. The soil contains immense quantities of fossil ivory, of the mammoth, &c. See Petermann's *Mitteilungen* (1888).

New South Wales is the oldest colony of Australasia. It formerly included what is now known as Queensland, New South Wales, Victoria, South Australia, Tasmania, and New Zealand, all under the governor at Sydney. The area is now diminished to 310,700 sq. m. or 198,848,000 acres, being five times that of England. It has the Pacific to the east, from Point Danger, $28\frac{1}{2}^{\circ}$ S. lat., to Cape Howe, $37\frac{1}{2}^{\circ}$; South Australia to the west, along the meridian 141° E.; Victoria to the south, by the Murray River; and Queensland to the north, from 29° S. lat. A series of mountain-chains, from 20 to 100 miles distance to the sea, extend from near Cape York to the Australian south-east corner. The southernmost are the Australian Alps, running over into Victoria, culminating in Mount Kosciusko, 7308 feet high. Northward are the Blue Mountains, west of Sydney, with peaks 4000 feet, and containing the Jenolan Caves (q.v.). Liverpool Range is more northerly; and the New England hills, north-east, rise 5000 feet. With the exception of some isolated mountains, the region to the west consists of vast plains, up to the Barrier Ranges near South Australia. The mountains give birth to short and rapid streams toward the sea, but long and sluggish ones westward. The Hawkesbury or Nepean, Hunter, Clarence, Shoalhaven, and Macleay are eastern. The Lachlan, 700 miles long, runs into the Murrumbidgee, which flows 1350 miles before falling into the Murray. The Murray, after 1100 miles on the New South Wales border, passes into South Australia. The Darling, rising in Queensland, has more than 1000 miles through the colony before reaching the Murray, the main receptacle of the country's waters. The Macquarie and Namoi go northward to the Darling. The dry interior has few streams. Among the few lakes are George, Bathurst, Illawarra, Macquarie, and Brisbane Waters—the last three sea-lakes. Two-fold Bay is not far from Cape Howe. North of it are Jervis Bay, Botany Bay, Port Jackson, Broken Bay, Port Hunter, Port Stephen, Port Macquarie. The capital, Sydney (q.v.), is on Port Jackson, and is the headquarters of the Australian naval squadron. Near it are Windsor and Parramatta. Newcastle and Maitland are by the Hunter River. Goulburn

and Bathurst are westward, Albany and Wentworth on the Murray, Bourke and Wilcannia on the Darling; Wellington is on the Macquarie, Wollongong by Illawarra, Deniliquin in Riverina, Silverton in the Barrier Ranges.

The colony was established in January 1788, under Governor Phillip, with a party of transported prisoners from England, as the former place of exile, America, was closed by the independence of that country. For years the settlement suffered much from want of food. The introduction of free colonists, to whom grants of land were given, promoted pastoral and agricultural pursuits; and the change from despotism to responsible government was gradually made. The cessation of transportation in 1840 was followed by social and political advance; and the gold discovery in 1851 gave a great impetus to the search for minerals. Town industries were developed; and commerce was aided by a fine harbour, an excellent mercantile marine, and the extension of railways.

As regards *flora*, the eucalyptus-tree prevails in the colony, but acacias also are common, and pines and cedars, as well as palms in the north-east. Forest preservation is now receiving official attention. In addition to products of native vegetation, plants of commercial value are being introduced, adapted to the warmer, colder, moister, or drier localities. Of 1600 economic plants in the colony, 210 are useful for food, 158 forage, 123 drugs, 57 oils, 87 tans, 60 gum-resins, 39 kinos, 14 perfumes, 35 dyes, 67 fibres, 630 timber. Some of these are available for export. There are more flowering plants than in all Europe.

The *fauna*, as in the rest of Australia, consists mainly of marsupial animals. In a single year there have been killed, as nuisances, 1,310,900 marsupials. Birds are of great variety, many of very beautiful plumage, and some of pleasant notes. Insects are pretty numerous, and not always welcome. Lizards and snakes may run to a good size, but there are no alligators. Fish, especially in the bays, are plentiful.

Geology.—Silurian and Devonian formations, with granitic, igneous, and metamorphic rocks, are rich in gold, silver, lead, copper, tin, and other metals. The hilly country forms the centre of mining industry, but the older rocks underlie the Tertiary and Post-Tertiary beds of the vast plains to the westward. Coal is seen in both Palaeozoic and Mesozoic strata. The Cretaceous beds are confined to the north-west corner. Trappean irruptions are of various geological epochs; yet the colony has fewer recent volcanic, though extinct, craters than its Victorian neighbour. Marsupial remains of huge dimensions are observed in the Pleistocene formations. Besides the monsters *Diprotodon* and *Nototherium*, there are the marsupial lion *Thylacoleo*, and the *Thylacinus*. In the Pliocene and Pleistocene are the alluvial gold workings and the diamond and tin washings. While the more ancient rocks prevail in the ranges, Mesozoic ones are nearly confined to the eastern side, north and south of Sydney, as the Sydney sandstone, and in the Clarence basin.

Gold, known in 1823, was first worked in 1851, near Bathurst. It is found over an area of 70,000 sq. m., in granite, porphyry, diorite, quartz, breccias, and alluvial deposits. Dry blowing is employed by miners where water is scarce. Gold is often mixed with silver, copper, or tin; and the ore is worth, according to purity, from 70 to 82 shillings an ounce. The output to the beginning of 1890 was nearly £38,000,000, though only £434,070 in 1889. Silver, found at Boorook, Sunny Corner, &c., abounds in the Barrier Ranges near South Australia, at Silverton, Thackaringa, &c.,

where there are over 4000 miners. Discovered in 1883, in an almost rainless region, the silver area is 100 miles by 12. One company paid in dividends £1,676,000 up to 1890, having raised 161,500 tons of ore, yielding 6,236,000 ounces of silver and 25,170 tons of lead. The district up to 1890 produced £4,168,397; the Broken Hill Company has raised 20,000,000 ounces; and in 1889 the product of silver for the colony was £1,971,198. Copper, first wrought in 1858, yielded £122,444 in 1889; its ore being known to extend over 8000 sq. m. Tin, worked since 1872, from streams and lodes in granite, has fields of equal area, with a yield for 1889 of £207,670. Lead is chiefly got from silver-mines. Antimony, manganese, bismuth, &c. are mined. Iron is abundant, but not profitable to work owing to the cost of labour. Precious stones, as the diamond, emerald, zircon, sapphire, topaz, &c., occur in granite localities. Asbestos, zinc, mercury, cobalt, and alum are exported. Graphite, kaolin, and building-stone enrich the colonists. Coal is the most valuable mineral of New South Wales. It extends over 24,000 sq. m.; £22,000,000 worth was raised during 1880-89; and the export of 28 million tons brought in £16,000,000. The yield for 1889 was £1,632,849, by 3,655,632 tons. Kerosene shale, rich in the Blue Mountains, yields 150 gallons crude oil per ton. Its product for 1889 was £77,667.

The *pastoral* resources are exhibited in the returns for 1889 of 50,106,768 sheep, in spite of a loss of 8,000,000 from drought in one year; cattle, 1,741,592; dairy cows, 248,894; horses, 430,777; swine, 238,585. Most of these animals are upon stations or runs, on land leased from government, sometimes at less than a penny an acre rental in the dry west. The leases are for twenty-one years in western divisions, ten in central, and five only in eastern, at a higher rent. The lessees are the squatters. In the early years of the colony only salt meat from England was in use, as there were no native sheep, cattle, or horses. The sheep imported from Bengal and the Cape were hairy, but the wool was improved by the introduction of Spanish merinoes; the cattle also were improved by good English stock. Pigs, goats, and poultry have been introduced. Wool exported in the year exceeds two hundred million pounds' weight.

Agriculture occupies far less land than pasturage. While 140,000,000 acres produce a rental of £917,190, being devoted to flocks and herds, there are but a million acres, or one acre to one inhabitant, devoted to culture, and nearly one-fourth of that is laid down in artificial grasses. But farming ground, especially near towns, is very valuable. Some of this is freehold, bought at government auction sales, though formerly bestowed in grants at a nominal quit rent. Much is leasehold, held at various rentals on terms of years from the state, till the full purchase is thereby effected. Of 46,197 holdings, 580 were over 10,000 acres each, and 6889 were under 15 acres. The land laws of New South Wales are liberal and easy to settlers. The country, however, is more pastoral than agricultural, growing less produce proportionately to its size than Victoria and South Australia. In March 1890 the area under crop was 947,072 acres, but 47,620 holdings contained 41,042,629 acres. In 1890 there were 419,758 acres in wheat, averaging 15 bushels to the acre; 173,836 in maize, averaging 30½; 5440 in barley; and 7867 in vines; hay, of various kinds, 222,262; sugarcane, 18,730; oranges, 9804; tobacco, 3239; orchards, 16,867; market-gardens, 5409; potatoes, 17,551. Yet, while the colony exported £1,076,350 of agricultural produce in 1889, it imported £5,548,915. The sugar-plantations in the north-east are not so productive as in Queensland; nor are the apple-orchards and potato-furrows equal to those of

Tasmania. But all the fruits that thrive in England and Italy grow here.

Climate influences vegetation in the colony. Farming facilities exist in the Dividing Range, the highlands of New England in the north-east, and the alpine slopes to the south, because of fair moisture. The seacoast, with from 40 to 70 inches of rain a year, differs much from the western interior, where in some years as little as 5 inches may fall. But the climate is so uncertain that a region may suffer from fearful drought in one season and floods in another. Cold and ice with heavy snows may be experienced on the lofty plains; but Sydney, 33° 50' lat., had no snow in thirty years. Though in summer the thermometer might rise to 100° and beyond it during the day, the nights are generally cool and recuperative after the heat.

The *trade* exceeds that of any of the neighbouring colonies. It was worth £46,157,991 in 1889—£22,863,057 in imports, £23,294,934 exports. Each averaged over £20 a head, or about £16 in produce of the colony. The re-exports amounted to £5,871,623. While the United Kingdom sent £8,736,478 of goods, receiving from the colony £8,964,625, the Queensland trade was £6,415,553; the Victorian, £7,804,338; the American, £2,225,286; the German, £1,052,517; the French, £284,004; the Indian, £202,359. The colonial overland trade was £10,070,189. New South Wales imported £2,164,206 of drapery; £1,046,146, apparel; £852,304, iron and machinery; £741,189, flour; £466,390, spirits; £385,363, teas; £438,094, beer; £220,793, tobacco. Of exports, the home produce was £17,423,311; the foreign, £5,871,623. The animal and vegetable products realised £7,300,526; minerals and metals, £1,655,776; live-stock, £1,175,979; and coal, £1,319,271. The colony's wool of 1889 brought £10,620,636. Duties are only levied on forty-seven articles; there are none *ad valorem*, what is practically free trade having been established in 1872-79. The customs realised £1,905,883 and excise £261,371. There entered, in 1889, 3254 ships of 2,632,081 tons; departed, 3229 of 2,689,098. Of the tonnage, 4,659,798 were British; 661,381, foreign. Of the former, 2,817,071 were colonial; of the latter, 210,164 were American. While London cleared 5,284,149 tons, and Liverpool 4,758,525, Sydney cleared 1,432,340, and the Newcastle coal-port of the colony, 1,126,892. The *railways* connect New South Wales with South Australia, Victoria, and Queensland. Of 2263 miles, 2183 belonged to government, costing £32,000,000, and already paying 3½ per cent. on capital, the net earnings being 37 per cent.

Government.—The governor is appointed by the Queen. The executive is of 10 ministers; the Upper House or Legislative Council has 21 life-members; the Lower, or Legislative Assembly, 137 members, in 74 electorates, receiving £300 a year. The parliament is triennial. The revenue in 1825 was £71,682; in 1890, £9,517,121. From taxation was raised £2,758,750; from land, £2,208,039; from postal, railway, and other services, £4,253,830. The public debt, contracted for useful works, was £48,578,837 in October 1890. An excellent volunteer force comprises some 3500 men. In 1885 a New South Wales contingent was sent to strengthen the British forces in the Soudanese war. There is also a naval brigade. The wealth of the colony is stated at £314 per head, that of the United Kingdom being £270.

The *population*, 1,200,000, of whom four-ninths are female, includes 10,000 Chinese and 1500 aborigines. The ports, farming localities, and mines return seven-eighths of the people. About 3000 manufactories employ 49,238, wages, for eight hours a day, being from 8s. to 12s. The birth-

rate is 33½ per thousand; marriage-rate, 6½; death-rate, only 13½. In religion, the Church of England claims one-half the population, the Roman Catholic nearly one-third; but returns for 1889 gave Sunday attendance at worship as follows: Roman Catholic, 94,422; Church of England, 83,819; Methodists (various), 64,900; Presbyterian, 33,247; Salvation Army, 14,423; Congregational, 13,669; Baptist, 4925.

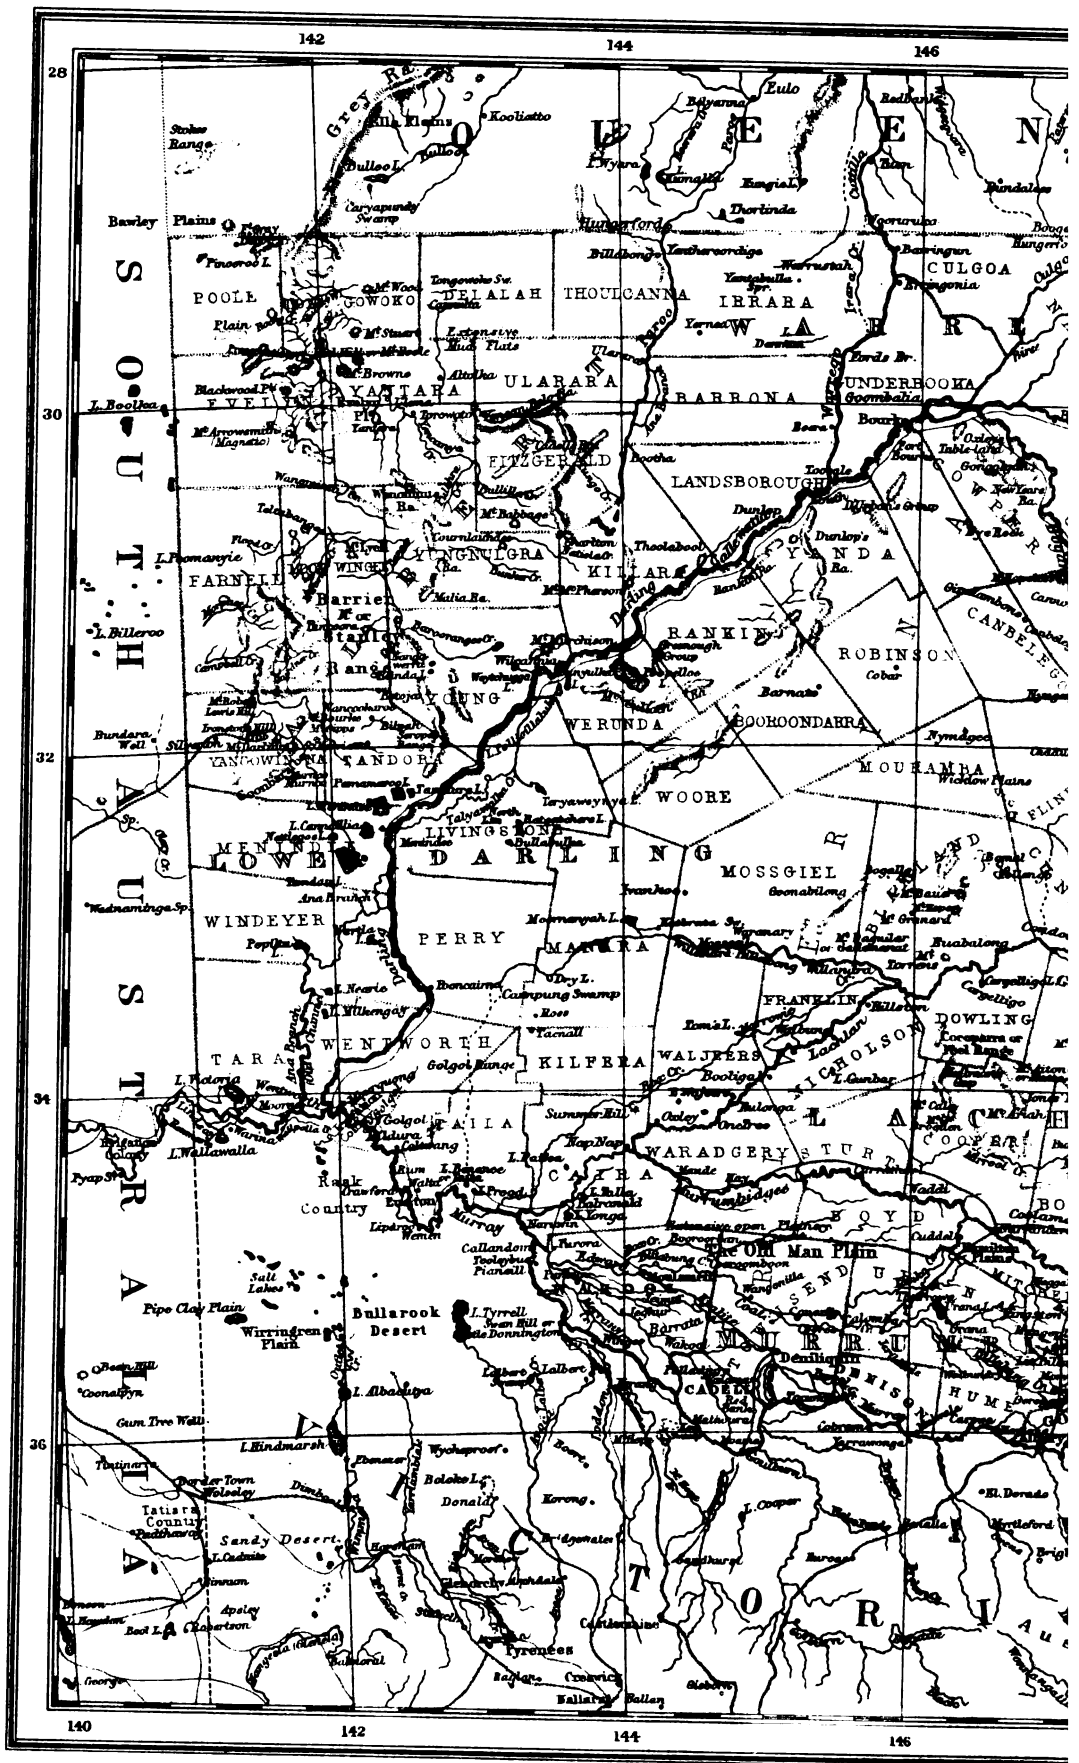

Public schools are now unconnected with churches, and no state aid is granted to a denominational school; but one hour a day may be devoted to religious instruction in state schools, where parents present no objection. On the roll in 2964 schools are 229,043 pupils. The annual cost to the government of each child is £4, 14s.; the fees bringing in 12s. 5d. But there are many private schools. The Church of England has 36,342 children in Sunday-schools; Roman Catholic, 25,820; Methodist, 29,385; Presbyterian, 12,054. There are technological, industrial, and general museums, picture-galleries, public libraries, schools of arts, and mining schools; and a noble state university, having affiliated colleges, crowns the educational edifice.

Trollope, *New South Wales and Queensland* (1874); Dr Lang, *Historical and Statistical Account of New South Wales* (1875); G. W. Griffin, *New South Wales, her Commerce and Resources* (1888); T. A. Coghlan, *The Wealth and Progress of New South Wales, 1889-90* (Sydney, 1890); G. B. Barton, *History of New South Wales from the Records* (16 vols. 1890 et seq.).

Newspaper, a sheet of paper printed and distributed at short intervals for conveying intelligence of passing events. This is a definition of a newspaper which might safely be employed for legal purposes; but it is altogether inadequate to describe the great institution which is now, in all parts of the civilised and semi-civilised world, at once the bearer of tidings, the herald of commerce, and, according to the predilections of its readers, a more or less accepted guide in matters of politics, theology, morals, arts, and sports.

The number of the newspapers of the world is (1891) estimated at 41,000, of which 24,000 appear in Europe. A further division, according to stricter geographical limitations, shows that Germany heads the list with 5500, then comes France with 4100, Great Britain and Ireland with 4000, Austria-Hungary with 3500, Italy with 1400, Spain with 850, Russia with 800, Switzerland with 450, and Belgium and Holland with 300 each. The rest of European newspapers are published in Portugal and the Scandinavian and Balkan countries. The United States of America must be credited with 12,500 newspapers. Canada claims 700, and Australia about the same number. Of journals issued in Asia, Japan alone has 200. Africa has 200 newspapers, and the Sandwich Islands three. Having regard to the respective popularity of the languages employed, it is found that 17,000 newspapers are published in English, 7500 in German, 6800 in French, 1800 in Spanish, and 1500 in Italian.

The newspaper came into existence when accounts of the imperial armies of Rome were sent to the generals in command in all parts of the provinces. These *Acta Diurna* were communicated by the generals to the officers under their command, and thus the foundation of a system of newspaper circulation was laid. It is to Germany that we have to look for the beginnings of modern European journalism. As early as the 15th century small news-sheets in the form of letters were issued in Augsburg, Vienna, Ratisbon, and Nuremberg. It was not until 1566, however, when the official

Notizie Scritte were established at Venice by order of the Venetian government, that a news-sheet at all answering to present ideas was produced. At first they were not printed but written out, and exhibited in various public places, any one being permitted to read them on payment of the small coin called a *gazetta*. From this these journals acquired the title of *Gazette* (q.v.), and the demand for them was so great that it became necessary to print them. *Gazettes* were soon afterwards issued in most of the leading cities of Europe.

Setting aside the apocryphal history of the *English Mercurie*, said to have been published in 1588 under the sanction of Queen Elizabeth, the *Weekly News* of 1622, edited by Nathaniel Butter, is, so far as positive evidence goes, the first English newspaper, as we understand the term. The *London Weekly Courant* made its appearance in the same year. Twenty years later what has been called 'the era of the *Mercuries*' was entered upon, and *Mercuries* of many kinds claimed public patronage—amongst others the *Mercurius Clericus*, started in 1641 in the interests of the clergy; the *Mercurius Britannicus* (1642); the *Mercurius Civicus* (1643), whose first number contained portraits engraved on wood of Charles I. and Sir Thomas Fairfax; the *Mercurius Politicus*, published in London, and reprinted in Scotland for the entertainment of Cromwell's army; and the weekly *Mercurius Caledonius*, the first strictly Scottish newspaper, which, however, did not live beyond its tenth number. During the protectorate the newspaper press enjoyed the luxury of freedom, and there was a great increase in the number of political journals. In 1663 the *Public Intelligencer* was established by Sir Roger L'Estrange, but was suspended on the issuing of the *London Gazette*, the first number of which was published at Oxford on the 7th November 1665. A newspaper censorship, begun in 1662, was continued with more or less stringency during the reign of Charles II. and down to 1695, when the press licensing law was abolished. During that period there was no newspaper that could be properly so called except the *London Gazette*, which, as Macaulay puts it, 'contained nothing but what the secretary of state wished the nation to know.' Comments on political events rather than news formed the staple of such periodicals as were published during the existence of the censorship. There was the *Observer*, started by L'Estrange in 1681, which attracted some notice, but it was in no sense a newspaper. One of the earliest attempts at breaking down the barrier of exclusion was made in Worcester on the publication of *Berrow's Worcester Journal* in 1690, a paper which is still in existence. After the abolition of the censorship many new journals blossomed forth, including the *Postboy*, the *London Newsletter*, the *Flying Post*, the *English Courant*, and the *Lincoln, Rutland, and Stamford Mercury*. The *Edinburgh Gazette* was established in 1699, and published twice a week. It was not until 1702 that a daily paper was put forth in England. This was the *Daily Courant*, a small sheet printed on one side only.

Advertisements, which now form so important a factor in the prosperity of newspapers, did not appear in any journal, so far as can be ascertained, until towards the middle of the 17th century. Occasional books and pamphlets were advertised in 1647-48, and in 1649 a reward was offered in the *Moderate* for the recovery of 'a piebald nag;' but it was not until 1673 that anything like a regular system of advertising was established, when the *Index Intelligencer* opened its columns to paid announcements, at the rate of 'a shilling for a horse or coach for notification, and sixpence for renewing.' A little later the *Observer Reformed*

was prepared to insert eight lines for a shilling; but, as the public began to awaken to the value of this new medium of publicity, the government became equally alive to its value to the revenue, and in 1701 imposed a duty of one shilling for each advertisement. In the same year a bill was brought into parliament for the purpose of enforcing a tax of one penny on every publication periodically issuing from the press. Owing to the representations of the newspaper proprietors, who pointed out that they had been in the habit of selling their sheets in many cases at a halfpenny a copy, the proposed measure was abandoned; but in 1712 a tax of one halfpenny per sheet was imposed on every newspaper of a sheet and a half. As a consequence, many newspapers at once ceased to exist, the *Observer* amongst the number. During the reign of George III. the press was subjected to several additional imposts. At the beginning of the reign the tax on newspapers was a penny a copy; in 1776 it was raised to three-halfpence; in 1789 to twopence; in 1794 to twopence-halfpenny; in 1797 to threepence-halfpenny; and in 1815 to fourpence. With these heavy taxes on papers there was of necessity a corresponding increase in their cost to the public, until the general price reached sevenpence, a condition of things which lasted until 1836, when the duty was reduced from fourpence to a penny, the impost being entirely abolished in 1855. Another tax that affected the cost of newspapers was the paper-duty, which was repealed in 1861, leaving British journals free from imposts of any kind.

In spite, however, of the heavy burdens against which they had to struggle, through nearly the whole of the 18th and a great part of the 19th centuries, newspapers gradually increased in number and influence, and exercised much power in the directing of public opinion. In all the chief centres of population in the provinces, as well as in London, papers of importance were established. The first half of the 18th century saw a striking extension of journalistic enterprise. In the metropolis there was, in addition to the *Courant*, the *London Daily Post* and *General Advertiser*, established in 1726. This changed its title in 1752 to the *Public Advertiser*, and attained celebrity as the medium through which the Letters of 'Junius' were first given to the world. Defoe's *Review of the Affairs of State*, begun while the editor was in prison, existed from 1704 to 1713. The *St James's Post* and the *St James's Evening Post*, started as distinct journals in 1715, were by amalgamation as the *St James's Chronicle* assured of a long existence. The *London Post*, started in 1715, had the honour of publishing a reprint of Defoe's *Robinson Crusoe* as a serial story, commencing in No. 125 (7th October 1719) and concluding in No. 289 (19th October 1720). In 1731 there existed 22 journals in London and 23 in the provinces, amongst the latter being the *Edinburgh Courant*, the *Edinburgh Gazette*, the *Nottingham Journal*, the *Newcastle Courant*, the *Hereford Journal*, the *Liverpool Courier*, the *York Mercury*, the *Glasgow Courant*, the *Leeds Mercury*, the *Northampton Mercury*, the *Gloucester Journal*, the *Norwich Mercury*, and the *Ipswich Journal*. Still greater activity was displayed in the later half of the 18th century. It was in 1762 that the *North Briton* was first issued by John Wilkes, No. 45 of that notorious journal being the one which was burned by the hangman, and for which Wilkes was put in the Tower and cast in heavy damages. The *Morning Chronicle* was started in 1770, the *Morning Post* in 1772, and the *Morning Herald* in 1781. The *Times* (q.v.)—the chief and central figure of modern journalism—was started in 1788, as a development of the *Daily Universal Register*, which had existed from 1785.

Mr John Walter was the originator and sole owner of both papers, and mainly through his energy and ability did the journal ultimately attain its position of pre-eminence. In the literary direction of the paper he always employed the highest available talent, while in the mechanical production of it he effected numerous improvements. In 1814 he succeeded in printing the *Times* by steam-power.

The publication of the leading London and provincial newspapers involves an immense outlay, and the co-operation of an army of experts representing every department of human knowledge. The work is now divided and subdivided in such a way that it is difficult to describe its organisation on the lines of the old official designations. It is no longer possible to speak unreservedly of an 'editor-in-chief' as having necessarily supreme power as the representative of the proprietors. So onerous and so various have the duties of that office become that it is, so to speak, frequently 'put into commission.' It is not uncommon to find a managing editor whose business it is to control in every way the supply of news, including foreign correspondence and reporting of all kinds, and a literary editor who controls the general policy of the paper, and is responsible for the style and substance of all original matter. It is increasingly rare to find an editor who writes any one of the several leading articles with which most of the great dailies furnish their readers. Each of these journals has a staff of leader-writers, who are often well-known workers in literature outside of journalism. On the principal newspapers the leader-writing staff includes experts of the highest mark, who are paid retaining fees in order that they may be in readiness, on the shortest notice, to supply essays on the subjects of which they are masters. For the leaders themselves they are paid special fees. A similar system prevails with respect to special correspondents, whether employed in a military or social capacity. George Borrow was the first war-correspondent, writing from Spain to the *Morning Herald* in 1839. Some of these gentlemen receive what Mr G. A. Sala has described as 'the wages of an ambassador,' in consideration of being always prepared to start for a campaign in 'Darkest Africa,' or to chronicle a royal progress. That the services rendered in return involves much personal danger is sadly suggested by the memorial in the crypt of St Paul's to the war-correspondents who fell in the Soudan. The sub-editors vary in number, according to the completeness of the organisation of the particular paper. The duties of the sub-editor on all important newspapers, whether metropolitan or provincial, have been almost revolutionised during the last four decades of the century. It is true that on the evening papers it is still necessary that the sub-editors should make a special study of the morning papers of the current date. This indeed enables the evening, or more properly speaking the afternoon, journals to appropriate the most interesting telegraphic items within a few hours of their appearance in the morning papers, to whose conductors such specially wired news may have caused a heavy expense. It may be noted that in some of the British colonies a law already exists giving copyright of 'exclusive' news for twenty-four hours after publication. On the whole, however, the sub-editor has almost ceased to be a gleaner in the fields which have been sown and already reaped by his colleagues. The old-fashioned sneer at the conductors of newspapers, that they 'put in anything to fill up,' is now only an amusing anachronism. Such are the 'services' of news which a daily paper is obliged to employ—whether they be those of the Press Association, the Central News, the Central Press, the Exchange Telegraph

Company, Reuter's, or Dalziel's—that a sub-editor's trouble in leaving his work is to reconcile the amount of 'flimsied' matter which he has put into the waste-paper basket with his duties to his chiefs. Reuter's Agency was founded in 1858, the Central Press in 1863, the Press Association in 1868, and the Central News Agency in 1870.

There used to be twelve or sixteen parliamentary shorthand reporters on every London daily. At that time the daily provincial papers obtained their telegraphic reports of parliament solely from one or other of the news organisations. This is now changed. The chief papers in the provinces have formed syndicates in accordance with their respective politics for the purpose of obtaining special reports of the debates from their own associated staffs of reporters. This arrangement, which parliament sanctions, enables the leading provincial dailies to supply parliamentary reports according to their own special requirements, the result being that debates are frequently reported at greater length in those papers than in the London journals of the same date. Thus it arises that the chief provincial papers have offices in the neighbourhood of Fleet Street or the Strand, where a special wire or wires will connect the London and the country offices. Formerly the journalists who were in charge of these wires were styled the 'wire men;' now they are designated London editors. In the city there are also editors whose special functions are the furnishing of information connected with financial matters to various papers. The chief London dailies retain the exclusive services of a city editor, while several provincial journals, published in different localities, are served by one and the same city editor. These remarks apply also in a modified degree to colonial and even foreign newspapers, which often have their own special services of news, and special representatives, in London and other principal cities.

Another important representative of modern newspaper enterprise is what is known as the London correspondent. There were London correspondents of a kind even in the days of the Restoration, but it was not until 1863 that the 'London letter,' as it is now known, was introduced as a special feature of provincial papers. In that year the Central Press Agency proposed to supply their clients with 'a London letter once a week, written by a gentleman of long standing in the literary world. This was the late Edward Spender, who for some years continued to write what formed an admirable compendium of the week's political, social, and literary gossip for country readers. As time went on the weekly letter became a daily contribution, and other London correspondents entered the field, until now the London letter is an indispensable feature of all provincial journals. Many well-known journalists are engaged in this work, including several members of parliament, and the lobby of the House of Commons forms their chief hunting-ground.

In 1843 the number of newspapers published in London was 79; in 1880 it was about 340; in 1890 it had increased to 646. Of these 28 are daily, 9 of which are issued in the evening (nominally), their first editions being issued about noon. The price of these papers is either a penny or a half-penny, with the sole exception of the *Times*, which continues to be published at threepence. The list of daily papers, which formerly consisted almost entirely of political journals, has during recent years been increased by the appearance of several daily sheets devoted exclusively to financial and commercial matters. Financial journalism, indeed, forms a very special feature of modern newspaper enterprise. The *Economist*, established in 1843, and a few other weeklies of kindred aims, held this

ground with success for many years, but the great speculative rush of more recent times, consequent on the altered conditions brought about by the passing of the Limited Liability Acts, has produced a vast number of papers of this class, the *Financial News*, started in 1884, and the *Financial Times*, founded a little later, being amongst the more widely circulated of financial daily newspapers. And again, not only does a fully-illustrated newspaper, the *Daily Graphic* (1890), appear every morning, but many of the other daily journals give illustrations of current events with more or less frequency. The difficulties of producing clear illustrations by the rotary printing-machines which are necessitated by large circulations are being gradually overcome.

Of purely literary journals the number is not large. The *Athenæum*, founded in 1828, is devoted exclusively to books, authors, science, art, music, and the drama. The *Academy*, established in 1869, follows on similar lines; and there is also the *Literary World*, covering much of the same ground. Prominent success has been achieved, however, by several weekly journals which, while devoting special attention to literary criticism, have by their free, frank, and able handling of political and social subjects made themselves both feared and admired. The *Examiner*, established by Leigh Hunt in 1808, lost ground after Hunt's retirement in 1821, but five years later, when Albany Fonblanque succeeded to the post, it again became a power, and for many years remained the champion of Radical thought. The *Spectator*, edited by Rintoul, also held a strong independent position about this period. Both papers were much read by the cultured classes; but after changes of editorship and policy a term of decadence set in; and when, in 1854, the *Saturday Review* made its appearance, controlled and contributed to by some of the brightest intellects of the day, a great stride in advance was made, and the weekly review became as influential as the great quarterlies had been in former days. About the same time the *Spectator* was remodelled by R. H. Hutton and Meredith Townsend, and has ever since stood high as the representative of what may be termed the Philosophical Radicals. The *Speaker*, established in 1890, is edited by Mr T. Wemyss Reid, and is the organ of the more advanced Radicals. The *National Observer*, published simultaneously in London and Edinburgh, also holds prominent rank as a political and literary review, is as daring in tone as the *Saturday Review* was in its earlier career, and is uncompromisingly Conservative. What is called 'society' journalism represents a new departure that dates from the first publication of *Vanity Fair* in 1868, and which received a conspicuous strengthening by the issuing of the *World* in 1874, and *Truth* in 1877. These papers, and a host of journals that have been published in imitation of them, have made the writing of personal paragraphs and articles a leading feature; one of the results being a marked increase in the number of libel suits. The combination of the personal and sensational elements constituting what it is customary to describe as the 'new journalism' likewise calls for mention. Cradled in America, it was boldly adopted in England by Mr W. T. Stead in the early days of his editorship of the *Pall Mall Gazette*, and eagerly taken up by numerous others.

The following figures will give some idea of the magnitude of the newspaper press of the United Kingdom, and also of its classification: Daily morning papers, 85; daily evening papers, 126; papers published in England outside London, 1318; in Scotland, 241; Ireland, 192; Wales, 90; the Channel Islands, 14; the Isle of Man, 7.

In the following analysis of class and trade journals it has been found practically impossible to differentiate between newspapers properly so called and other periodicals. Occasionally, too, a journal will appear under more than one classification. The distribution of papers according to subjects, however, may be thus distinguished: Accountants, 2; agents, 3; agriculture, 30; antiquities, 3; anti-vaccination, 1; architecture, 8; army, 11; art, 16; astronomy, 1; athletics, 12; auctioneers, 3; bakers, 3; banking, 1; Baptists, 11; bees, 3; bells, 1; booksellers, 9; boot and shoe trades, 2; botany, 2; boys, 6; brewers, 4; builders, 13; building-societies, 2; butchers, 1; carpenters, 1; caterers, 3; cattle-dealers, 2; charities, 5; chemists and druggists, 10; chess, 3; Church, 47; civil service, 8; coach-builders, 2; coal trade, 2; colonies, 21; comic, 30; commercial, 41; confectionery, 3; contracts, 4; co-operation, 4; country, 7; county courts, 1; cow-keepers, 1; cricket, 1; cycling, 5; decoration, 6; dental, 3; dogs, 5; drama, 13; drapers, 4; dyers, 1; education, 23; electricity, 6; engineering, 10; entomology, 1; estates, 7; exchange, 4; fashions, 37; financial, 39; fire, 2; fishing and fish-trades, 4; food, 3; freemasonry, 4; Free Methodists, 2; friendly societies, 4; Friends (Society of), 3; fruit trades, 2; furniture, 8; gardening, 16; gas, 3; geographical, 2; geology, 1; German, 2; grocers, 9; gynecology, 1; hairdressers, 2; hardware, 1; hatters, 1; homœopathy, 2; horology, 2; horses, 2; hosiers, 1; illustrated, 14; implements, 1; India, 6; india-rubber, 1; insurance, 18; inventions, 3; iron and ironmongers, 7; jewellers, 1; Jewish, 4; labour, 4; laundry, 3; law, 18; leather, 5; licensed victuallers, 6; lifeboats, 1; literary, 18; live-stock, 7; local government, 6; machinery, 3; matrimonial, 2; mechanics, 3; medical, 26; meteorology, 1; millers, 2; mineral waters, 4; mining, 3; music, 18; natural history, 6; navy, 14; Nonconformists, 13; non-sectarian (religious), 46; notes and queries, 2; numismatics, 1; official, 2; oil and colour trade, 2; paper trades, 10; pawn-brokers, 1; peace, 1; photography, 10; phrenology, 2; plumbers, 1; pottery, 1; poultry, 8; Presbyterian, 3; Primitive Methodist, 7; printers, 12; railways, 10; Roman Catholic, 15; saddlers, 3; sanitary, 8; scientific, 6; secular, 3; shipping, 14; shorthand, 3; society, 24; sporting, 40; stamps, 1; Sunday-schools, 6; tailors, 3; telegraphy, 2; temperance, 32; textile industries, 11; timber trade, 2; time-tables, 36; tobacco, 4; undertakers, 1; Unitarian, 2; warehousemen, 3; Wesleyans, 6; wine and spirits, 4; yachting, 1.

The circulations attained at the present day by the leading metropolitan and provincial papers is in some instances very large. The *Daily Telegraph* and the *Standard* each circulates close on a quarter of a million copies. Amongst the London evening papers the *Star*, the *Echo*, and the *Evening News* and *Post* each claims a circulation of 200,000 copies or thereabouts. Of the penny weeklies, *Lloyd's Newspaper* heads the list with half a million copies, and a further half-million is divided between the *Weekly Dispatch* and *Reynolds's Newspaper*. Other London circulations are the *Police News*, 300,000; the *Referee*, 150,000; the *Illustrated London News* and the *Graphic*, from 120,000 to 130,000 copies each. In the provinces there are the *Yorkshire Post*, 45,000, the three Manchester morning papers (with a combined issue of at least 100,000), and the *Birmingham Post*, 30,000, amongst the morning dailies; and a glance at the list of provincial weeklies gives us the *Sheffield Weekly Telegraph*, 215,000, the *Glasgow Weekly Mail*, 200,000, the *Dundee Weekly News* and *People's Journal*, 200,000, the *Newcastle Weekly Chronicle*, 100,000, the *Manchester Weekly Times*, 100,000, and the *Sunday*

Chronicle (Manchester), 200,000. It should be mentioned also that since 1882, when *Tit-Bits* was started, there have sprung into existence a large number of journals which are neither strictly newspapers nor magazines, but are widely popular. *Tit-Bits* has a circulation of over half a million copies per week. Following in its train are such papers as *Rare-Bits*, *Illustrated Bits*, *Answers*, &c., all of which sell largely.

As already mentioned, the newspaper press of Scotland had its origin during the civil wars of the 17th century, a printer named Higgins, attached to Cromwell's army, being employed to reprint the London *Mercurius Politicus* for the benefit of the troops then in Scotland. This issue was continued from 1653 to 1660; in which latter year the *Mercurius Caledonius* was published, existing only for three months, and being succeeded by the *Kingdom's Intelligencer*. In 1669 came the *Edinburgh Gazette*, in 1702 the *Edinburgh Courant*, in 1706 the *Scots Courant*, and in 1718 the *Edinburgh Evening Courant*. In 1720 the *Mercurius Caledonius* was revived as the *Caledonian Mercury*, and survived until the middle of the 19th century. The *Scotsman*, which may be regarded as the *Times* of Scotland, came into existence in 1817, the *Glasgow Herald* in 1782, the *Aberdeen Journal* in 1746, the *Kelso Mail* in 1797, the *Dundee Advertiser* in 1801, the *Ayr Advertiser* in 1803, the *North British Daily Mail* in 1847, and the *Scottish Leader* in 1887.

In Ireland, a news-sheet called *Warranted Tidings from Ireland* saw the light during the rebellion of 1641, but the *Dublin Newsletter*, started in 1685, was the first Irish newspaper properly so called. A Dublin daily, called *Pue's Occurrences*, ran from 1700 to about 1750; and *Faulkner's Journal*, another Dublin daily journal, was started in 1728. *Saunders's Newsletter*, established in 1746, existed down to 1879. The *Dublin Evening Post* was first issued in 1725; and in 1737 the *Belfast Newsletter*, the oldest existing Irish newspaper, was started. The *Derry Journal* was established in 1772, the *Limerick Chronicle* in 1766, and the *Belfast Northern Whig* in 1824.

The English papers of the principality of Wales show evidences of the pressure of a public demand which every year becomes more exacting. In the northern division, a thinly-spread population have still to be content with weekly papers—Welsh and English—with the addition of such daily supply as is afforded by the Liverpool press. The tenacity with which the masses cling to the native language enables the *Baner* of Denbigh to hold a commanding position among the newspapers of North Wales. A different condition of things obtains in the busy centres of South Wales, with its vigorous industrial life and populous communities. Two daily papers share the patronage of the South Walian. The *Western Mail*, a progressive Democratic-Conservative journal, is the senior in point of age. The *South Wales Daily News* is the organ of the advanced Liberalism professed by the majority of South Wales electors. Both papers are published in Cardiff. Each populous district has its local journal, and the vernacular press is supported by a large, but diminishing, class.

In the different British colonies newspaper enterprise has been very active in recent years. As far back as 1803 the Australian colonies were catered for by the *Sydney Gazette* and *New South Wales Advertiser*, which was published 'by authority.' The *Australian*, also issued in New South Wales, was originated in 1824, but succumbed in 1848. In 1831, however, the *Sydney Morning Herald* was established, and has long held the position of being the most substantial paper in the colony. In

Victoria the *Melbourne Advertiser* was the progenitor of the existing race of Victorian journals. At first it was written, not printed, and had a circulation of not more than a dozen copies at sixpence a copy. It ceased with its thirty-second number. The *Argus* and the *Age*—the latter reputed to have the largest circulation of any in Australia—now hold the first rank. South Australia has in the *Register* a journal which has been published daily since 1850. There are not more than about a score of journals in Western Australia, the number including three dailies. The *Brisbane Courier* is the patriarch of journalism in Queensland. There are two other dailies in Brisbane, and about seventy papers altogether in the colony. In Tasmania the newspaper press began to have a history in 1810. There are four dailies in the colony, and about twenty others. In New Zealand there are no fewer than fourteen towns which have daily papers, besides more than a hundred other journals published throughout the island.

In the South African colonies the *Cape Times*, although it was only established in 1876, takes the lead. In Johannesburg English enterprise has a great daily paper in the *Cape Argus*. The *Cape Mercury*, published three times a week, was established in 1875 in King William's Town. Natal has three daily papers and many weeklies. On the Gold Coast, in Sierra Leone, St Helena, Mauritius, British Guiana (which has a daily paper at Georgetown), and the West Indies (with a daily journal in Jamaica) British journalism is more or less well represented. Even Cyprus has its weekly *Owl*. China claims to have had newspapers before they were known in Europe, and we are specially interested in the three or four English dailies published in Hong-kong.

In India we find an English press powerful and influential out of all proportion to the extent of its circulation. Every European British subject in India, who has brains and character, is the centre of a social system. To him the newspaper, which constitutes the link between his early home and the scene of his daily labour, is an infinitely more important institution than the British journal is to the citizen of London or Liverpool. The *Englishman*, a daily paper published in Calcutta, first made its appearance in 1821, under the title of the *John Bull in the East*, and had set up at its press the rough proofs of several of Macaulay's best-known essays. There are two other dailies in Calcutta, while Bombay, Madras, Allahabad, Delhi, Lahore, and Rangoon have each one or more daily newspapers. Many journals are issued in English by natives for native readers, and the sheets printed in the vernacular languages are legion. The small cost of native labour largely aids the multiplication of Indian journals.

United States and Canada.—In 1890 there were issued in the United States and Canada a total number of 17,760 newspapers and periodical publications, consisting of 13,164 weeklies, 2191 monthlies, 1626 dailies, 280 semi-monthlies, 217 semi-weeklies, 126 quarterlies, 82 bi-weeklies, 38 bi-monthlies, and 36 tri-weeklies. The geographical distribution of the 17,760 periodicals is as follows: New York state, 1778; Illinois, 1309; Pennsylvania, 1281; Ohio, 1043; Dominion of Canada, 812; Kansas, 807; Iowa, 799; Missouri, 756; Massachusetts, 685; Indiana, 651; Michigan, 644; Nebraska, 565; California, 536; Wisconsin, 529; Texas, 494; Minnesota, 427; New Jersey, 318; Colorado, 268; Georgia, 257; Kentucky, 257; South Dakota, 250; Tennessee, 236; the Territories, 220; Virginia, 220; North Carolina, 192; Arkansas, 185; Connecticut, 182; Maryland, 178; Alabama, 175; Maine, 156; Mississippi, 155; Louisiana, 152; Washington, 146; West Virginia,

143; Oregon, 133; New Hampshire, 126; Florida, 121; South Carolina, 120; North Dakota, 119; Vermont, 83; District of Columbia, 68; Rhode Island, 64; Montana, 58; Delaware, 38; Nevada, 24. It is estimated that the total issue of a single edition of all these papers represents a circulation of 41,524,000 copies, being an average edition of 2335 copies. According to classification it is found that there are 27 publications with circulations of 150,000 for each issue, 28 with 100,000, 35 with 75,000, and 42 with 50,000; while at the other end of the scale there are 5426 publications classed as issuing only 500 copies per issue. New York prints more than a quarter of all the papers which are sold, and Pennsylvania, Illinois, and Massachusetts more than another quarter. Nearly 75 per cent. of all the publications issued appear weekly. Reckoning the combined population of the United States and Canada at 65,000,000, the circulations given are sufficient for three yearly subscriptions to every five people.

The earliest newspaper published in America was *Publick Occurrences*, 1690; this was followed in 1704 by the *Boston News-letter*, which continued without a rival until 1719, when the *Boston Gazette* was issued 'by authority.' Later on the *News-letter* extended its title, and became the *Massachusetts Gazette and Boston News-letter*, and was conspicuous for its support of the British rule in the early days of the war of independence, ceasing to exist, however, when the English troops evacuated Boston. In 1721 the *New England Courant* was established by James Franklin, and subsequently was conducted by his more renowned brother, Benjamin Franklin. The latter started a paper of his own, the *Pennsylvania Gazette*, in 1729, after the death of the *Courant*, and this appeared weekly down to 1745, when it merged in the *North American*. Edes's *Boston Gazette*, begun in 1755, was for a long time the chief organ of the popular party, and was the medium through which John Adams published his 'Letters of Novanglus.' The *Massachusetts Spy* was another paper of note on the revolutionary side. On being removed from Boston to Worcester its title was changed to the *Worcester Spy*. At the revolution the New England colonies possessed 14 newspapers; Pennsylvania, 9; New York, 4; and the middle and southern colonies, 10. All save the semi-weekly *Advertiser* of Philadelphia were published weekly. From this period onward the progress of American journalism was marked by rapid strides; it extended by leaps and bounds, developing an originality all its own, and displaying an activity in some directions altogether out-distancing the achievements of Great Britain.

What the existing journalistic enterprise of the North American continent represents has already been indicated; it is desirable, however, that some of its more salient features should be referred to. American papers have always been more strongly personal than English journals. It is to the transatlantic reporter that we owe the introduction of 'interviewing' and the invention of 'head-lines,' amongst other things. No effort is spared to make an American newspaper understood and admired of the people; it gives news in abundance, usually presented in a sensational manner, and vents its views and opinions with what an English journalist would regard as a reckless unrestraint. The organisation and equipment of the leading papers of the chief cities are most complete, including an editorial and reportorial staff of many subdivisions, backed by a proprietary of remarkable vigour and enterprise. The great majority of American and Canadian papers are, of course, printed in English, but there is a considerable number published in other tongues.

Those published in the German language number 724, while 112 are in French, 59 in the Scandinavian languages, 34 in Spanish, 16 Bohemian, 12 Dutch, 7 Polish, 4 Danish, 5 Welsh, 8 Finnish, 5 Italian, 2 Portuguese, 2 Chinese, and 2 Hungarian. The principal papers of America and Canada have a world-wide renown. The *Herald*, originated by James Gordon Bennett, the *Tribune*, founded by Horace Greeley, the *World*, the *Times*, the *Sun* are the chief papers of New York; and in Chicago, Boston, Baltimore, Cincinnati, Philadelphia, St Louis, San Francisco, and other cities there are journals hardly less famous. Amongst the chief Canadian papers may be mentioned the *Toronto Globe*, which claims to be the leading paper of the Dominion, the *Montreal Herald*, the *Quebec Morning Chronicle*, the *Ottawa Free Press*, and the *Ottawa Citizen*. There is a considerable sprinkling of Canadian papers printed in French, the chief of them appearing in Quebec and Montreal. The Sunday paper has long been a specially popular institution in America. Nearly every prominent daily in the States issues its enlarged Sunday edition, which in addition to its news proper contains a vast amount of miscellaneous reading, culled from all kinds of sources, and often including special contributions of great merit. In Canada Sunday papers are not so common.—In some of the large cities of South America, also, as in Rio de Janeiro and Buenos Ayres, there are ably conducted English newspapers.

France.—Journalism in France began with the *Gazette* in 1631. The first French daily paper was the *Journal de Paris*, started in 1777. Many journals sprang into existence with the Revolution, but most of them had but a brief career. Under the first Napoleon the freedom of the press was much restricted. It was then that the danger attending the handling of political questions suggested the filling of a large portion of the sheet with the 'Fenilleton' (q.v.). There are at present about 44 daily papers (morning and evening) published in Paris alone. As newspapers, in the full sense of the phrase, the journals of France cannot be compared with those of Great Britain. They contain less matter, and they do not, as a rule, report with any degree of fullness home or foreign events. The *Temps*, which is said to have a circulation of 45,000 per day, approaches somewhat to the English standard; but the *Figaro*, which, with its singular mixture of clericalism and worldliness, would be considered frivolous in England, has a circulation of 100,000 daily. French daily papers generally cost at least twice as much as English ones. A notable exception, however, is found in *Le Petit Journal*, an evening paper costing 5 centimes (one halfpenny), which has probably the largest circulation of any paper in the world; it is put down at 950,000. See also GALIGNANI.

Belgium.—An illustrated war-gazette called the *Nieuwetijdinghe* was the first journal published in the Low Countries, in 1605, and was succeeded by the *Gazette van Antwerpen*, which survived until 1805. The Belgian newspapers are now numerous, including about a dozen daily journals in Brussels, and half that number (mainly in Flemish) in Antwerp. The *Indépendance Belge*, on the Liberal side, and the *Journal de Bruxelles*, as the organ of the clerical party, with the *Etoile Belge*, are the leaders of public opinion.

Holland.—The newspapers of Holland were at an early date remarkable for the fullness and accuracy of their intelligence; but until 1830 their news was chiefly confined to commercial matters. The principal Dutch journals of to-day are the *Allgemeene Handelsblad* of Amsterdam, and the *Amsterdam Courant*; the *Harlemsche Courant*; and the *Journal de la Haye*, *De Nederlandsche*

Stoompost, and *Staats-Courant*, published at the Hague.

Switzerland.—Although the Swiss press is generally speaking ably conducted, it does not include any journal of European importance. The different cantons have their local newspapers, in which local matters are discussed with much political bias, and latterly there have been published one or two Swiss journals printed in French and English, and intended mainly for the travelling public, the *Swiss Times* being the first of these.

Germany, as we have seen, was furnished with news-sheets long prior to their introduction into England; but it was not before 1615 that any German newspaper had a really settled habitation. Frankfurt was the first town to possess a journal of its own; Fulda, Hildesheim, and Herford followed. The first Leipzig newspaper was published in 1660. The *Hamburgische Correspondent* deserves mention as the first paper to organise a staff of foreign correspondents. In 1798 the *Allgemeine Zeitung* was established by Cotta, and gradually made its way into the front rank of European journals, being still regarded as the leading paper in Germany. Severe restrictions have fettered the German press even in recent years, the government having exhibited no little animus against the many socialistic journals which have sprung into existence, but now comparative freedom is enjoyed. Berlin owns a large number of daily papers, including the *Vossische Zeitung*, the *Norddeutsche Allgemeine Zeitung*, the *Neue Preussische Zeitung*, the *Post*, the *National Zeitung*, and the *Volkszeitung*. The *Cologne Gazette* is a paper of influence, and at Hamburg and other leading towns there is considerable journalistic enterprise. In 1833 Germany had 350 journals of all kinds; it has now 5500, about a quarter of which were until recently avowedly government organs—hence the vogue of the term ‘Bismarck’s reptile press.’

Austria.—Austrian journalism has similarly expanded and improved in recent years. Vienna is a very active centre, and within its boundaries many excellent papers are issued, the *Neue Freie Presse* and the *Neue Wiener Tagblatt* being the most important.

Hungary.—The literary activity of Hungary may be judged by the fact that there are no fewer than 17 papers published daily in the capital, some of them having a circulation of 25,000.

Denmark.—Up to 1830 only two newspapers were printed in Copenhagen, and both were entirely made up of extracts from foreign journals. The official paper, the *Berlingske Tidende*, which was established in 1749, is published daily, and has a circulation of 10,000. There are ten daily journals published in the capital, and the *Aftenposten*, an evening paper, has the largest circle of readers.

Sweden and Norway.—The *Ordinarie Post Tidende*, started in 1643, seems to have been the first Swedish paper. Stockholm now boasts four daily journals, the *Stockholm Dagblad* having a circulation of 23,000. *Den Morgenblad* is the leading paper of Norway.

Spain.—Spanish journalism cannot be said to have really existed until a comparatively recent period. There was no liberty of the press in Spain until after the revolution of 1854. The chief daily journals of Madrid are the *Correspondencia de Espana* and the *Imparcial*, the former having a circulation of about 50,000, the latter of some 70,000. The press of Portugal is not more flourishing than that of Spain.

Italy.—Mention has already been made of the early *Gazettes* of Italy. Their successors were denounced by the popes, especially by Gregory XIII., and up to 1847 the Italian press was of small account. A rigid censorship existed until

far into the 19th century. There are now fifty daily papers published in Italy, chiefly in Rome, Bologna, Florence, Genoa, Milan, Leghorn, Naples, Palermo, and Turin. The *Secolo* of Milan is credited with a daily circulation of 120,000.

Russia.—Peter the Great was the author of Russian journalism. Political journalism, however, is practically forbidden in the dominion of the czar, the papers occupying themselves for the most part with literary and scientific questions. The *Journal de St Petersburg* (1824) is semi-official, and, though it has but a small circulation, it is well known throughout Europe, being published in French. The two daily papers of largest circulation are the *Novoe Vremya* (‘New Times’), the organ of the popular party, and the *Novosti* (‘Latest News’), which represents the doctrinaire Liberals.

Turkey.—Journalism in Turkey is chiefly of foreign origin, and the French were the first to exploit this form of enterprise in the land of the sultan. Any opposition to the government is not permitted, therefore the Turkish papers contain no leading articles. Some fourteen sheets, however, are issued daily in Constantinople, in Turkish, French, or English. The leading Turkish journal, the *Djeridei Havadis*, was established in 1843 by an Englishman.

See the articles REPORTING, ADVERTISING, and PRINTING; also Andrews’ *History of British Journalism* (Lond. 1859); Grant’s *The Newspaper Press: its Origin, Progress, and Present Condition* (Lond. 1871); H. Fox Bourne’s *English Newspapers* (Lond. 1887); Pebody’s *English Journalism, and the Men who have made it* (Lond. 1882); Baker’s *The Newspaper World* (Lond. 1890). A very valuable and extensive collection of early newspapers is to be found in the British Museum.

Newstead Abbey, 10 miles NNW. of Nottingham, on the border of Sherwood Forest, was founded for Augustinian Canons by Henry II. in atonement for Becket’s murder (1170), and in 1540, after the dissolution, was given to ‘Sir John Byron the Little, with the great beard.’ Among his descendants were the first Lord Byron (cre. 1643), the ‘wicked Lord Byron’ (1722–98), and the poet Lord Byron (q.v.), who made the half-ruinous old place his home in 1808, but sold it in 1818, since which time about £100,000 has been spent on its restoration. For a full description of Newstead, its lake, ruined church, superstitions, and memories, see Washington Irving’s *Abbotsford and Newstead* (1835).

New Sweden. See PENNSYLVANIA.

Newt, or EFT (*Triton*), a genus of caducebranchiate Amphibians (q.v.), corresponding in many respects to the Salamanders, but more slender and active, and making up with them the family Salamandridæ. The newts have a soft, sensitive skin, covered with warty tubercles or granules; a laterally-compressed tail; four fingers and five toes; teeth on the jaws and palate; an upper and a lower eyelid, and a third eyelid or nictitating membrane; small nostrils near the snout, opening internally into the mouth; and generally well-developed organs of the lateral line. They are found in marshes and ponds and damp places. In habit they are carnivorous, devouring insects of various kinds, worms, snails, frog-spawn, and even smaller animals of their own kind. Sixteen species are enumerated, widely distributed in Europe, and found also in Algeria, North China and Japan, the eastern states of North America, California, and Oregon. The Great Water Newt, or Warty Newt (*T. cristatus*), is the largest British species. It is about 6 inches long; the body is thick and round, the upper parts are generally very dark, the sides are dotted with white, and the breast and belly are of a bright orange colour,

with black spots. The male is more vividly coloured than the female, the sides of the tail are of a beautiful pearly colour, and at the breeding season he develops a large back crest (fig. 1). The movements

Fig. 1.—Great Water Newt (*Triton cristatus*).

in slow swimming are accomplished by means of the tail and the limbs; but in fast swimming both pairs of limbs are laid alongside the body, and the movements are effected by rapid undulations of the body and tail. On land they crawl by means of their weak limbs. In summer they cast their skin perhaps many times, sometimes by complete sloughing, but sometimes it comes off in shreds. In winter they generally remain at the bottom of ponds and ditches. Like many other animals of the same genus, they show great power of reproducing lost parts, the tail, limbs, and portions of the head being very perfectly restored, even several times in succession. They are also able to withstand great cold. In laying her eggs the female deposits them on the leaves of aquatic plants, each egg being deposited separately below a leaf, which is then folded, apex to petiole, by means of the newt's hind-limbs, so as to retain the egg in position. The embryo grows rapidly and becomes bent in shape. In seven days the gills and legs appear as small knobs. By the ninth day the tail is oar-shaped, and the heart may be seen beating. On the tenth day the fore-limbs and claspers appear beside the gills. In two or three days more the eyes appear as distinct structures, and the gills become leaf-like. About the fourteenth day the embryo escapes from the egg and holds on to leaves of water-plants by means of its claspers. At this stage of its existence it resembles a fish in outward form and internal structure, and its whole anatomy may very easily be studied on account of its transparency. About twelve days after leaving the egg the fore-feet are longer, rudiments of toes are visible; the gills, at first simple, become fringe-like, and red blood circulates through them, and the claspers

Fig. 2.—Larvæ of *Triton cristatus*.

A, condition before leaving the egg; B, tadpole shortly after it is hatched; C, at about the twenty-second day; D, at about the forty-second day.

disappear. About the twenty-second day it begins to breathe by means of its developing lungs; the gills are still large, and the hind-legs begin to sprout. This change takes place concurrently with

the change of diet from vegetable to animal food. About the forty-second day after hatching, the gills begin to grow smaller and are soon obliterated. The newt then seeks to leave the water, respire atmospheric air only, and goes on to sexual maturity. In some circumstances individuals of this species occasionally retain some of the external appearances of immaturity in spite of having become capable of reproduction (a phenomenon more common, however, in a European species, *T. alpestris*, which may become sexually perfect even in its tadpole stage); and in rare instances they may bring forth their young alive as do the true salamanders. The Great Water Newt is seldom found on land. The Common Smooth Newt (*T. punctatus*), a smaller species about $3\frac{1}{2}$ inches long, is much more common in Britain than the great newt, from which it also differs in having a smooth skin, the back crest continuous with the tail crest, and in being often found on land. Its eggs are laid in the axils of leaves quite as often as under the leaves. The Palmated Smooth Newt (*T. palmipes*) is the only other common British species. It has been found in various parts of Britain from the Isle of Wight to the north of Scotland. The toes of the hind-foot are webbed, the tail ends in a long filament, and the back crest is straight; these characteristics are prominent only in the breeding season.

Newts form very interesting inmates of aquaria, where they may be easily reared and kept; and their graceful movements and development interest the observer. The words *newt* and *eft* are really identical, a *newt* = an *eft*, A.S. *efeta*, just as an *adder* resulted from a *nadder* by mistake.

Newton, (1) capital of Harvey county, Kansas, 134 miles by rail SW. of Topeka, is the centre of a rich coalfield. Pop. (1890) 5602.—(2) A city of Massachusetts, 7 miles WSW. of Boston by rail, and almost surrounded by the Charles River. It contains many suburban residences belonging to citizens of Boston, and has manufactures of cloth, silk, shoddy, machinery, glue, &c. Pop. (1860) 8382; (1885) 19,759; (1890) 24,379

Newton, SIR ISAAC, the greatest of natural philosophers, was born on 25th December (o.s.) 1642—year remarkable in English history for the breaking out of the Civil War, and doubly remarkable in the history of science by the birth of Newton and the death of Galileo. The farmhouse he was born in, still preserved religiously, is at the hamlet of Woolsthorpe in Cottesworth parish, Lincolnshire, 8 miles S. of Grantham (q.v.), at whose grammar-school the boy received his early education. On the 5th of June 1661 he left home for Cambridge, where he was admitted as subsizar at Trinity College. On the 8th of July following he matriculated as sizar of the same college. He immediately applied himself to the mathematical studies of the place, and within a very few years must have not only made himself master of most of the works of any value on such subjects then existing, but had also begun to make some progress in the methods for extending the science. In 1665, in which year he took his B.A., he committed to writing his first discovery on fluxions; and in 1666, according to Voltaire's *Lettres sur les Anglais* (1733), the fall of an apple, as he walked in the garden at Woolsthorpe, suggested the most magnificent of his subsequent discoveries—the law of universal gravitation. On his first attempt, however, by means of the law so suggested to his mind, to explain the lunar and planetary motions, he employed an estimate then in use of the radius of the earth which was so erroneous as to produce a discrepancy between the real force of gravity and that required by theory to explain the motions, corresponding to the respective figures 16·1 and 13·9.

He accordingly abandoned the hypothesis for other studies. These other pursuits to which he thus betook himself consisted chiefly of investigations into the nature of light, and the construction of telescopes. By a variety of ingenious and interesting experiments upon sunlight refracted through a prism in a darkened apartment, he was led to the conclusion that rays of light which differ in colour differ also in refrangibility. This discovery enabled him to explain an imperfection of the telescope, which had not till then been accounted for. The indistinctness of the image formed by the object-glass was not necessarily due to any imperfection of its form, but to the fact of the different coloured rays of light being brought to a focus at different distances. He concluded rightly that it was impossible for an object-glass consisting of a single lens to produce a distinct image. He went further, and too hastily concluding, from a single experiment, that the dispersive power of different substances was proportional to their refractive power, he pronounced it impossible to produce a perfect image by a combination of lenses. This conclusion—since proved erroneous by the discovery of the achromatic telescope (see ACHROMATISM)—turned Newton's attention to the construction of reflecting telescopes; and the form devised by him is the one which, at later periods, reached such perfection in the hands of Sir William Herschel and Lord Rosse.

Newton became a Fellow of Trinity in 1667, and Lucasian professor of Mathematics in 1669; and it was on 11th January 1671 that he was elected a member of the Royal Society, having become known to that body from his reflecting telescopes. At what period he resumed his calculations about gravitation, employing the more correct measure of the earth obtained by Picard in 1670, does not clearly appear; but it was in the year 1684 that it became known to Halley that he was in possession of the whole theory and its demonstration. It was on the urgent solicitation of Halley that he was induced to commit to a systematic treatise these principles and their demonstrations. The principal results of his discoveries were set down in a treatise called *De Motu Corporum*, and were afterwards more completely unfolded in the great work entitled *Philosophiæ Naturalis Principia Mathematica*, which was finally published about midsummer 1687.

Shortly before the *Principia* was given to the public Newton had been called to take an active part in defending the rights of the university against the illegal encroachments of James II. The conspicuous part which he had taken on that occasion procured him a seat in the Convention Parliament, in which he sat from January 1689 to its dissolution in 1690. In 1696 he was appointed Warden of the Mint, and was afterwards promoted to the office of Master of the Mint in 1699, an office which he held till the end of his life. He again took a seat in parliament in the year 1701 as the representative of his university. Thus engaged in the public service, he had little time left for mere scientific studies—pursuits which he always held of secondary importance to the public duties in which he was engaged. In the interval of public duty, however, Newton showed that he still retained the scientific power by which his great discoveries had been made. This was shown in his solution of two celebrated problems proposed in June 1696 by John Bernouilli, as a challenge to the mathematicians of Europe. A similar mathematical feat is recorded of him so late as 1716, in solving a problem proposed by Leibnitz for the purpose, as he expressed it, of feeling the pulse of the English analysts. When in parliament Newton recommended the public encouragement of the invention of a method for determining the longitude—the first reward in

consequence being gained by John Harrison for his chronometer. He was president of the Royal Society from 1703 till his death, a period of twenty-five years, being each year re-elected. In this position he could do much for the advancement of science; and one of his most important works during this time was the superintendence of the publication of Flamsteed's *Greenwich Observations*—a task, however, not accomplished without much controversy and some bitterness between himself and that astronomer. The controversy between Newton and Leibnitz as to priority of discovery of the differential calculus, or the method of fluxions, was raised rather through the partisanship of jealous friends than through the anxiety of the philosophers themselves, who were, however, induced to enter into and carry on the dispute with some degree of bitterness and mutual recrimination. The verdict of the impartial historian of science must be that the methods were invented quite independently, and that, although Newton was the first inventor, a greater debt is owing by later analysts to Leibnitz, on account of the superior facility and completeness of his method. In 1699 Newton was elected a foreign associate of the Academy of Sciences, and in 1703 he received the honour of knighthood from Queen Anne. He died at Kensington on 20th March 1727, and his remains received a resting-place in Westminster Abbey, where a monument was erected to his memory in 1731. Roubilliac's magnificent full-length statue was erected in 1755 in the antechapel of Trinity College, Cambridge.

Besides the first edition of the *Principia*, other editions appeared in 1713, 1726, 1729, 1730; and at Geneva the Jesuits' edition (1739-42; republished at Glasgow, 1822). An admirable reprint is that by Sir W. Thomson and Professor Blackburn (Glasgow, 1871). Clarke's Latin translation of the *Optics* appeared in 1706; the *Optical Lectures* in 1728; the *Fluxions* in 1736; and Horsley edited an edition of his collected works (5 vols. 4to 1779-85). Newton was a student of Alchemy (q.v.); and he left a remarkable monument of his interest in theology, especially prophecy, a MS. work on the prophecies of Daniel and on the Apocalypse, a history of the Creation, and a number of tracts. See the articles in this work on ASTRONOMY, FLUXIONS, GRAVITATION, LIGHT, MOTION (LAWS OF), OPTICS, SPECTRUM; Sir David Brewster's *Life of Newton* (1855); and Augustus de Morgan's *Newton, his Friend, and his Niece* (1885), that friend being John Conduitt (1688-1737), Newton's successor as master of the mint, who in 1717 married Newton's niece, Katherine Barton, the widow probably of the Earl of Halifax.

NEWTON'S RINGS.—In his investigations of the colours produced by thin plates of any material, solid, fluid, or gaseous, Sir Isaac Newton hit upon the following mode of exhibiting the colours produced by reflection from a film of air. He took two lenses, one convexo-plane, its convex side having a radius of 14 feet, the other equi-convex, with the radii of its surfaces 50 feet, and laid the first with its plane surface downwards on the top of the second, thus producing a thin film of air between the lenses; the film being thinnest near the centre, and becoming gradually thicker outwards. On slowly pressing the upper lens against the under one, a number of concentric coloured rings, having the point of contact of the lenses for their centre, appeared, and increased in size when the pressure was increased. These rings, or more properly systems of rings, are in this form of the experiment seven in number, and each of them is composed of a number (ranging from eight in the first or smallest ring to two in the outermost) of rings of different colours, the colours, though different in each of the systems of rings, preserving the same arrangement as the colours of the spectrum; thus, in the second ring the inside

colour is violet, and the outside scarlet red. The colours are very distinct in the first three systems of rings, but become gradually confused and dull towards the outside, till they almost fade away in the seventh system. The centre is deep black. The thickness of the air-film at the centre is about half a millionth of an inch, and increases gradually to nearly $\frac{1}{1000}$ of an inch, when the colours disappear. See INTERFERENCE.

Newton, JOHN, the friend of Cowper, was born in London, 24th July (o.s.) 1725. He had little schooling, and, as his father was master of a trading ship, the boy joined him at eleven and sailed under him for six years. Next impressed on board a man-of-war, he was made midshipman, but was degraded and cruelly treated for an attempt to escape. He was allowed at Madeira to exchange into an African trader, joined a slaver at Sierra Leone, and sailed with her for two years, returning to England in 1747. He next sailed to Guinea and the West Indies as mate on a Liverpool slaver, married in 1750, and made several voyages of the same nature as master, giving his leisure to study. In 1755 he renounced his calling to become tide-surveyor at Liverpool. His religious opinions had already undergone an important change, which led him to apply in 1758 to the Archbishop of York for holy orders, but without success. In 1764 he was offered the curacy of Olney, and he was at once ordained deacon, and next year priest, by the Bishop of Lincoln. Hither the poet Cowper came about four years later, and an extraordinary friendship quickly sprang up between the two men. Newton was a burning Calvinist, and it cannot be doubted that the converted slaver's influence was to a great extent disadvantageous to the sensitive nature of the poet. Newton left Olney in 1779 to become rector of St Mary Woolnoth, London, and here he died, December 31, 1807. Newton's prose-works, *Omicron* (1762), *Cardiphonia* (1781), &c., are now but little read, save his vigorous and interesting *Authentic Narrative of some Interesting and Remarkable Particulars in his own Life*. But his name can never be forgotten from its association with Cowper, and from some of his *Olney Hymns*, which have been taken to the heart by the English-speaking religious world. Of these need only be named here: 'Approach, my soul, the mercy-seat;' 'How sweet the name of Jesus sounds;' 'One there is, above all others;' and 'Quiet, Lord, my froward heart.'

See the Life by Richard Cecil (1808), prefixed to a collected edition of Newton's works (6 vols. 1816); Thomas Wright, *The Town of Cowper* (1886); and other works cited at COWPER.

Newton, THOMAS, was born at Lichfield, January 1, 1704. From Westminster he passed to Trinity College, Cambridge, became one of its fellows, took orders, and after minor preferments was made Bishop of Bristol and Canon Residentiary of St Paul's in 1761. He died 14th February 1782. Newton's annotated edition of Milton's *Paradise Lost* and *Paradise Regained*, and his *Dissertations on the Prophecies* (3 vols. 1754-58) long enjoyed a reputation far beyond their deserts.

Newton-Abbot, a market-town of Devonshire, at the influx of the Lemon to the Teign estuary, 15 miles (by rail 20) S. of Exeter. Ford House, a good Tudor building, has lodged both Charles I. and William of Orange, who here in 1688 was first proclaimed king. Pop. (1851) 3147; (1881) 9826.

Newton Heath, a town and local government district, and part of the parliamentary borough of Manchester, with a pop. of 29,189.

Newton-in-Makerfield (otherwise NEWTON-LE-WILLOWS), with its suburb of Earlstown, a thriving town of Lancashire, 16 miles E. of Liver-

pool and 16 W. of Manchester. An important railway junction, it has rapidly increased in size, and large printing-works, paper-mills, iron-foundries, and a sugar-refinery are here in operation, whilst numbers of hands are employed in the making of bricks and railway wagons. Near to the town is a fine racecourse on which a meeting is held annually in July. At Parkside, $\frac{1}{2}$ mile distant, the Right Hon. W. Huskisson met with the accident which caused his death, on the occasion (15th September 1830) of the opening of the railway. Newton returned two members to parliament from 1558 to 1832, when it was disfranchised. Pop. (1801) 1455; (1881) 10,580; (1891) 12,861.

Newton-Stewart, one of the most beautifully situated among the smaller towns of Scotland, on the Wigtownshire side of the river Cree, near its mouth, by rail 50 miles W. of Dumfries and 24 E. of Stranraer. It owes its name to a son of the Earl of Galloway, who obtained a charter making it a burgh of barony in 1677. Manufacturing enterprises have hitherto proved unsuccessful. Its buildings are a fine town-hall (1884) and an endowed school, the Ewart Institute (1864). Pop. (1841) 2432; (1881) 3070; (1891) 2332.

Newtown (Welsh *Drefnewydd*; anc. *Llanfair Cedewain*), a manufacturing town of Montgomeryshire, North Wales, on the Severn and the Montgomery Canal, 13 miles SSW. of Welshpool. It is the centre of the Welsh flannel manufacture, and also produces tweeds, shawls, &c. With Montgomery, &c., it returns one member. Robert Owen was a native. Pop. (1851) 6371; (1891) 6610.

Newtownards, a town of County Down, 14 miles E. of Belfast by rail. Flax-spinning, muslin-weaving and embroidering, and nursery-gardening are the industries, and there are important markets. Pop. (1881) 8676.

New Westminster, formerly the capital of British Columbia, is on the north bank of the Fraser River, 10 miles from its mouth and 113 miles by rail and steamer NNE. of the present capital, Victoria, on Vancouver Island. Here are a penitentiary and a lunatic asylum, sawmills, and great salmon-canning establishments. Pop. 2700.

New-year's Day, the first day of the year. The custom of celebrating by some religious observance, generally accompanied by festive rejoicing, the first day of the year, appears to have prevailed among most of the ancient nations. The Jews, the Egyptians, the Chinese, the Romans, and the Mohammedans, although differing as to the time from which they reckoned the commencement of the year (see CALENDAR, CHRONOLOGY, YEAR), all regarded it as a day of special interest. On the establishment of Christianity the usage of a solemn inauguration of the New Year was retained; but considerable variety prevailed, both as to the time and as to the manner of its celebration. Christmas Day, the Annunciation (25th March), Easter Day, and 1st March have all, at different times or places, shared with the 1st of January the honour of opening the New Year; nor was it till late in the 16th century that the 1st of January was universally accepted as the first day of the New Year. The early Fathers—Chrysostom, Ambrose, Augustine, Peter Chrysologus, and others—in reprobation of the immoral and superstitious observances of the pagan festival, prohibited in Christian use all festive celebration; and, on the contrary, directed that the Christian year should be opened with a day of prayer, fasting, and humiliation. The festal character of the day, however, generally was preserved, though the day was also observed as a day of prayer.

From the earliest recorded celebration, we find notice of feasting and the interchange of presents

as usages of New-year's Day. Suetonius alludes to the bringing of presents to the capital; and Tacitus makes a similar reference to the practice of giving and receiving New-year's gifts. This custom was continued by the Christian kingdoms into which the western empire was divided. In England we find many examples of it, even as a part of the public expenditure of the court, so far down as the reign of Charles II.; and, as all our antiquarian writers mention, the custom of interchanging presents was common in all classes of society. In England, as in Germany, this custom has been largely eclipsed by the still more popular practice of Christmas gifts (see CHRISTMAS); in Scotland, as in France and Italy, New-year's Day is still the day most observed, and the festival according to Old Style, twelve days later, still lingers in corners of the country. In some parts of the United States and Canada gentlemen are exceptionally industrious in making social calls on the first day of the year. In many countries the night of New-year's Eve, 'St Sylvester's Eve,' was celebrated with great festivity, which was prolonged till after twelve o'clock, when the New Year was ushered in with congratulations, complimentary visits, and mutual wishes for a happy New Year; this is an ancient Scottish custom (see HOGMANAY). In many places the practice of tolling bells till midnight, and then 'ringing in the New Year,' is still observed. Many religious communions are wont to celebrate it with a special service or 'watch night.' In the Roman Catholic Church New-year's Day is a holiday of strict obligation. See Chambers's *Book of Days*.

New York, the 'empire state' of the American Union, is the twenty-fifth in area and the first in population. It lies between 45° Copyright 1891 in U.S. by J. B. Lippincott Company. and 40° 29' 40" N. lat., and (including Long Island) between 71° 51' and 79° 47' 25" W. long. It is somewhat triangular in shape, and has a very irregular outline. Its boundary line measures 1420 miles, of which 879 miles, or nearly two-thirds of the entire length, lie along the shores of Lake Erie, the Niagara River, Lake Ontario, the St Lawrence River, and Lake Champlain. The remaining portions of the boundary are formed by arbitrary straight lines. Area, 49,170 sq. m., or almost that of England. Long Island is the largest, and Manhattan, containing the most populous part of New York City, the most important of the many islands.

The surface structure of New York is remarkably diversified, and presents many contrasts of elevation. The state is traversed by numerous chains of mountains and hills, among which lie beautiful valleys. There is also much rolling land, and there are several extensive plains. The greatest elevations are in the eastern and north-eastern parts of the state, but nearly the whole of the south-eastern part is hilly or mountainous. From this highland region the land slopes gradually, and declines in a series of terraces, north and west toward Lake Ontario. The most level portions are those bordering that lake and the St Lawrence River. The mountainous region in the east is cut by the gap of the Mohawk River. The narrow valley of this stream, once traversed by a mighty river which drained the great Ontario basin, joins at right angles the deep depression in which are Lake Champlain, Lake George, and the Hudson River. Both of these valleys pass directly through the Appalachian system of mountains, and divide the state into three distinct sections. The mountains are also disposed in three groups. The Adirondacks (highest point, Mount Marcy, 5400 feet), in the north-eastern part of the state, are completely isolated by the valleys of Lake Champlain and the Mohawk River from all other parts of the Appal-

achian system. South of the Mohawk valley are the Catskills with various associated groups, such as the Helderberg and the Shawangunk Mountains, covering an area of about 500 sq. m. The Shawangunk Mountains are continuous with the Blue or Kittatinny Mountains of Pennsylvania. The Taconic range of New England enters the state still farther south, and passes south-westerly into New Jersey. This range is cut by the Hudson River, and forms the celebrated Highlands.

The geology of New York is peculiarly interesting and comprehensive. With the exception of the Jurassic formations and a few others closely related in time with the Jura-Trias, its rocks exhibit deposits of nearly every period, from the primitive Archæan rocks to the Tertiary and recent alluvium. Briefly and superficially classified, the outcropping rocks are disposed as follows: In the north-eastern part of the state, with the Adirondacks as a centre, is a somewhat circular area of Archæan formation. Along the eastern side of the Hudson River and near its mouth, the Archæan rocks again appear, and are continuous with the primitive formations of New England. Nearly surrounding the Adirondack region is a belt of Silurian rocks, which extends southward along the western shore of the Hudson, and westward, bordering upon Lake Ontario and Lake Erie. North of the Adirondacks is a belt of Cambrian rocks, and south and west of the Silurian belt the greater part of the formation belongs to the Devonian age, with traces of Carboniferous deposits, but no true coal-measures. There are in the state some extensive iron-mines, deposits of lead, copper, zinc, and other valuable minerals, and an abundance of building-stones. The salt-springs, especially those of the Onondaga salt group, are of great value. There are also valuable petroleum springs, and mineral and medicinal springs—the most noted are those at Saratoga, Ballston, Sharon, Richfield, Avon, and New Lebanon.

The most important river belonging entirely to the state is the Hudson (q.v.). The Oswego, draining a chain of lakes in the central part of the state, the Black, and the Genesee are affluents of Lake Ontario; the St Lawrence forms part of the northern boundary; the Niagara connects Lakes Erie and Ontario, and the Delaware, the Susquehanna, and the Allegany rise within and drain the southern portions of the state.

New York lies mainly in the lake region of North America. The eastern part of Lake Erie, one-half of Lake Ontario, and one-half of Lake Champlain are controlled by the state. Among the numerous lakes of north-eastern New York, Lake George and the Adirondack lakes are the most noted. There are three groups of picturesque lakes in central New York. The mountains, rivers, and lakes of New York make it famous for its scenery. Of this, one of the most notable features is the number of waterfalls, among which the mighty Niagara is of course pre-eminent. Other beautiful falls are the Falls of the Genesee (q.v.), Trenton Falls, the Kaaterskill Falls in the Catskills, and those of Cohoes, Ticonderoga, and at Watkins Glen.

The average temperature of New York is about 47° F., with a range of over 100°. The climate is thus subject to extremes, but is very healthful. Although the surface is so diversified, most of the soil is arable, and much of it is fertile. More than one-half the area of the state is under cultivation. The usual farm products are raised in abundance. In the lake valleys there are many vineyards. Hops and tobacco are also important crops. In the vicinity of New York and the other large cities market-gardening is a profitable occupation, and the highland regions yield excellent milk, butter, and cheese. But manufacturing is the leading

industry, and in the value of its manufactured products New York is the foremost state of the Union. Moreover, its geographical position and its natural avenues of communication with other parts of the country, together with the system of canals and railroads, make it the leading commercial state. There are several canals, of which the Erie (see CANAL) is the most important. New York is the centre towards which nearly all the great railroads of the country tend, and within the state there are nearly 7800 miles of railway.

Previous to the coming of the whites the territory now known as New York was occupied by the Iroquois (q.v.) Indians. Almost simultaneously, in 1609, Samuel Champlain discovered the lake which bears his name, and Henry Hudson explored the Hudson River as far as the present site of Albany. A few years later settlements were made by the Dutch, but they were looked upon as intruders by the English, who in 1664 forced them to surrender their city of New Amsterdam, which had grown up on Manhattan Island. The name was then changed to New York, and, with the exception of a short period in 1673, the city remained in the possession of the English till the war of the revolution. As in the other colonies, the early settlers endured many vicissitudes, and were at different times engaged in conflicts with the Indians. In the struggle for independence, in the war of 1812, and in the civil war New York played a prominent part. The physical structure of the state has made it a most important factor in the development of the nation, and in population, wealth, and political influence it has always held the pre-eminence.

With her great material prosperity New York has not neglected the education of her people. There is no more complete school-system in the country. It includes more than 11,000 school districts. There are eight normal schools in the state, and the normal college at New York City, beside many private schools and academies; and there are nearly thirty colleges, universities, and schools of higher learning, not including theological seminaries and professional schools.

Politically the state is divided into sixty counties; it returns the largest number (34) of members to congress. No other state has so many large cities and thriving, enterprising towns. New York City is the centre of a thickly populated district, which is second only to London in the number of its people and the importance of its commercial interests. The other most important cities are Albany (the capital), Brooklyn, Buffalo, Rochester, Troy, Syracuse, Utica, Oswego, Kingston, Elmira, Poughkeepsie, Auburn, Cohoes, Newburgh, Yonkers, Long Island City, Binghamton, Schenectady, Lockport, Rome, Ogdensburg, Watertown, Hudson, and Dunkirk. Pop. (1800) 589,051; (1850) 3,097,394; (1880) 5,082,871; (1890) 5,981,934.

New York City, the largest and most important city on the American continent, and the third wealthiest on the globe, is situated on the east side of Hudson (here called North) River, at its confluence with the East River (q.v.), which opens into Long Island Sound. It lies in the state of New York, in a straight line $8\frac{1}{2}$ miles, and by the waterway about 12 miles from the ocean, in $40^{\circ} 42' 43''$ N. lat., and $74^{\circ} 0' 3''$ W. long. It comprises the island

of Manhattan, formed by the two rivers, which is separated from the mainland by a narrow strait, the east portion of which is known as Harlem River, and the west as Spuyten Duyvil Creek. It also includes several small islands in the inner bay and East River. In 1873 the city's limits were extended so as to embrace 12,100 acres on the mainland, lying toward the east and north, in Westchester county, as far as the city of Yonkers. The total area of New York City now embraces $41\frac{1}{2}$ sq. m. Manhattan Island is $13\frac{1}{2}$ miles long, with an average breadth of $1\frac{1}{2}$ mile. A rocky ridge runs through the upper part of its western side, rising to 238 feet, known as Washington Heights. With the exception of a small portion of wild and stony space, which is being utilised for ornamental purposes, the entire island is laid out in avenues and streets, lined with

houses; its area includes several greens and parks. The lower part of the city has to a considerable extent been extended by filling in on the two river-sides.

The bar at Sandy Hook, 18 miles south of the city, which divides the Atlantic Ocean from the outer bay, is crossed by two ship-channels, from 21 to 32 feet deep at ebb-tide. The lower bay covers 88 sq. m. for anchorage. In it are buildings for quarantine and hospital purposes, and an anchored floating hospital-ship, in charge of a health-officer. The Narrows, through which all large ships pass on their way to the inner harbour, is a strait between Long Island and Staten Island, about a mile in width, 8 miles distant from the city, in a south-easterly direction. This approach is defended by Forts Wadsworth, Tompkins, and Hamilton. There is also another channel leading

from the sea, through the so-called Kills, around Staten Island, between it and the New Jersey shore; only vessels of light draught can approach by this route. Vessels that come from the north and east, by way of Long Island Sound, pass the fortifications at Throgg's Neck on the mainland and Willett's Point on Long Island, about 10 miles from the city; their nearer approach is hindered by the rocky shoals and intricacies at Hell Gate (see **BLASTING**). New York's harbour or inner bay covers about 14 sq. m.; it is one of the amplest, safest, and most picturesque on the globe, open all the year round; many waterways place it in easy communication with the interior. Bridges span the East River and Harlem River, and about thirty steam-ferries are in constant intercourse with the neighbouring shores. The island of Manhattan has nearly 25 miles of water-frontage, of which 13 miles are on the Hudson River side; a large, unimproved part of the shore remains for future extension. The city is the centre of finance and commerce of the United States. It receives 66 per cent. of all the imports, and sends abroad 44 per cent. of the exports. Over 4000 steamers and 4000 sailing-vessels enter and clear in the coastwise trade, and 2150 steamers and 5000 sailing-vessels in the foreign trade. The annual exports of merchandise in 1890 amounted to about \$400,000,000, the imports to over \$500,000,000. There are more than seventy wooden piers on each river; and for want of convenient wharf accommodation several lines of foreign steamers have transferred their piers to the shores of Brooklyn and New Jersey, while a large amount of staple produce from the southern states and from distant lands is housed on the wharves and in the large storehouses of Brooklyn. Liberty Island, for a long time known as Bedloe's Island, is situated in the harbour, about 1½ mile from the lower end of the city. In 1886 the famous Bartholdi (q.v.) statue was erected on this spot, and occupies its central surface. The New York and Brooklyn Suspension Bridge (see **BROOKLYN**) spans the East River from opposite the old City Hall Park.

Old New York is laid out very irregularly. Here the money interests and wholesale traffic are centred. Wall, New, and Broad streets are the great centres in which banking and speculative enterprises are conducted to an enormous extent. The first-named thoroughfare is hardly half a mile in length, but in extent of business is perhaps unequalled by any other locality on the globe. The newer part of the city, from 14th Street to the end of the island, northward, is divided into twelve great avenues and several smaller ones, from 75 to 150 feet in width, running north and south. These are crossed at right angles by streets, mostly 60 feet in width, running from river to river. Fifth Avenue, the great modern central thoroughfare, divides the city into eastside and westside. Twenty street blocks measure a mile; every tenth street is double the usual width, designed for business purposes. Among old inhabitants remote parts of the city still bear the names of former village sites. The original great thoroughfare, Broadway, runs a distinct, devious course through the regular street arrangement, making several short angles and turns through the middle of the island. On reaching 59th Street it resolves itself into a grand boulevard. The streets, in general, are substantially paved, and at night well lighted by gas and electric lights. Many, however, are suffered to remain in an unswept and neglected condition. In the lower part of the city obstructions are often permitted permanently to occupy the sidewalks, and pedestrians are compelled, among carts and horses, to explore their way through the middle of the street.

Night and day sumptuous passenger steamers pass up and down Hudson River, Long Island Sound, and beyond the Narrows, down to the lower bay. Lines of railroads radiate from the Grand Central Depot; others run from the opposite shores of New Jersey and Brooklyn. The large city depot is 695 feet long and 240 wide; about 125 trains arrive and depart daily. Several of the city's avenues are traversed their full length by elevated steam passenger-railroads, built on wrought-iron structures, which from early dawn to midnight carry crowds of local passengers. Besides these there are many lines of horse and cable tramways, and a few worked by electric agency. Already these modes of conveyance are so overtaxed that additional travelling facilities are urgently demanded. More river-bridges, a viaduct avenue, subterranean roadways, and tunnelling under the rivers are in active contemplation; for most of these enterprises charters have already been granted. The number of houses is estimated at above 120,000, mostly built of red brick, the better class of brown sandstone, a few of wood. Besides these there are stores built of iron, brown and yellow sandstone, and a few of marble; little granite is being used in modern structures. The construction of wooden buildings in the lower part of the city has been interdicted. The modern tendency is to build roomy, tall, fireproof and semi-fireproof structures for apartment-houses and for business purposes, the internal ascents of which are made, from story to story, by mechanical elevators. Most of these structures range from 75 to 100 feet in height, and are costly and elegant. Among prominent public edifices are noteworthy: the City Hall, County Court-house, Custom-house, Treasury Building, Tombs (prison), Barge Office, Masonic Temple, Academy of Design, Cooper Union, Post-office, Produce Exchange, Madison Square Garden Hall, University of the City of New York, Lenox Library, Temple Emanuel, Trinity Church, and the Roman Catholic cathedral, besides numerous large, imposing hotels and palatial dwellings and business depôts. In many cases vaulted basements and sub-cellars are laid out under the buildings and sidewalks on an extensive scale. Among the apartment-houses conspicuous for size and luxurious appointments are Navarro's Spanish Flats, the Dakota, Gerlach, Knickerbocker, Florence, and Central Park structures. In out-of-the-way side streets the dependent and poorer classes are huddled together in equally tall, brick-built, dirty, yardless tenement houses. Immense retail bazaars and arcades are found on Broadway, Grand Street, 14th, 23d, and 125th Streets, and 3d, 6th, and 8th Avenues.

The city government is under a mayor and board of aldermen; these offices are mostly filled by adopted citizens from Ireland and Germany, who form a large part of the city's voting elements. The police force numbers 3420 men; there are thirty-five station-houses, where prisoners are temporarily conveyed, and shelter is provided for the homeless at night. New York has a paid fire-department, conducted at an annual expense of \$2,000,000, and divided into 76 companies; 1039 well-trained men and 337 horses are employed. Its appointments include, among others, 89 steam fire-engines, 15 trucks, and 84 telegraph stations. The lighting of the city is mostly done with gas, although electric lighting is gradually being brought into use. Of public gas-lamps there are some 25,000. Four gas companies are in operation, and have together about 900 miles of mains laid under ground. The Croton Aqueduct conveys to the city an ample supply of soft water from the Croton River and its lakes, a distance of about 40 miles, to the four reservoirs of the city (see **AQUEDUCT**).

In Central Park the retaining reservoir holds 1,030,000,000 gallons, the receiving reservoir 150,000,000 gallons, the distributing reservoir on 5th Avenue 20,000,000 gallons; at High Bridge there is also a high-service reservoir, with a capacity of 11,000,000 gallons. The iron main-pipes are little short of 500 miles in length. Electric telegraphs and telephones are largely in use. The New York General Post-office building, erected of granite, at a cost of \$6,500,000, was first occupied in 1875. It is situated in what was formerly known as the City Hall Park, in the lower part of the city. More than 2500 persons are here employed. There are 18 stations and 20 sub-stations in various parts of the city, and 1600 lamp-post boxes. A federal commissioner now receives and attends to the wants of immigrants. In some years the immigration by way of New York has risen to nearly half a million.

The Battery Green encloses twenty-one acres, planted with trees, shrubbery, and grass, and occupies the most southern point of Manhattan Island; it marks the original site of Nieu Amsterdam. After the American revolution it was used for military and civic displays, and from that time until near the middle of the 19th century was the fashionable promenade. On its west side is Castle Garden (q.v.). The grading of Central Park was begun in 1857. It is laid out in the highest style of art, containing walks, drives, and bridle-paths, and is decorated with artificial lakelets, fountains, bridges, monuments, statues, recreative and garden structures. It also holds the Egyptian obelisk, brought from Alexandria in 1880. Within the park confines, besides the reservoirs, are the Museum of Art and buildings for a zoological collection, while 'annex' grounds contain the Museum of Natural History. Central Park comprises 843 acres, extends from 59th to 110th Street, and is bounded by 5th and 8th Avenues; its dimensions are thus $\frac{1}{2}$ miles by $\frac{1}{2}$ mile. Riverside Park is a narrow, irregular strip of land, running alongside the Hudson from 72d to 130th Street, much used for riding and driving purposes. On the newly-acquired mainland two extensive parks have been laid out—Jerome and Van Cortlandt—the first named being used as a racecourse.

New York has 97 local fire-insurance companies, 10 local marine-insurance companies, 39 local life-insurance companies, 83 commercial banks (of which several have a capital of \$5,000,000), 23 savings-banks, and 15 trust-companies. About 288 newspapers (daily, weekly, and monthly) are published—some of them are in foreign languages; the prominent journals occupy immense buildings. Dispensaries, hospitals, and charitable institutions are numerous. Homes for the aged and crippled, the insane, idiots, blind, deaf and dumb, magdalens, and foundlings are provided. Of church buildings there are about 400—91 Episcopal, 88 Methodist, 84 Presbyterian, 59 Roman Catholic, 54 Baptist, and 29 Jewish. There are congregations of Christian-Israelites, Swedenborgians, Salvation-Armysts, Spiritualists, and Chinese. Of the public schools 47 are primary and 85 grammar-schools, each jointly under a male and female principal. Many children of Roman Catholic parents are being withheld from these institutions, in favour of parish schools of their own denomination. The day attendance at public schools averages 307,000; at evening schools about 20,000. There are four general colleges—Columbia, the University of the City of New York, the College of the City of New York, and the Normal College, the last two belonging to the public-school system. Besides these there are many special colleges and academies, Union Theological Seminary (Presbyterian), the Protestant Episcopal General Theological Seminary, &c. Among libraries may be

named the Astor, with 240,000 volumes; Mercantile, 207,000; Columbia College, 105,000; Apprentices', 84,000; Historical Society, 72,000; and Society, 70,000. Besides these there are a number of free circulating libraries. The Museum of Art, Museum of Natural History, and Lenox Gallery are free to the public. Annual exhibitions of paintings and statuary are held at the Academy of Design and other places, and of mechanical inventions at the hall of the American Institute. The theatres number 24, besides an opera-house and numerous concert-halls. Among the wealthy club life is rapidly on the increase; in a few instances it extends to the gathering of women. Noted clubs are the Manhattan, Union, New York, St Nicholas, Knickerbocker, Union League, University, Lotus, Harmonic, and Century. Of musical clubs and singing societies there are many, mostly under German leadership and patronage. Prominent are the Liederkrantz, with 1600 members, and Arion, with 800 members. The principal orchestral society is the Philharmonic.

John Verrazani, a Florentine navigator, was the first European who entered New York bay, in 1525. His exploration was interrupted by a storm that compelled him to put to sea without making a settlement. In 1609 Henry Hudson entered Hudson River, and, trading with the aborigines, ascended the stream for about a hundred miles. In 1614 the Dutch built a fort on Manhattan Island, and in 1623 a permanent settlement was made, named Nieu Amsterdam. In 1674 Manhattan Island came into the possession of Great Britain, who gave it the name New York, in honour of James, Duke of York. At the time of the American Revolution the city's population was less than that of Philadelphia and Boston. It was evacuated by the forces of Great Britain in 1783, and from 1785 to 1789 was the seat of government of the United States. In 1774 the city census, taken by government, showed a population of 22,861; (1800) 60,489; (1825) 166,136; (1850) 550,394; (1860) 813,669; (1870) 942,292; (1880) 1,206,599; (1890) 1,515,301. A recounting was made by the city police in the last-named year, under the direction of the mayor, in which the returns amounted to 1,710,715 persons. Should we add the populations of several adjacent cities that bear a suburban relation to the great metropolis, the busy hive would count no less than three million people. See *Histories by Lossing* (2 vols. 1885) and by *Roosevelt* (1891).

New Zealand, a British colony in the South Pacific Ocean, comprises three main islands—named the North Island, the South or Middle Island, and Stewart Island, the last being much the smallest—besides a number of islets near the coast. The North and South Islands are long and narrow, so that no place is more than 75 miles from the coast. Their position relative to Australia is much the same as that of Turkey to England, as they lie 1200 miles more to the east and stretch 600 miles farther south. The main islands have a length of 1100 miles, and lie between 34° 22' and 47° 18' S. lat. and 166° 27' and 178° 34' E. long. Projected on the map of Europe, these latitudes would begin in central France and end in the north of Africa. The total area of the colony is 106,240 sq. m., or about one-eighth less than that of Great Britain and Ireland. Cook Strait, a deep and somewhat stormy passage of 13 miles at the narrowest part, separates the North and South Islands. Foveaux Strait, about 15 miles in width, divides the South Island from Stewart Island.

Coast Features.—In its northern half the North Island is deeply indented by the sea, and contains many excellent harbours; the southern half has but one harbour, that of Wellington or Port Nicholson in the south-west corner. The coast of the South

Island is little broken except in the north-east and south-west corners, where the country is mountainous; but the volcanic projections of Banks and Otago peninsulas supply commodious harbours, which have been greatly improved by moles and dredging. The ports carrying on the great import and export trade of the colony are Auckland, Napier, and Wellington in the North Island, and Lyttelton, Dunedin (Port Chalmers), and Bluff Harbour in the South Island. Coasting steamers call at numerous minor ports, the chief being, in the North Island, the Bay of Islands, Tauranga, Gisborne, Foxton, Wanganui, New Plymouth, Manukau, and Kaipara; and in the South Island, Nelson, Picton, Akaroa, Timaru, Oamaru, Hokitika, Greymouth, and Westport. The harbours of Timaru and Oamaru consist of spacious basins enclosed by massive concrete moles. Those at Greymouth and Westport have been constructed at great expense at the mouths of the rivers Grey and Buller to facilitate the shipping of the excellent coal found in vast quantities in the neighbouring hills. Large sums have been spent in improving the harbours of the colony.

Surface.—New Zealand is composed of rocks of all geological ages, and the chief mountain-chains are of great antiquity. A third of the North Island is covered by recent volcanic rocks and their debris. Both islands are mountainous, but this is especially true of the South Island. Each is traversed by a great mountain-chain running in a north-east and south-west direction, which practically divides them into an eastern and a western side, between which traffic is mainly carried on by sea. In the North Island the east and west sides are connected by two railways, one of them passing through the beautiful Manawatu Gorge, and also by a coach-road passing over the ranges west of Hawke Bay. Resting on the main chain of the North Island on its west side lies a vast triangular plateau, the eastern border of which constitutes the volcanic belt of New Zealand. On this stand up two extinct volcanoes—the majestic cone of Mount Egmont, near the west coast, and the massive Ruapehu (9195 feet) in the centre, with the active cone of Tongariro hard by. The latter still gives off steam and smoke, but has not ejected lava in historic times. In this plateau the chief rivers of the North Island take their rise. The Waikato, the largest and longest, passes through the beautiful Lake Taupo, and at length flows out on the west coast. A few of the rivers are navigable for small vessels in their lower course. The North Island contains many extensive plains of low elevation and remarkable fertility, besides large areas of fern-clad or grassy hills well fitted for occupation. The favourable climate renders even the upland plateaus capable of close settlement. The better lands of the South Island are now mostly taken up, though far from closely settled, but in the North Island there remain vast tracts of excellent land waiting to be cleared and occupied. Much of it belongs to the natives, who are no longer reluctant to sell their lands at a fair price. Two-thirds of the South Island is covered by the broad and lofty chain of the Southern Alps, and its eastern and southern offshoots. It culminates in Mount Cook, towering to a height of 12,349 feet amid many other snow-clad peaks, and mantled by glaciers of greater magnitude than any in the Alps of Europe. This elevated region is penetrated by the great valleys of the numerous rivers flowing away to the east and south. These have all a rapid fall, are liable to sudden floods, and being snow-fed have a much larger volume in summer than in winter. Their valleys sometimes open out into extensive upland plains having a hot, dry summer, and a sharp but bright winter. The

principal rivers are the Buller, Waimakariri, Waitaki, Clutha, and Waiau. The chief lowlands of the South Island lie to the east and south of the main chain. The vast Canterbury plains, in many parts of great fertility, skirt the east coast, and the Southlands plain, equally extensive, lies between the mountains of Otago and the south coast. Much of the east and south-east seaboard and interior is occupied by fertile downs and low hills. The west coast consists of a narrow belt of low land clothed with impenetrable forest, save where miners and farming settlers have made clearings, and where the broad river-beds come down to the sea. A coach-road passes over the main chain at a height of 3000 feet, connecting Canterbury and Westland, and a railway was in 1890 in course of construction along the same picturesque but difficult route. In the North Island much of the finest land is covered by forests of tropical luxuriance, which ascend the mountains to a height of 4000 feet, but the greater part of the South Island is very scantily supplied with timber, and mountains and lowlands alike are open and well grassed, yielding good pasture even in their natural condition. The great peninsula north of Manukau Harbour differs from the rest of New Zealand in enjoying a humid semi-tropical climate. Much of this region is admirably fitted for cottage husbandry, and the fruits of the warmer latitudes grow in great abundance and perfection. Settlers can here live like the peasantry of Spain and Italy, growing flowers for perfumes, maize, figs, olives, grapes, oranges, lemons, mulberries, and other tender fruits. This district is the home of the noble kauri pine, and supplies most of the kauri gum brought to the market. The numerous inlets and the large Wairoa River give ready access to the best of the land.

Climate.—The climate of New Zealand is one of the best and healthiest in the world. The rate of mortality has been decreasing for a number of years, and is now as low as 9·04 per thousand. Diseases from malaria are unknown. Owing to the great length of the islands the climate presents considerable variety, and the direction of the mountain-chains increases the difference due to latitude alone. The average temperature is remarkably equable at all seasons, and the air is singularly fresh, being constantly agitated by winds that blow over a boundless expanse of ocean. The climate is such as Italy would have if it were 1000 miles from the nearest continent. The average daily range of temperature is 20°. The average annual temperature of the North Island is 7°, and of the South Island 4°, higher than that of London. Near the western seaboard the climate is more equable and much moister than on the long eastern and northern slopes. More rain falls than in England, and the weather is generally more changeable, but there are fewer wet days. The country is everywhere well watered, and prolonged droughts are unknown. Snow seldom falls even in the southern lowlands, and it usually melts in a day. The mildness of the winter allows cattle and horses to remain in the fields without shelter, and even in the south dairy cows are housed at night only for a few months. The prevailing winds blow from the south-west and are often chilly and boisterous. Other winds are light, with fine weather; but fierce gales are often experienced near Cook Strait and along the eastern edge of the plateau-like offshoots of the Southern Alps.

Scenery.—For variety, picturesqueness, and wild grandeur, the scenery of New Zealand is unrivalled in the southern hemisphere, and the colony is rapidly becoming to Australia and the far East what Switzerland is to Europe. In the North Island is the wonderland of the volcanic belt,

remarkable for its hot lakes and pools, which possess great curative virtue for all rheumatic and skin diseases, its boiling geysers, steaming fumaroles, sulphur-basins, and pumice plains. These and other interesting phenomena are scattered broadcast over a wide belt, stretching from the extinct Ruapehu to the active volcano of White Island in the Bay of Plenty. The exquisite siliceous terraces of Rotomahana, once the cynosure of the island, are now buried beneath the debris of Mount Tarawera, shattered to dust by the gigantic steam explosion of June 1886. This region shows better perhaps than any other quarter of the globe the senile and expiring efforts of a prolonged cycle of volcanic activity, and every part of it can be explored without hardship and in perfect security. A well-appointed sanatorium is carried on at Rotorua by the government for the healing of the people of the Australian colonies, and is much frequented. Earth tremors and slight earthquakes are not uncommon in the neighbourhood of Cook Strait, but they have done less harm since the colony was settled than earthquakes have done in England during the same period. In the South Island the Central Alps of the Mount Cook district display to the visitor the grandest glaciers in the temperate zones, splendid clusters of snowy mountain-peaks, and stupendous valleys set off by a series of placid yellow-tinted lakes. Farther south the Otago lakes—Wanaka, Wakatipu, Te Anau, and Mani-pori, embosomed in mountains 5000 to 8000 feet high—present some of the finest lake and mountain scenery in the world, and prove an unfailing source of delight to sightseers from every land. The south-west coast of Otago is pierced by a series of deep and tranquil sounds of exquisite beauty, charming the beholder now with their picturesque variety, and anon with their precipitous grandeur and impressive quietness and gloom. Milford Sound, near which are the famous Sutherland Falls, 1904 feet in height, is justly reckoned one of the finest sights the world has to show.

Fauna and Flora.—New Zealand is a group of true oceanic islands, having been severed from all adjoining lands for countless ages. Originally it contained no mammals except two species of bat. The next highest animals were a few small and harmless lizards, the largest being the remarkable 'tuatara,' famous for its median pineal eye hidden under the skin of the head. Among the birds are several parrots, one of which—the mountain Kea (q.v.)—has recently acquired the habit of killing sheep by pecking the flesh of the loins, and several wingless kiwis (see *APTERYX*), the puny surviving relatives of the gigantic Moas (q.v.), now extinct, but in former times the lords of creation in these islands. The Maoris brought dogs with them, and doubtless the native rat also. Cook gave them pigs, whose wild descendants are still common enough in spots remote from settlement. The colonists introduced the common domesticated animals of Europe, which all thrive to perfection. Many kinds of English birds, and also black swans from Australia have been established in the country, and they are now numerous, and in some cases very troublesome. Most unfortunately rabbits also have been acclimatised, and they swarm in such numbers as to be a serious pest, which it costs more than £100,000 a year to keep in check. Fresh-water fishes of many kinds have been introduced with great success, but salmon have proved hard to establish. The honey and humble bees multiply to an extraordinary degree. In fact, acclimatisation experiments have proved only too successful, and the colony would gladly pay a million or more to be rid of rabbits, sparrows, and linnets alone. Nearly all the native trees and shrubs are ever-

green. The most important plants are the timber-trees. The best pine is the kauri, but rimu, matai, and totara are also of great economic value. Many other forest trees—beeches, ratas, puriri, kowhai, &c.—yield excellent timber. The Phormium or native flax thrives best in wet ground, and grows wild in great profusion. The smaller native grasses yield excellent pasture, and the tall 'toi-toi' and *Danthonia* surpass the well-known pampas grass in elegance of form. Ferns of many kinds greatly abound, including numerous tree-ferns. The fruit and other trees of temperate zones thrive admirably, and a great variety has been already introduced. European grasses and trefoils spread with great rapidity, and so do weeds of every kind, especially sweetbriar, gorse, thistles, cat's-ear, sorrel, and docks. Most of these plants grow with a luxuriance unknown in England. Many garden flowers have also run wild.

Soil and Productions.—The deeper alluvial soils and the extensive tracts of limestone formation are both extremely fertile. Considerable tracts of the Canterbury and the inland plains are shallow and arid, and require irrigation, which is now extensively applied. The rest of the lowlands is clayey and heavier to work, but yields a good return for tillage or under pasture. The best lands of the North Island regularly carry 8 to 10 sheep per acre on the sown pastures alone. On good land wheat yields a return of 60 to 70 bushels an acre, and oats do still better. The average yield of cereals per acre is: wheat, 25 bushels; oats, 32 bushels; and barley, 27 bushels; while potatoes give 5½ tons; and this with the simplest farming, for manuring of any kind is little used. In 1889, to which year all the other statistics refer unless otherwise mentioned, the aggregate production of wheat and oats was 8,448,506 bushels and 13,673,584 bushels. The area ploughed and laid down in grass or crops was 4,414,199 acres, while 3¼ million acres were sown with grass without ploughing, chiefly in the fern and forest lands of the North Island. The people are a farming people, and their chief employment is the raising of agricultural and pastoral produce. The volume of these productions may be judged from the present value of the exports, the entire home consumption of the articles exported being of course provided for in addition. Wool amounted to £3,976,375, the produce of 15¼ million sheep. The home consumption was 3,556,004 lb. Cereals gave £975,983, wheat being £489,728 and oats £360,086. Including flour, meal, bran, &c., the whole export of grain produce was £1,248,866. This produce went chiefly to Australia, wheat alone going in quantity to London. Frozen, preserved, and salted meats were valued at £922,221, the frozen meat alone reaching £783,374. Nearly a million frozen sheep were shipped to England, and it is believed that the pastures will in a few years yield twice as large a supply. Notwithstanding this enormous drain on the flocks of the colony, they become every year finer and more numerous, since settlers find the rearing of sheep and cattle more remunerative and less toilsome than growing cereals, while the value of their produce is less affected by sudden fluctuations in prices. Kauri gum, chiefly shipped to America, was £329,590. Dairy produce exported reached a value of £213,945, the home consumption of these articles being also very large. The exports of butter and cheese have greatly increased in recent years. Phormium fibre was valued at £361,182, a total many times greater than the average yearly export of this article. See *FLAX* (NEW ZEALAND). Among miscellaneous exports are skins and hides, £276,393; timber, £199,293; tallow, £159,460; potatoes, £93,996; leather, £65,487; seeds, £45,239; bacon and hams, £31,156;

hops, £15,965; onions, £12,963; oysters, £8745; fungus (for the Chinese market), £15,903.

Minerals.—The chief mineral product is gold, mainly derived from alluvial workings. The total export up to 1889 was 11,625,028 oz., and for that year 203,211 oz. For years this export has been declining in value, but recent developments of alluvial mining promise a considerable permanent increase. Silver, lead, copper, antimony, and manganese are produced in small quantities, and by crude processes. The coal raised in 1889 was 586,445 tons. The import of this mineral is less than a fifth of the home production, and comes chiefly as return cargo from New South Wales. The coal of the extensive fields near Greymouth and Westport is unsurpassed in quality for gas and steam purposes. Brown coal and lignite are mined in most parts of the colony, and afford supplies of cheap fuel. The other mineral resources are little developed, but the recent success in smelting the iron sand which abounds on the west coast of the North Island seems to prove the dawn of a great and permanent iron-working industry. The number of miners is about 23,000, or 4 per cent. of the population.

Manufactures.—The manufactures are entirely of articles largely consumed in the colony. They are stimulated by high protective duties, are rapidly growing, and afford employment to a large part of the population. The chief are woollen cloths, wools, hosiery, blankets, soap, candles, leather, biscuits and confectionery, boots and shoes, paper, machinery and implements, apparel, ropes and twine, beer, &c.

Trade.—The volume of foreign trade increases every year, and for several years the exports have exceeded the imports. The excess of exports over imports grew from £620,654 in 1887 to £3,042,168 in 1889. This implies that the colony is rapidly paying off old debts. These wiped off, home capital will grow rapidly, and exports will tend to balance imports. In 1889 the total exports were £9,339,265, and the total imports £6,297,097. Of the exports there went to Britain £6,599,682, to Australia £2,145,671, and to the United States £341,362. Of imports, £4,126,311 came from Britain, £1,107,132 from Australia, and £342,436 from America.

Finance, &c.—The consolidated revenue was £4,209,247, and the expenditure £4,121,842. The chief sources of revenue are customs duties (average 25 per cent. *ad valorem*), stamps, post-office, telegraph and railway profits, property-tax, and pastoral rents. The net public debt (March 1890) was £37,284,518, bearing an annual charge of £1,851,421. There were 1813 miles of railway, which cost nearly £15,000,000, and yielded a profit of £412,782, nearly 3 per cent. on the capital invested. The railways have proved an excellent investment. They and the telegraph lines belong to the state, though there are two private railways of considerable importance. The telegraph lines measure 11,827 miles, and a telephone service is provided in all the larger towns. Three submarine cables connect the North and South Islands, and two the colony and New South Wales, thus bringing New Zealand into telegraphic communication with the rest of the world. For the purpose of levying the property-tax, the property in the colony is valued at £218,033,039. All debts deducted, there remains a national capital stock of £128,521,234, created in fifty years by the industry of a community numbering on the average less than the population of a second-rate English city.

Education.—Liberal provision is made for the education of the people, and only 9000 persons above ten years of age are unable to read and write. Elementary education is free, compulsory, and secular. A highly efficient education is given

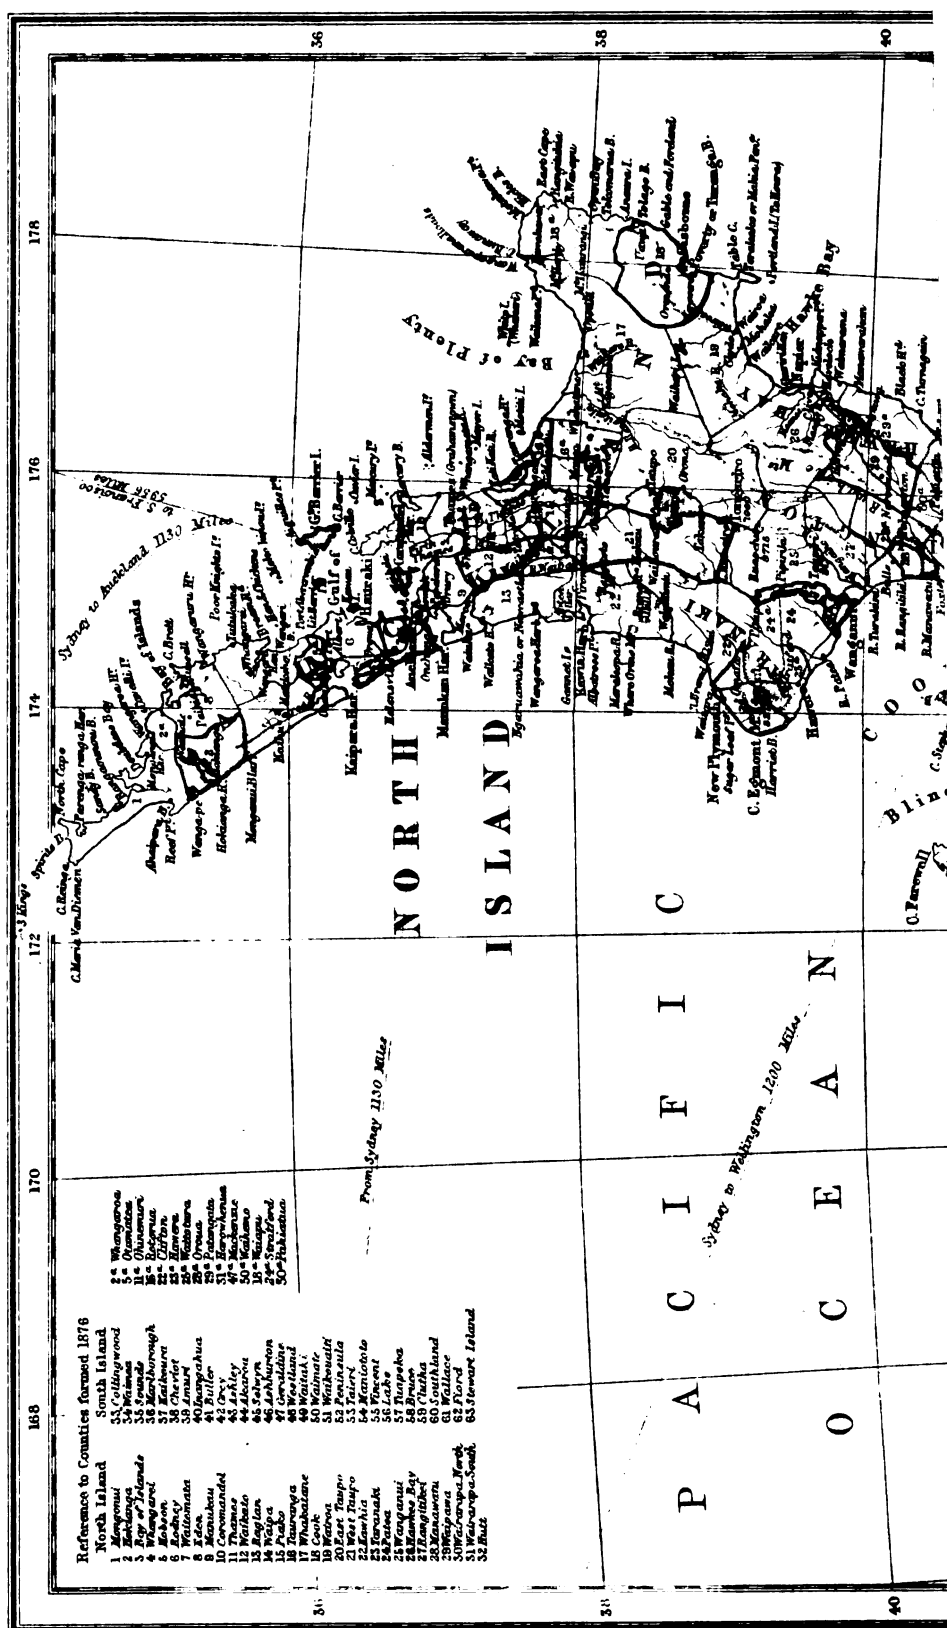

at the 1155 public schools, which are attended by 115,456 scholars, and maintained at a cost of £394,088 a year. There are also 72 schools for the natives (Maoris) alone, costing £16,000 a year. Higher schools for boys and for girls are numerous, and many of them have valuable endowments. These are attended by 2147 pupils, and cost £43,900 a year. There are three university colleges at Auckland, Christchurch, and Dunedin respectively, attended by 588 students. They are affiliated to the University of New Zealand, established by royal charter. It is only an examining body, and has granted 236 degrees in arts, science, medicine, law, and mining.

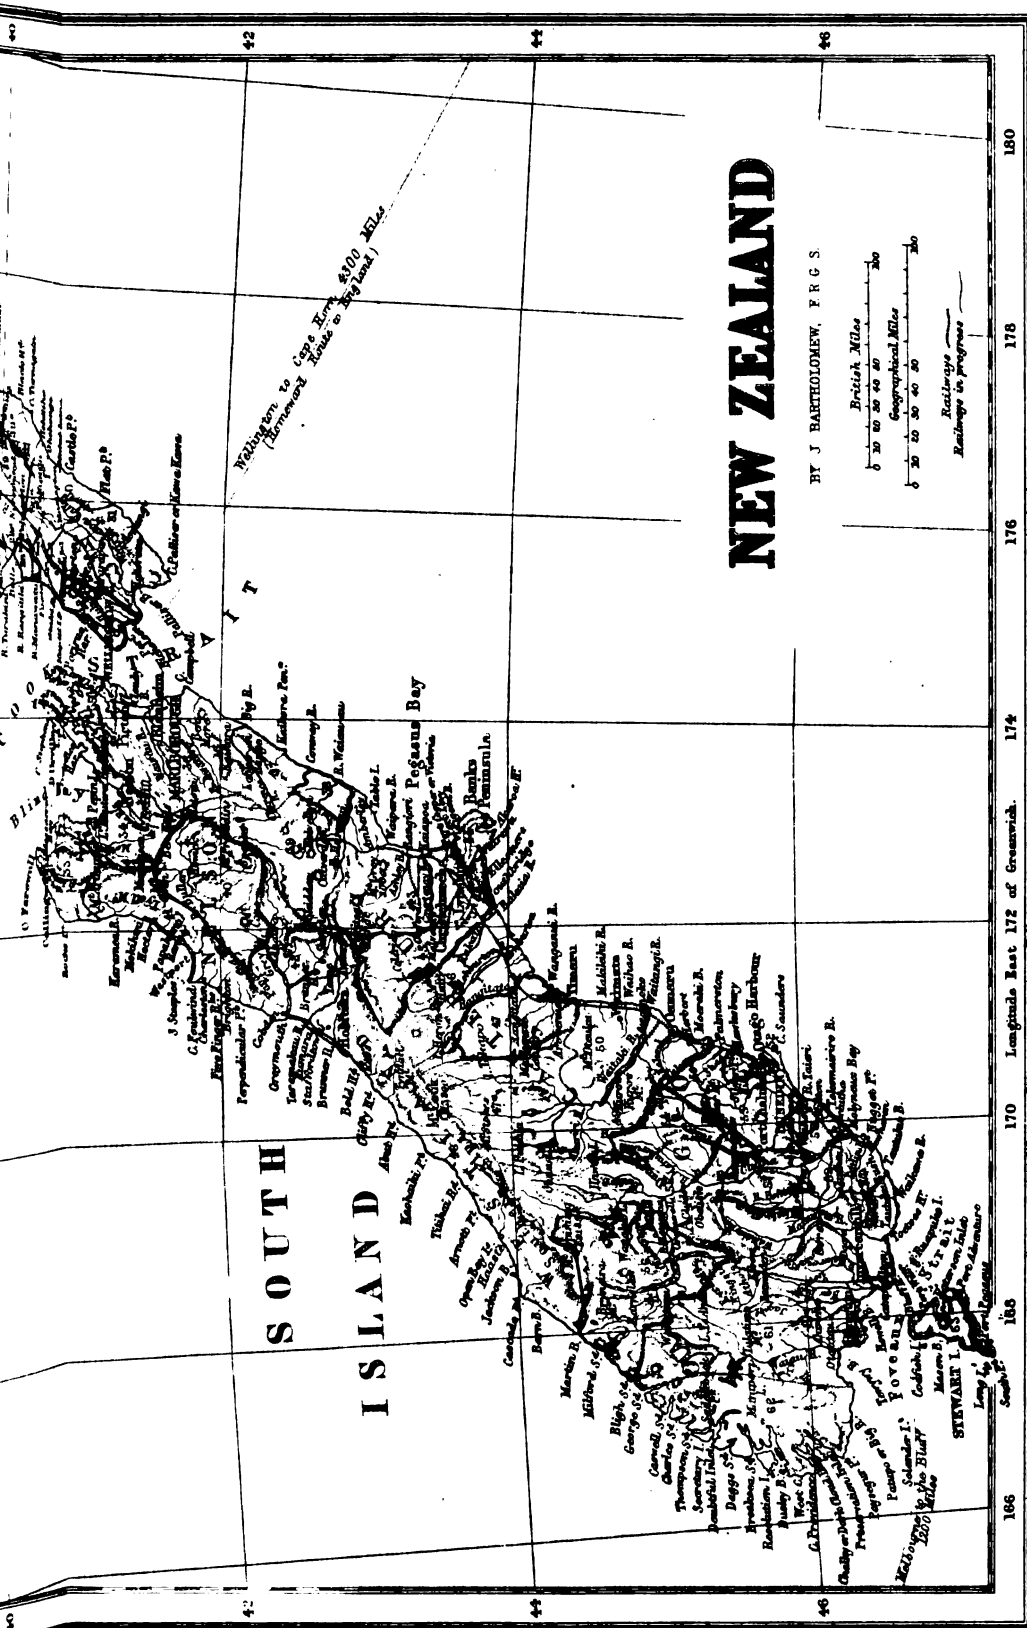

Settlement, &c.—More than 19 million acres have been already alienated by the crown. There were (December 1889) 37,432 freeholders of areas of 5 acres or more, of whom 35,548 held 1000 acres or less. About 400,000 acres have been taken up for settlement annually for some years. Rural lands may be acquired cheaply, and on most liberal terms. Selectors are restricted to 640 acres of first-class, and to 2000 acres of second-class land. Land is sold for cash mostly at auction, or taken up on deferred payment (the price being paid in equal instalments spread over 14 years), or on perpetual lease, the annual rent being 5 per cent. on the capital value, by paying which the freehold can be secured at any time. The last is much the most popular form of tenure. In 1889 the average price of cash lands was 19s. 6d. an acre, the average yearly instalment on deferred payment lands 1s. 9d., and the average rent on perpetual lease lands 10d.

Population.—In 1851 the white population was 26,707; (1861) 99,022; (1871) 256,260; (1881) 489,933; (1886) 578,482. In 1889 the pop. was 620,279, exclusive of 42,000 Maoris. More than half the people have been born in the colony, and only 13,000 are of non-British descent. Nowhere out of England does so pure an Anglo-Saxon community exist. There are 4500 Chinese residents. Five-sixths of the people are Protestants. Anglicans predominate in Canterbury, and Presbyterians in Otago, and there are many Wesleyans.

Political Divisions, &c.—Up to 1876 the North Island was divided into four provinces: Auckland, Hawke Bay, Taranaki, and Wellington; and the South Island into five: Nelson, Marlborough, Canterbury, Westland, and Otago. These are now known as provincial districts, and, though subdivided into numerous counties, retain great geographical importance, as they mostly form distinct natural divisions of the country. Wellington is the capital and seat of government (pop. 30,000). Auckland is the largest city (pop. 50,000). The other chief towns are Napier, Wanganui, and New Plymouth in the North Island; and Nelson, Blenheim, Christchurch (40,000), Timaru, Oamaru, Dunedin (44,000), and Invercargill in the South Island. Stewart Island has a sparse population on the north-east coast, and several excellent harbours.

Maoris.—The Maoris, as the natives call themselves, belong to the Polynesian race. Tradition says they came to New Zealand twenty-seven generations ago from Hawaiki, an island of the Pacific not identified with any certainty; but the real date of their migration is quite unknown. They probably displaced or absorbed an earlier and darker indigenous race, and this mixture would explain the diversity of type still found among them. From the first they were brave, generous, and warlike. About as tall as Englishmen, they have strong muscular frames, with legs that are short for their stature. The head is well shaped, and, though the lips are generally thick, the features are not unpleasing, and are often handsome. The skin is

usually an olive-brown. Most of them have long black slightly waved hair, but in some it is reddish. Tattooing, once practised by both sexes, is now almost abandoned. The punctures were made with a hammer and a small-toothed chisel, and were stained with the soot from kauri gum. The patterns, which extended over the face, hips, thighs, &c., consisted of ornamental spirals and scrolls, elaborated according to the wearer's rank. The women were but slightly adorned in this fashion. The priests had great influence, and could at will make any person or object 'tapu' or Tabu (q.v.)—i.e. sacred and inviolable. This was partly a religious and partly a political institution, and it was always respected by mutually hostile tribes, even in times of war. Cannibalism was universally prevalent as part of their system of warfare. The last known instance of it occurred in 1843. Infanticide, commonly practised in their heathen days, is now everywhere abolished, as is the case with slavery and polygamy. They marry early, but have few children, three to a family on the average. Many die in infancy and childhood. At the time of Cook's visit, and down to the formation of the colony, the tribes lived in a chronic state of warfare. They fought with clubs and spears of heavy wood and stone, and made excellent fortifications. Their most remarkable weapon was a short club, often made of nephrite, and called a *mère*. Among the chiefs these weapons descended from father to son, and were regarded as precious heirlooms. Other nephrite weapons were highly valued and very costly. Firearms are now in common use among them, but in the olden time they had no knowledge of pottery and metals or even of the bow and arrow. Their alphabet contains only fourteen letters, and every word and syllable ends in a vowel. Their names of places, rivers, &c. have generally passed into current use among the colonists. The language is rich and sonorous, and well adapted for the oratory, songs, and lyric poetry of which they were passionately fond. Five-sixths of their numbers are nominally Christians. Those living within or on the border of settlement are becoming gradually assimilated to the colonists, wearing European dress, &c. In remote parts they are even now content with a blanket for a garb. They still own large areas of land, on which they raise crops and keep great numbers of sheep, but they are not very industrious. They all wish to have their children educated, and send them regularly to school. They have a special franchise, and elect four members to the House of Representatives; two of their chiefs are members of the Legislative Council. In Cook's time they numbered 100,000, but there are now no more than 42,000, who almost all live in the North Island. The 'King movement' has at length died out, and the haughty and sullen 'King tribes' are giving up the seclusion into which they retired after the last native war.

History.—Tasman discovered the islands in 1642 and called them *Nova Zeelandia*, but Cook first made them known to the world. He surveyed the coasts and learned a great deal about the people in 1769 and following years. At the beginning of the 19th century whaling-ships began to frequent the coasts and to have intercourse with the natives, while a trade in kauri spars and native flax sprang up with the young settlement at Sydney Cove. This trade was stimulated by the eager desire of the Maoris for guns, tools and utensils of iron, and blankets. The introduction of guns made the constant tribal war more deadly than ever, and brutal slaughter greatly thinned the number of the people. The continual fighting and disorder caused the British government to include the islands in the territory of New South

Wales, and soon led to the cession of the colony to the British crown by the treaty of Waitangi (1840). By this treaty the native title to the soil was guaranteed, and every acre since sold has been duly paid for. Missionaries settled in the north in 1814, and soon formed a network of stations over the North Island. Within twenty years their labours were crowned with remarkable success, not only in converting the people, but equally in encouraging a more peaceful and civilised mode of life. The colony was planted in 1840 by the New Zealand Company, who with auxiliary associations founded successively the settlements of Wellington, Nelson, Taranaki, Otago, and Canterbury. The earliest and most irregular settlement was at the Bay of Islands. For a time the capital was fixed at Auckland, but in 1865 it was transferred to Wellington. A series of native wars began in 1843 and ended in 1869, since which year the colony has enjoyed complete peace. The wars arose partly from jealousy of the power and influence of the colonists, but chiefly from endless disputes about land sales, which were greatly complicated by the vague tribal tenure on which land was held by the natives. All through the wars, which were brought to an end by the unaided colonists, the trade and population of the colony grew at a rapid rate. Self-government was granted in 1852. The provinces created by the Constitution Act were abolished in 1875, and the government centralised and strengthened, while a complete system of local government by county and borough councils was soon after established. The government consists of a governor appointed by the crown, and a legislature composed of an upper chamber named the Legislative Council, with members appointed for life, and a lower chamber named the House of Representatives, elected for three years.

New Zealand Flax. See FLAX (NEW ZEALAND).

Ney, MICHEL, one of the most famous marshals of the great Napoleon, was born a cooper's son at Saarlouis, 10th January 1769. He was a non-commissioned officer in a hussar regiment when the Revolution began, but in the new order of things his merit quickly brought him promotion, and during the blockade of Mainz (1794) Kléber made him his adjutant-general. In 1796 he served under Jourdan, and earned the rank of general of brigade on the field of Forchheim. For the capture of Mannheim by a daring *coup de main* he was made a general of division in 1799. He was interim commander of the Army of the Rhine for a short time, during which he frustrated by a bold diversion an important movement of the Archduke Charles against Masséna and the Army of Switzerland. After the peace of Lunéville Bonaparte brought about his marriage with Aglaé Louise Auguié de Lescans, a young friend of Hortense Beauharnais, and appointed him inspector-general of cavalry. On the establishment of the empire he was made marshal of France. In 1805 he stormed

the entrenchments of Elchingen, for which he was created Duke of Elchingen. He distinguished himself anew at Jena and Eylau, and his conduct at Friedland earned him the title from Napoleon of 'le brave des braves,' and the grand-eagle of the Legion of Honour. He next served in Spain, but quarrelled with his superior Masséna about the plan of the campaign and returned to France, where he remained inactive till in 1812 he received the command of the third corps in the Grand Army. He covered himself with glory at Smolensk and Borodino (q.v.), and was rewarded with the title of Prince of the Moskwa. He led the rear-guard in the disastrous retreat, and his sleepless vigilance alone saved the remnant of the Grand Army. In 1813 he opened the battle of Lützen, and showed his usual capacity and courage at Bantzen, but was defeated by Bülow at Dennewitz. He fought heroically throughout the fatal struggle at Leipzig, and was also in the last defensive campaign of 1814; but after the capture of Paris he urged the emperor to abdicate, and submitted to Louis XVIII., who loaded him with favours. On Napoleon's return from Elba Ney was sent against him at the head of 4000 men; but the old enthusiasm proved too much for him, and with most of his soldiers he went over to his old master's side. In the final campaign he commanded the first and second corps, opposed Brunswick at Quatrebras (June 16), and led the centre with more than bravery at Waterloo; twice—once at the head of the cavalry, last with the Old Guard—he strove to break the English force in vain. During the day he had five horses shot under him. After the capitulation of Paris he yielded to the entreaties of his family to set out for Switzerland; but a costly Egyptian sabre, the gift of Napoleon, led to his being suspected by an official, and arrested near Aurillac. He was condemned to death for high-treason, and was shot in the garden of the Luxembourg on 7th December

1815—a cruel act of revenge that might well have been spared the bravest among the sons of France. Even the cost of the prosecution, 25,000 francs, was extorted from his unhappy widow. He left three sons, who published his *Mémoires* (2 vols. 1833).

Nez Percés, a tribe of American Indians, settled in Idaho, on the Lapwai River. The Nez Percés 'proper' have always been loyal to the whites, and are making good progress in civilisation. But in 1877 the treaty reductions of their reservation led to a sanguinary outbreak on the part of the 'non-treaty' Nez Percés, who murdered settlers, fought the soldiers, and then fled across Idaho, Montana, and Dakota. They were overtaken and beaten, and the survivors (some 350) transferred to Indian Territory; but in 1885 some were restored to Idaho, and the rest joined the Colville Indians, in Washington. There is no evidence that they ever had a custom which would justify their name, 'pierced nose.'

Ngami, LAKE, a South African lake, situated at the northern extremity of the Kalahari Desert, in 20° 30' S. lat. and 23° E. long., at an altitude of 2810 feet. Its extent and depth vary with the fall of rain in the country to the north of it; its average size is 50 miles long and from 10 to 20 broad. The chief tributary, the Okavango or Cubango, called in its lower course the Tioje, brings down from the north-west vast volumes of water. At another season of the year the Suga or Zouga brings in a supply from the east. It is not yet decisively settled whether in times of flood the lake sends off the surplus water to the Zambesi.

Niagara ('Thunder of Waters'), a river of North America, which forms part of the boundary between New York state and the province of Ontario. It flows from Lake Erie to Lake Ontario, a course of 36 miles, during which it makes a total

Plan of Niagara Falls.

descent of 326 feet—about 50 feet in the rapids immediately above the great falls, and nearly 110 feet in the seven miles of rapids below. It encloses several islands, the largest Grand Island, which is nearly 10 miles long. Four miles below this island are the most famous falls in the world. The centre of the river here is occupied by Goat Island, dividing the cataract into two—the Horseshoe (Canadian) Fall, with a descent of 158 feet, and the

American fall, 162 to 169 feet; the outline of the former is about 2640 feet, of the latter 1000 feet. The volume of water which sweeps over this immense chasm (nearly nine-tenths passing over the Canadian fall) is about 15,000,000 cubic feet a minute. The depth of water on the crest of the falls is less than 4 feet, except in a few places, notably at the apex of the Horseshoe Fall, where it is about 20 feet. The limestone edge of both falls is rapidly wearing

away in the centre: the contour lines in the map represent this in the case of the Canadian fall, whose centre now presents the form of a V; in the American fall the same tendency is visible, although the process has begun much more recently. For seven miles below the falls (to the point, that is, where it has been supposed that the falls originally stood) the river is shut in between perpendicular walls of rock, from 200 to 350 feet high. For some distance below the falls there is still water, the body of water which pours over the precipice sinking; and only coming to the surface again two miles below, where the whirlpool rapids begin; a little lower is the whirlpool, where a sharp turn sends the waters hurling against the Canadian side, and then sweeping round in a great eddy before they find a vent at a right angle with their former course. Just below the cataract the river is crossed by a suspension bridge for carriages and foot-passengers, and a mile and a half farther down there are two railway bridges—one a cantilever bridge—about 100 yards apart. On both shores the lands bordering on the river, for some distance above and below the falls, are under the immediate control of the respective governments. The 'New York State Park at Niagara Falls' (1885) embraces 115 acres, and the 'Queen Victoria Niagara Falls Park' (1888) about 154 acres. From both sides visitors, cased in waterproofs, are conducted under the falls.

Niagara, a town of Ontario, popular as a summer-resort, is situated on Lake Ontario, at the mouth of the river Niagara, 15 miles from the falls. Niagara (then Newark) was burned down in December 1813 by the American General M'Clure on his retreat. Pop. 1441.—*Niagara Falls*, a village of New York, is the principal place in the neighbourhood of the falls, and has several flour-mills, and sash and blind factories. The new suspension bridge connects it with the Canadian side, and there is also a bridge to Goat Island. On October 4, 1890, the first sod was cut of a tunnel for utilising the water-power of the falls, to be completed by January 1927; it is to be $1\frac{1}{2}$ mile long, passing under the village. Pop. 3320.—The name Niagara Falls has also been given to Clifton (q.v.).

Niam-niam, an African people dwelling between 4° and 6° N. lat. and 25° and 30° E. long., along the watershed that parts the feeders of the Bahr al-Ghazal from those of the Welle-Makua and other northern tributaries of the Congo. They are a branch of the A-Sandeh tribes, who all belong to the stock of the negroid Nubas. In person they have round faces, broad heads, bodies long in proportion to the legs, and are inclined to corpulency. The men dress their hair in the most elaborate fashions, chiefly of long plaits and tufts. They colour their chocolate-brown bodies red with a vegetable dye. Whilst the men devote themselves to hunting and war, the women cultivate the fields of eleusine, manioc, sweet potato, gourds, yam, banana, &c. These with game are the chief food, though a portion of the people are notorious cannibals. They have no cattle. Considerable manual and artistic skill is shown in the forging of iron, making of pottery and baskets, and the carving of wood. They are passionately fond of music, and play a kind of mandolin. Although polygamy prevails, the warriors have an affectionate regard for their wives. The weapons are spears, knives, a species of iron boomerang, and shields. The dead are buried. It is to these people that the legends of 'tailed men' are referable (see Baring-Gould, *Curious Myths*, 1875). See also Schweinfurth, *Heart of Africa* (1878); and Junker, *Travels in Africa*, vol. ii. (1891).

Nias, an important island belonging to Holland, lies to the west of Sumatra, and has an area of

about 2100 sq. m. The surface is mountainous, the highest peak rising 1970 feet. In 1857, when the Dutch took complete possession of the island, the population was reckoned at 170,000. They grow rice, cocoa-nuts, bananas, tobacco, sugar-canes, &c., and annually about 110,000 lb. of pepper. The Niassers are of the Malay race, but fairer than the Malays usually are. They are gentle, sober, and peaceful, remarkably ingenious in handicraft. See *Roy. Scot. Geog. Mag.* for 1888 and 1891; and Modigliano, *Un Viaggio a Nias* (1890).

Nibelungenlied, also called **DER NIBELUNGE NÔT**, an old German epic poem, that takes rank next after the Homeric poems amongst the great epics of the world. The original substratum of the work is undoubtedly the saga of Sigurd, recounted in the Elder Edda; it is from that source the epic derives its mythological elements, and in all probability the tragic conception of an all-compelling destiny which dominates the action of the poem. To this original substratum must be added two others—one taken from the legendary history that grew up out of the migrations of the peoples, especially the struggle between the Huns and the Burgundians; the other embodying the spirit, the sentiment, the life and circumstances of the crowning age of chivalry, the middle of the 12th to the middle of the 13th century, during which period the poem, as we now have it, was unquestionably written. Who was its author, or rather the man who cast it in its present form, is altogether unknown; the attribution of it to the minnesinger of Kurenberg in Upper Austria now finds very little acceptance. The oldest elements of the work must have been long current in the form of popular songs or versified sagas; but the incidents of the story as recounted in the epic seem to have been fused into a unity some time previous to the 12th century. The existing version is due to one who was steeped in the ideas of the courtly poetry of the middle ages; the writer took the story that had in process of time grown together into a connected epic narrative, and impressed upon it his own methods of poetic vision, and his own peculiar versification—in short, his own style. German commentators are of opinion that the writer worked from originals composed in Latin. After the Reformation all interest in the poem quite died out, and was only revived in the end of the 18th century. But it was not until twenty years and more of the 19th century had passed that German students began to be aware of the inestimable literary treasure they possessed in the *Nibelungenlied*. A keen discussion arose as to its unity; one school, headed by Lachmann, maintained that it was merely a collection of folk-songs, loosely strung together, or rather intermingled one with another; an opposing school defended the unity of the narrative and of the poem. The views of the latter body of scholars are now generally accepted.

The narrative is briefly this. Sigfried, the son of the king of the Netherlands, has become the possessor of the storied treasure of the Nibelungs, which carries with it the curse of dire evil to its owner. Sigfried marries Kriemhild, sister of Gunther, king of Worms, and then helps Gunther to win to wife Brunhild of Iceland, by taking Gunther's place without her knowledge and overcoming her in three trials of bodily skill and strength. After some years a bitter dispute breaks out between the heroines as to whether Gunther or Sigfried is the greater. Brunhild's jealousy is so great that she induces Hagen, one of Gunther's vassals, to murder Sigfried. Kriemhild, though she mourns long years for her husband, at length marries Etzel (Attila), king of the Huns. After Sigfried's death she had become the possessor of the

Nibelungs' treasure; but Hagen had wrested it from her and sunk it at the bottom of the Rhine. At the end of several years Kriemhild, who still mourns for Sigfried, and still nourishes the desire for revenge upon Hagen and Gunther, invites her brother and his court to visit her. They do so, accompanied by a body of 11,000 knights and men-at-arms. The conclusion of the epic relates the bloody incidents attendant upon the total annihilation of the Burgundians at the court of Etzel, and the slaughter they made amongst their foes. There is a continuation of the poem, called the *Nibelungenklage*, or Lament for the Nibelungs, a production in every way much inferior to the *Nibelungenlied*. In spite of the uncouth versification of this last, it exercises a strong fascination upon the reader, owing to the grandeur of its conception, its strong characterisation, its earnestness and tragic intensity.

There exist numerous old MSS. of the poem; but the most valuable are three, called respectively the Munich, St Gall, and Lassberg MSS, all of the 13th century. The best modern High German versions are those by Simrock (40th ed. 1880), Bartsch (2d ed. 1880), and L. Freytag (2d ed. 1886). There are English translations by Lettsom (1850), Foster-Barham (1887), and Birch (3d ed. 1887). See also Carlyle's *Miscellanies* (vol. iii.).

Nicæa. See NICE.

Nicaragua, an independent state of Central America, stretching right across the isthmus from the Caribbean Sea to the Pacific, between Costa Rica on the south and Honduras on the north. An irregular square, the east (Caribbean) coast measuring 290 miles and the west coast 185, Nicaragua has an area of about 51,650 (or 58,000?) sq. m. The Central American Cordilleras form the backbone of the country; they run north-west and south-east at a distance of 12 to 30 miles from the Pacific, and attain elevations of 4000 and 5000 feet above sea-level. On the west the surface sinks rapidly to a longitudinal depression (110 feet), the southern two-thirds of which are filled by the large lakes of Nicaragua (115 miles long, 45 broad, and 140 feet deep in most parts) and Managua (35 miles long, 20 broad, 30 feet deep), the latter lying north of the former and 25 feet higher. This depression is studded with a chain of volcanic cones, standing on islands in the lakes (Ometepe and Madera, 4190 feet), and clustering thickly between the northern end of Lake Managua and the Gulf of Fonseca at the north-western extremity of the country, as Coseguina (3835 feet, which was the scene of a tremendous outbreak, lasting over four days, in 1835), Viejo (6287), Telica (4200), Momotombo (6890), Mombacho (4600), and several others. Though most of these are quiescent, some of them burst forth in eruption from time to time; Ometepe poured out its lavas during seven days in 1883. Another low range separates this depression from the Pacific. The districts west of the central backbone are the chief seats of the population. There stand the towns Managua (the capital), Leon, Granada, Chinandega, Rivas. On the western coast there are three harbours—the Gulf of Fonseca in the north, Salinas Bay in the south, and the port of Corinto towards the north. The only port on the east side is Greytown, at the mouth of the river San Juan.

East of the Cordilleras the surface falls away gradually; the spurs that break off from the main ridge sink into the low alluvial plains that face the Caribbean Sea. Thick forests clothe extensive areas on this side. Several rivers carry off the surplus water eastward, a few being of good length, such as the Coco or Wanks (350 miles long), which serves as the conventional northern boundary; the San Juan (125 miles), which drains Lake Nicaragua and separates the state of Nicaragua

from Costa Rica on the south; the Bluefields and the Rio Grande (230 miles). The low coast-belt, called the Mosquito Territory (q.v.), is lined with salt lagoons—Pearl lagoon having an area of 200 sq. m., and Bluefields lagoon half as much. The mountain-spurs east of the main chain are rich in minerals; gold is mined in the neighbourhood of Libertad on to Matagalpa, in the heart of the country, and silver near the sources of the Coco in the north; coal, copper, tin, iron, lead, zinc, antimony, quick-silver, marble, &c. exist, but are not worked. As a rule the climate varies between 70° and 90° F., and there is a dry season lasting from about December to May. The natural products of the soil are accordingly tropical. The forest trees include mahogany, rosewood, logwood, fustic, sandalwood, india-rubber, and numerous others that yield fancy woods, medicinal plants, gums, and dye-woods. Large herds of cattle are bred and reared on the extensive plains of the centre and east. The rich soil of the cultivated western region yields maize (the staple food of the people), coffee, cocoa, sugar, cotton, rice, tobacco, indigo, and a great variety of tropical fruits. The exports—chiefly coffee, india-rubber, bananas, hides, metals, gums, woods—average £304,000; the imports, mostly manufactured goods, £429,000. The animal life is similar to that of Guatemala (q.v.). The population are stated to have been 259,794 in 1884, one-third Indians, and one-half mulattoes and negroes. The state religion is the Roman Catholic, but all creeds are tolerated. The educational standard is low, in spite of two universities (so called), at Leon and Granada, with about 350 students in all. The country is governed by a president (elected for four years), a legislative assembly of eleven members, and a senate of ten; both these bodies are elected by the people, the former for four, the latter for six years. There are 100 miles of railway, connecting the chief towns with Corinto. The public revenue (£152,600) is derived chiefly from monopolies on spirits, tobacco, and gunpowder, and from import dues. The national debt amounts to £603,000.

Nicaragua, like the states north of it, was a centre of Aztec civilisation; but the Aztecs were preceded by another race, likewise civilised, who have left stone sculptures and monumental remains. The Aztec influence survives in archaeological ruins and relics and in the Indian dialects. Columbus sailed along the Mosquito coast in 1502. Twenty years later the country was overrun by the Spaniards under Gil Gonzalez D'Avila, and in 1524 the city of Granada was founded. This town soon developed as the head of a stream of commerce that flowed up and down the San Juan River. In 1610 was founded Leon, the democratic rival of the aristocratic Granada. During the Spanish supremacy (after 1550) Nicaragua was a province of Guatemala. In 1821 it asserted its independence, and two years later joined the federation of the Central American states, a connection that lasted sixteen years. The history of the country after the severance from Spain until 1865 is a record of war and dissension, war with Costa Rica, with Guatemala, and with Great Britain (1848), which had asserted a protectorate over the Mosquito Coast since 1655. This region was given up to Nicaragua in 1860. Between 1855 and 1860 the aristocratic and the democratic party were fighting tooth and nail, the latter being assisted by the adventurer William Walker (q.v.). Since then Nicaragua has made laudable efforts to develop her resources and to advance along the path of civilisation, and she now compares most favourably with her sister states in Central America.

See Squier, *Nicaragua* (1852); Belt, *Naturalist in Nicaragua* (1873); Bodham-Whetham, *Across Central*

America (1877); Leoy, *Notas Geográficas y Económicas sobre Nicaragua* (Paris, 1873); Bancroft, *History of Pacific States: Central America* (1882); and Bonvallius, *Nicaraguan Antiquities* (Stockholm, 1886).

Nicaragua Ship-canal. The plan of cutting a canal through Central America by way of the San Juan River and Lake Nicaragua is by no means new. But the project was not taken up in earnest until 1884, when a treaty with this object in view was signed between the United States and Nicaragua. The Nicaragua Canal Company was formed early in 1889, and operations were commenced at Greytown, at the mouth of the San Juan, in November of the same year. During the first year of work the harbour was dredged, a pier built, and some 10 miles of railway constructed, and the ground cleared for excavation. The plans have been prepared by A. G. Menocal of the United States navy. The canal utilises the San Juan and Lake Nicaragua, and will have a total length of 170 miles; of this distance 121 miles will be free navigation on the river (64½ miles) and lake (56½ miles), 21 miles free navigation on basins formed by damming small streams, and 28 miles only will be excavated. A breadth of only 12 miles, with a low divide (152 feet above sea-level), intervenes between the lake and the Pacific; this will be traversed from the lake exit near Rivas to Port Brito by basin navigation and cut stretches of artificial canal. There will be three locks on each side of the lake (110 feet above sea-level), and there will be a minimum depth of 30 feet of water in the canal. It was estimated that the works would cost about £12,000,000, that they would be completed in six years, and that vessels would be able to pass from ocean to ocean in 28 hours.

Niccola Pisano. See PISANO.

Nice (Ital. *Nizza*), chief town of the department of the Alpes Maritimes, France, stands on a beautiful well-sheltered site on the coast, 140 miles E. by N. of Marseilles and 110 SW. of Genoa. On the north of the city the hills rise in terraces and shield it from the cold winds. On the south it faces the sea, which tempers the heat in summer. Owing to the advantages of its situation, Nice has for many long years been celebrated as a winter-resort for invalids; the number of visitors is usually estimated at 15,000, but in the winter of 1889 and 1890 they reached 40,000 to 45,000. The mean temperature of winter is 49° F., of summer 72°. Frosts occur but seldom. Pop. (1872) 42,363; (1886) 65,053 (commune, 77,478). The city consists of three parts—the New Town on the west, the Old Town, and the Port on the east. The first of these is the part frequented by foreigners, particularly English (whence its name of 'English town'). Beautiful promenades stretch along the seashore, and are overlooked by villas and hotels. Numerous bridges across the little river Paglione (Paillon) connect the New Town with the Old or Upper Town. This part, with narrow streets, clusters at the foot of a rocky height, the Castle Hill; on the other (east) side of this hill is the harbour, which was enlarged to twice its original size in 1889, and deepened to 25 feet. The Castle Hill is an isolated mass of limestone 318 feet high, formerly crowned by a strong castle, now in ruins, and is laid out in public gardens. The chief public buildings are the cathedral, the Gothic church of Notre Dame, the natural history museum, art gallery, library, observatory, casino, &c. The people manufacture artistic pottery, perfumery, and Italian pastes, grow flowers and southern fruits, the last of which they preserve, and produce inlay work in olive-wood. Most of these things are exported, chiefly by way of Genoa and Marseilles. The exports from the port of Nice

range in annual value from £94,656 to £56,982, the greater portion being for olive-oil. The imports, varying from £570,687 to £1,809,590, consist of wine, oil, and cereals, with smaller quantities of coal, charcoal, timber, bran, and flour. The ancient Ligurian town of Nicæa, founded by a colony of Phœceans from Massalia (Marseilles), became subject to Rome in the 2d century B.C. It was in the hands of the Saracens during the greater part of the 10th century. Then, after existing as an independent city, it acknowledged the supremacy of the Counts of Provence and the House of Savoy (1388). In 1543 it was taken and pillaged by the Turks under Barbarossa. From 1600 onwards it was repeatedly taken by the French; and they kept possession of it from 1792 to 1814. In 1860 it was ceded to France by Sardinia (Savoy). Masséna was born near to the city, and Garibaldi in it. See Nash, *Guide to Nice* (1894).

Nice, or NICEÆA, a city of ancient Bithynia, in Asia Minor, situated on the eastern shore of Lake Ascania. It was built by Antigonos, the son of Philip (316 B.C.), and received the name of Antigoneia, which Lysimachus changed to Nicæa, in honour of his wife. It was a handsome town, and of great importance in the time of the Roman and Byzantine emperors. It is famous in ecclesiastical history for two Councils held in it, the First and Seventh Ecumenical Councils. The First Council of Nice was held 325 A.D., and was convened by the Emperor Constantine, for the purpose of defining the questions raised in the Arian controversy (see ARIUS, ATHANASIUS); the Nicene Creed adopted is discussed at CREED. The Council also deliberated on the Meletian Schism; and its decree on the celebration of Easter met with universal acceptance. See Stanley's *History of the Eastern Church*.—The Second Council assembled under the Empress Irene (787), for the purpose of reconsidering the subject of Images (see IMAGE-WORSHIP).

Nicholas, the name of five popes and an antipope. NICHOLAS I. was born of a noble Roman family, and was elected as successor to Benedict III. in 858. He showed great persistence in his endeavours to assert the supremacy of the Roman curia, especially in his successful disputes with Archbishop Johannes of Ravenna, Archbishop Hincmar of Rheims, and the patriarch Photius of Constantinople. His latest triumph was the restoration to her rights of Thietberga, the unjustly divorced wife of the Emperor Ludwig's younger brother, Lothaire, king of Lorraine. A synod of Metz in 862 had allowed the king to put her away and marry his mistress, but the pope reversed the judgment and deposed the too compliant Archbishops of Cologne and Treves. Nicholas died in 868.—NICHOLAS V. was originally called Thomas Parentucelli. Born at Pisa in 1398, he was educated at Florence and Bologna, and was named Bishop of Bologna by Eugenius IV. He showed such astuteness during the troubles of the Councils of Basel and Florence that he was chosen to succeed Eugenius IV. in 1447. He prevailed on the antipope, Felix V., to abdicate, and thus restored the peace of the church in 1449. He was a liberal patron of scholars, and despatched agents both to the East and West, to purchase or to copy important Greek and Latin manuscripts. The number collected is said to have exceeded 5000. He remodelled, and may almost be said to have founded, the Vatican Library. He invited to Rome the most eminent scholars of the world, and extended his especial patronage to those Greeks whom the troubles of their native country drove to seek a new home in the West. He endeavoured to arouse the Christian princes of Europe to the duty of succouring their brethren of the East; but the age of enthusiasm was past, and

he was forced to look on inactive at the fall of Constantinople in 1453. Nicholas died in 1455, at the comparatively early age of fifty-seven. He must not be confounded with an antipope of the same name, Peter de Corbario, who was set up, in 1328, by Ludwig of Bavaria, in antagonism to John XXII. (q.v.). See also NICOLAS (ST).

Nicholas I., emperor of Russia, was the third son of Paul I., and was born at St Petersburg, 7th July 1796. He was very carefully educated under the eye of his mother, a princess of Würtemberg, and subsequently devoted his attention to military studies and political economy. He visited England and other European countries in 1816, and in the same year made a tour through the Russian provinces. On 13th July 1817 he married the eldest daughter of Frederick-William III. of Prussia—a union that long affected European politics—and lived in domestic retirement till the death of Alexander I. (December 1825), when, owing to the resignation of his elder brother Constantine, he succeeded to the throne of Russia. A long-prepared military conspiracy broke out immediately after his accession, which he suppressed with great vigour and cruelty. After a brief ebullition of reforming zeal, he reverted to the ancient policy of the czars—absolute despotism, supported by mere military power.

Soon after his accession a war with Persia commenced, but it was concluded by the peace of Turkmanshai (1828), which gave a considerable extent of territory to Russia. In the same year he entered upon a war with Turkey, in which victory, though at enormous cost, constantly attended his arms, and the peace of Adrianople obtained for Russia another increase of territory. The political movements of 1830, in the west of Europe, were followed by a national rising of the Poles, which was suppressed after a desolating contest of nine months, in which the utmost efforts of the whole military resources of Russia were required. Nicholas punished the rebellion by converting the kingdom of Poland into a mere Russian province, and strove to extinguish the Polish nationality. This policy, however, was viewed with great dissatisfaction throughout Europe, and the vanquished Poles were everywhere regarded with general sympathy. Russia, by Nicholas's mode of government, became more and more separated from the fellowship of the western nations. Intellectual activity was, as far as possible, restrained to things merely practical, education limited to preparation for the public service, the press was placed under the strictest censorship, and every means used to bring the whole mind of the nation under official guidance. His Pan Slavism (q.v.) also prompted him to Russianise all the inhabitants of the empire, and to convert Roman Catholics and Protestants to the Russian Greek Church, of which the czar is the head. War was waged against the mountaineers of the Caucasus with the greatest energy and perseverance, at the cost of immense sacrifices both of money and lives. The extension of British influence in central Asia was also viewed by him with alarm, and led to an unsuccessful expedition to Khiva. During the political storm of 1848–49 he abstained from interference until an opportunity was found in the request of the emperor of Austria for his assistance to quell the Hungarian insurrection. He succeeded at the same time in drawing closer the bonds of alliance between the Russian and Prussian monarchies. The re-establishment of the French empire still further tended to confirm these alliances, and led Nicholas to think that the time had at length come for carrying into effect the hereditary Russian scheme for the absorption of Turkey; but the unexpected opposition of Britain and France, and his own invincible repugnance to

give up his long-planned scheme of conquest, brought on the Crimean War (q.v.), during the course of which he died at St Petersburg, March 2, 1855. He was remarkable for temperance, frugality, and patriotism, and was fanatically beloved by his Russian subjects; he was at the same time regarded by them with feelings of awe, a tribute to his lofty stature and imperial bearing. See Lacroix, *Histoire de Nicolas I.* (8 vols. 1864–73).

Nichols, a family of printers and antiquaries, associated with the *Gentleman's Magazine* from 1778 to 1856. To it belonged John Nichols (1745–1826); his son, John Bowyer Nichols (1779–1863); and his son, John Gough Nichols (1806–73).

Nicholson, JOHN, a distinguished Indian soldier, was born in Dublin, 11th December 1822. In 1838 he joined the East India Company's service, and in 1840 his regiment was ordered to Ghazni in Afghanistan (q.v.), where, two years later, it was compelled to surrender to the enemy. After a time of miserable captivity he regained his liberty. On the breaking out of the Sikh war in 1845 he served in the campaign on the Sutlej, and was present at the battle of Ferozeshah. He was now appointed assistant to the resident at the conquered capital, Lahore. During the Sikh rebellion of 1848 he greatly distinguished himself, the preservation of the important fortress of Attock being due to his daring and promptitude, whilst soon after, at the Margulla Pass, he succeeded in intercepting and defeating a large body of the insurgents. At the battles of Chillianwalla and Gujrat successively he earned the special approval of Lord Gough, to whom he was immediately attached. The Punjab having finally become a British province, Captain Nicholson was appointed a deputy-commissioner under the Lahore Board. His success in bringing the savage tribes under thorough subjection to law and order was something marvellous.

In the mutiny in 1857 Nicholson perhaps did more than any other single man to hold firm the British grasp of the Punjab. He it was who suggested the formation of the famous movable column, and he presided over its organisation; while in his dealings with the suspected regiments of sepoys he exhibited throughout a brilliant combination of boldness with subtlety, discretion, and astuteness. At Trinmoo Ghaut on the 12th and 14th July he nearly annihilated a force of rebels, and at Najafgarh on the 24th he dispersed another body of mutineers. As brigadier-general, on September 14 he led the first column of attack at the siege of Delhi, and after the troops had forced their way into the city he still exposed himself in the most fearless manner, and fell, shot through the body. He died on 23d September 1857. Over the whole of India it was felt that, to use Lord Canning's expression, 'a tower of strength' had fallen.

See Kaye's *Lives of Indian Officers* (2 vols. 1867; new ed. 1889); R. Bosworth Smith's *Life of Lord Lawrence*; and Edwards and Merivale, *Life of Sir J. Lawrence*.

Nicias, a famous Athenian statesman and general during the Peloponnesian war, was the son of Niceratus, a very wealthy citizen, who had acquired his fortune by working the silver-mines at Laurium. He belonged to the aristocratic party, and after the death of Pericles was the chief opponent of the demagogue Cleon, and later of Alcibiades. In 427 B.C. he captured the island of Minoa, next year he ravaged the island of Melos and the coasts of Locris, the next he compelled the Spartan force in Sphacteria to surrender, and defeated the Corinthians. In 424 he ravaged part of Laconia and captured the island of Cythera. After the death of Cleon he brought about a peace between the Spartans and Athenians, 421. Six years later the Athenians at the instigation of

Alcibiades resolved on a great naval expedition against Sicily. Nicias was appointed one of the commanders, although he had strongly protested against the undertaking. In the autumn of 415 he laid siege to Syracuse, and was at first successful, but subsequently experienced a series of disasters; his fleet was destroyed, and his troops began a retreat towards the interior of Sicily. They were speedily forced to surrender, and Nicias was put to death in 414. See the *Histories of Thirlwall and Grote*, and *Plutarch's Life of Nicias* (ed. by H. A. Holden, 1887).

Nickel (sym. Ni; atom. wt. 58.6; sp. gr. 8.3 to 8.7). This metal was discovered by Cronstedt in 1751; but long before he isolated the metal, alloys of it obtained from ore were used by the Chinese. Within living memory it was considered a feat to fuse a piece of nickel as large as a hazel-nut, so that it may be said to be a comparatively recent addition to the useful metals. It was shown by Richter in 1804, and again by Deville in 1856, that the pure metal is malleable and ductile and of higher tenacity than wrought-iron. Nevertheless the only application of nickel previous to 1879 was as a constituent of certain alloys—German Silver (q.v.), for example—usually for the purpose of giving them a white colour. In that year Fleitmann of Iserlohn, having previously ascertained that the brittle nature of all commercial nickel was due to occluded carbonic oxide, discovered that the addition of one-eighth per cent. of magnesium (which requires to be made with due precaution in an atmosphere of carbonic acid) conferred upon it the malleability of the pure metal. He was likewise successful in welding nickel thus refined to wrought-iron so thoroughly that two pieces of these metals—i.e. one of each—joined in this way could be rolled out into a very thin sheet without any break in the continuity of either surface. Fleitmann's firm have turned this to useful account by manufacturing cooking-pots and other articles iron-plated with nickel on both sides. The action of organic acids on nickel is so slight that these cooking utensils may be safely used. Nickel can also be made malleable by the addition of metallic manganese in the proportion of 5 parts of the latter to 100 parts of the former. This process was patented by Messrs Wiggins of Birmingham on 11th March 1880, specification No. 1058. Wharton in 1873 or earlier made vessels in America of pure nickel rendered malleable by forging it in a spongy state with a steam-hammer.

Nickel is of a white colour, its peculiar hue being between that of silver and bright steel. It is not altered by exposure even to moist air, and it is not tarnished by sulphuretted hydrogen. Dilute sulphuric and hydrochloric acid attack it only slowly, but it dissolves readily in nitric acid. Caustic alkali lyes have no action upon the metal. Owing to these properties and to its having the strength and malleability of wrought-iron, nickel is a valuable metal for many purposes. Besides its use in forming highly serviceable alloys with copper and zinc, of which German silver and some of the white compounds used for coinage on the continent of Europe are the most important, it is employed alone for nickel-plating, for chemical vessels, and, as has been stated, for coating iron cooking-pots in thin layers. An electro-deposit of nickel on steel instruments, such as those used in surgery, is specially useful in preventing rust. Magnets are sometimes made of nickel; and now that it can readily be made pure enough to be welded, rolled into sheets, drawn into wire, stamped, or raised by beating, it is likely to receive new applications. In 1890 it was reported that the Americans had proved by trials at Annapolis that armour-plates of steel alloyed with nickel are superior to such plates made of steel

itself; and preparations were made in other countries to try this nickel-steel on a large scale. In 1873 the price of nickel rose from 4s. to 16s. per lb. on Germany adopting a nickel alloy for coinage. Owing to the now abundant supply, it has fallen to 2s. per lb. In 1889 it was announced by the German chemist Kruss that he had succeeded in splitting up nickel and cobalt each into two parts, and that both these metals have one component in common; but this has not been confirmed by subsequent research. See the *Chemical News* (1889).

Ores of Nickel.—Till about 1875 the most important ore was *kupfer-nickel* (false copper). This mineral is arsenide of nickel, and contains from 35 to 45 per cent. of the metal. It is found in Norway, Germany, Hungary, France, and the United States. It is abundant in some districts of South America, and sometimes is found in Cornwall. *Magnetic pyrites* or *pyrrhotite*, a compound of iron and sulphur, often contains from 3 to 5 per cent. of nickel. When it does so it is used as an ore of that metal. It has been largely smelted for nickel at New Jersey, and a nickeliferous ore of this kind is now found plentifully in Norway. *Nickel glance* is a compound of nickel with arsenic and sulphur, in which the percentage of nickel varies from 25 to 35 per cent. It is found in Sweden, in the Harz, in Thuringia, and one or two other places. *Pentlandite* is a sulphide of iron and nickel, found in Norway and in Argyllshire. It has from 14 to 20 per cent. of nickel. *Millerite*, a sulphide of nickel, rich in the metal, is found in Lancaster county, Pennsylvania. *Ullmanite* is a compound of sulphur, antimony, and nickel; and *Annabergite* is an arseniate of nickel. *Garnierite* is an ore of nickel, which was first discovered about 1874 in New Caledonia, and is now the most important source of the metal. It is a hydrosilicate of magnesia and nickel, and contains on an average from 7 to 10 per cent. of the latter. Its value as an ore is increased by the fact that it is without either arsenic or sulphur. Large quantities of it have been shipped to England and France, and in some years the total production of the island amounted to 12,000 tons, representing 850 tons of nickel. An ore similar to that from New Caledonia has been discovered in Oregon and in North Carolina, apparently in rich deposits in the former state. Discoveries of nickel ore have also been made in Texas and Nevada. Extensive deposits of mixed nickeliferous pyrrhotite and copper pyrites have within the last four years been found in Canada (Sudbury district), and some are now being vigorously worked. *Kupfer-nickel* or *nickeline* and a rich amorphous nickel ore are known to occur on Michipicoton Island. The nickel ore raised in Canada in 1888 amounted to 1,220,000 lb.

Nickel is not found separately in the native state, but it is always present in meteoric iron. Cobalt is very frequently associated with nickel in ores. In the smelting of arsenical ores the product obtained in the first instance is called speiss, but in one smelting operation regulus, metal, and slag may be obtained as well as speiss. Nickel speiss is a mixture chiefly of the arsenides and sulphides of nickel, iron, and copper, left as a residue in the pot used in the preparation of Smalt (q.v.), from complex arseniferous nickel and cobalt ores previously roasted. In this process the cobalt practically all passes into the blue glass of which smalt consists.

Smelting.—At the older nickel-works in different parts of Europe much of the nickel produced is extracted from speiss or from regulus, in either of which the metal has become concentrated, and may amount to from 30 to 60 per cent. A good deal of secrecy has been observed regarding the smelting of nickel, but accounts of some of the processes in use have been published. Briefly stated, one of

these consists in removing by suitable methods the metals other than nickel in the speiss, in getting rid of the arsenic by forming an alkaline arsenite which is soluble in water, and in obtaining a sulphide of nickel which is usually mixed with a small quantity of cobalt. This sulphide when boiled with sulphuric acid yields sulphate of nickel, from which potash precipitates the hydrated oxide mixed with a little cobalt. The separation of the oxides of nickel and cobalt is effected by dissolving the mixture of them in an acid, neutralising, and adding a slight excess of nitrite of potassium and acetic acid. After a few hours the double nitrite of cobalt and potassium is deposited, while the filtered liquid contains only the nickel. Its hydrate is precipitated by caustic potash and redissolved in oxalic acid. When the oxalate of nickel is heated in a wind-furnace fused metallic nickel is obtained.

The New Caledonia ore (garnierite) is smelted by one process in this way. It is placed along with limestone and coke or charcoal in a furnace about 16 feet high with tuyères. Here a regulus is produced with 60 or 70 per cent. of nickel, and containing also some iron, some carbon, and sometimes a little sulphur. This is manipulated in a Siemens' furnace to remove the iron, and also sulphur if present, and the nickel is then refined with oxide of manganese and alkaline flux in a plumbago crucible.

Oxides of Nickel.—These are nickel monoxide, NiO, the hydrate of this oxide, Ni(OH)₂,—both of which are green—and nickel sesquioxide, Ni₂O₃, which is a black powder. The monoxide of nickel is used to give a soft brown colour to pottery.

Salts of Nickel.—Of these Roscoe and Schorlemmer, in their *Treatise on Chemistry*, say they are derived from the monoxide. In the anhydrous condition they are usually yellow-coloured, whilst in the hydrated state and combined with colourless acids they possess an apple-green to an emerald-green colour. The soluble normal salts have a slightly acid reaction and a sweetish, astringent, metallic taste, and act as emetics.

Nicker (A.S. *nicor*, pl. *niceras*, in *Beowulf*), a malignant kind of water-sprite in Teutonic mythology. He often presents himself on the shore in the shape of a horse, and has thus close affinities with the Scotch *kelpie*; while indeed the Old Norse *nikr* (Old High Ger. *nichus*) is thought by some to mean the hippopotamus only. In our own demonology we find both a male *nix* and a female *nixie*. The modern Dutch *nikker* is merely an ordinary evil spirit or devil, recalling our own familiar *Old Nick*.

Nicobar Islands, a group of islands in the Indian Ocean, forming with the Andamans, to the south of which group they lie, an extension of the great island chain of which Java and Sumatra are the principal links. Just a score in number, of which twelve are inhabited, they consist of two divisions—the northern, low and planted with coconut trees, and the southern, mountainous (2000 feet) and covered with timber. Malaria prevails nearly all the year round; the temperature seldom moves outside the limits 80°–85° F. The people belong to two races, an inland tribe, little civilised, who show Mongolian affinities and are regarded as indigenous, and the coast people, about 6000 in number, who are of mixed Malay blood, but idle and lazy. They collect and export trepang and edible birds'-nests. The archipelago was occupied by Denmark from 1756 to 1856. In 1869 it was annexed by Britain, to put a stop to the piracy of the people. A penal colony for India exists at Nankauri on the island Kamorta (see map at BURMA).

Nicolai, CHRISTOPH FRIEDRICH, author, bookseller, and publisher, was born 18th March 1733, at Berlin, where his father was also a bookseller. He

early distinguished himself by a series of critical letters (1756), in which he exposed the errors of both Gottsched and Bodmer, then carrying on a controversy which was agitating the literary world of Germany. With Moses Mendelssohn he edited the *Bibliothek der schönen Wissenschaften* (1757–58), and contributed with Lessing to *Briefe die neueste deutsche Literatur betreffend* (1759–65). By this he was led to conceive the plan of the *Allgemeine deutsche Bibliothek* (108 vols. 1765–92), a periodical which he edited for many years, and which contributed to the progress of literature and improvement of taste in Germany, but became ridiculous from the inability of its editor to appreciate the new spirit that was stirring in Herder, Goethe, Schiller, Kant, and others, with all of whom he was at feud. He wrote topographical works, satires, anecdotes of Frederick the Great, and an autobiography, in which he describes strange apparitions or obvious hallucinations by which he was visited. He died 8th January 1811.

Nicolai, OTTO, musical composer, born at Königsberg, 9th June 1810. His early life was a struggle with poverty and difficulties. He studied in Berlin and in Rome, and in 1847 became Kapellmeister at Berlin. His best-known work is the opera *The Merry Wives of Windsor* (1848). He died 11th May 1849.

Nicolaitans, an immoral sect mentioned in Rev. ii. 6, 15, and sometimes, but apparently on very feeble grounds, connected with Nicolas the proselyte of Antioch, mentioned in Acts, vi. 5. Indeed the name seems rather to be symbolic than historical, the Greek *Nikolaos* being an equivalent to the Hebrew *Balaam*. In this sense the passage in the Apocalypse harmonises closely with what is said of the followers of Balaam in Jude and 2 Peter, and Rev. ii. 15 need not be taken as referring to a different class from verse 14. Their error was a licentiousness which they brought into the Christian church from the heathen world, and the subtler wickedness of defending this as supported by a doctrine and a prophetic illumination (2 Pet. ii. 1). There is no satisfactory evidence of the existence of such a sect after the time of John; still Irenæus mentions the Nicolaitans as a sect of Gnostics of the Ophite class, and in this he is followed by Hippolytus.

Nicolas, ST, the patron saint of Russia, whose life is wrapped in an obscurity that is but little lightened by fable. He was bishop of Myra in Lycia, and according to Metaphrastes was imprisoned under Diocletian and released under Constantine. The statement that he was present at the Council of Nice is in the highest degree improbable. His supposed relics were conveyed from the East to Bari, in the kingdom of Naples, on 9th May 1087; and it is a curious fact that in the Russian Church the anniversary of this translation is still observed as a festival. In Catholic countries St Nicolas is especially the patron of the young, and particularly of scholars. In England his feast was celebrated in ancient times with great solemnity in the public schools, Eton, Sarum Cathedral, and elsewhere; and still in Germany on the vigil of his feast, which is held on the 6th December, a person in the appearance and costume of a bishop assembles the children of a family or of a school, and distributes among them, to the good children, gilt nuts, sweetmeats, and other little presents, as the reward of good conduct; to the naughty ones, the redoubtable punishment of the 'Klaubauf.' *Santa Claus* is a corruption of the name, introduced into England from America; the old Dutch settlers of New York kept a San Claus holiday. St Nicolas was also the patron of merchants, sailors, and travellers; and as he was prayed

to for protection against robbers, the term 'Clerks of St Nicolas' came, oddly enough, to be a cant name for robbers.

Nicolas, SIR NICHOLAS HARRIS, antiquary, was born 10th March 1799, of a Cornish family of Breton origin. He entered the navy, and had reached the rank of lieutenant by 1815, but at the close of the war left the service to study law, and was called to the bar at the Inner Temple in 1825. He devoted himself chiefly to genealogical and historical studies, and his great work, the *History of the Orders of Knighthood of the British Empire* (4 vols. 1841-42), remains a solid monument of learning. Harris was made K.H. in 1831, and K.C.M.G. in 1840, and died at Cape Curé, near Boulogne, August 3, 1848. He devoted the energies of his later years to works on the naval history of England: *Dispatches and Letters of Admiral Lord Viscount Nelson* (7 vols. 1844-46), and the unfinished *History of the British Navy* (2 vols. 1847), as well as the papers of Sir Hudson Lowe. Harris wrote biographical notices of many of the poets in Pickering's Aldine edition, as well as many useful historical handbooks, as a *Synopsis of the Peerage of England* (1825), *Testamenta Vetusta* (1826), the *Chronology of History* (1835). Other works are *Proceedings and Ordinances of the Privy Council of England* (7 vols. 1833-37); a *Life of William Davison*, Queen Elizabeth's secretary and scapegoat in the execution of Mary, and an ancestor of his wife's (1823); *Memoirs of Ritson* (1833); and a host of books and papers—all of value—on heraldic, genealogical, antiquarian, and historical questions. A list of these is given in the *Gentleman's Magazine* for October 1848.

Nicole, PIERRE (1625-95), one of the most distinguished of the Port Royalists (see PORT ROYAL), the friend of Arnauld and Pascal. See also JANSEN.

Nicoll, ROBERT, minor Scottish poet, was born the son of a small struggling farmer at Little Tullybeltane, in the Perthshire parish of Auchtergaven, 7th January 1814. He was four years a grocer's apprentice at Perth, next opened a circulating library in Dundee, and here took to writing for the newspapers, and published a volume of *Songs and Lyrics* (1835). In 1836 he became editor at a salary of £100 of an ultra-radical weekly, the *Leeds Times*, but worked too zealously for his health, and gave himself his death-blow by his exertions in the victorious contest of Sir William Molesworth with Sir John Beckett in the summer of 1837. He went north for rest, only to die of consumption at Trinity, near Edinburgh, 7th December 1837. He was buried in North Leith Churchyard. Beyond a doubt Nicoll was a genuine poet, and moreover it must ever be remembered that he died at twenty-three. But it is far more from their intrinsic value than the mere pathos of his story that his countrymen remember such poems as 'We are Brethren a', 'Thoughts of Heaven,' and 'The Dew is on the Summer's Greenest Grass.'

See the *Life* by Mrs Johnstone, first prefixed to the 1842 edition of the poems; that prefixed to the Paisley edition (1877); and the somewhat uncritical life, by P. R. Drummond (published posthumously, 1884).

Nicomedia, the capital of ancient Bithynia, situated at the north-eastern angle of an inlet of the Propontis, was built in 264 A.D. by Nicomedes I. It soon became one of the most magnificent and flourishing cities in the world, and some of the later Roman emperors, such as Diocletian and Constantine the Great, selected it for their temporary residence. It suffered greatly from earthquakes. Hannibal committed suicide in a castle close by, and Constantine died near the city, which

was the birthplace of the historian Arrian. The small town of Ismid now occupies its site. See BITHYNIA for Nicomedes.

Nicopolis, a town of Bulgaria, with 4652 inhabitants, is on the Danube, 56 miles W. of Rustchuk. The Berlin Congress of 1878 provided for the demolition of the fortifications. Here the Hungarians were defeated by the Sultan Bajazet in 1396; and the place has been more than once taken by the Russians (1810, 1827, 1877).

Nicosia, (1) called also LEVKOSIA, the capital of Cyprus, situated near the middle of the northern half of the island, is surrounded with old Venetian walls, and is the residence of the British High Commissioner, and the see of a Greek archbishop. There are numerous mosques and churches, and some manufactures of silk, leather, and cotton. Pop. 11,536.—(2) A city of Sicily, 40 miles NW. of Catania. Pop. 14,941.

Nicot, JEAN, born at Nîmes in 1530, died at Paris in 1600, French ambassador at Lisbon, introduced into France the tobacco-plant, which was called after him *Nicotiana* (see TOBACCO). He also compiled one of the first French dictionaries, *Trésor de la Langue Française* (1606).

Nicotine, $C_{10}H_{17}N$, is a volatile liquid alkaloid, and constitutes the active principle of the tobacco-plant, in all parts of which it occurs in combination with malic and citric acids. It is likewise contained in minute amount in the smoke of the burning leaves. When pure and freshly prepared it is a colourless, intensely poisonous liquid, which evolves a very irritating odour of tobacco, but on exposure to the air it rapidly oxidises and becomes brown in colour. It is moderately soluble in water, and dissolves readily in alcohol and ether. The quantity of nicotine in tobacco varies from 2 to 8 per cent.; the coarser kinds contain the larger quantity, while the best Havana cigars seldom have more than 2 per cent., and often less. Locally, nicotine is very irritating. Taken internally, it is one of the most powerful poisons known; $\frac{1}{4}$ grain taken by the mouth has caused in man distinct symptoms of poisoning, there being first seen a short stage of excitement, followed by headache, vertigo, great weakness, and general depression. Larger doses ($\frac{1}{2}$ grain) caused in addition trembling, vomiting, collapse, and great depression of the heart and respiration. A single drop is sufficient to kill a rabbit or cat in a few minutes. It has been used rarely for homicidal and suicidal purposes, but the minimum lethal dose in man is not accurately known.

Nictitating Membrane, or THIRD EYELID. See BIRD, and EYE.

Nidderdale, the valley of the river Nidd, which rises at the foot of Wharfedale, in Yorkshire, and flows south-east and east, and joins the Ouse a few miles above York. The upper portion of the stream flows through picturesque scenery, and past Ramsgill, the birthplace of Eugene Aram. Above Lofthouse it disappears underground for about two miles. See Joseph Lucas's *Studies in Nidderdale* (1882).

Nibelungen. See NIBELUNGENLIED.

Niebuhr, BARTHOLOMÄUS GEORG, one of the most distinguished of modern historians, was born August 27, 1776, at Copenhagen, the son of the famous traveller, Karsten Niebuhr. From his infancy he showed unusual promise, and he was carefully educated under his father's eye. After his studies at Kiel he became private secretary to Count Schimmelmann in Copenhagen, and devoted himself to the study of the natural sciences at London and Edinburgh (1798-99). In 1800 he married and entered the Danish state-service, and

held various appointments, which he resigned in 1806 to enter the Prussian civil service on the invitation of Stein. During the next three years, the darkest in the history of Prussia, Niebuhr was actively employed in public business and in various secret financial missions. But his scholar's temperament was but ill adapted for political intrigue, and the opening of the university of Berlin in 1810 proved a new era in his life. He gave (1810-12) a course of lectures on Roman history which, by making known the results of the new and critical theory that he had applied to the elucidation of obscure historical evidence, established his position as one of the most original and philosophical of modern historians. His appointment, in 1816, to the post of Prussian ambassador at the papal court, where he remained till 1823, gave him an opportunity of testing on the spot the accuracy of his conjectures in regard to many questions of local and social bearing. On his return from Rome Niebuhr took up his residence at Bonn, where his admirable lectures gave a powerful impetus to classical and archaeological learning. He was thus employed when the revolution of 1830 roused him from the calm of his literary pursuits. His sensitive nature, unstrung by physical weakness, led him to take an exaggerated view of the consequences of this movement, and to anticipate a recurrence of all the horrors of the former French revolution, and the result was to bring about a state of mental depression and bodily prostration, which ended in his death, 2d January 1831.

Niebuhr's attainments were of extraordinary range, and his genius strikingly original in cast. He had mastered twenty languages before the age of thirty, and his tenacious memory retained everything he read; while he possessed in a remarkable degree the gift of intuitive sagacity that enabled him to sift true from false historic evidence, and often to supply by felicitous conjecture the link wanting in some imperfect chain of evidence. It is not to be denied, however, that his scepticism as to the credibility of early history goes too far, and that he is often arbitrary and unhistorical in his conjectures; indeed, the stricter sort of sceptical critics, like the late Sir George Cornewall Lewis, go so far as to regard his effort to construct a continuous Roman history out of such legendary materials as we possess as, on the whole, a failure. Niebuhr's theory of the construction of the earlier Roman history from still earlier ballads is not now accepted by scholars; but the fact remains that the bulk of his contribution to history still stands substantially unshaken, and it would be difficult to overestimate the strength of the impetus he gave to its study on a really scientific method.

Of his *Römische Geschichte* (vols. i. and ii. 1811-12; 2d ed. 1827-28; vol. iii., coming down to end of first Punic war, edited from his papers by Classen, 1832) the first two volumes were translated by Julius Hare and Connop Thirlwall, and the third by Dr W. Smith and Dr L. Schmitz; other works translated by Schmitz into English are *Lectures on the Hist. of Rome, to Fall of Western Empire* (2d ed. 3 vols. 1850), *Lectures on Ancient Hist.* (3 vols. 1852), and *Lectures on Ancient Ethnography and Geog.* (2 vols. 1853). Other works are *Griech. Heroengeschichte* (1842), written for his son Marcus; *Kleine historischen und philologischen Schriften* (2 vols. 1828-43); besides numerous other essays on philological, historical, and archaeological questions. Niebuhr co-operated with Bekker and others in re-editing *Scriptores Historiae Byzantinae*; he also discovered hitherto unprinted fragments of classical authors, as of Cicero's *Orations* and portions of Gaius; published the *Inscriptiones Nubienses* (Rome, 1821); and was a constant contributor to the literary journals of Germany. See Madame Hensler's *Lebensnachrichten* (1838; Eng. trans. by Miss Winkworth, 3 vols. 1852), and the studies by Classen (1876) and Eysenhardt (1886).

Niebuhr, KARSTEN, a distinguished geographer and traveller, was born in 1733, in the Hanoverian territory of Hadeln. He spent several years as a day-labourer; but having acquired a small property, he studied at Göttingen, entered the Danish service, and in 1761 joined an expedition to explore portions of Arabia, Persia, Asiatic Turkey, and India. On his return to Denmark in 1767 he published the results of his mission, *Beschreibung von Arabien* (Copenhagen, 1772), and *Reisebeschreibung* (3 vols. 1774-98). He also edited and published at his own cost the natural history notes of his deceased friend and fellow-traveller, P. Forskål, *Descriptiones Animalium* (1775) and *Flora Aegyptiaco-Arabica* (1776). He accepted in 1778 a civil post at Meldorf, in the Ditmarsh district of Holstein, then Danish. He died 26th April 1815. See his son's *Leben Niebuhrs* (1817).

Niederwald, the western termination of the Taunus range, that abuts upon the Rhine over against Bingen. On a commanding site near its summit was erected, on 28th September 1833, the national (German) memorial commemorative of the successful war of 1870-71. An extensive pedestal, ornamented with allegorical figures, is surmounted by a bronze figure of Germania, 34½ feet in height. The whole was designed by Schilling, a Dresden sculptor. Toothed-railways carry visitors up to the monument from the villages of Rüdesheim and Assmannshausen at the foot, both noted for their wine.

Niel, ADOLPHE, French marshal, was born at Muret (Upper Garonne) on 4th October 1802, and entered the army as an engineer officer; he took part in the storming of Constantine in Algeria (1836), the siege of Rome (1849), the bombardment of Bomarsund in Finland (1854), the fall of Sebastopol (1856), and in the battles of Magenta and Solferino (1859). His share in these battles won him the marshal's baton. He was made minister of war in 1867, and was busily employed reorganising the French army when he died, 14th August 1869. It is from him that the favourite Marshal Niel (yellow) rose derives its name.

Niello-work (Ital. *niello*, from Low Lat. *nigellum*, 'black enamel'), a method of ornamenting silver or gold plates by engraving the surface, and filling up the lines with a black composition to give clearness and effect to the incised design. The plates so ornamented were principally employed in the making of church-plate reliquaries, and for costly personal ornament. Traces of the art are found in ancient Roman work, and it was much practised under the Byzantine empire from the 16th century onwards. The Italian goldsmiths attained remarkable skill in niello-work; and the most eminent and famous of these was the Florentine Maso or Tommaso Finiguerra, whose work, in addition to its artistic excellence, derives peculiar interest from the fact that he, being the first to take paper proofs from his engraved work, directly led the way to the production of line-engravings. The name niello is given not only to the engraved and niellated metal-work, but also to the paper proofs taken from them; and as these were only casually taken they are very rare, and bring great prices, as much as 300 guineas having been paid for a single small proof. Niello-work is still practised by goldsmiths, especially in Russia, the silver niellated boxes made in that country being popularly known as 'platina boxes.' See ENGRAVING, Vol. IV. p. 378; and a long article in the *Athenaeum* for 27th February 1886 on the extensive fabrication of *nielli* at Venice in the early part of the 19th century.

Niemen, a river of western Russia, whose lower course (70 of its 500 miles) lies within the province of East Prussia, where it is called the

Memel, rises a few miles south of the city of Minsk. It is navigable to Grodno; below Tilsit it divides into two branches, which reach the Kurisches Haff each by four mouths. For its trade, see TILSIT.

Niepee, JOSEPH NICÉPHORE, one of the inventors of photography, was born at Châlon-sur-Saône, 7th March 1765, served in the army in Italy, and in 1795 became administrator of the district of Nice. Returning to Châlon in 1801, he devoted himself to chemistry, lithography, and to those experiments with sunlight pictures which brought him into connection with Daguerre and made Photography (q.v.) possible. He died 5th July 1833.—His nephew, CLAUDE MARIE FRANÇOIS NIEPCE DE ST VICTOR (1805–70), also a soldier, contributed to the furtherance of the new art, and wrote a *Traité Pratique* (1856) on the subject, and *Recherches Photographiques* (1855).

Nierstein, a village of Hesse-Darmstadt, on the Rhine, 10 miles SSE. of Mainz, famous for its Rhine wine. Pop. 3283.

Nieuwveld Mountains. See CAPE COLONY.

Nièvre, a central department of France, occupies a portion of the watershed between the Loire and the Seine, and is bounded on the west by the rivers Allier and Loire. Area, 2632 sq. m.; pop. (1881) 347,576; (1886) 347,645. Mountains belonging to the Morvan system, which forms the watershed between Seine and Rhone, divide the department into two great declivities. There are plateaus more or less fertile, vine-clad hills, and valleys rich in pastures; but the principal wealth of the department consists in its forests and minerals—coal, iron, and gypsum. The Nièvre, whence the name of the department, is an inconsiderable affluent of the Loire from the right. The three chief rivers—the Allier, Loire, and Yonne—are navigable, and the Yonne, which belongs to the system of the Seine, is connected with the Loire by a canal. More than a third of the whole surface is covered with forests. Good wine is made; the iron industry is important, and pottery and glass are manufactured. Arrondissements, Nevers, Château-Chinon, Clamecy, and Cosne; capital, Nevers.

Nifheim ('the abode of clouds'), in Scandinavian Mythology (q.v.), the kingdom of cold and darkness, separated from Muspelheim, the kingdom of light and heat, by a huge chasm (Ginnungagap). Nifheim was also the abode of Hel (q.v.), the goddess of death.

Nigella, a genus of plants of the natural order Ranunculaceæ, having five coloured spreading sepals; five or ten small two-lipped petals, with tubular claw; the carpels more or less connected together, many-seeded; the leaves divided into threadlike segments, the flowers solitary at the top of the stem or branches. They are annuals, natives chiefly of the countries near the Mediterranean and the warmer temperate parts of Asia. Some of them, occasionally seen in gardens in Britain, are vulgarly known as *Devil-in-a-mist*. The seeds are aromatic and somewhat peppery. Those of *N. sativa*, a species common in cornfields in the south of Europe, are supposed to be the Black Cummin of the ancients, and perhaps the Cummin of the Bible.

Niger, the name now generally applied to one of the most remarkable river-systems of West Equatorial Africa, first appears in Ptolemy as designating, it is believed, the modern Wadi Draa, and coupled with a river Gir, which may be identified with the modern O-Guir, flowing southward from the Atlas towards the oases of Tuat. The word not improbably contains the root *gir*, *gar*, or *jur*, not infrequent in the river-names of

northern Africa. Mixed up as it was from time to time with the problem of the Nile, the problem of the Niger remained almost till the 19th century one of the most perplexed and bemuddled in the whole range of geography. Though the Portuguese had ascended the river from the sea in the 16th century, the most contradictory opinions were held as to its character and relations down to the later part of the 18th century: it was an affluent of the Nile; an affluent of the Congo; an independent river terminating in an inland basin; and so on. It was still left to Mungo Park and other workers in the service of the African Association (1788) to lay the basis of our present fairly accurate knowledge of the system. Apart from some of the tributary streams, the hundred years of exploration now leave only a blank of some 60 or 70 miles in the middle course of the main river.

The Niger proper (Joliba or Dhiuliba, Isa, Kworra or Quorra, &c.) has a total length of 2600 miles, and the area of the entire basin (including that of the Benué) is estimated at 1,023,280 sq. m. The head-waters are situated in the region now known as the States of Samory, inland from Sierra Leone and Liberia, and are contiguous to the head-waters of the Senegal. The Tembi (first explored by Zweifel and Moustier in 1879), rising at a height of about 3000 feet above the sea in the Loma Mountains in 8° 36' N. lat. and 10° 33' W. long., is now accepted as the conventional 'source.' This and its sister streams, though draining a comparatively limited area, soon gather into a good navigable river, which holds a north-easterly course as far as Timbuktu (18° 4' N. lat., 1° 45' W. long.), first visited by Laing in 1826. About 300 miles above this famous city it is joined by an important right-hand tributary, the Mayel-Balevel, and develops a tendency to split up into numerous and widely diverging channels, with cross-creeks, back-waters, and swamps. Beyond Timbuktu a more easterly direction is maintained for 200 miles, and then with its now united forces the Niger turns south-east to cut its way through a rocky tract of country, and to pass in succession Gao (Gogo) on the southern skirt of the Sahara; Say, the southern point of Barth's exploration; Gompá, the northern limit of Flegel and Thomson; Bussa, where Park came to his untimely end; Rabba, one of the largest cities on its course; and Egga, where the river, having struck across the Rennell Range (2800 feet), turns more to the south. During this long journey from Timbuktu (1130 miles) a chief characteristic of the Niger has been the insignificance of its tributary streams; but at last, in 7° 50' N. lat. and 6° 45' E. long., it meets in the Benué or Mother of Waters a rival both in volume and in beauty. This river has travelled 860 miles from the east; and, though exploration in 1890 has deprived it of the credit (hypothetically assigned) of being a link through the Tuburi swamp with the system of Lake Tsad, it has interest enough, geographical and commercial, of its own. The united river, leaving the sandstone plateau through which it has been carving its channel, 'passes through a series of bold, picturesque hills by a narrow gorge,' and below Onitsha begins to break up into one of the most remarkable mangrove-covered deltas in the world. See Johnson, paper and map, in *Proc. Roy. Geog. Soc.* 1888.

The greater bulk of the exploration of the Niger (especially towards the south) has been accomplished by Britain (Park, Clapperton, Beccroft, Trotter, Baikie, &c.), and thanks mainly to Macgregor Laird, who founded the African Steamship Company in 1832, Britain has held her ground against all foreign commercial competition. By the Berlin Conference of 1884 the whole course of

the river below Timbuktu (while its navigation is declared free) is placed under the protection of Britain; and the British United African Company (founded 1879, chartered 1886), with its stations at Akassa, Onitsha, Asaba, Lokoja, &c., has practical command of the trade. The English Church Missionary Society has long laboured in the delta region and inland as far as possible; and in 1864 Bishop Crowther was appointed to the bishopric of the Niger. Above Timbuktu the control is in the hands of the French, who have steamers on the river, have built forts at Kouroussa, Siguiri, Kanguba, and Bamako, and are rapidly pushing eastwards. Germany made a strong effort, mainly through Flegel, to seize the control on the Benué, but was thwarted by the United African Company. For a long time slaves were almost the only article of export from the Niger; at a later date palm-oil became so distinctly the staple that the name Oil Rivers was given to the various outlets of the delta in which the Niger proper interlaces with several seaboard streams. As European influence advances inland the variety of commercial products increases.

See Joseph Thomson, *Mungo Park and the Niger* (1890); *Le Soudan Français*, and Binger, *Du Niger au Golfe de Guinée*, in Bull. de la Soc. de Géog. (1889); and *Die Flegelsche Routenkarte*, in Z. der Ges. für Erdkunde (1889).

Night. See DAY.—Amongst the ancient Greeks Night (*Nyx*) was personified as a powerful goddess, who by means of sleep exercised power over men and gods. According to Hesiod, she was the daughter of Chaos, wife of Erebus, and mother of Aether and Hemera (Day), of the Fates, Sleep, Death, Dreams, Hunger, Fear, Nemesis, and Strife. By day she dwelt in Tartarus, enveloped in thick clouds.

Night-hawk, the usual name in the United States for the *Chordeiles popetue*, a goatsucker belonging to a different genus and species of the Caprimulgidae from the European Goatsucker (q.v.). It is found over nearly the whole of North America, has long, thin, pointed wings, a forked tail, a very small beak, and wide gaping mouth, furnished with bristles.

Night-heron (*Nycticorax*), one of the genera of Herodiones (see HERON), cosmopolitan in its distribution, and including nine species. One species, *N. griseus*, widely distributed over the whole of Africa and southern Asia, breeding in the Spanish peninsula and in Italy, and a migrant to places near the Baltic, has now, since the year 1872 when it was first recorded near London, become an almost annual visitor to various parts of the British Islands in spring and autumn, and would probably breed if unmolested. It is about 23 inches long; it nests in colonies on trees or bushes in swamps, or on reeds strongly built together in a pile, and feeds on water insects and their larvæ, worms, snails, small fish, and frogs. Closely allied forms inhabit America, the *N. navius* (*Nyctiardea Gardeni*, Baird), the common American night-heron, being found all over the United States, as a permanent resident in the southern portion only; and in the Malayo-Australian region *N. caledonicus*, a distinct species, occurs.

Nightingale (*Daulias*) a genus of Passerine birds of the family Turdidæ. The bill is straight, slender, not quite as long as the head; the wings do not much pass beyond the base of the tail; the first quill is very short, the third is the longest; the tail is slightly rounded; toes long, claws rather short. The Common Nightingale (*D. luscinia*) is well known as the finest of songsters. It is rather larger than the hedge-sparrow, with about the same proportionate length of wings and

tail. It is of a rich russet-brown colour above, shading into reddish chestnut on the tail-coverts and tail; the lower part grayish white; bill, legs, and feet brown. The sexes are alike in plumage. It is a native of many parts of Europe and Asia, and of the north of Africa, extending as far as to Abyssinia, and to the Gold Coast in West Africa, and is a bird of passage, extending its summer migrations on the continent of Europe as far north as the south of Sweden, though in Britain it has scarcely ever been seen farther north than Yorkshire. It is plentiful in some parts of the south and east of England, but is less common in the western counties, and does not visit Scotland, Ireland, or Wales, except Glamorganshire and Brecon. It frequents thickets and hedges and damp meadows near streams. The market-gardens near London are among its favourite haunts. It feeds very much on worms, beetles, insects, ants' eggs, caterpillars and other insect larvæ. It arrives in England about the middle of April, the males about ten days before the females. It is at this season, and before pairing has taken place, that bird-catchers generally procure nightingales for cage-birds, as they then become easily reconciled to confinement, whilst if taken after pairing they fret and pine till they die. If nightingales, however, are to be kept in confinement they ought to be taken from the nest when young and reared by the hand. The nightingale makes its nest generally on the ground, but sometimes on a low fork of a bush. The nest is loosely constructed of dead leaves, rushes, and stalks of grass, with a lining of fibrous roots. The eggs are from four to six in number, of a uniform deep olive-brown. The song of the male ceases to be heard as soon as incubation is over. In captivity, however, it is often continued through a more considerable period. The nightingale usually begins its song in the evening, and sings with brief intervals throughout the night. The variety, loudness, and richness of its notes are equally extraordinary; and its long quivering strains are full of plaintiveness as well as of passionate ecstasy. The nightingale has been a favourite from most ancient times, and is often mentioned in the poetry of India and Persia, of Greece and Rome, as well as by Shakespeare and Herrick, Keats and Coleridge, and many others. The loves of the Bulbul (q.v.) and the rose are a fanciful theme in which eastern poets delight. The nightingale, as a rule, is not a shy bird, for although it is but seldom seen it seems to prefer to live near the abode of man; nor is it quarrelsome with others of its own species except at pairing time. A closely allied species (*D. golzii*) is found from the Caucasus to Turkestan and Persia, and in north-eastern and central Europe the Northern Nightingale or 'Sprosser' (*D. philomela*) is found, quite a

Common Nightingale
(*Daulias luscinia*).

distinct species, of rather larger size, less russet in hue, and slightly spotted on the breast.

Nightingale, FLORENCE, the daughter of William Edward Nightingale of Embley Park, Hampshire, and Lea Hurst, Derbyshire, was born at Florence in May 1829. She was taught mathematics, the classics, and modern languages under the guidance of her father, and thus highly educated and brilliantly accomplished she early exhibited an intense devotion to the alleviation of suffering, which in 1844 led her to give attention to the condition of hospitals. She visited and inspected civil and military hospitals all over Europe; and in 1851 went into training as a nurse in the institution of Protestant Deaconesses at Kaiserswerth on the Rhine, and studied with the Sisters of St Vincent de Paul in Paris the system of nursing and management carried out in the hospitals of that city. On her return to England she put into thorough working order the Sanatorium for Governesses in Harley Street. Ten years was the term of apprenticeship thus served in preparation for the work of her life. In the spring of 1854 war was declared with Russia; Alma was fought on the 20th of September, and the wounded from the battle were sent down to the hospitals on the Bosphorus, which were soon crowded with sick and wounded, their unhealthy condition becoming apparent in a rate of mortality to which the casualties of the fiercest battle were as nothing. In this crisis Miss Nightingale wrote on 15th October and offered to go out and organise a nursing department at Scutari. Lord Herbert, who had already written a letter 'requesting' her to go, which crossed that containing Miss Nightingale's offer, gladly accepted, and on the 21st of October she departed with thirty-four nurses. She arrived at Constantinople on the 4th of November, the eve of Inkermann—the beginning of the terrible winter campaign—in time to receive the wounded from that second battle into wards already filled with 2300 patients. Her devotion to the sufferers can never be forgotten. She would stand twenty hours at a stretch, in order to see them provided with accommodation and all the requisites of their condition, and a few months after her arrival she had 10,000 sick men under her care. But she saw clearly in the bad sanitary arrangements of the hospitals the causes of their frightful mortality, and her incessant labour was devoted to the removal of these causes, as well as to the mitigation of their effects. In the spring of 1855, while in the Crimea organising the nursing departments of the camp-hospitals, she was prostrated with fever, the result of unintermitting toil and anxiety; yet she refused to leave her post, and on her recovery remained at Scutari till Turkey was evacuated by the British, July 28, 1856. She, to whom many a soldier owed life and health, had expended her own health in the physical and mental strain to which she had subjected herself. In 1857 she furnished the 'commissioners appointed to inquire into the regulations affecting the sanitary condition of the British army' with a paper of written evidence, in which she impresses forcibly and clearly the great lesson of the Crimean war, which she characterises as a sanitary experiment on a colossal scale. At the close of the Crimean war a fund of £50,000 was subscribed for the purpose of enabling her to form an institution for the training of nurses; this is spent in training a superior order of nurses in connection with St Thomas's (the Nightingale Home) and at King's College Hospital. From the Queen she received an autograph letter of thanks, and a cross set with diamonds, as also a bracelet set with brilliants from the Sultan of Turkey. Her experience in the Crimea turned the attention of Miss Nightingale to the general

question of army sanitary reform, and first to that of army hospitals. In 1858 she published her valuable *Notes on Nursing*, and she contributed two papers to the National Association for the Promotion of Social Science, on Hospital Construction and Arrangement. The *Notes on Hospitals* (1859), from their clearness of arrangement and minuteness of detail, are most valuable to the architect, the engineer, and the medical officer. In the year 1863 was issued the Report of the Commission on the Sanitary Condition of the Army in India. These reports were sent in manuscript to Miss Nightingale, and at page 347 of vol. i. are inserted her incisive and admirable observations upon this immense mass of evidence. In 1871 Miss Nightingale published *Notes on Lying-in-Institutions*; in 1873, *Life or Death in India* and (in *Fraser's Magazine*) 'A "Note" of Interrogation,' which attracted a good deal of attention, mainly on account of the way she handles religious beliefs and life. From America and from different European governments her advice has been sought as to army sanitation; she assisted in founding the Red Cross Society. Longfellow's *Santa Filomena* is in her praise. The article HOSPITALS in this Encyclopædia is from her pen.

Night-jar. See GOATSUCKER.

Nightmare (A.S. *neahht*, 'night,' and *mara*, 'night-mare'; originally 'the crusher'). See DREAMING.

Nightshade, the English name of certain plants of the natural order Solanaceæ (q.v.), possessing the narcotic properties frequently developed in that order. Among them are some species of *Solanum* (q.v.), particularly the Common Nightshade, or Black Nightshade (*S. nigrum*), an annual or biennial, with erect angular stem, ovate, sinuate-dentate leaves, drooping lateral umbels of white flowers, and globose black berries; a frequent weed in waste places in England and in most parts of the world. Few plants are more widely diffused. It is only slightly narcotic. The leaves in a fresh state are said to be injurious to animals which eat them, but seem to lose almost all narcotic property by boiling, and are used as spinach, particularly in warm climates. The berries, although generally dreaded or suspected, may also, it is said, be eaten, at least in moderate quantity, without danger. They contain, however, the alkaloid *Solanine*, found also in the shoots of the potato. For the Woody Nightshade, see BITTERSWEET; for the Deadly Nightshade, see BELLADONNA; and for Enchanter's Nightshade, see CIRCEÆ.

Nigritia. See SOUDAN.

Niigata, a seaport of western Japan, situated on a narrow strip of land at the mouth of the Shinano River, was opened to foreign trade in 1859. The harbour does not admit of the entrance of vessels of foreign build, and the roadstead is exposed; the foreign trade has therefore remained

Common or Black Nightshade
(*Solanum nigrum*).

only nominal. The apples and water-melons of the province are noted for their excellence. Pop. (1889) 40,778.

Nihilism is a term used to describe certain negative systems of philosophy. It was applied to some rationalists in the 12th century (Peter Lombard, q.v.), and in modern times to various negative systems of metaphysics, ethics, and atheist philosophy. Of late, however, it has become familiar as applied to Russian revolutionists, and especially (though improperly) to those of the 'terrorist' wing. In Russian life it was first introduced by Turgenieff (q.v.), in *Fathers and Sons* (1862), to characterise a new type appearing at that time among the Russian educated classes—men who, in Turgenieff's own words, 'bow before no authority of any kind, and accept on faith no principle, whatever veneration surround it.' Accordingly, they defied 'the fathers' 'to find out, in our present life, family and social, one single institution which would not deserve an absolute and pitiless negation;' and, 'abandoning all talk about art, unconscious artistic creation, parliamentarism, reformed tribunals, and what not else,' they put above all 'the question of daily bread for all,' repudiated art as long as it is not in the service of the masses, waged war against prejudices, and reformed their own lives according to truth and sincerity, assuming an outward roughness in their behaviour as a protest against the polished and insincere relations in civilised life. Turgenieff's eminently objective description of the new type having been misunderstood, Tchernyshevsky (q.v.) wrote the novel *What is to be done?* representing the Nihilists not as simple philosophers of negation, but as people engaged either in science, or in social reforms on Robert Owen's lines, or (a few of them) as popular revolutionists; and especially insisting upon their highly respectful relations to woman, whom they consider as an intellectually equal comrade in work. The two novels, both drawn from life, thus complete one another, and give a correct idea of Nihilism, which in its philosophical aspects is an outcome of the philosophy of the 18th century as modified by modern science (Buckle, Darwin, H. Spencer, and J. S. Mill being the most popular authors among Nihilists), while in social life it appears as a protest against 'the conventional lies of civilised mankind.' Nihilism is thus the Russian equivalent of the 18th century's Scottish and French Encyclopædist philosophical movements; but it differs from them by having transported their philosophical conceptions into everyday life. The teachings of Nihilism, which has its roots in all previous life of the Russian educated classes (Pushkin was already nicknamed Nihilist by his adversaries), found two very gifted expounders in the art-critic Dobroluboff (1836-61) and the political writer Pisareff (died 1872), and has created a very bulky literature, especially of novels propagating the same ideas. They have exercised a deep influence upon the life of the educated classes in Russia, and created in Russian literature and art a current which makes them differ so widely from literature and art in western Europe. They also contributed to the deep-reaching movement in favour of the higher education of Russian women, which, notwithstanding the opposition of government, is now further advanced in Russia than in any European country. The 324 non-classical gymnasia for girls—quite equal to the best institutions of the same kind—have now 90,000 pupils. Four women's universities and one medical academy, all supported by private contributions and quite equal to the best male universities, had an aggregate of 2000 students when closed by government in 1886-88 (one is reopened); besides, 830 ladies already have

obtained doctors' degrees in Russia after having passed the same examinations as the male doctors.

'Nihilists' are now found in all classes of educated Russians, the great bulk taking no part whatever in the political struggle; while those revolutionists who are described in western Europe as Nihilists have political programmes directly borrowed from western Europe, and are known in Russia as Radicals, Socialists, Anarchists, Popularists, or Party of the Will of the People (the latter resorting to political terror in order to obtain a constitution).

The name of Nihilist has, however, been so much identified with the revolutionary movement in Russia that a brief account of the latter must be given under this heading. It was born, especially under the influence of Herzen (q.v.) about 1860, when the hopes of thorough reforms awakened by the proposed emancipation of the serfs were frustrated by the ascendancy acquired by the serf-owners' party in the councils of the czar. Proclamations appealing to the peasants to revolt were issued in 1861; and two secret societies—'The Great Russian' and 'Land and Liberty'—were organised. In 1861 the poet Mikhailoff (died in Siberia in 1867) and in 1864 Tchernyshevsky (died in 1887 at Astrakhan, after 20 years' confinement in Siberia) and several others were sent to hard labour in Siberia in connection with this movement. When, after the Polish insurrection (1863), the old party took the upper hand in the Winter Palace, new revolutionary circles made their appearance; they resulted in a peasants' outbreak at Kazan (1864), a revolutionary propaganda among workers, and an attempt by Karakozoff upon the life of the czar (1866). In 1870 a similar movement was started among the youth under the leadership of Netchaieff. The failure of these two movements led to the appearance all over Russia of circles for more serious self-education, which, however, soon took a more revolutionary character, chiefly under the influence of the powerful agitator, Michael Bakunin (q.v.), the ideas of the International Working-men's Association, which rapidly spread in Russia after the Paris Commune, and the socialist writings of Colonel Peter Lavroff. Young men and women of rich families abandoned their homes, and went to the villages and factories in the capacity of workers, schoolmasters in villages, medical helps, midwives, and so on, either simply to share with the people their life of privation or to carry on a revolutionary propaganda. More than 2000 persons were arrested (1873-76) in connection with the movement and kept for years in prison; but only 193 could be brought (end of 1877) before a supreme court. It could not but acquit most of them; yet even then they were sent into exile. Several smaller groups were tried and condemned during the same years.

The flogging of a prisoner in the St Petersburg prison by the then prefect of police, General Trépoff—a most influential person among the advisers of the czar—and the impossibility of otherwise bringing the fact to publicity, induced Vera Zasulich to make an attempt upon General Trépoff's life (February 1878). She was sent as a common-law offender before a jury and acquitted (April 1878), the attempt at rearresting her as she left the court being baffled by a riot in the streets, during which one of her friends was shot. The trials for political offences were now withdrawn from the senate (which formerly used to judge them) and assigned to courts-martial; while on the other side the revolutionists, abandoning more and more the propaganda among the people, resorted to a policy of terror. They killed several spies, one police official, the governor-general of Kharkoff, and the chief of the state police, General Mezentsoff, in broad daylight in St Petersburg (August 1878).

Russia was then divided into general governorships, the governors receiving the power of confirming the sentences of death pronounced by the courts-martial, and freely using it. Several attempts against the life of the czar were made: by Solovioff (in April 1879), twice by wrecking imperial trains (November 1879), and finally by a destructive explosion in the Winter Palace (February 1880). Seventeen revolutionists were hanged and hundreds exiled to Siberia during the same twelve months. After the Winter Palace explosion Alexander II., who already more and more abandoned the direction of state affairs, nominated Count Loris-Mélikoff president of a supreme commission for the management of the affairs of the state. Wide promises of constitutional reforms were circulated by the new ruler, but none of them were realised, and the nomination was cancelled a few months later. So the executive committee of the party of the 'Will of the People,' which had at that time very wide ramifications over Russia, and whose secret press always reappeared in spite of the seizure of its printing-offices, prosecuted its underground work, and Alexander II. was killed by bombs March 13, 1881, on the morning of which very day he had signed the convocation of what he himself described as the *Assemblée des Notables*. The new czar, Alexander III., after a six weeks' hesitation, dismissed his father's ministers and proclaimed his resolution to remain an absolute sovereign. He lives almost a prisoner in Paul I.'s palace at Gatchina, and fresh plots continue to be discovered, spreading also into the army and navy. On March 13, 1887, revolutionists bearing bombs were arrested in a street a few minutes before the passage of the czar. Public discontent finds a new force in the systematic demolition of the reforms of the last reign which is now prosecuted, and it penetrates among the peasants, who see in the abolition of the justices of peace (1889) and the restrictions imposed upon the provincial self-government so many steps towards the reintroduction of the manorial justice of the nobles, and who met these measures by a series of outbreaks in 1889-90.

See G. B. Arnaudo, *Il Nihilismo* (Turin, 1879; also trans. into French); S. Stepniak, *Underground Russia* (1883); *Geschichte der revolutionären Bewegungen in Russland*, an elaborate work by A. Thun (1883); *Almanac of the Will of the People* for 1883 (published at Geneva in Russian, contains all the names and dates, and an historical sketch of the movement); Stepniak, *Russia under the Tsars* (1885); E. Noble, *The Russian Revolt* (1885); 'Russia and the Siberian Exiles' (*Century Magazine*, December 1887 to November 1889), by George Kennan; P. Kropotkin, 'The Russian Revolutionary Party' (*Fort. Review*, March 1882), and *In Russian and French Prisons* (1887).

Nijni-Novgorod ('Lower Novgorod'), a famous commercial city of Russia, and capital of a government, is situated at the confluence of the Oka with the Volga, 274 miles E. of Moscow by rail. There is an upper city, containing the Kremlin and many of the fifty churches, a lower city, and a suburb. The great fair brings buyers and sellers from all climes between Germany and China. For the convenience of those frequenting the fairs, there is an enormous market-hall, and sixty blocks of buildings for booths, containing more than 2500 apartments separated by fireproof walls. There are three annual fairs, two of them of minor account. The third, beginning at the 15th of July and continuing into September, is still the greatest in the world. But like the fair of Leipzig, it is evident that the great Russian fair is declining in importance. During the fair, the normal population (66,716 in 1885) is increased fivefold or even sevenfold; and the value of the goods sold at the great fair of 1889 was stated at

£18,854,277. At these fairs all foreign goods were supplied in smaller quantities, those of Russian production showing an increase. Nijni-Novgorod, founded in 1221, was devastated on several occasions by the Tartars; its prosperity dates from the year 1817, when the great fair was removed to Nijni-Novgorod from Makarief after a great fire.—The government, which has an area of 19,797 sq. m. and a pop. (1885) of 1,513,318, produces timber, iron and iron goods, salt, copper, gypsum, wool, and leather.

Nijni-Tagilsk, a town of the Russian government of Perm, amid the Ural Mountains, 150 miles E. of Perm by rail, with great platinum, copper, and iron works. Pop. 30,000.

Nikolaevsk, a decayed town of eastern Siberia, 23 miles from the mouth of the Amur. Pop. 3500.

Nikolaieff, headquarters of the Russian Black Sea fleet, in the government of Kherson, at the confluence of the Ingul with the Bug, and 42 miles from the Black Sea. The joint estuary of the Bug and Dnieper is defended by the forts of Otchakoff and Kinburn; and Nikolaieff is a great fortified naval station, with docks, an arsenal, &c., and has a large trade in exporting grain, though its imports are trifling. Since its connection with the central railway system of Russia its trade and importance have increased rapidly. Pop. (1885) 67,249.

Nikolsburg (Czech *Mikulov*), a town of Austria, in the south of Moravia, 27 miles S. of Brünn by rail, lies at the foot of hills famous for their rich red wines. In the middle of the town, upon a rock, stands the castle of the princely Dietrichstein family. Pop. 7642.

Nikon (1605-87), the Russian patriarch and primate whose revision of the very incorrect Slavonic service-books caused the secession of the Raskolniks (q.v.).

Nikosia. See NICOSIA.

Nile, the longest river of Africa, if not of the world, hydrographically, historically, and geographically a river of the greatest interest, and to the ancient Egyptians pre-eminently the sacred river, draws its largest supplies of water in the country of its sources from the Victoria and Albert Nyanzas. Several streams flow into the Victoria Nyanza, but which originates farthest to the south is not yet definitely known; the honour seems to lie between the Shimiyu and the Isanga. At any rate, the most distant feeders of the great river may probably be placed near to 4° S. lat. The river Kagera or Alexandra Nile, which joins the Victoria Nyanza high up on the west side, is believed to issue from Lake Alexandra, some 250 miles to the south-west; that stream brings a large volume of water to the lake. The Nile leaves Victoria Nyanza at its northern end, pouring over the Ripon Falls, 150 to 170 yards wide but only 12 feet high, and then for 300 miles races between high rocky walls, over rapids and cataracts, at first north-west, then west, until it joins Albert Nyanza near its north-east corner. About 20 miles from this lake the river leaps down 120 feet into a wild gorge, with high rocky walls. The section between the two Nyanzas is called the Victoria Nile or Somerset River. At its south-western extremity the Albert Nyanza is joined by the river Semliki, which drains away the surplus water of the Albert Edward Nyanza (discovered by Stanley in 1889); and this lake in its turn drains the slopes of the snowy Ruwenzori and adjacent mountains. The combined river leaves the northern extremity of the Albert Nyanza as the Bahr-el-Jebel, and from that point flows in a general northerly direction to the Mediterranean. The first 130 miles to Dufile it passes through a level country, and frequently

expands into lakes. From Dufile to Lado (120 miles) the bed is contracted by rocky hills from a mile to a quarter of a mile in width; and the stream is forced over the Yarborah Rapids. At Lado (5° N. lat.) the river enters the plains, and moves thence slowly and sluggishly down to Khartoum, 900 miles to the north. The whole of this stretch is navigable for river-steamers of fairly large size. In 7½° N. lat., however, the main channel divides; whilst the right arm, the Bahr-el-Zeraf, goes almost due north, the left arm, which still continues to be called the Bahr-el-Jebel, trends slightly to the west. Both streams flow, at no great distance apart, through a low swampy region, that is during the rainy season generally inundated for miles wide. The banks are lined with tall reeds and papyrus, the abode of numerous aquatic birds, and the shelter of swarms of gnats and other insect plagues. Since the year 1863 both these channels have been at times rendered wholly or in part impassable by vast accumulations of vegetable debris completely choking them. In 9¼° N. lat. the Bahr-el-Jebel is met by the Bahr-al-Ghazal, which, coming directly from the west, gives the united stream, now called the White Nile, a due easterly course. Although this tributary, navigable for some 200 miles above the confluence, runs nearly dry in the dry season, it gathers to itself the contributions of a very large number of rivers, some of them 300 and 400 miles long, which have their sources to the south and south-west in the country of the Niam-Niam tribes; one only, the Bahr-al-Arab, comes from the northern side—viz. from Darfur, to the north-west.

Sixty miles east of the confluence the White Nile receives the Bahr-el-Zeraf, and 30 miles farther east still the Sobat, which, navigable for 180 miles, if not farther, has its sources on the western slopes of the Galla country, to the south-east. From the point of junction with this affluent the White Nile flows almost directly north to Khartoum without being augmented by a single tributary stream. At Khartoum (in 15° 37' N. lat.) the White Nile, or Bahr-al-Abiad, is joined from the south-east by the Blue Nile, the Bahr-al-Azrak, the water of the respective streams being of the colour indicated in the names. The Blue Nile, 950 miles long, gathers its volume principally from Lake Tana (5658 feet above sea-level), situated on the Abyssinian plateau, in which region it is known as the Abai. It leaves the lake towards its southern end, and, after running south-east, curves right round by way of the south till it comes to flow north-west. After leaving the mountains it traverses an extremely fertile plain, the capital of which is Sennaar. From Khartoum the Nile flows north-north-east, and 200 miles below that city is joined from the right by the Atbara, called also the Bahr-al-Aswad, or Black Nile. It is the black sediment brought down by this river that settles in the Nile delta, and makes it so extraordinarily fertile. This affluent, too, has its source on the Abyssinian plateau, and its volume is increased by two large tributaries, the Takazze and Mareb, both striking into it from the right. During its course from the confluence of the Atbara through the Nubian Desert the great river makes two deep bends, first round by the north, then round by the south, and subsequently resumes its northerly flow. Below Khartoum navigation is

rendered extremely dangerous by the cataracts which obstruct the bed of the river, the sixth occurring not far north of Khartoum, the first near Assouan, in Egypt, just above 24° N. lat. The course of the river from Assouan to the sea is sufficiently described under Egypt (q.v.), where also a map of the entire course is sketched. The total length of the river cannot be stated precisely; from Victoria Nyanza it is estimated to measure 3400 miles. The Nile begins to rise at Gondokoro in April, the Bahr-al-Ghazal perhaps a week or two earlier. At Khartoum the rise begins in May, and reaches its maximum in September, whilst the Blue Nile rises from July to the third week in August (see NILOMETER). Irrigation is largely regulated by the great Nile Barrages at Rosetta and Damietta, constructed by French engineers in 1843–61, and practically reconstructed in 1886–90 at a cost of £405,000.

The ancients had little authentic knowledge of the Nile above Meroe, the ruins of which lie nearly half-way between Berber and Khartoum. The place of accurate knowledge was taken by

The Nile.—The First Cataract, looking down the river towards Assouan.

myth, to the effect that the river had its origin in Mauretania (now Morocco), and flowed several days' journey underground until it came to the south of Ethiopia; thence it passed northwards as the Astapus. The Emperor Nero began the fascinating work of searching for the sources of the Nile by sending two expeditions, which seem to have ascended beyond the confluence of the Sobat and White Nile. Ptolemy speaks of two streams issuing from two lakes 6 and 7 degrees south of the equator and uniting in 2° N. lat., and being joined in 12° N. lat. by the Astapus, which likewise flowed from a lake (Coloe). The two lakes in the far south were fed by the melting snows of a great range of mountains, the Mountains of the Moon (which Stanley now identifies with Ruwenzori, Gordon Bennett, and the adjoining peaks). This remained the sum total of information about the river down to the 19th century, except that in 1770 Bruce discovered that the Blue Nile issued from Lake Tana. The Egyptian government in the years 1839–42 sent three expeditions up the river, which got as far as Gondokoro. In 1858 Speke reached the Victoria Nyanza, and in 1862 discovered Ripon Falls. Two years later Sir Samuel Baker discovered Albert Nyanza, and in 1868–71 Schweinfurth explored the western feeders of the White Nile. Stanley, in 1875, sailed all round Victoria Nyanza, and in 1889 traced the

course of the Semliki, and discovered Albert Edward Nyanza and Mount Ruwenzori.

See works of the explorers named, also others by Marno, Von Klöden, Wilson and Felkin, Schuver, Petherick, Junker, &c., with Walter Budge's *The Nile: Notes for Travellers in Egypt* (1890). For the battle of the Nile, see ABOUKIR.

Nilgiri. See NEILGHERRY.

Nilometer, an arrangement for measuring the height of the Nile in Egypt. On the island of Rhoda, opposite to Cairo, is a square well, connected with the river by a canal, and containing a graduated marble pillar, divided into 24 cubits, each measuring 21·386 inches. A rise of 18 cubits is traditionally regarded as the height of the lowest inundation; 19 cubits is considered tolerable, 20 excellent, 21 adequate, and 22 complete, but 24 is ruinous. The ordinary maximum of the rise at Cairo is stated at from 24 to 26 feet. For the inundations from 1849 to 1878, see *Nature*, vol. xxv. The nilometer of Rhoda was constructed during the reign of the calif Al-Mutawakkil, in the year 847. Anciently there seem to have been various nilometers of different kinds, all along the river, as at Memphis (probably the oldest), Ekhnin, Elephantine, and elsewhere.

Nilsson, CHRISTINE, operatic singer, was born the daughter of a farmer at Wexiö, in Sweden, 3d August 1843, and singing at a fair in 1857 so impressed a magistrate of Ljungby that he sent her for a musical education to Stockholm and Paris. She made her début at Paris in *La Traviata* in 1864; and in London, where she appeared in 1867, soon took rank as one of the foremost soprano singers. Marguerite is one of her best-known parts. She has repeatedly visited the United States. She was married (1872) to M. Rouzand, who died in 1882.

Nimach, a town of India, in the territory of Gwalior, on the north-western border of Malwa, 370 miles SW. of Delhi by rail, 1613 feet above sea-level, with an agreeable and healthy climate. There has been a British cantonment here since 1817. Pop. of town, 5161; of cantonment, 13,069.

Nimbus, in Art, especially in Sacred Art, is the name given to the disc or halo which encircles the head of the sacred personage who is represented. Its use is almost universal in those religions of which we possess any artistic remains—the Indian, the Egyptian, the Etruscan, the Greek, and the Roman. Some, indeed, have sought directly to derive it from the Greek *mēnikos*, or metal disc placed over the heads of statues to keep off the droppings of birds. Nevertheless, the nimbus, strictly so called, is comparatively recent in Christian art, not appearing before the 6th century. Later in Christian art it became almost a necessary appendage of all representations of God or of the saints. Its ordinary form is the circular or semicircular; but the nimbus of the Eternal Father is often in the form of a triangle, and that of the Trinity an emanation of light, the rays of which form the three arms of a cross. The nimbus of the Virgin is sometimes a simple ring, and sometimes a crown or diadem; occasionally it is encircled by an ornamental border, on which twelve stars are sometimes represented. Her nimbus, as well as that of the Divine Persons, is commonly of gold; but occasionally it is in colours, as blue, red, purple, or white. The nimbus of the saints is ordinarily the semicircle or lunula. In later art the nimbus became lighter and more aerial, melting, as it were, into the picture. In connection with the nimbus may also be mentioned the *Aureole*, an illumination surrounding, not the head only, but the entire figure. If the figure be upright the aureole is commonly oval, when it is

called the *vesica piscis*, and is supposed to contain an allusion to the sacred Christian emblem, the *ichthys*. With a seated figure it becomes circular, and is occasionally divided by radiating bands, in the form of a wheel; sometimes it takes a quatrefoil form. It is commonly of gold, but occasionally also is in colours. The *Glory* is a combination of the nimbus and the aureole, and is chiefly seen in Byzantine pictures and those of the early South German school.

Nimeguen (Dutch *Nijmegen*), a town of Holland, in the province of Guelderland, on the left bank of the Waal, 73 miles by rail E. of Rotterdam. It is built on the slope of the Hoenderberg ('Hill of the Huns'), on which the Romans formed the permanent camp of *Noviomagus*; and some of its streets are steep and narrow, but others are broad and handsome. On a neighbouring height stood till 1796 a castle, said to have been founded by Cæsar and inhabited by Charlemagne; and towards the brow of this height there still stands a little sixteen-sided Romanesque baptistery of the 12th or 13th century. On another eminence is the modern Belvidere, whose summit commands a wide view. The fortifications have been demolished; but Nimeguen retains its Renaissance town-hall (1554), adorned with medallions of German emperors, and the fine Gothic church of St Stephen (dating from 1272). The manufactures include tobacco, Eau de Cologne, metal-work, beer, &c. Pop. (1875) 22,929; (1890) 32,326. Regained by the Spaniards (1585–91), Nimeguen is celebrated in history for its great peace congress, which on 12th August 1678 concluded a treaty between France and Holland, on 13th December between France and Spain, and on 5th February 1679 between Austria and France.

Nîmes, the capital of the French department of Gard, lies in a fertile plain, engirt by the vine-clad Cevennes, 31 miles by rail NE. of Montpellier and 30 SW. of Avignon. The old town, with narrow crooked streets, is separated by shady boulevards from the well-built faubourgs; and mediæval and modern edifices are a much mutilated cathedral, the prison (formerly citadel, 1687), the palais de justice, St Paul's (1850), St Baudile's (1875), &c., with a most magnificent fountain, and a monument (1874) to Antoninus Pius. But the glory of Nîmes is its Roman remains of the ancient *Nemausus*. These include the 'Maison Carrée' (now a museum, with Delaroche's masterpiece, 'Cromwell looking on Charles I.'s corpse'), a splendid specimen of Corinthian architecture; an amphitheatre (now a bull-arena), 70 feet high, and seating 20,000 spectators; the exquisite Nymphæum; a mausoleum ('La Tour magne'), baths, and two gates, whilst 14 miles NE. is the 'Pont du Gard,' most perfect of Aqueducts (q.v.). Nîmes is a seat of great commerce and manufactures, these comprising silk and cotton goods, carpets, shawls, wine, brandy, boots, &c. Pop. (1872) 60,020; (1886) 67,274, of whom one-third were Protestants. Supposed to have been colonised from *Massilia* (Marseilles), and the capital of the Volcæ Arecomici, Nîmes flourished under the Romans, and was one of the great cities of Gaul. It was taken by the Visigoths (465), the Franks (507), and the Saracens (725), and subsequently became an appanage of Aragon, but was finally restored to France by the treaty of Corbeil (1259). The inhabitants adopted Calvinism in the 16th century; and it was a stronghold of the Camisards (q.v.). In 1791 and 1815 it was the scene of bloody religious and political reactions. Nicot, Guizot, and Daudet were natives. See works by Ménard (7 vols. 1875), Perrot (11th ed. 1856), Durand (1876), and Pieyre (3 vols. 1888).

Nimrod. See BABYLONIA, Vol. I. p. 633, BABEL; as a *nom de plume*, see APPERLEY.

Nine Eyes, a popular name for the young lampreys found in rivers. See LAMPREY.

Nineveh, the modern *Kouyunjik*, capital of the ancient kingdom of Assyria. Its original capital was Assur, the ruins of which are now called *Kalah Sherghat*, but the group of cities some sixty miles to the north, above the Greater Zab, and on the eastern side of the Tigris, namely Nineveh, Calah (*Nimrud*), and Dur-Sargon (*Khor-sabad*), ultimately supplanted it in importance. When Nineveh itself fell, the whole Assyrian empire—essentially a military power—perished with it. In the Sassanian period a village was built on the mounds which covered its ruins; but when its buildings had also crumbled into ruins, the very site of the proud ancient city remained for centuries unknown. Rich in 1818 conjectured that the mounds of Kouyunjik, opposite the modern town of Mosul, concealed its ruins beneath, but it was not until the excavations of Botta in 1842 and Layard in 1845 that the remains, first of Dur-Sargon, then of Nineveh itself, were revealed to the world. The sculptured monuments of its ancient kings and the relics of its clay-inscribed library soon yielded up their secrets to the investigations of scholars, and ere long the life and history of the ancient kingdom of Assyria were known almost with as much certainty as those of Greece and Rome. See ASSYRIA, and CUNEIFORM INSCRIPTIONS.

Ning-po, a treaty-port of the Chinese province of Che-keang, stands in a fertile plain, 16 miles from the mouth of the Takia (Ning-po) River and about 100 miles S. of Shanghai. It is surrounded by a wall 25 feet high and 16 feet thick, and contains numerous temples, colleges, &c., chief amongst them the temple of the Queen of Heaven, figured under CHINA (Vol. III. p. 187); the temple was founded in the 12th century, but the present building, elaborately and richly ornamented, dates from 1680. The people, 250,000 in number, make sedge hats and mats, grow cotton, catch cuttle-fish, and carry on an active trade, especially in the export of green tea. The customs returns show the annual value of the imports—chiefly opium (30 per cent. of the total), cotton and woollen goods, tin and iron, medicines (in transit), dried *lunggans*, kerosene oil, indigo, sugar, and tobacco—to be £1,887,900, and the exports—green tea (70 per cent. of the total), cuttle-fish, sedge hats and mats, silk goods, and raw cotton—to be £1,259,300. Apart from junks, some 550 vessels, of 382,800 tons, enter every year, of which 158 vessels, with an aggregate of 127,900 tons, are British.

Ninian, St, the first known apostle of Scotland, was born of noble parentage, about 360, on the shores of the Solway Firth. Of studious and ascetic habits, he was moved by the Holy Spirit to make a pilgrimage to Rome, and there, after some years' stay, was consecrated bishop by the pope. On his homeward way he visited St Martin (q.v.) at Tours, and after his arrival in Galloway he founded the 'Candida Casa,' or church of Whithorn, dedicating it to St Martin, the news of whose death had just reached him (397). Later he laboured successfully for the evangelisation of the Southern Picts, and in 432 (according to the Bollandists) died 'perfect in life and full of years,' and was buried in his church at Whithorn. His festival falls on 10th September. His Life by St Ailred (1109-66), abbot of Rievaulx in Yorkshire, who visited Galloway, has been edited by Bishop Forbes (vol. v., 'Historians of Scotland' series, 1874), who enumerates sixty-six dedications in Scotland to St Ninian or 'Ringan'—the Lowland Scotch form

of his name—including the Episcopal cathedral at Perth.

Ninon. See LENCLOS.

Niobe, in Greek Mythology, the daughter of Tantalus and wife of Amphion, king of Thebes, to whom she bore six sons and six daughters. Proud of her children, she despised Leto or Latona, who had only two children, Apollo and Artemis; whereupon Latona, enraged at her presumption, moved her children to destroy all the children of Niobe with their arrows. They lay nine days in their blood unburied, when Zeus changed them into stone, and on the tenth day they were buried by the gods themselves. Niobe was changed into stone on Mount Sipylus, in Lydia, from which tears flowed every summer. Such is the Homeric legend, which, however, was afterwards much varied and enlarged. Only fragments exist of the tragedies of Æschylus and Sophocles on this theme, which was a favourite subject of ancient art. A noble group representing Niobe and her children was discovered at Rome in 1583, and is now in the Uffizi Palace at Florence. Even the ancient Romans were in doubt whether the work proceeded from Scopas or Praxiteles. See Heydemann, *Analekten zu den Kunstdarstellungen der Niobe* (Leip. 1883).

Niobium (sym. Nb; equiv. 94) is a rare metal discovered by H. Rose in the mineral *Tantalite*. It may be obtained by passing the vapour of the chloride along with hydrogen through a red-hot tube. It is of a steel-gray colour, specific gravity 4.06, and takes fire when heated in the air or in chlorine gas. It is but little acted on by hydrochloric or nitric acid, but is soluble in strong sulphuric acid. It forms compounds with oxygen, chlorine, sulphur, &c., but these are of little practical importance.

Niort, the capital of the French department of Deux-Sèvres, pleasantly situated on the navigable Sèvre Niortaise, 43 miles NE. of La Rochelle and 109 SW. of Tours. An important railway junction, it has an old castle, a *hôtel-de-ville* (1530), a fine public garden, and the 16th-century church of Notre Dame, with a spire 246 feet high. The dressing of leather and the manufacture of gloves are the leading industries. Pop. (1872) 20,022; (1886) 22,079. Niort in the 14th century was held for eighteen years by the English. It was the birthplace of Madame de Maintenon. See Favre's *Histoire de Niort* (1890).

Nipigon, a lake of Ontario, 30 miles NW. of Lake Superior, with which it is connected by the Nipigon River. It is about 70 miles long, but its deeply-indented coast-line measures 580 miles. Its greatest depth is 540 feet. The lake is studded with hundreds of islands.

Nip'issing, a lake of Ontario, north-east of Lake Huron, into which (Georgian Bay) it drains through French River (55 miles). Its length is about 50 by 28 miles.

Nipples. See BREASTS.

Nippon. See JAPAN.

Nirvana. See BUDDHISM, Vol. II. p. 519.

Nisch, the chief town and commercial centre of southern Serbia, stands in the midst of a vine-growing district, 152 miles by rail SE. of Belgrade. It is the seat of a Greek bishop and has a fairly strong citadel (1737). The place has played a conspicuous part in the Turkish wars from 1375 down to 1878, when it was occupied by Serbia. Here, on 23d September 1689, the Austrians defeated the Turks. Pop. (1884) 16,178.

Nishapur, a town of the Persian province of Khorassan, 53 miles W. of Meshed, in a beautiful and fertile valley, has 11,000 inhabitants and a

trade in turquoises. It was the birthplace, and contains the grave, of Omar Khayyám.

Ni'sibis, the capital of ancient Mygdonia, the north-eastern part of Mesopotamia, was a city of great antiquity, and was of importance both as a place of strength and as an emporium of the trade between the east and west. It was twice taken by the Romans (under Lucullus and Trajan), and again given up by them to the Armenians; but being a third time taken, in 165 A.D., it remained the chief bulwark of the Roman empire against the Persians, till it was surrendered to them after the death of Julian in 363. The name *Nisibin* is retained by a small village in the Turkish province of Diarbekir, round which are numerous remains of the ancient city.

Nisi prius is the name (borrowed from the first two words of the old writ which summoned juries) usually given in England to the sittings of juries in civil cases. Thus, a judge sitting at *nisi prius* means a judge presiding at a jury trial in a civil cause, and a *nisi prius* lawyer is one who devotes himself to jury practice.—For the decree *nisi*, see DIVORCE.

Nith, a beautiful Scottish river, rising in Ayrshire, and flowing 71 miles south-south-eastward (mainly through Dumfriesshire), until, 14 miles below Dumfries, its estuary joins the Solway Firth.

Nithsdale, WILLIAM MAXWELL, EARL OF, was born in 1676, and at seven succeeded his father as fifth earl. In 1699 he married at Paris Lady Winifred Herbert (c. 1679–1749), youngest daughter of the Marquis of Powis, and thenceforward lived almost constantly at his Kirkcudbrightshire seat, Terregles, much embarrassed in circumstances, and sorely troubled as a Catholic by the neighbouring Presbyterian ministers. In 1715 'Nithsdale's bonnie lord' at once joined the English Jacobites under Forster and Derwentwater, and was taken prisoner at Preston. He was tried for high-treason in London, and sentenced to death in spite of abject excuses; but on 23d February 1716—the night before the day fixed for his execution—not knowing he had just been reprieved, he escaped from the Tower in woman's apparel, through the heroism of his countess. Naturally delicate and then advanced in pregnancy, she had ridden up to London in the depth of winter; and after her lord's escape she came back to Terregles, and dug up the family deeds, which she had buried in the garden, and by one of which the estates had been disposed in 1712 to their only son. They now settled at Rome, where the earl died on 20th March 1744. See Sir W. Fraser's *Book of Carlevarock* (2 vols. 1873).

Nitrates. See NITRE, NITRIC ACID, NITRIFICATION, MANURE.

Nitre, or SALTPETRE (Lat. *sal petræ*, 'salt of the rock,' through Old French), is the nitrate of potash, KNO_3 . It usually occurs in long, colourless, striated, six-sided prisms; its taste is cooling, and very saline; it is soluble in seven times its weight of water at 60° (15.5° C.), and in less than one-third of its weight of boiling water, but is insoluble in alcohol. When heated to about 660° (348° C.) it fuses without decomposition into a thin liquid, which, when cast in moulds, solidifies into a white, fibrous, translucent mass, known as *sal prunelle*. At a higher temperature part of the oxygen is evolved, and nitrate of potash is formed. Owing to the facility with which nitre parts with its oxygen, it is much employed as an oxidising agent. Mixtures of nitre and carbon, or of nitre and sulphur, or of nitre, carbon, and sulphur, deflagrate on the application of heat with great energy; and if nitre be thrown on glowing coals it produces a brisk scintillation. *Touch-paper* is

formed by dipping paper in a solution of nitre, and drying it.

Nitre occurs as a natural product in India and Persia, where it is found sometimes as an efflorescence upon the soil, and sometimes disseminated through its upper stratum. The crude salt is obtained by lixiviating the soil, and allowing the solution to crystallise. Much nitre used to be artificially formed in Europe by imitating the conditions under which it is naturally produced. Animal matter, mingled with ashes and lime rubbish, is placed in loosely aggregated heaps, exposed to the air, but sheltered from rain. The heaps are watered from time to time with urine or stable runnings; at suitable intervals the earth is lixiviated, and the salt crystallised. As there is always a considerable quantity of the nitrates of lime and magnesia present, which will not crystallise, carbonate of potash, in the shape of wood-ashes, is added so long as any precipitate occurs. The nitrate of lime is decomposed, and the insoluble carbonate of lime separated. The clear liquor is then evaporated and crystallised. But the bulk of the nitre of commerce is now made from the Chilian nitrate of soda by double decomposition. The common varieties of Indian nitre, which have a dirty yellowish appearance, are termed *rough* or *crude saltpetre*, while the purer kinds are called *East India refined*. The purification or refining of nitre is effected by dissolving it in water, boiling the solution, removing the scum, straining it while hot, and setting it aside to crystallise. The most common impurities are sulphate of potash, chlorides of sodium and potassium, and nitrate of lime. Chloride of barium will detect the first of these impurities, nitrate of silver the second, and oxalate of ammonia the third.

Nitre is employed in the manufacture of sulphuric acid, in the preparation of nitric acid, as an oxidising agent in numerous chemical processes, as an ingredient of fireworks, and especially in the manufacture of gunpowder. It is used in medicine. In moderate doses (from ten grains to a scruple) it acts as a refrigerant, diuretic, and diaphoretic, and hence its use is indicated when we wish to diminish abnormal heat, and to reduce the action of the pulse, as in febrile disorders and hemorrhages. In acute rheumatism it is given in large doses with great benefit. It is a popular remedy in sore throat, in the form of nitre balls, which should be retained in the mouth till it melts, and the saliva impregnated with it gently swallowed. The inhalation of the fumes produced by the ignition of *touch-paper* often gives speedy relief in cases of spasmodic asthma.

Cubic Nitre, or *Nitrate of Soda*, NaNO_3 , occurs abundantly on the surface of the soil in Chili and Peru (especially Atacama and Tarapacá). It derives its name from its crystallising in cube-like rhombohedrons. In most of its properties it resembles ordinary nitre, but, in consequence of its greater deliquescence, it cannot be substituted for that salt in the preparation of gunpowder. Being considerably cheaper than the potash-salt, cubic nitre is often substituted for it in the manufacture of nitric and sulphuric acids; and it is largely used in agriculture (see MANURE). In 1882 the amount shipped from South American ports was stated at 476,000 tons; in 1889, at 930,000. See W. H. Russell's *Visit to Chili and the Nitrate Fields of Tarapacá* (1890). For the Sweet Spirits of Nitre, see NITROUS ETHER.

Nitrian Desert. See NATRON LAKES.

Nitric Acid is the most important of the five compounds which oxygen forms with Nitrogen (q.v.). Until 1849 it was known only in the hydrated form (the *aqua fortis* of the older chemists),

but in that year Deville showed that *Anhydrous Nitric Acid*, or *Nitric Anhydride*, N_2O_5 (see NITROGEN), might be obtained in transparent colourless crystals by the action of perfectly dry chlorine gas on well-dried crystals of nitrate of silver, the reaction being exhibited in the equation :

It is a very unstable compound, and sometimes explodes spontaneously. It dissolves in water with evolution of much heat, and forms hydrated nitric acid. Nitric Acid (sym. HNO_3 ; equiv. 63; sp. gr. 1530), when perfectly pure, is a colourless, limpid, fuming, powerfully caustic fluid, possessing an intensely acid reaction, as shown by its action on litmus. It boils at 187° (86°C.). It parts very readily with a portion of its oxygen to most metals, and hence is used in the laboratory as an oxidising agent. Whether in the concentrated or in a more dilute form, it acts energetically on organic matters. As examples of such actions we may refer to its power of decolorising indigo; of staining the skin and all albuminous tissues of a bright-yellow colour; of coagulating fluid albumen; and of converting cotton fibre into an explosive substance (see GUN-COTTON). The applications of this acid in the arts, in manufactures, and in chemical processes are very extensive.

The concentrated acid, HNO_3 , is by no means a stable compound. If it be exposed to the action of light it is decomposed with the formation of lower oxides of nitrogen; and mere distillation produces a similar effect. When it is mixed with water it emits a sensible amount of heat, owing to the formation of a much more stable hydrate, $2\text{HNO}_3 + 3\text{H}_2\text{O}$, which distils at 250° (121°C.) without change, and is unaffected by exposure to light. Its specific gravity is 1.424; and it is found that a weaker acid when heated parts with its water, and a stronger acid with its acid, till each arrives at this density. The existence of this hydrate has, however, been called in question by Roscoe. The so-called *Fuming Nitric Acid* is merely a mixture of the pure acid with one of the lower oxides.

Nitric acid does not occur naturally in a free state; but it is found tolerably abundantly in combination with potash, soda, lime, and magnesia; and after thunderstorms traces of it, in combination with ammonia, are found in rain-water. It may be formed in small quantity by passing a series of electric sparks through a mixture of its component gases in the presence of water, which is a mere imitation, on a small scale, of the mode in which it is produced in the atmosphere by a storm. It is usually prepared in the laboratory by the application of heat to a mixture of equal weights of powdered nitre (nitrate of potash) and oil of vitriol (hydrated sulphuric acid) placed in a retort. A combination of sulphuric acid and potash remains in the retort, while the nitric acid distils over, and is condensed in the receiver, which is kept cool by the application of a wet cloth. The reaction is explained by the equation :

During distillation red fumes appear, arising from the decomposition of a portion of the nitric acid and a formation of some of the lower oxides of nitrogen. In this operation *two* equivalents of oil of vitriol are taken for *one* of nitre, these being the proportions found by experience to be most suitable. If they are taken equivalent for equivalent, a very impure red fuming acid is the result. In the manufacture of nitric acid on the large scale the glass retort is replaced by a cast-iron cylinder coated with fire-clay, and the receiver by a series of earthen condensing vessels connected by tubes; and nitrate of

soda (see NITRE) is substituted for nitre, in consequence of its being a cheaper salt, and of its containing 9 per cent. more nitric acid.

Nitric acid combines with bases to form *nitrates*, some of which, as those of potash, soda, oxide of ammonium, silver, &c., are anhydrous, while others combine with a certain number (often six) of equivalents of water of crystallisation. Most of them are soluble in water, crystallisable, and readily fusible by heat; and at an elevated temperature they are all decomposed, usually leaving only the oxide of the metal. If paper be soaked in a solution of a nitrate, allowed to dry, and ignited, it burns in the smouldering mode characteristic of *touch-paper*. This property is, however, shared by other salts.

The tests for this acid when it is present in small quantities are less satisfactory than those for the other ordinary mineral acids. All its compounds are so soluble that no *precipitant* for this acid is known. The best method for its detection is mixing the fluid to be tested with a solution of sulphate of iron, and then carefully pouring sulphuric acid through a tube to the bottom of the glass so as to form a lower layer. If much nitric acid is present a black colour is produced; if only a small quantity is present the liquid becomes reddish brown or purple; the dark colour being due to the formation of nitric oxide by the de-oxidising action of a portion of the iron salt on the nitric acid.

Medicinal Uses.—In the British pharmacopœia there is both a strong and a dilute acid. The strong acid has a specific gravity of 1.42, contains 70 per cent. of real acid, HNO_3 , while the diluted acid is prepared by mixing six ounces of the former with about twenty-five of distilled water, and has a specific gravity of 1.101. The dilute acid is used internally as a tonic in conjunction with bitter infusions. In many cases of biliousness, of chronic inflammation of the liver, and in syphilitic cases in which mercurials are inadmissible, it may be prescribed with great benefit, either alone or in conjunction with hydrochloric acid, externally as a bath or lotion, or internally in doses of about 20 minims properly diluted. The strong acid is useful as an escharotic; e.g. to destroy warts, some kinds of polypi, the unhealthy tissue in sloughing ulcers, &c., and as an application to parts bitten by rabid or venomous animals. Largely diluted—as 50 or 60 drops of the strong acid to a pint or more of water—it forms a stimulative application for torpid ulcers.

Nitrification is the changing of nitrogenous organic matter or ammonia compounds into nitrates. Possibly the nitrogen of the air under certain circumstances also undergoes this change in soils. Some authorities ascribe the change to 'a ferment,' 'an organised structure,' the 'micrococcus nitrificans,' &c., but it is a power possessed possibly by many micro-organisms. These nitrifying bacteroids perform their work under certain conditions. First, the temperature must be suitable, for at about 5°C. the process is stopped; but with a rise of temperature there is a proportionate increase of work—commencing at about 12°C. —until 37° is reached, which is the 'optimum' temperature, and from this onwards there is a diminution of action until the 'maximum' temperature of 55°C. is reached, when nitrification ceases. These bacteroids are annihilated at a temperature of 90°C. , although the same result will follow *drying* even at a much lower temperature. The second condition is the presence of oxygen; and the third is the presence of a salifiable base, such as lime, potash, soda, &c., without which nitrification cannot proceed. Under these conditions nitrification goes on in every fertile soil, the atmospheric nitrogen, nitrogenous organic matter, or ammonia

compounds being converted, in the presence of lime or potash, into the corresponding *nitrites* of lime or potash; and from these *nitric* compounds plants derive the most or all of their nitrogen, although some experimentalists maintain that some plants obtain part at least of their nitrogen from ammonia. See Lawes and Gilbert, *Proc. Roy. Soc.*, vol. xlvii.; Marshall Ward, *Phil. Trans.*, B. 1887, vol. clxxviii.

Nitro-benzol, $C_6H_5NO_2$, is a yellow, oily fluid, of sp. gr. 1.2, which may be distilled without decomposition, and boils at 415° (213° C.). It has a sweet taste, is insoluble in water, but dissolves freely in alcohol and ether. Its odour is very similar to that of oil of bitter almonds, which has led to its use in perfumery under the name of *Essence of Mirbane*. It is obtained by treating benzol, C_6H_6 , with warm fuming nitric acid, when one atom of hydrogen is replaced by the group of atoms NO_2 , so that the benzol, C_6H_5H , becomes converted into nitro-benzol, $C_6H_5NO_2$. The vapour of nitro-benzol when inhaled produces, after from 6 to 12 hours, coma and sometimes death. The fact that its action is so long delayed seems to indicate that its poisonous action is due to some product of its decomposition rather than to itself. In cases of poisoning artificial respiration and powerful stimulants should be resorted to.

Nitrogen (Fr. *azote*; sym. N; atom. wt. 14) is an elementary gas, which in the free state forms nearly four-fifths by volume of our atmosphere. In combination with other elements nitrogen is a necessary constituent of every organised body, and it forms a very large number of most important compounds. Its name (derived from *nitron*, 'nitre,' 'saltpetre,' and *gennao*, 'I produce') was given to it shortly after it had been proved to be an essential constituent of nitre or potassium nitrate. Its presence in the atmosphere was discovered in 1772 by Rutherford, at that time a professor of botany in the university of Edinburgh. It was more particularly investigated soon after by Priestley, Scheele, and Lavoisier. It is a colourless, tasteless, inodorous gas, and was formerly regarded as permanent or incondensable; but it can be reduced to the liquid state by the application of sufficient pressure after it has been cooled to a very low temperature. The Critical Temperature (q.v.) of nitrogen, or the point of temperature above which it cannot be condensed into a liquid by the application of any pressure however great, is -146° C. When cooled to this temperature a pressure of thirty-five atmospheres must be applied in order to liquefy it.

Nitrogen is fourteen times as heavy as hydrogen, and is slightly lighter, bulk for bulk, than atmospheric air, its sp. gr. being 0.9713, compared with air = 1. It is but slightly soluble in water, one hundred volumes of water at ordinary temperatures dissolving only about one and a half volumes of it.

Whilst nitrogen is a constituent of all plant and animal organisms and of many important compounds, it is, in the free state, rather inert towards other elements, and does not readily enter into direct combination with them. It is not combustible, nor does it act in the atmosphere as a supporter of combustion, a lighted taper plunged into a jar containing nitrogen being at once extinguished. It is almost unnecessary to say that nitrogen is not poisonous, since it is breathed freely along with oxygen by all animals; but it cannot support animal life, and an animal placed in it will die from suffocation for want of the oxygen necessary for respiration. Its function in the atmosphere seems to be mainly that of diluting the oxygen with which it is there associated. Although nitrogen forms about 79.1 per cent. of the total volume and 77 per cent.

of the total weight of the atmosphere, the free gas does not appear to play any important part in supplying nitrogen for the construction of the tissues of plants. Vegetable physiologists are at present actively inquiring into this question; and it appears to be definitely established that plants cannot directly absorb from the atmosphere the nitrogen which they require. It is found, however, that certain classes of plants when they are grown in a soil which is practically free from nitrogen compounds do start with do take up nitrogen. One explanation of this fact is that free atmospheric nitrogen becomes converted in small quantity into nitrogen compounds in the soil through the influence of micro-organisms present there. Another explanation attributes the fixation of nitrogen to micro-organisms existing in, or on the surface of, the plant. On the other hand, it has been conclusively shown that certain plants are unable to exist unless appropriate compounds of nitrogen are supplied to them in the soil in which they grow. The main supply of the nitrogen of plants is certainly drawn from nitrogen compounds existing in or artificially supplied to the soil. The most important of such nitrogen compounds are nitrates, which are present in every fertile soil. These may be produced by the decay in the soil of nitrogenous animal or vegetable matters existing in it or supplied to it as manure; or they may be added to it ready formed—as, for instance, in the form of sodium nitrate, which is frequently applied as a manure to soils poor in nitrates.

Many attempts have been made to discover methods by which the free nitrogen of the atmosphere could be converted on a manufacturing scale into nitrogen compounds, but as yet no workable and economical method has been discovered. There are numerous methods for preparing pure or nearly pure nitrogen. One method by which it is obtained very nearly pure is to remove the oxygen as completely as possible from atmospheric air. This can best be done by passing a current of air slowly through a red-hot tube packed with copper turnings or with spirals of copper wire gauze. The oxygen of the air combines with the copper to form an oxide of copper, whilst the nitrogen passes on. Or the oxygen can be very completely removed from a confined portion of moist air by suspending in it pieces of phosphorus until the volume of the gas ceases to diminish. Nitrogen can also be prepared by passing a current of chlorine gas into a solution of ammonia. In this method care must be taken always to use ammonia in excess, otherwise chloride of nitrogen would be produced, which is a dangerously explosive substance. A steady current of nitrogen can be very easily obtained by heating together strong solutions of ammonium chloride and of potassium nitrite. Owing to the great difficulty of forming compounds from free nitrogen, new compounds of nitrogen are generally prepared from compounds already existing. The most important of these compounds are the nitrates which are found in the soil in very considerable quantity in different parts of the world, and in some places occur in large deposits, as in the nitrate regions of South America. From these nitrates Nitric Acid (q.v.) and other compounds of nitrogen are derived. Several compounds of nitrogen with oxygen are known.

Nitrous Oxide, or laughing-gas, N_2O , was discovered in 1772 by Priestley, who obtained it by the action on nitric oxide of easily oxidisable substances. It is now prepared by the action of heat on ammonium nitrate:

It is a colourless gas, which can with moderate ease be reduced to the liquid state, a pressure of thirty

atmospheres being required to liquefy it at 0°C . Davy discovered in 1800 that it possessed anæsthetic properties, and it is now used as an anæsthetic in minor surgical operations. For such purposes it is stored in the liquid state by dentists and others in wrought-iron bottles. It is a supporter of combustion, and burning materials placed in it continue to burn with almost as great brilliancy as if placed in free oxygen.

Nitric Oxide, NO , is produced by the action of nitric acid on copper, silver, or mercury. It is a colourless gas, which like nitrogen can only be reduced to the liquid state by pressure after it has been cooled to a very low temperature. Its most striking character is the great readiness with which it unites with free oxygen, forming dense brown fumes, which consist mainly of peroxide of nitrogen.

Nitrous Anhydride has been described as a gas easily condensable to a liquid, possessing the composition represented by the formula N_2O_3 . It seems very questionable whether a single substance exists either in the state of gas or of liquid possessing this composition. The gas which was supposed to be nitrous anhydride was certainly a mixture. Although nitrous anhydride cannot be obtained pure, and the corresponding acid—nitrous acid—is an unstable substance at ordinary temperatures, a number of nitrites, salts corresponding to nitrous acid, are known.

Peroxide of Nitrogen, NO_2 or N_2O_4 , is produced when oxygen and nitric oxide are mixed. It is a dark-brown liquid at ordinary temperatures, which boils at 22° , yielding a brown vapour, and solidifies at -9° , forming colourless crystals.

Nitric Anhydride, N_2O_5 , is the anhydride of nitric acid, and can be obtained amongst other ways from nitric acid by the action on it of phosphoric anhydride (see NITRIC ACID).

The following are some of the other more important nitrogen compounds: ammonia and the ammonium salts (see AMMONIA); the vegetable alkaloids (see ALKALOIDS); aniline and its derivatives; cyanogen and the cyanides, including hydrocyanic acid; albumenoid substances; urea and uric acid; nitro-benzene, and other nitro compounds; pyridine and allied substances, hydrazine compounds, ptomaines, &c. See AZOTISED BODIES.

Nitro-glycerine (known also as *Glonoin* or *Glonoin-oil*) can be readily prepared by dissolving glycerine in equal measures of strong nitric and sulphuric acids and pouring the solution into water, when the nitro-glycerine becomes precipitated. Nitro-glycerine was discovered by Sobrero, a young Italian chemist at Paris, who in 1846 found that by the above process he could produce a highly explosive mixture. There was little idea at the time of the value of the discovery, which was treated solely as a chemical curiosity, until about fifteen years later, when Alfred Nobel, a Swedish engineer and chemist, perceiving the value of the unrecognised explosive and turning his attention to its development, rapidly introduced it as a blasting agent for industrial purposes. The new explosive was eminently satisfactory so far as blasting power was concerned; but a series of fearful accidents, notably that to the ship *European* at Panama in 1866—numerous expedients devised to render it safe in transit notwithstanding—called public attention to the danger inseparable from its conveyance, and in 1869 parliament, so far as Britain was concerned, placed its veto on nitro-glycerine.

The drawbacks which culminated in this prohibition led to the production of the nitro-glycerine compounds, now forming a large group, notably dynamite (see DYNAMITE, Vol. IV. p. 144), in which nitro-glycerine, absorbed by some inert

porous substance, is thereby rendered safe from the dangers incident to the employment of nitro-glycerine without such treatment. Nitro-glycerine, as manufactured on a large scale for commercial purposes, is formed by the mixture of strong nitric and sulphuric acids, cooled by water, previous to being introduced into a large leaden vessel, the temperature of which is kept down by water circulating through coils inside. Glycerine is then injected by compressed air as a fine spray, and becomes immediately nitrated, considerable heat being evolved. On the completion of the nitration, as indicated by the fall of temperature, the mixture is run off into another leaden vessel and allowed to stand. In about an hour the separation is complete. The nitro-glycerine, after being thoroughly washed in water and subsequently in an alkaline solution to remove every trace of acid, is ready for manufacture into dynamite or other nitro-glycerine compounds.

The utmost care is exercised in the above processes, and any abnormal rise in temperature is strictly guarded against, or accidents would arise. For similar reasons the materials employed in the manufacture of nitro-glycerine are in every particular the best and purest attainable. Colourless when pure, but having as an article of commerce a pale brown colour, nitro-glycerine is a dense, oily liquid, having a specific gravity of 1.6. It is inodorous, but has a sweet, pungent, aromatic taste; a single drop, however, if placed on the back of the tongue, will produce headache and pain in the back lasting for hours. By those accustomed to handling this substance, no inconvenience whatever is experienced. Nitro-glycerine enters into medical prescriptions for certain diseases of the heart.

If ignited in the open air nitro-glycerine burns rapidly and with a brisk flame without any explosion; and if poured out in a thin sheet it ignites with difficulty and burns incompletely; but it explodes at once if it is exposed to a moderately strong blow or concussion, to the concussion due to the explosion of gunpowder, to contact with red-hot iron, and especially to the action of detonating mixtures and fulminates. It likewise explodes on exposure to a high temperature, the exploding-point for nitro-glycerine compounds being about 420°F .; but 150° to 180°F . is sufficient to set up decomposition in the cartridge, and this will quickly raise the temperature to exploding-point. According to Dr Rudolf Wagner, nitro-glycerine, if chemically pure, may be cooled down to 4° without becoming solid; that of commerce, however, becomes solid if exposed for a considerable time to a temperature of about 40° to 45°F ., crystallising in long needles, which are most dangerous to handle, since they explode, even if gently broken, with much violence. In such condition the nitro-glycerine compounds should not be used for blasting, but can be readily thawed in a simple form of pan heated by hot water. At 320° nitro-glycerine begins (according to Adriani) to decompose, giving off red vapours; and if the heat be suddenly applied, or slightly raised above this point, violent explosion will occur. For equal bulks nitro-glycerine is calculated to be thirteen times as strong as gunpowder, while for equal weights it is eight times as powerful.

Nitro-glycerine compounds have been employed in the largest blasts that have been made, notably those at Hell Gate (see BLASTING). The manufacture of nitro-glycerine compounds in Great Britain is strictly controlled by legislation, and carried on under government supervision. See Eissel, *Handbook of Modern Explosives* (1891).

Nitrous Ether, or NITRITE OF ETHYL, $\text{C}_2\text{H}_5\text{NO}_2$, is a very volatile ether, with an agree-

able apple odour, and having a specific gravity of .900. It boils at 64.4° (18° C.), and is highly inflammable. It is readily soluble in alcohol and glycerine, less so in water. It is very liable to decomposition, becoming acid on keeping. It may be prepared by the action of sulphuric acid and alcohol on nitrite of potash. In itself it is of little importance, but on account of its relation to the *sweet spirits of nitre* or *spirit of nitrous ether* is one of the most important drugs. It was for long thought that the virtues of this valuable remedy were proportionally due to the nitrous ether present, and attention was directed to the preparation of the pure substance. When this was administered in the form of solution of the strength of sweet spirits of nitre, it was found that its action was different from and inferior to that of the latter. The sweet spirits of nitre contains in addition aldehyde and paraldehyde, and it is believed that to these we must ascribe much of its virtue. Be this as it may, the legal test is based on the presence of some ethereal body, presumably nitrite of ethyl, and yet many a sample may be efficacious and fail to satisfy the standard test. The *spirit* should be freshly made, be kept in well-closed bottles, and should not be acid. Its specific gravity should not exceed .845, as an admixture of water tends towards decomposition. It may be prepared by the action of nitric and sulphuric acids on alcohol in the presence of copper, but manufacturers attain the same end by other processes. It is used, in conjunction with other medicines, as a diuretic, especially in the dropsy which follows scarlatina; and it is employed, in combination with acetate of ammonia and tartarised antimony, in febrile affections. The dose in febrile cases is from half a drachm to a couple of drachms; while for a diuretic two or three drachms should be given.

Nitrous Oxide. See NITROGEN.

Nitzsch, KARL LUDWIG, a Protestant theologian, was born 6th August 1751 at Wittenberg, laboured as pastor and superintendent, became in 1790 a professor at Wittenberg, and in 1813 director of the seminary for preachers there. Here he died, 5th December 1831. He wrote two works on revelation.—**KARL IMMANUEL NITZSCH**, his son, was born at Borna, in Saxony, 21st September 1787, studied at Wittenberg, preached there, and obeyed a call to a chair at Bonn in 1822. Here he laboured assiduously till 1847, when he went to Berlin as successor to Marheineke, as well as university preacher and consistorial councillor. Here he died, 21st August 1868. Nitzsch was the most prominent supporter of the Union (see LUTHERANS), and in theology he was an independent supporter of Schleiermacher's opinions. He subordinated dogma to ethics, and was one of the leaders of the 'Vermittelungstheologie'—the broad evangelical school. Of his books the chief are *System der Christlichen Lehre* (1829; Eng. trans. 1849), *Praktische Theologie* (3 vols. 1847-67), *Akademische Vorträge über Christliche Glaubenslehre* (1858), several volumes of sermons, and *Gesammelte Abhandlungen* (2 vols. 1870). See the studies by Beyschlag (2d ed. Halle, 1882) and Hermens (Barmen, 1886).—**GREGOR WILHELM NITZSCH**, philologist, a brother of the preceding, was born at Wittenberg, 22d November 1790. He studied in his native town, fought as a volunteer at Leipzig, became in 1827 professor at Kiel, in 1852 at Leipzig, and died there, 22d July 1861. His studies were mainly devoted to the Homeric poems, and the defence of their unity of origin. Of his writings may be named *Erklärende Anmerkungen zu Homers Odyssee* (1826-40), *Meletemata de Historia Homeri* (1830-37), and *Die Sagenpoesie der Griechen* (1852). See the study by Lübker

(Jena, 1864).—**KARL WILHELM NITZSCH**, son of the preceding, was born at Zerbst, 22d December 1818, studied at Kiel and Berlin, became in 1844 extra-ordinary, in 1858 ordinary professor at Kiel, in 1862 at Königsberg, in 1872 at Berlin, and died 20th June 1880. His writings embrace historical studies on Polybius (1842) and the Gracchi (1847), *Die Römische Annalistik* (1873), *Deutsche Studien* (1879), as well as the posthumous history of the German people to the peace of Augsburg, edited by Matthäi (3 vols. 1883-85), and a history of the Roman republic, edited by Thouret (2 vols. 1884-85).—**FRIEDRICH AUGUST BERTHOLD NITZSCH**, theologian, son of Karl Immanuel, was born at Bonn, 19th February 1832, studied at Berlin, Halle, and Bonn, and became in 1868 professor of Theology at Giessen, in 1872 at Kiel. His writings include *Das System des Boethius* (1860), *Grundriss der Christlichen Dogmengeschichte* (1870), *Luther und Aristoteles* (1883).

Nivelles (Flem. *Nyvel*), a town in the Belgian province of Brabant, on the Thines, 19 miles by rail S. of Brussels. Its fine Romanesque church (1045) contains the relics of Pepin's daughter, St Gertrude. In 1381 the townsfolk of Ghent were defeated here by Count Louis of Flanders, and 6000 burned in a monastery. Nivelles has manufactures of cotton, paper, lace, &c. Pop. 10,788.

Nivernais, formerly a province in the middle of France, nearly corresponding to the present department of Nièvre. Its towns enjoyed municipal privileges at a very early period. The principal landowners were the counts, afterwards dukes, of Nevers, who held under their vassalage more than 1800 fiefs.

Nix, NIXIE, a class, mostly malignant, of northern water-spirits. See DEMONOLOGY.

Nizam's Dominions. See HYDERABAD.

Noah. See DELUGE.

Noailles, a distinguished French family which dates from the 11th century, and played an important part in history from the reign of Louis XIV. to the Revolution. Antoine (1504-62) was ambassador in England in 1553-56, and admiral of France. Anne Jules (1650-1708), son of the first duke, commanded against the Huguenots and in Spain during the war of the Spanish succession, and was made marshal; whilst his brother, Louis Antoine (1651-1729), was Archbishop of Paris from 1695 till his death, and was made cardinal in 1700. The third duke, Adrien Maurice (1678-1766), won the marshal's baton in the wars of Louis XV. in Spain, Italy, and Germany. The fifth duke, Paul François (1739-1824), attained eminence as a chemist and was elected to the Academy of Sciences in 1777; his brother, Emmanuel Marie Louis (1743-1822), was French ambassador at Amsterdam (1770-76), London (1776-83), and Vienna (1783-92). The sixth duke, Paul (1802-85), wrote historical works, and was elected to Chateaubriand's chair in the Academy in 1849. His second son, Emmanuel Victorien (born 1830), was ambassador at Washington (1872), Rome (1873), and Constantinople (1882-86), and has written works on the history and literature of Poland. A grandson of the third duke, Louis Marie (1756-1804), served in America under his brother-in-law Lafayette, embraced for a while the French Revolution, and defended San Domingo against the British.

Nobile Officium, the term used in the law of Scotland to denote the high prerogative right of the Court of Session to exercise jurisdiction in certain cases—as, for example, to appoint a judicial factor to young children or to lunatics.

Nobility, that distinction of rank in civil society which raises a man above the condition of

the mass of the people. Society has a tendency to inequality of condition, arising from the natural inequality, physical, moral, and intellectual, of those who compose it, aided by the diversity of external advantages, and of the principles and habits imbibed at an early age. This inequality is apt to increase; the son inheriting the faculties of his father is more favourably situated than his father was for making use of them; and hence in almost every nation in even the very early stages of civilisation we find something like a hereditary nobility. Privileges originally acquired by wealth or political power are secured to the family of the possessor of them; and the privileged class come to constitute an order, admission into which requires the consent of society or of the order itself.

The ancient Romans were divided into *nobiles* and *ignobiles*, a distinction at first corresponding to that of patricians and plebeians. A new nobility afterwards sprang out of the plebeian order, and obtained (338 B.C.) the right to rise to high offices in the state; and in course of time the descendants of those who had filled curule magistracies inherited the *jus imaginum*, or right of having images of their ancestors—a privilege which, like the coat-of-arms in later ages, was considered the criterion of nobility. The man entitled to have his own image was a *novus homo*, while the *ignobilis* could neither have his ancestor's image nor his own.

The origin of the feudal aristocracy of Europe is in part connected with the accidents which influenced the division of conquered lands among the leaders and warriors of the nations that overthrew the Roman empire, and is sketched in the article Feudalism (q.v.); and the evolution of the dignities of Baron, Count (*Comes*), Earl, Marquis, Duke, and other ranks will be found under those several heads. In the subinfeudations of the greater nobility originated a secondary sort of nobility, under the name of Vavasours, Castellans, and lesser barons; and a third order below them comprised vassals, whose tenure, by the military obligation known in England as knight's service, admitted them within the ranks of the aristocracy. In France the allegiance of the lesser nobles to their intermediary lord long continued a reality; in England, on the other hand, William the Conqueror obliged not only his barons who held in chief of the crown, but their vassals also, to take an oath of fealty to himself; and his successors altogether abolished subinfeudation. The military tenant, who held but a portion of a knight's fee, participated in all the privileges of nobility, and an impassable barrier existed between his order and the common people. Over continental Europe in general the nobles, greater and lesser, were in use, after the 10th century, to assume a territorial name from their castles or the principal town or village on their demesne; hence the prefix 'de,' or its German equivalent 'von,' still considered over a great part of the Continent as the criterion of nobility or gentility. Britain was, to a great extent, an exception to this rule, many of the most distinguished family names of the aristocracy not having a territorial origin. See NAMES.

Under the feeble successors of Charlemagne the dukes, marquises, and counts of the empire encroached more and more on the royal authority, and by the end of the 9th century the Carolingian empire had been parcelled into separate and independent principalities, under the dominion of powerful nobles, against whom, in Germany, the crown never recovered its power. In France, however, the royal authority gradually revived under the Capetian race, the great fiefs of the higher nobility being one by one absorbed by the crown. In England, where the subjection of the feudal aristocracy to the crown always was, and continued

to be a reality, the resistance of the nobles to the royal encroachments was the means of rearing the great fabric of constitutional liberty. All those who, after the Conquest, held *in capite* from William belonged to the nobility. Such of them as held by barony (the highest form of tenure) are enumerated in Domesday. Their dignity was territorial, not personal, having no existence apart from baronial possession. The *comes* was a baron of superior dignity and greater estates; and these were in England the only names of dignity till the time of Henry III.

After the introduction of Heraldry (q.v.), and its reduction to a system, the possession of a coat-of-arms was a recognised distinction between the noble and the plebeian. On the Continent whoever has a shield of arms is a nobleman; and in every country of continental Europe a grant of arms, or letters of nobility, is conferred on all such a noble's descendants. In England, on the other hand, the words noble and nobility are restricted to the five ranks of the peerage constituting the greater nobility, and to the head of the family, to whom alone the title belongs. Gentility, in its more strict sense, corresponds to the nobility of continental countries (see GENTLEMAN). This difference of usage is a frequent source of misapprehension on both sides of the Channel; at some of the minor German courts the untitled member of an English family of ancient and distinguished blood and lineage has sometimes been postponed to a recently-created baron or 'Herr von,' who has received that title, and the gentility accompanying it, along with his commission in the army. It has been taken for granted that the latter belongs to the 'Adel' or nobility, and not the former. For the German nobility, see GERMANY, Vol. V. p. 177. Throughout the middle ages the lesser nobility of Britain preserved a position above that of most continental countries, being, unlike the corresponding class in Germany, allowed to intermarry with the high nobility, and even with the blood-royal of their country.

The higher nobility, or nobility in the exclusive sense, of England consist of the five temporal ranks of the peerage—Duke, Marquis, Earl, Viscount, and Baron (in the restricted signification of the word, q.v.), who are members of the Upper House of Parliament. Archbishops and bishops are lords temporal, but not peers. The dignity of the peerage is hereditary, but in early times was territorial, the dignity originally being attached to the possession of lands held directly from the crown in return for services to be performed to the sovereign. Later, peers were created by writ of summons to attend the king's council or parliament, but now the creation of a new peer is always made by letters-patent from the crown. In order to the efficient carrying out of the appellate jurisdiction of the House of Lords there are now a limited number of life peers, styled Lords of Appeal in Ordinary. By the Appellate Jurisdiction Act, 1876, as amended 1887, it is enacted that every such lord, unless he is otherwise entitled to sit in the House of Lords, shall by virtue and according to the date of his appointment be entitled during his life to rank as a baron, and shall be entitled to a writ of summons to attend and to sit and vote in the House of Lords. But his dignity is not to descend to his heirs. A peerage is forfeited by attainder for high-treason; attainder for felony forfeits a peerage by writ, not by patent; on attainder, peerage cannot be restored by the crown, only by an act of parliament. Ladies may be peeresses in their own right either by creation or by inheritance. The wives of peers are also styled peeresses. The question as to descent through males only or heirs-female will be found noted at

the articles on the several orders of nobility. The oldest English peerage is the earldom of Arundel, dating from 1155, and now held by the Dukes of Norfolk; the Irish barony of Kingsale dates from 1181; to the period 1181-1205 belong four baronies now merged in other titles; the Scottish earldom of Sutherland goes back to 1228; and the baronies of Le Despencer, De Ros, and Hastings are all of the year 1264.

By the Act of Union between England and Scotland the Scotch peers elect sixteen of their number to represent their body in the House of Lords in each parliament. The peers of Ireland, in virtue of the Irish Act of Union, elect twenty-eight of their number to sit in the House of Lords for life. The Act of Union with Scotland has been understood to debar the sovereign from creating any new Scotch peerages; all peers created in either England or Scotland between that date and the union with Ireland are peers of Great Britain; and peers created in any of the three kingdoms subsequently to the union with Ireland are peers of the United Kingdom, with this exception that one new peerage of Ireland may be created on the extinction of three existing peerages. When the Irish peers are reduced to one hundred, then on the extinction of one peerage another may be created. All peers of Great Britain or of the United Kingdom have a seat in the House of Lords. A Scotch peer, though not one of the sixteen representative peers, is debarred from sitting in the House of Commons, a disability which does not attach to Irish peers. The peerage has from time to time recruited by new additions, the persons selected being in general peers of Scotland or Ireland; younger members of the families of peers; royal bastards (so recently as 1831); persons distinguished for naval, military, political, or diplomatic services; eminent lawyers promoted to high judicial appointments; persons of large property and ancient family, noble in the more extended sense; and lastly, persons who have by commerce acquired large fortunes and social importance. Many of the Scotch and Irish peers sit in the House of Lords as peers either of England, Great Britain, or of the United Kingdom. The privileges belonging to peers as members of parliament will be explained under PARLIAMENT; as peers, they also possess the following immunities: they can only be tried by their peers for felony, treason, or misprision of treason, when the whole members of the peerage are summoned. All the privileges belonging to the English peers, except the right of sitting in the House of Lords, were extended to the peers of Scotland by the Treaty of Union. A peer who has different titles in the peerage takes in ordinary parlance his highest title, one of the inferior titles being given by courtesy to his eldest son. Certain Courtesy Titles (q.v.) belong also to the daughters and younger sons of a peer, but do not extend to their children. British subjects can hold foreign titles of nobility only by consent of the crown. The ancient Scottish barony of Fairfax has since 1800 been confirmed to citizens of the United States, landholders in Virginia. The sixth baron was a friend of Washington, the tenth (1829-69) was speaker of the California House of Representatives. The barons of Longueuil, a Canadian family, are recognised in Britain (see LE MOYNE).

In France a limited body of the higher nobility, styled the peers, were in the enjoyment of privileges not possessed by the rest. The title of Duke was subject to strict rule, but many titles of Marquis and Count, believed to be pure assumptions, were recognised by the courtesy of society. The head of a noble family often assumed at his own hand the title of marquis; and if an estate was purchased which had belonged to a titled family the purchaser

was in the habit of transferring to himself the honours possessed by his predecessor—a practice to which Louis XV. put a stop. Immediately before the Revolution 80,000 families claimed nobility, many of them of obscure station, and less than 3000 of ancient lineage. Nobles and clergy together possessed two-thirds of the land. Practically, the estimation in which a member of the French nobility was held depended not so much on the degree of his title as on its antiquity, and the distinction of those who had borne it. The higher titles of nobility were not borne by all members of a family; each son assumed a title from one of the family estates—a custom productive of no small confusion. Unlike 'roturier' lands, which divided among all the children equally, noble fiefs went to the eldest son. The Revolution overthrew all distinction of ranks. On 18th June 1790 the National Assembly decreed that hereditary nobility was an institution incompatible with a free state, and that titles, arms, and liveries should be abolished. Two years later the records of the nobility were burned. A new nobility was created by the Emperor Napoleon I. in 1808, with titles descending to the eldest son. The old nobility was again revived at the Restoration. All marquises and viscounts are of pre-revolution titles, none having been created in later times.

Commercial pursuits have more or less in different countries been considered incompatible with nobility. In England this was less the case than in France and Germany, where for long a gentleman could not engage in any trade without losing his rank. A sort of commercial 'Bürger-Adel,' or half-gentleman class, was constituted out of the patrician families of some of the great German cities, particularly Augsburg, Nuremberg, and Frankfurt, on whom the emperors bestowed coats-of-arms. In semi-feudal Italy there was on the whole less antagonism between nobility and trade than north of the Alps. The aristocracy of Venice had its origin in commerce; and, though untitled, they were among the most distinguished class of nobles in Europe. On the other hand, in Florence, in the 14th century, under a constitution purely mercantile, nobility became a disqualification from holding any office of the state. In order to the enjoyment of civil right, the nobleman had to be struck off the rolls of nobility; and an unpopular plebeian was sometimes ennobled in order to disfranchise him. A little later there grew up, side by side with the old nobility, a race of plebeian nobles—as the Medici—whose pretensions were originally derived from wealth, and who eventually came to be regarded as aristocrats by the democratic party.

The nobility of Spain boasts of a special antiquity and purity of blood, a descent from warriors and conquerors alone. 'Hidalgo' (q.v.) is a term which implies gentility or nobility; the hidalgo alone has in strictness a right to the title 'Don,' which has latterly been used by persons who have no proper claim to it about as extensively as 'Esquire' in England. The higher nobility are styled *Grandees* (q.v.); the class of nobility below them are called '*Titulados*.' Red blood is said to flow in the veins of the hidalgo, blue in that of the grandee. The preservation of noble blood, untainted by plebeian intermixture, has often been reckoned a matter of much moment. In Spain most of all this purity of lineage has been jealously guarded. In the German empire no succession was allowed to feus holding immediately of the emperor, unless both parents belonged to the higher nobility. In France the offspring of a gentleman by a plebeian mother was noble in a question of inheritance or exemption from tribute, but could not be received into any order of chivalry. Letters of nobility were

sometimes granted to reinstate persons in this position. In Norway titular hereditary nobility was abolished in 1821; in Sweden it still survives. It is in Germany still important for many purposes to possess eight or sixteen quarterings—i.e. to be able to show purity of blood for four or five generations, the father and mother, the two grandmothers, the four great-grandmothers, and also, in case of the sixteen quarterings, the eight great-great-grandmothers, having all been entitled to coat-armour. Among the higher grades of the peerage in England a considerable number may be pointed out who do not possess this complete nobility.

See the works of May, Hallam, Stubbs, and Herbert Spencer; Sir H. Nicolas's *Historic Peerage* (1825; new ed. by Courthope, 1856); Freeman's *Comparative Politics* (1873); also the *Peerages of Debrett* (since 1802); Burke (since 1826), and J. Foster (since 1880).

Noble, a gold coin first minted by Edward III., and so called from its being of noble metal: on the one side was a ship, in allusion to Edward's victory at Sluys. The original value was half a mark, or 6s. 8d. A later issue (Edward IV.) bore a rose on the same side as the ship, and were called *rose-nobles* and *ryals*. Silver having depreciated, the value of the noble rose to 10s. (much greater purchasing value than now), and a new coin of the old value was issued, called the *Angel* (q.v.).

Nocera, an episcopal city of South Italy, 8 miles NW. of Salerno. Pop. 12,522.

Noctiluca (lit., 'night-light'), a phosphorescent marine Infusorian, extremely abundant round British and other coasts, one of the chief causes of the 'phosphorescence' of the waves. It is a spherical animal—large for an Infusorian ($\frac{1}{16}$ in. in diameter)—and moves by means of a long stout lash or flagellum, beside which there is a second, very much smaller, lying in the 'mouth' region. Its substance is remarkably spongy, and the phosphorescence is said by Allman to have its seat just underneath the rind. See INFUSORIA, PHOSPHORESCENCE.

Nocturn. See BREVIARY.

Nocturne ('night-piece'), a dreamy musical piece, generally for the piano, especially associated with the names of Field (q.v.), its inventor, and Chopin. See MUSIC, p. 358.

Nodal Lines. See HARMONICS, SOUND.

Noddy (*Anous*), a genus of birds of the family Laridae, differing from terns in having the bill slightly angular, thus exhibiting an approach to

Noddy (*Anous stolidus*).

gulls, and the tail not forked, but somewhat wedge-shaped. Altogether seven species are enumerated, widely distributed throughout the tropics and in the temperate zones. One species (*A. stolidus*)

has been recorded as found off Wexford and in Dublin Bay, but no specimens other than the two obtained there have been taken in the British Isles or on the Continent. It is a familiar bird in the Atlantic and Pacific Oceans, not unfrequently alighting on vessels and suffering itself to be taken by the hand; and so at its breeding-places also, where, not accustomed to the visits of man, it scarcely gets out of the way, and the female sits undisturbed on the nest. Hence it commonly shares with the booby the reputation of unusual stupidity. It is about 15 or 16 inches long, from the tip of the bill to the end of the tail, the general colour being a brownish black. The food consists chiefly of small fish and molluscs. Particular islands seem to be specially selected as the breeding-places of noddies, among them being the Bahamas, many of the Keys of the West Indies, the Laccadives, St Helena, Ascension, and many islands of Polynesia and Australia. Their nests, which are built on shelves of rocks or patches of sand or on trees, are sometimes very closely placed together. Each nest generally contains only one egg, which is about two inches long and of a buff colour, sparsely speckled with reddish brown. The eggs are very good to eat, and in some places are collected in large numbers. The other species of noddy are distinguished by their smaller size and slightly different colour.

Nodes, in Astronomy, are the two points in which the orbit of a planet intersects the plane of the ecliptic, the one through which the planet passes from the south to the north side of the ecliptic being called the *ascending node* (Ω), and the other the *descending node* (ϖ). As all the bodies of the solar system, whether planets or comets, move in orbits variously inclined to the ecliptic, the orbit of each possesses two nodes, and a straight line drawn joining these two points is called the *line of nodes* of each body. It is scarcely necessary to add that as the earth moves in the plane of the ecliptic she has no nodes. The places of the nodes are not fixed points on the plane of the ecliptic, but are in a constant state of fluctuation, sometimes *advancing* (eastward), and at other times *receding* (moving westward). This motion is produced by the mutual attractions of the planets, which tend to draw each of them out of the plane of its orbit; and it depends upon the relative positions of the planets with respect to another planet whether that planet's nodes shall advance or recede. On the whole, however, the majority of possible 'relative positions,' or *configurations*, as they are called, is in favour of a retrograde motion; and we find by observation that in an average of many revolutions round the sun a constant retrogradation of the node takes place. The determination of this retrogradation in the case of the planets is a most complicated problem, as the separate action of each on the others has to be taken into account. The revolutions of the planetary nodes are accomplished very slowly, never amounting to as much as a single degree in a century. The nodes of the lunar orbit retrograde with much greater speed under the disturbing influence of the sun. It is owing to the fact that they complete a revolution in nearly eighteen Julian years and eleven days that series of eclipses regularly recur in that period. See ECLIPSES, ORBIT, PERTURBATIONS; and Herschel's *Outlines of Astronomy*.

Nodes, in Botany. See STEM.

Nodier, CHARLES, a considerable French writer, was born at Besançon, 29th April 1780 (Sainte-Beuve), in 1781 (Weiss), or even 1783 (Quérard), the son of a revolutionist lawyer. He lived a shifty life at Paris, Besançon, Dôle, Laibach, and last

again at Paris, where he was appointed in 1823 to the librarianship of the Bibliothèque de l'Arsenal. As a child an ardent Jacobin, he became a royalist at the Restoration, was elected to the Academy in 1833, and died 27th January 1844. He was a devoted student of entomology, philology, and bibliography, but his importance in literature depends mainly upon the influence his personality exerted on the group of Romanticists of 1830. Most of his literary work is already forgotten, save his delightfully fresh and fantastic short stories, of which may here be named *Smarra*, *Histoire du Roi de Bohême et de ses sept Châteaux*, *La Fée aux Miettes*, *Inès de las Sierras*, *La Légende de Sœur Béatrix*, *Franciscus Columna*, and his volume of Fairy-tales. His *Souvenirs de Jeunesse* (1832) must not be taken too seriously. The *Œuvres Complètes* (12 vols. 1832-34) are far from complete. There are Lives by Wey (1844) and Mme. Ménessier-Nodier (1867). See also Mérimée's admirable *éloge*.

Noë. See CHAM.

Noctians. See PATRIPASSIANS.

Nogent-le-Rotrou, a town in the French department of Eure-et-Loir, prettily situated on the Huisne, 93 miles by rail SW. of Paris. It is a long, well-built place, with the ruined château of the great Sully, his violated sepulchre, and a statue of General Saint-Pol, who fell before Sebastopol. The Germans here won two fights, on 21st November 1870 and 6th January 1871. Pop. 7346.

Nolsseville, a village of France, 5 miles E. of Metz, where, on 31st August and 1st September, Bazaine attacked the German besiegers of Metz with 120,000 men and 600 guns. He had some success on the first day, against the 41,000 men and 138 guns commanded by Manteuffel; but on the second day gave up the attempt to break through the German line, which had been reinforced during the night by 30,000 men and 162 guns.

Nola, an episcopal city of Italy, 16 miles ENE. of Naples. It is built on the site of one of the oldest cities of Campania, founded by the Ausonians, and taken by the Romans in the Samnite war, 313 B.C. Augustus died here, 14 A.D. Pop. 7496.

Noli me tangere. See LUPUS, TUBERCLE.

Nollekens, JOSEPH, was born in London, 11th August 1737, the son of a painter from Antwerp. Being placed in the studio of Scheemakers the sculptor, he made such progress that the Society of Arts repeatedly awarded him valuable prizes. In 1760 he settled in Rome. Garrick, whom he met there in the Vatican, immediately recognised his countryman as the young sculptor to whom the prizes had been awarded by the Society of Arts, sat to him for his bust, and paid him handsomely for it. He also executed in Rome a bust of Sterne in terra cotta, which added greatly to his reputation. After residing ten years in Rome he returned to London, where he set up his studio; and the reputation he had acquired in Rome was such that he immediately had full employment, and within a year after (in 1771) was elected an Associate of the Academy, and a Royal Academician the following year. His forte was in modelling busts; and through them he has handed down the likenesses of most of the important personages who figured in Great Britain in the end of the 18th and at the commencement of the 19th century—of Samuel Johnson, who was his friend and frequent visitor, of Fox, Pitt, and other political characters. George III. also sat to him. Besides busts, Nollekens executed numerous commissions for public monuments and statues. He also executed a number of classical and mythological statues and

groups. He died in London, 23d April 1823, leaving no children to inherit a fortune of £200,000. See J. T. Smith's *Nollekens and his Times* (1828).

Nolle Prosequi, a term used in English law to denote that the plaintiff does not intend to go further with the action.

No Man's Land, a name applied to outlying districts in various countries, especially at one time to what now corresponds mainly to Griqualand East (q.v.), and also to a territory of 80,000 sq. m. in South Australia.

Nom de Plume, somewhat doubtful French for *nom de guerre* or Pseudonym (q.v.).

Nominalism, a famous controverted doctrine of the middle ages, respecting the nature of our general or abstract ideas, or of 'universals.' It was contended by some that abstractions—as a circle in the abstract, beauty, right—had a real existence apart from round things, beautiful objects, right actions. This was called Realism. Those who held the opposite view were called Nominalists, because they maintained that there is nothing general but *names*; the name 'circle' is applied to everything that is round, and is a general name; but no independent fact or property exists corresponding to the name. Specifically the controversy was as to the existence of 'universals' or of genera and species, and arose out of a passage in the Latin translation of Porphyry's *Isagoge*. The watchwords of three schools were *universalia ante res*, 'the universals before the concrete things,' of Platonic Realism; *universalia in re*, 'the universals in the thing,' held to be Aristotelian Realism; *universalia post rem*, 'the universals after the thing,' covering both Nominalism (that the universals were but *flatus vocis*, sounds) and Conceptualism (that the universals had an existence in the mind of the thinker).

Scholastic Realism of what was regarded as the Aristotelian type prevailed until the 11th century, when Roscelin defended a distinctly Nominalistic doctrine. Unhappily he applied his philosophy to the doctrine of the Trinity, and arrived at a tritheistic heresy, which (and Nominalism with it) was condemned by the church. Henceforward Nominalism carried with it, not unreasonably altogether, a savour of heresy and rationalism, and Realism was dominant, though the controversy raged throughout the 12th century. Abelard was a modified Realist; Albertus Magnus, Aquinas, and Duns Scotus were Realists of a kind, though in the 13th and 14th centuries the feud between Nominalists and Realists was no longer the central debate of scholasticism. Nominalism triumphed with William of Ockham (died 1347), with whom scholasticism may be held to have begun to dissolve. See SCHOLASTICISM, and works quoted there; the articles on the chief mediæval thinkers; the article PHILOSOPHY; and monographs by Exner (1841), Köhler (1858), and Löwe (1876).

Non-combatants. See COMBATANTS.

Non-commissioned Officers, in the British army (*sous-officiers* in the French, and *unter-offizieren* in the German), form a most valuable and important class, intermediate between the commissioned officers and the men. It is essential that some persons in authority should live amongst the men, superintend their Mess (q.v.), teach them their drill and duties, take charge of small parties on duty and in the field, and, generally, overlook them in every way. None are so well fitted to do so as those who are selected from amongst the men themselves, after several years' service as private soldiers, for promotion to non-commissioned rank. They must be well qualified by good conduct, tact, temper, education, and knowledge of military

duties—in the two last mentioned they must pass examinations—and the efficiency of the corps will largely depend upon the way in which they do their duty. Besides extra pay, they enjoy special privileges, and many obtain commissions as officers. All quartermasters and riding-masters, all officers of the Coast Brigade Royal Artillery and Coast Battalion Royal Engineers, and many combatant officers of cavalry and infantry are selected from amongst them. They can only be reduced to the ranks, or to a lower grade, by sentence of a court-martial, and cannot be subjected to any minor punishment except a reprimand. The following are included in the term 'non-commissioned officer': master-gunners, 3d class (who have charge of the armament and magazines in a fort), staff-clerks, all Sergeants (q.v.), Corporals (q.v.), and Bombardiers (q.v.). Sergeants have a separate Mess (q.v.), and in most barracks there is a corporals' room. The proportion of non-commissioned officers to other soldiers in a battalion at war strength is 91 to 959; in a regiment of cavalry, 83 to 551; and in a battery of artillery, 21 to 149. The following are warrant officers, a class ranking above non-commissioned officers, from whom they are nearly all selected, but below officers: Bandmasters, schoolmasters of more than twelve years' service, conductors of supplies or stores, master-gunners (1st and 2d class), superintending clerks, 1st class staff-sergeants, sergeant-majors, and corporal-majors. For the Navy, see PETTY OFFICERS, WARRANT OFFICERS.

Nonconformists, a name sometimes given generally to all sectaries who, at any period in English history since the establishment of Protestantism, have refused to conform to the doctrine and practices of the Episcopal Church. It is used in a restricted sense to denote the clergy who in 1662—two years after the Restoration—left the Church of England rather than submit to the conditions of the Act of Uniformity. In 1727 the Presbyterians, Independents, and Baptists received some special legal recognition, and came to be known as the Three Denominations. See ENGLAND (CHURCH OF), PRESBYTERIANS, INDEPENDENTS, &c.

Non-effective (Fr. *non-activité*) is the term used to describe the status of officers of the British army or navy who are on retired or half-pay. Non-commissioned officers and men who are discharged, die, or desert are also said to become 'non-effective.'

Nones. See CALENDs.

Nonius Marcellus, a Latin grammarian, of whose life nothing is known. Little can be made of his surname *Tuburticensis*, but at least we may date him later than the middle of the 2d century, as he frequently copies A. Gellius, and earlier than the sixth, as he is frequently quoted by Priscian. His name is attached to a treatise in eighteen chapters, without arrangement or critical sagacity, but precious as preserving many words in forgotten senses, and passages from books of ancient Latin authors now lost. A good edition is that by Gerlach and Roth (1842); see also Professor Nettleship's *Essays in Latin Literature* (1885). A collation of the Harleian MS. of Nonius, by the late J. H. Onions (1852-80), was published in 1882 in the Clarendon Press *Anecdota*. The last seven years of this brilliant young scholar's life were devoted to preparing an edition of the text of Nonius Marcellus for the Clarendon Press.

Nonjurors, the name given to that portion of the clergy in both England and Scotland who, having taken the oath of allegiance to James II., refused at the Revolution to take it to William and Mary. An act of parliament required them all to take this oath by 1st August 1689, six

months' grace being allowed before deprivation; but it was refused by Archbishop Sancroft of Canterbury, by Bishops Ken of Bath and Wells, Turner of Ely, Frampton of Gloucester, Lloyd of Norwich, White of Peterborough, Thomas of Worcester, Lake of Chichester, and Cartwright of Chester (the three last died during the year), and by about 400 of the English clergy. In Scotland, where all the bishops refused the oath, Episcopacy was abolished in 1689, and more than 300 clergymen were thrust out; and not till the death of Prince Charles Edward in 1788 did the Protestant bishops in Scotland, 'upon mature deliberation with their clergy, unanimously agree to comply with and submit to the government of King George III.,' nor until four years later did the bill for their relief receive the royal assent. South of the Tweed the schism was perpetuated by the consecration in 1694 of Hicke (q.v.) and Wagstaffe as suffragan bishops of Thetford and Ipswich, in 1713 of Jeremy Collier (q.v.) and two others, as also by the introduction in 1718 of the 'usages' (a new communion office, prayer for the dead, mixed chalice, &c.). Thereby, however, for some thirteen years the Nonjurors themselves were split into two bodies, both ordaining bishops, till the dispute was terminated by the general adoption of the 'usages.' A fresh breach occurred through the consecration in 1733 of Roger Lawrence by a single Scotch bishop; and this branch supplied some adherents to the rebellion of the '45, in which none of the regular body were involved. For, High Churchmen as were all the Nonjurors, and believers in the doctrine of passive obedience, it is a great mistake to imagine that they were all Jacobites, or, at anyrate, active Jacobites; while, on the other hand, there were many active Jacobites who were not Nonjurors (for instance, Atterbury). Robert Gordon, the last of the regular Nonjuring bishops, died in 1779; Booth, the last of the irregular Nonjuring bishops, in 1805; and James Yeowell, probably the very last Nonjuror, long the sub-editor of *Notes and Queries*, in 1875. Nonjurors, not mentioned already, were Thomas Baker, Carte, Hearne, William Law, Charles Leslie, and Robert Nelson (q.v.).

See JACOBITES, and works there cited; Lathbury's *History of the Nonjurors* (1845); and Abbey and Overton's *English Church in the Eighteenth Century* (2d ed. 1887).

Non Nobis Domine. See GRACE AT MEALS.

Non Possumus (Lat., 'we cannot'), a papal formula taken from Acts, iv. 20 (Vulgate), and said to have been used by Pope Clement VII. in reply to Henry VIII.'s demand for the dissolution of his marriage with Catharine of Aragon; used in general expression for the refusal of the Roman curia to yield to the demands of the temporal power.

Non-residence. See PLURALISM.

Non-suit is a legal term in England, which means that, where a plaintiff in a jury trial finds he will lose his case owing to some defect or accident, he is allowed to be non-suited, instead of allowing a verdict and judgment to go for the defendant. But there is now, in general, no difference between the effect of a non-suit and that of a verdict for the defendant.

Non-user. See DESUETUDE.

Nootka Sound, a harbour on the west coast of Vancouver Island, British Columbia, its entrance protected by an island of the same name.

Norbertines. See PREMONSTRATENSIS.

Nord, the most northerly department in France (whence its name), corresponding with the former province of French Flanders, and bordering on Belgium and the Strait of Dover. Area, 2193 sq. m.; pop. (1881) 1,603,259; (1886) 1,670,184. It is

composed of two parts, or at least contracts near the middle at Armentières, on the Lys, to a very narrow strip. It is watered by the Scheldt and the Sambre, with their affluents, and by numerous canals. Next to that of the Seine, it is the most densely-peopled department in France; two of its cities have more than 100,000 inhabitants (Lille and Roubaix), and five more than 30,000. In blood the people are Flemish and Walloon in about equal proportions; some 177,000 still speak Flemish. The soil is fertile, well cultivated, and yields more abundant harvests than any other part of the country; the fisheries are productive, the mineral wealth very great, especially in coal; and for its manufacturing industries Nord is in several respects the foremost of French departments—iron, machinery, porcelain, glass and mirrors, paper, candles, soap, chemicals, beet-sugar, and cotton, woollen, linen, and silk cloths being all made on a large scale. It is abundantly equipped with railways and navigable streams. The department possesses five fortresses of the first class, and has been the scene of many great campaigns and battles. The arrondissements are Lille, Douai, Cambrai, Valenciennes, Avesnes, Hazebrouck, and Dunkirk. The chief town is Lille, the chief port Dunkirk.

Nordenham. See BREMERHAVEN.

Nordenskiöld, BARON NILS ADOLF ERIK, Arctic navigator, was born at Helsingfors in Finland, on 18th November 1832. He acquired a taste for mineralogy, geology, chemistry, and similar sciences from his father, the head of the mining department of Finland, and studied them further at the university of his native town and at Berlin. In 1857 he naturalised himself in Sweden, and in the following year was appointed head of the mineralogical department of the Royal Museum at Stockholm. During the next twenty years he frequently visited Spitzbergen; in 1864 he completed the measurement of an arc of the meridian there, and mapped the south of the island. After two preliminary trips to the mouth of the Yenisei, by which he proved the navigability of the Kara Sea, he successfully accomplished (June 1878—September 1879), in the celebrated *Vega*, the navigation of the North-east Passage, from the Atlantic to the Pacific along the north coast of Asia. On his return he was made a baron of Sweden (1880), and during the next five years published the results of the journey in *Voyage of the Vega round Asia and Europe* (Eng. trans. 2 vols. 1881), *Scientific Results of the Vega Expedition* (1883), and *Studies and Investigations* (1885). To Greenland, too, he has made two expeditions; members of his party on the second occasion (1883) reached a point 140 miles distant from the east coast, but without finding the ice-free interior Baron Nordenskiöld believed to exist. Three years later he published a book on the icy interior of Greenland. In 1891 he proposed to lead an expedition to the Antarctic polar region, the expense being borne in part by the Australian colonies. For biographical details, see A. Leslie's *Arctic Voyages of A. E. Nordenskiöld, 1858-79* (1879).

Norderney, a small treeless island, lying 3 miles off the coast of the Prussian district of East Friesland, and forms one of a string of islands that line that coast. Area, 4 sq. m.; pop. 2850. It enjoys a great reputation for sea-bathing, and in summer may have 13,000 or 14,000 visitors.

Nordhausen, a flourishing town of Prussian Saxony, pleasantly situated at the southern base of the Harz Mountains, and the west end of the fertile *Goldene Aue* ('golden plain'), on the Zorge, 48 miles by rail NNW. of Erfurt. St Blasius, one of its seven churches, contains two paintings by

Cranach; and there are also a quaint town-hall, seventy extensive distilleries of corn-brandy or 'Nordhäuser schnaps' (11,000,000 gals. per annum), and manufactures of tobacco, sugar, leather, chemicals, &c. Dating from 874, and in 1253 created a free imperial city, Nordhausen embraced the Reformation in 1522, and in 1803 fell to Prussia. Pop. (1875) 23,570; (1890) 26,744. See works by Förstermann (1825-55), Lesser (1860), and Girschner (1880).

Nördlingen, a town in the west of Bavaria, is situated on the river Eger, 44 miles NW. of Augsburg by rail. It has a Gothic church (restored 1880), with a high tower and fine organ, and manufactures carpets. Here took place, 6th September 1643, the great battle in which the Swedes were defeated by the Imperialists with a loss of 12,000 killed and wounded. Pop. 8095.

Nore is a sandbank in the estuary of the Thames, 3 miles NE. of Sheerness and 47 from London. Off its east end is the floating light, which revolves 50 feet above high-water. The name is commonly applied to the portion of the estuary in the vicinity of the Nore light and sandbank. It was here that the outbreak of the fleet, known as the 'mutiny at the Nore,' broke out on 20th May and lasted until 13th June 1797. The ringleader, Richard Parker, who had styled himself President of the 'Floating Republic,' was hanged on the 30th from the yardarm of his ship; and a few other men soon afterwards executed or flogged through the fleet. *The King's Own*, by Marryat, gives a sketch of the mutiny.

Norfolk, an important county on the east coast of England, oval in shape, and in size yielding only to Yorkshire, Lincolnshire, and Devonshire, is bounded N. and NE. by the North Sea, SE. and S. by Suffolk, and W. by Cambridgeshire, Lincolnshire, and the Wash. With an extreme length and breadth of 66 miles by 42, it has an area of 2119 sq. m. or 1,356,173 acres. Pop. (1801) 273,371; (1831) 390,000; (1881) 444,749; (1891) 456,474. Its coast-line, upwards of 90 miles in length, is for the most part flat, and skirted by low dunes, except near Cromer, and again at Hunstanton, where cliffs, from time to time undermined by the sea, rise to a height of from 100 to 200 feet. Inland the surface is undulating, well timbered, and well watered, the principal rivers (by which, and by the Great Eastern and Eastern and Midlands Railways communication throughout the county is kept up) being the Ouse, which flows northward to the Wash, and the Bure, Yare, and Waveney, which fall into the sea near Yarmouth, and in their course link together the numerous Broadlands (q.v.) situate in the north-eastern district. The soil consists chiefly of light loams and sands—in places there are extensive rabbit-warrens, and with so much wood (51,258 acres in 1889) there is naturally an abundance of game. The climate, though in the spring-time cold owing to the prevalence of east winds, is on the whole dry and healthy. Apart from lime, chalk, and excellent brick-earth, no minerals of any importance are worked, but agriculture in all its different branches is here brought to the highest state of perfection: all the usual crops, especially turnips, swedes, and mangold, are extensively cultivated; upwards of 3400 acres are occupied as market-gardens and orchards; whilst great attention is paid to the rearing of turkeys and geese for the London markets, and on the rich marsh-lands in the extreme west of the county, as well as on the pastures bordering the various rivers, great quantities of cattle are grazed. The principal manufactures are noticed under NORWICH, and of other industries the most important is the herring-fishery connected with

Yarmouth and other ports. Norfolk comprises 33 hundreds, the city of Norwich, the municipal boroughs of King's Lynn, Great Yarmouth, and Thetford (parts of the two latter extending into Suffolk), and 736 civil parishes with parts of 9 others, mostly in the diocese of Norwich. Its parliamentary divisions are six in number, each returning one member, and the county council consists of 76 members. Towns other than the foregoing are Dereham, Diss, Downham Market, North Walsham, Swaffham, and Wymondham. In the history of the county the most notable incidents have been the settlements within its borders of the Flemish refugees and Walloons in the reigns of Henry I., Edward III., and Queen Elizabeth; and Ket's rebellion (1549). Many interesting traces of the handiwork of its former occupants are still extant in the ruins of priories at Castle Acre, Thetford, and Walsingham, in the castles of Norwich, Castle Rising (where Queen Isabella was confined a prisoner), and Caistor, in earthworks at Buckenham, Caistor, and Thetford, and in the old halls of Blickling (the home of the Boleyns), Holkham, Houghton, Oxburgh, and East Barham. Among Norfolk 'worthies' (omitting those noticed under Norwich) are to be found the names of Gonville (founder of the college at Cambridge which bears his name), Sir John Fastolf, the Earl of Surrey, Sir Thomas Gresham, Skelton and Shadwell (poets-laureate), Sir Edward Coke, his descendant the Earl of Leicester, Spelman (the antiquary), Sir Roger L'Estrange, Sir Cloudesley Shovel, Sir Robert Walpole and his son Horace, Blomefield (the topographer), Tom Paine, Windham (the statesman), William Godwin, Lord Nelson, Professor Porson, Manby (inventor of life-saving apparatus), Sir Astley Cooper, Elizabeth Fry, Fowell Buxton, Lord Cranworth, Captain Marryat (the novelist), Cattermole (the painter), Borrow (the Romany Rye), Bulwer Lytton, and Rider Haggard. For the Dukes of Norfolk, see HOWARD.

See the county histories by Blomefield (11 vols. 1806-10), Chambers (2 vols. 1829), Rye (1885), and White (new ed. 1890); also A. D. Bayne's *Eastern England* (2 vols. 1873), G. C. Davies' *Norfolk Broads and Rivers* (1884), and Jessopp's *Arndy* (1887).

Norfolk, a city and port of entry of Virginia, on the right bank of the Elizabeth River, 8 miles from Hampton Roads, and 33 miles from the ocean. The city is irregularly built on low ground, and contains a city hall, mechanics' and masonic halls, custom-house, military academy, and Catholic seminary. Its large deep harbour is defended by Fort Calhoun and Fortress Monroe. A government navy yard, dry-dock, and hospital are at Gosport, a naval suburb of Portsmouth, on the opposite bank of the river. Norfolk ships considerable quantities of cotton, oysters, and early fruits and vegetables; lines of steamers connect it with New York and other cities, and three canals end here. The town was burned by the British in 1776. For the engagement between the *Merrimac* and the *Monitor*, fought off Norfolk, see NAVY. Pop. (1870) 19,229; (1890) 34,871.

Norfolk Island lies in the Western Pacific, about half-way between New Zealand and New Caledonia, 400 miles NNW. of the former. The coasts are high (mean altitude, 400 feet) and steep, and the surface generally uneven, rising in Mount Pitt to 1050 feet. The island is 6 miles long, and has an area of 13½ sq. m. The soil is fertile and well watered, and the climate healthy. The Norfolk Island Pine grows to a height of 200 feet; the Norfolk Island Cabbage is a dwarf pine. Norfolk Island was discovered by Cook in 1774. Between 1788 and 1805, and again between 1826 and 1855, it was a penal settlement for convicts sent from New South Wales. In 1856 many of the

inhabitants of Pitcairn Island (q.v.) were transferred hither by the British government. In 1888 the pop. was 741. This includes about 150 Melanesian boys and girls being educated at Bishop Patteson's mission-station of St Barnabas, Norfolk Island being the headquarters of the diocese of Melanesia, which was founded in 1861. The people govern themselves, under the superintendence of the government of New South Wales; they fish, farm, and supply provisions to passing vessels.

Norham Castle, the Border fortress of the Bishops of Durham, on the right bank of the Tweed, 8 miles SW. of Berwick. Founded in 1121, and deemed impregnable in 1522, it has memories of Kings John, Edward I., and James IV., but is known best through *Marmion*. The picturesque ruins comprise a great square keep, 70 feet high. See Hubert Jerningham's *Norham Castle* (1883).

Noricum, a Roman province, situated between Rætia on the west and Pannonia on the east, and corresponding to the present states of Austria proper south of the Danube, Styria, Carinthia, and part of Salzburg. The Roman emperor Drusus subdued the native Celtic Norici or Taurisci in 15 B.C. The name survives in the Noric Alps; see ALPS.

Normal Schools, or TRAINING-COLLEGES, institutions where teachers are instructed in the principles of their profession and trained in the practice of it. See EDUCATION, Vol. IV. pp. 211, 217.

Norman Architecture, a style originated and chiefly used by the Normans. Soon after their conquest of the north of France they began to erect churches and cathedrals in memory of their victories; and, not contented with the small churches then common in France, they desired to erect monuments worthy of their great conquests. They accordingly expanded the dimensions, while to a great extent retaining the style of the buildings they found in the north of France; though they seem also to have borrowed some of their ideas from the Rhine (see GOTHIC ARCHITECTURE).

The leading characteristics of their style were size and massiveness. They adopted the old Latin plan (derived from the Basilica) of central and side aisles; and at the east end they invariably placed a semicircular apse. They seized on the tower as a distinguishing feature, and developed it as their style progressed. The ornaments are simple and of great variety, but the most common and distinctive are the zigzag, billet, chevron, nail-head, &c. The windows and doors are simple, with semicircular arched heads—the former without tracery. The tympanum of the door-arch is occasionally filled with sculpture. The nave-arches are carried sometimes on single pillars, but more frequently, especially as the style advanced, on piers with shafts. The shafts are almost always recessed in nooks (or 'nook shafts'). Owing to the great size of the buildings the architects were unable at first to vault the main aisle, which, accordingly, had usually a wooden roof, the side aisles only being vaulted. The masonry is rude, the joints being large, and the stones generally unhewn. The style prevailed from about the beginning of the 10th century till the death of William the Conqueror, near the end of the 11th century. There are many examples in Normandy, the churches at Caen being well-known buildings of the date of William.

This style of architecture was brought into England by the Normans at the Conquest, 1066. They there extended the scale of the buildings, as they had done in Normandy, preserving, however, many local peculiarities of the Saxon style, which

they found in the country. The chapel of St John, on the second floor of the White Tower of London, is the earliest example of pure Norman work in England, that ancient keep having been built by William the Conqueror in 1078. There are, however, many buildings, both in England and Scotland, which date from before the end of the 12th

St John's Chapel, Tower of London.

century, when the pointed style began to be used; Durham, Lindisfarne, Canterbury, Dunfermline are partially Norman, besides many other churches and castles. The Anglo-Norman is heavier than the French-Norman, the cylindrical nave piers of the English buildings being much more massive than those of French works. To relieve this heaviness the chevron, spiral, and other groovings were cut in the piers. The mouldings and forms of doors and windows are the same as those of Normandy. There is one remarkable difference in the plans of the Early Norman churches in the two countries: in France the apse at the east end is always semi-circular, but in England this form was gradually given up, and towards the end of the style the square east end was generally adopted.

Normanby, a town in the North Riding of Yorkshire, $3\frac{1}{2}$ miles SE., and mainly within the parliamentary boundary, of Middlesbrough. Pop. 7714. It has given the title of marquis in 1694 to John Sheffield (q.v.), Earl of Mulgrave and afterwards Duke of Buckinghamshire, as also in 1838 to Constantine Henry Phipps (1797-1863), previously Earl of Mulgrave, and a distinguished statesman.

Normandy, formerly a province of France, lying along the seaboard of the English Channel, between Brittany and French Flanders, its eastern boundaries being marked by the little rivers Eu and Epte, and its western by the Côtouénon. In area it corresponded approximately to the modern departments of Seine-Inférieure, Eure, Orne, Calvados, and Manche, its capital being Rouen. It is on the whole a fertile region, with well-cultivated fields and many smiling orchards, filled with apple-trees, from the fruit of which cider is made. The people are intelligent and industrious, and rank amongst the best and most energetic of French provincials. When the Romans were masters of Gaul this portion of the country formed part of *Gallia Lugdunensis Secunda*; after the Franks' invasion it made a constituent part of the kingdom of Neustria, and was given by Charles the Bald to the Duke of Paris. From the middle

of the 9th century its coasts were harried by the vikings or sea-rovers of the north (see **NORTHMEN**); shortly after the 10th century began they established themselves in such force along the Seine that Charles, king of the Western Kingdom, was glad to make a definite agreement with their leader

Rolf (Rollo, Rou) at Clair-sur-Epte in 912. Rolf, Duke of the Northmen, became the vassal of the king, but wrested his lands from the Duke of Paris, and consequently had him for an enemy all his life. Rolf at the same time became nominally a Christian, taking at his baptism the name of Robert. His successor was his son William Longsword, who declared himself King Charles's vassal in 927. His father had conquered lands to the west of those originally granted to him; William added the Cotentin, or peninsula of Manche, and thus extended the duchy westwards to Brittany and the sea. This he seems to have done partly with the help of new-comers from the north, who settled there. Thus there were striking differences between eastern and western Normandy: the former rapidly adopted Christianity, the French language (*langue d'oïl*), and the manners and customs of the French, whilst the newer districts stuck sturdily to their heathen faith

and customs and their native Norse tongue. Open war was waged between the rival parties not only during the lifetime of William, but in the reign of his son and successor, Richard the Fearless (943-996), who only overcame the heathen and Scandinavian party with the help of King Louis and the Duke of Paris. Louis then attempted to make himself master of Normandy—Richard being a youth—but was frustrated by Hugh of Paris, who now sided with the Normans. In 987 Hugh became king of the Western Kingdom of France; and the good understanding established between Normandy and France lasted from that time down to the accession of William, the Conqueror of England. Richard the Good, son of Richard the Fearless, began to rule in 996, and, dying in 1026, left his son Richard as his successor. It was during his reign that Nortmannia began to be substituted for Land of the Northmen; hence Normandy and Normans. The second Richard's sister Emma married, first Ethelred of England, and second Canute (Knut) of Denmark and England; this knit the first close ties between the ruling families of England and Normandy. The third Richard was succeeded after a reign of two years by his brother Robert, who died on his way back from a pilgrimage to Jerusalem in 1035, leaving as the heir to his duchy his natural son William, at that time a boy. During William's minority the duchy was the scene of anarchy and confusion. The western portion made an attempt to assert its independence, an attempt crushed by William with the help of the king of France at Val-ès-Dunes (1047). The next twenty years are written glorious in the annals of Normandy. William ruled with vigour and prudence; he fostered the noble houses, but kept a firm hand on the nobles; encouraged the churches, yet preserved the control of church matters himself; thoroughly established the feudal system; gave countenance and support to learning (Lanfranc, Anselm); and favoured the building of magnificent abbeys. He also waged war with the Count of Anjou, his southern neighbour, for the county of Maine, and conquered it in 1063; and even fought against the king of France, who

gave assistance to rebels against William's rule. After the conquest of England (q.v.) Maine revolted and had to be subdued again, William's son Robert rebelled against him in Normandy, and a war broke out with France, in which William (q.v.) lost his life. The incapable Duke Robert mortgaged his duchy to his brother William Rufus, and went crusading to the East. After his return he was defeated and imprisoned by his brother Henry I., who ruled Normandy till his death (1135), notwithstanding the efforts of Robert's son William to dislodge him. After the accession of Stephen in England Matilda's husband, Geoffrey of Anjou, gradually made himself master of Normandy (1139-45), but after reigning five years he resigned it to his son, afterwards Henry II. of England. Richard I. and John were the next dukes. But the duchy was taken away from John by the king of France (1203-4), on the plea that as the murderer of his nephew Arthur he (John) had forfeited his French fiefs. The claim to the title was, however, only formally renounced by Henry III. in 1259. Twice subsequently Normandy was in English hands: Edward III. conquered it in 1346, and Henry V. in 1417-18; but the English were finally driven out in 1450. The Channel Islands (q.v.) are a remnant of the Norman possessions still belonging to the descendants of the Norman kings of England. For map, see France in provinces; for the Norman-French and Anglo-Norman literature, see ENGLISH LITERATURE, Vol. IV. p. 366; FRANCE, Vol. IV. p. 785; and ROMANCE LANGUAGES.

CUSTOMARY LAW OF NORMANDY.—The duchy was governed by customary law, which grew up principally out of local usages; at first it was the same as the customary law of England. Even down to the present day the law administered in the royal courts of the Channel Islands is virtually the old customary law of Normandy. One feature survives in the Cry of Haro (q.v.). This ancient customary law of Normandy seems to have been collected in writing on three separate occasions. The earliest collection was apparently written down by private persons in 1200 and about 1220, and had no official character; the third collection (1585) is a revised edition of the second, the *Grand Coutumier*, completed early in the 14th century. See Sir Travers Twiss in *Academy*, 24th June 1882.

See Freeman, *Norman Conquest* (5 vols. 1877); Palgrave, *History of Normandy* (4 vols. 1878); Planché, *The Conqueror and his Companions* (1874); Spence, *Dreamland in History* (1890); and topographical works by Blackburn (1869) and K. Maquoid (1874).

Normanton, a town in the West Riding of Yorkshire, by rail 3 miles N.E. of Wakefield and 10 S.E. of Leeds, an important railway junction. and seat of coal-mining and iron-working. Pop. 8038.

Norns, the *Parææ* of Scandinavian mythology, were three maidens, by name Urd, Verdandi, and Skuld—i.e. Past, Present, and Future. They sit by the well of Urd, under the world-tree Ygdrasil in Asgard, and there determine the fate both of gods and men. Besides these three there are many inferior norns, both good and bad, answering to the genii of classical mythology; to such are attributable the unequal destinies of men in the world. Women who possessed the power of prediction or magic also bore this name.

Noronha, **FERNANDO**, a group of small islands belonging to Brazil, in the South Atlantic, about 200 miles E.N.E. of Cape San Roque. The group, which comprises a main island, 6½ miles long and about 2 broad, and several smaller islets, is of volcanic character, phonolite and other rocks of late formation resting on a foundation of basalt. A curious calcareous sandstone is also common,

consisting of sand and fragments of shells, rendered firm by the action of water. The climate is healthy, and the trade-winds keep the temperature moderate. The islands are fertile, and maize, sugar, sweet potatoes, casavas, melons, and bananas are raised. The low hills and valleys of the main island are thickly wooded; a sort of fig (*Ficus noronhæ*), like the Banyan (q.v.), drops aerial roots from its branches. The group was visited in 1775 by Captain Cook, and in 1832 by Darwin, who investigated its geology. The *Challenger* Expedition explored the smaller islands. The main island has been made a penal settlement, where about 1500 convicts are kept, guarded by 200 soldiers.

Norristown, capital of Montgomery county, Pennsylvania, on the left bank of the river Schuylkill (crossed by three bridges to Bridgeport), 17 miles by rail N.W. of Philadelphia. It contains a fine marble court-house, a state asylum for the insane, a number of cotton-mills and woollen-factories, rolling-mills and foundries, flour-mills, and manufactories of glass, tacks, &c. Pop. (1890) 13,063; (1890) 19,791.

Norrköping, the first manufacturing town of Sweden after Stockholm, stands at the head of the Bråvik, 113 miles by rail S.W. of Stockholm, and is a well-built modern town. First founded in 1384, it has been several times destroyed by fire. The rapid river Motåla, which connects Lake Vetter with the Bråvik, and which is spanned by several substantial bridges, affords considerable water-power, by which the numerous manufactories are worked. Here are cloth-mills, cotton spinning and weaving, manufactures of sugar, paper, tobacco, &c., and shipbuilding (gunboats, &c.). Here Charles IX. (1604) and Gustavus IV. (1800) were crowned. Pop. (1886) 28,993.

Norse. See ICELAND, SAGA, SCANDINAVIA, NORTHMEN.

North, a family famous in the history of England, the most illustrious members of which were three of the sons of Dudley, fourth Baron North of Kirtling in Cambridgeshire, all of whose lives fortunately were written by their youngest brother Roger, who has also bequeathed to posterity an interesting and characteristic, but unfinished, autobiography. These have all been collected by Dr Jessopp (3 vols. 1890).—SIR EDWARD NORTH (1496-1564) was famous as a lawyer, and was created Baron North of Kirtling in Cambridgeshire in 1554. His second son was SIR THOMAS NORTH, of whose life we know but little save that he was still living in 1603 when the third edition of his translation of Plutarch (first 1579) was published. This work, a translation from the French of Amyot, remains a noble monument of English, and was beyond doubt one of the fountains from which Shakespeare drew his knowledge of ancient history. There is an admirable edition of the portions relating to Shakespeare by Professor Skeat (1875). Other translations by North were *The Diall of Princes*, from a French version of Guevara (see EUPHUISM), and *The Morall Philosophie of Doni*, from the Italian (1570; new ed. by Joseph Jacobs, 1888).—CHARLES, the eldest son of the fourth Baron North, was created Lord Grey of Rolleston, but on the death s.p. of his son, William, sixth Baron North (1734), the barony of Grey ceased, and that of North devolved upon his cousin, Francis, third Baron Guilford. He was created Earl of Guilford in 1752, and his son, the second Earl of Guilford and eighth Lord North, was the famous statesman under George III. The third earl had only three daughters, between whom the barony of North of Kirtling fell into abeyance on his lordship's death in 1802, until in 1841 it vested in Susan, Baroness North (1797-1884), whose son, William-Henry John, succeeded as

eleventh Baron North in 1884. The other honours of the third earl devolved upon his brother, Francis, fourth earl; and next on another brother, Frederick, fifth earl; on whose death in 1827 the earldom reverted to his cousin, Francis, sixth earl; who was succeeded by his grandson, Dudley-Francis, seventh earl; and he in his turn, in 1885, by his son, Frederick-George, eighth Earl of Guilford.—FRANCIS NORTH, second son of Dudley, fourth Baron North, was born 22d October 1637. He had his education at Bury and St John's College, Cambridge, studied law at the Middle Temple, and was called to the bar in 1655. He worked hard, was judicious in his drinking, and more than prudent in his marriage, and was knighted and made Solicitor-general in 1671, and Attorney-general in succession to Sir Heneage Finch but two years later. In 1674 he became Lord Chief-justice of the Court of Common Pleas. As far from being the despicable creature of Macaulay's picture as the saint and sage of his brother's eulogium, he knew how to make interest for himself, and quickly became a privy-councillor, and in 1682 Lord-keeper of the Great Seal, and Baron Guilford (September 1683). We know of his love for music, his kindness to his brothers and sisters, his dislike of witchcraft trials, and his distrust of all the many plots of the time. After the king's death he was much vexed by the intrigues and insolence of Sunderland and Jeffreys, but soon after died, 5th September 1685.—SIR DUDLEY NORTH, the third son, was born 16th May 1641, and, like his brothers, educated at Bury. Even at school he was a trader, and at an early age he was bound to a Turkey merchant in London. Ever the industrious apprentice, he yet solaced himself with cock-fighting and swimming. He made a voyage to Archangel, next to Smyrna, where he settled for some years in trade. Afterwards he settled in Constantinople, returning to England some years after with a considerable fortune, which he continued to increase by keeping an interest in the Levant trade. He became one of the sheriffs of London, and was pliant enough in the interest of the crown. He was knighted, married the widow Lady Gunning, and was appointed a Commissioner of Customs, next of the Treasury, then of the Customs again. Under James II. he sat in parliament for Banbury, and after the Revolution made but a sorry defence of his actions as sheriff. He was a keen-eyed observer of men and manners, had great mechanical genius, a passion for architecture, and quite extraordinary ability as a financier. Indeed, his *Discourses upon Trade* (1691) anticipate in a striking manner some of the ideas of Adam Smith. He died 31st December 1691.—DR JOHN NORTH, the fifth son, was born in London, 4th September 1645, was educated at Bury, and entered Jesus College, Cambridge, in 1661, becoming fellow there in 1666. He was strangely timid, yet a severe student, solacing himself by book-buying and by keeping great spiders in wide glass bottles. He succeeded Barrow as Master of Trinity College in 1677, became clerk of the closet to Charles II., and died, after a long and grievous sickness, in April 1683.—ROGER NORTH, the sixth and youngest brother, was born at Tostock in Suffolk, 3d September 1653, educated at Bury and Jesus College, Cambridge, entered the Middle Temple, and under the influence of his brother the lord-keeper, soon rose to a lucrative practice at the bar. At the Revolution his hopes of advancement were closed, and he cast in his lot with the nonjuring party, and retired to his estate of Rougham in Norfolk, where he indulged the family passion for building, and acted as trustee for his great brother's estate at Wroxton. In 1696 he married, and lived henceforth the life of a country gentleman and virtuoso, his only unusual tastes

being a passion for acquiring books, and for planting trees. He died 1st March 1734. His three hyper-eulogistic biographies, his autobiography, with all its naïveté of detail and its amusing prejudices, and his *Examen* (1740) of Dr White Kennet's *History of England* give him a place in English literature not quite commensurate with own merits.—FREDERICK NORTH, eighth Lord North and second Earl of Guilford, a famous English minister, was born April 13, 1732, and educated at Eton and Trinity College, Oxford. When only twenty-two he entered the House of Commons, and was made a Lord of the Treasury in 1759, having inherited the Tory politics of his ancestors. On the death of Charles Townshend in 1767 he was made Chancellor of the Exchequer and leader of the House of Commons, a post for which he was well qualified by his eloquence, good-humour, wit, and readiness of resource, even against such antagonists as Fox and Burke. In 1770 he succeeded the Duke of Grafton as prime-minister. North was largely responsible for the measures that brought about the loss of America; as a minister he was too ready to surrender his own judgment to that of the narrow-minded and obstinate king. Indeed, North was called by Horace Walpole the *ostensible* minister; the *real* minister was George III. In 1778 he renounced the right of taxing the colonies, already seeing that the war was hopeless, and in 1782 he resigned. With North's retirement came to an end the king's scheme of governing the country by his own will, and ruling the House of Commons by thinly-disguised corruption. North was succeeded by the Marquis of Rockingham, on whose death Lord Shelburne became premier. Fox's dislike of the terms of peace with America led him to enter into a coalition with North, whom he had for so many years inveighed against as a minister without foresight, treacherous, vacillating, and incapable. North and Fox took office under the Duke of Portland in 1783, but the coalition destroyed Fox's popularity, and the Portland administration only lasted a few months. North was afflicted by blindness during the last five years of his life. He succeeded to the earldom of Guilford in 1790, on the death of his father, and died 5th August 1792.—BROWNLOW NORTH, evangelist, was grandson of that Brownlow North (1741–1820), Bishop of Lichfield, Worcester, and Winchester, whose son succeeded in 1827 as sixth Earl of Guilford. Born at Chelsea, January 6, 1810, he spent six years at Eton, travelled abroad, gambled, and lived much in the north of Scotland, but underwent conversion in 1854, and thereafter devoted himself entirely to evangelical labours under the Free Church of Scotland, as well as in Ireland and England. He died at Tullichewan in Dumbartonshire, November 9, 1875. See his *Life* by K. Moody-Stuart (1878).

North Adams, a manufacturing village of Massachusetts, picturesquely situated on the Hoosac River, near the west end of the Hoosac Tunnel (q.v.), 143 miles by rail W. by N. of Boston. It has a large number of woollen and cotton mills, shoe and print-cloth factories, a foundry, &c. Pop. (1885) 12,540; (1890) 16,074.

Northallerton, the capital of the North Riding of Yorkshire, 30 miles NNW. of York. It has a town-hall (1874); a fine cruciform church, Norman to Perpendicular in style; a cottage hospital (1877); and sites of a Roman camp and a Norman castle of the bishops of Durham. At Standard Hill, 3 miles N., was fought, on 22d August 1138, the great battle of the Standard, in which Archbishop Thurstan routed David I. of Scotland, and which got its name from the banners of SS. Peter, John of Beverley, and Wilfrid, hung

out from a car in the English host (see FLAG, Vol. IV. p. 662). From 1640 to 1832 Northallerton returned two members, and then till 1885 one. Pop. 3692. See the *History of Northallerton* by Ingledew (1858), and that by Saywell (1886).

Northampton, the capital of Northamptonshire, and a county, parliamentary, and municipal borough, is seated on rising ground on the left bank of the river Nen, 66 miles NW. by N. of London and 50 SE. of Birmingham. It has a fine town-hall (1861-64), to which other municipal offices have more recently been added at a cost of £24,000; a county hall, noticeable for its decorated ceiling; corn exchange (1850); museum, free library, and schools of science and art (enlarged 1889); several large hospitals; a theatre (1884); infantry barracks (1797; rebuilt 1877-78); and thirteen churches, the most interesting of which are St Peter's (Norman), St Sepulchre's (Norman and Decorated, one of the few remaining round churches in England), All-Saints' (rebuilt subsequent to 1675, but with a fine west tower partly Norman), and St Giles' (cruciform). The principal manufacture is that of boots and shoes, the town being the English centre of that industry; a considerable trade is carried on in the dressing of leather, some lace is made, and extensive breweries are also in operation. On the outskirts of the town is a fine racecourse, on which meetings are held annually in April and November. Pop. (1801) 7020; (1831) 15,351; of the municipal borough (1891), 61,016, and of the parliamentary borough, which returns two members, 70,872.—Of the many stirring events of which Northampton has been the theatre, the principal are its burning by the Danes (1010); the rebuilding, and erection of its castle (of which no traces now remain) by one Simon de St Liz (c. 1075); its siege by the barons (1215), when garrisoned for King John; the establishment of its university (1260), which was abolished some few years later; the conclusion of a treaty (1318) by which the independence of Scotland was formally recognised; the holding of many parliaments; royal visits by Richard I. (in whose reign a royal mint was established here), John, Henry III. (who here received homage from Alexander II. of Scotland), Edward I., Queen Elizabeth, and Charles I.; a battle (10th July 1460) fought in the meadows below the town between Henry VI. and the Yorkists, in which the former was defeated and made prisoner; a visitation of the plague (1637), which in five months claimed 500 victims; the mustering here in 1642 of the parliamentary forces under Lord Essex on the outbreak of the Civil War; and a great fire (20th September 1675) which almost entirely destroyed the town.

Northampton, capital of Hampshire county, Massachusetts, stands near the west bank of the Connecticut River (here crossed by a bridge to Hadley), 103 miles by rail W. of Boston and 3 miles NW. of Mount Holyoke. It contains the state lunatic asylum, the Clarke Institute for deaf-mutes, a public library, housed in the handsome Memorial Hall, and Smith College for women. The manufactures are of importance, and include paper, silk, cotton and woollen goods, sewing-machines, cutlery, baskets, brushes, jet ornaments, &c. Pop. (1880) 12,172; (1885) 12,896; (1890) 14,980.

Northamptonshire, or **NORTHANTS**, a midland county of England, 67 miles long, and 25 where broadest, is surrounded by the counties of Rutland, Lincoln, Cambridge, Huntingdon, Bedford, Buckingham, Oxford, and Warwick. Area, 984 sq. m., or 629,912 acres, of which more than half is pasture. Pop. (1801) 131,757; (1841) 199,208; (1881) 272,555; (1891) 302,184. In the north-east near

Peterborough the county is flat, and forms part of the Bedford Level (q.v.), but elsewhere the surface is undulating, the highest ground—about 800 feet above the sea-level—being found in the neighbourhood of Daventry. It is traversed by the London and North-Western, Midland, and Great Northern railways, and communication by water is maintained by the Nen and the Welland, which are the chief rivers, as also by the Grand Junction, Union, and Oxford canals. The soil, a black, peaty mould in the north-east, and a brown loam on the uplands, is on the whole very productive. Corn and green crops are largely grown, but, as compared with the previous year, the area of land devoted to those crops in 1889 showed a decrease of 9680 acres. On the broad pastures many cattle are grazed, and dairy-farming is carried on, but, although Northants is a great hunting county, the breeding of horses is not much encouraged. The principal minerals are limestone, which is quarried in the north-east, and ironstone of excellent quality, which is found near Kettering and Wellingborough; in 1889 the amount of ore produced was 1,257,080 tons, whilst 230,820 tons of pig-iron were made. The manufactures are inconsiderable apart from those noticed under Northampton. The county comprises twenty hundreds, the municipal boroughs of Brackley, Daventry, Higham Ferrers, Northampton, Peterborough, and Stamford (the last two extending into Huntingdonshire and Lincolnshire), and has in all 344 civil parishes, with parts of four others, almost entirely in the diocese of Peterborough. The parliamentary divisions are four, each returning one member, whilst the county council (exclusive of that for the Soke of Peterborough, which has forty members) numbers sixty-eight. In history the principal incidents connected with the county, omitting those noticed under Northampton (its capital), have been the battles of Edgecote (1469) and Naseby (1645), the beheading of Mary Queen of Scots at Fotheringhay Castle (1587), and the imprisonment of Charles I. at Holmby House (1647). Of its natives, besides Richard III. and (perhaps) Catharine Parr, the best known are Archbishop Chichele (the founder of All-Souls' College at Oxford), Sir Christopher Hatton (the courtier), Catesby (of Gunpowder Plot renown), Thomas Fuller, James Harrington, Bishop Cumberland, Dryden, Charles Montagu, Earl of Halifax, William Law, Gill and Carey (the eminent Baptists), Doddridge (the Nonconformist), James Hervey, Cartwright ('the father of Reform'), Dr Paley, William Lisle Bowles, Clare (the peasant poet), the Earl of Cardigan (leader of the Balaklava charge), and Dean Mansel. See the county histories by Bridges (2 vols. 1791), Baker (2 vols. 1822-41), and Whellan (2d ed. 1874).—Hampshire (q.v.) is the county of Southampton.

North Berwick, a fashionable watering-place of Haddingtonshire, at the entrance to the Firth of Forth, 23 miles by a branch-line (1848) ENE. of Edinburgh and 10 by water SSE. of Elie in Fife. Behind it rises conical North Berwick Law (612 feet); and westward stretch splendid golf-links with an 18-hole course. Tantallon Castle, 3 miles E., fronting the Bass Rock (q.v.), is a magnificent ruin, finely described in Scott's *Marmion*. A stronghold of the Douglasses, it resisted James V. in 1528, but in 1639 was 'dung down' by the Covenanters. Robert III. made North Berwick a royal burgh, and till 1885 it returned, with Haddington, &c., one member to parliament. Pop. 1711. See Ferrier's *North Berwick* (11th ed. 1890).

Northbrook. See BARING.

North Cape, the northernmost point in Europe, in 71° 10' N. lat. It is not however on the continent, but on the island of Magerö. The northernmost point on the continent is Cape

Nordkyn (71° 6' N. lat.), 6 miles farther south than the North Cape, and some 45 miles to the east of it.

North Carolina, one of the thirteen original United States of America, is situated on the Atlantic seaboard, south of Virginia, Copyright 1891 in U.S. by J. B. Lippincott Company. in 33° 50'—36° 33' N. lat., and 75° 27'—84° 30' W. long. Its extreme length is about 500, its breadth 186 miles. Area, 52,250 sq. m., or larger than that of England.

The eastern part of the state is low, and in some parts swampy, the central part undulating, and the western mountainous; but everywhere, except in limited areas in the eastern section, the soil is remarkably fertile and the climate salubrious. The highest mountains in the United States east of the Mississippi are in North Carolina, at least twelve peaks being higher than Mount Washington, in the White Mountains, and more than fifty exceeding 6000 feet in altitude—Mitchell's Peak (6707 feet) the highest. Most of these are clothed to their tops with thick forests, but some have prairie-like summits covered with deep turf. All this picturesque region, known as 'the Land of the Sky,' is a favourite resort in summer for southerners and in winter for northerners.

North Carolina is rich in mineral products. The value of its gold and silver deposited for coinage and assay from 1793 to 1891 exceeds \$12,000,000. A branch U.S. mint was established at Charlotte in 1838, and has since 1873 been continued as an assay office. Silver occurs associated with lead in Clay and Davidson counties, and zinc in the latter county. Iron is widely disseminated in the form of specular ores, hematites, and magnetites; copper and plumbago also are found in many counties. Coal of excellent quality has been profitably mined in the vicinity of Deep River, and is abundant, too, near the Dan River. There are valuable deposits of corundum and extensive beds of mica in the west; and more than 150 species of gems, &c. are found in the state, including the rich 'hiddenite' or lithia-emerald, which is not known to occur elsewhere. Granite and marble abound in some localities, and there are valuable phosphate beds in the eastern section.

Maize has hitherto been the principal agricultural product, but has recently been rivalled by cotton in the annual value of its crop. Wheat, oats, hay, tobacco, and sweet potatoes are the next most valuable products of the soil. One of the chief industries in eastern North Carolina has long been the production of tar, rosin, and spirits of turpentine from the forests of long-leaved pine (*Pinus palustris*) and allied species. The manufacturing industries until 1880 were limited, but since that date the spindles and looms for the manufacture of cotton and woollen fabrics have been largely increased, tobacco-factories have been established and enlarged, and in 1888 the first silk-factory in the southern states was established. Fisheries constitute a profitable industry along the coast, and employ from 6000 to 7000 men.

North Carolina contains 96 counties, and returns nine members to congress. It has about 3000 miles of railway. The chief port and largest city is Wilmington, the capital Raleigh. Parts of the state are deficient in good schools, but there are excellent graded schools in the principal towns. Besides several denominational colleges, there is a state university (1795) at Chapel Hill, and a state agricultural college was established at Raleigh in 1889. There are asylums for the insane at Goldsboro, Raleigh, and Morganton—the first for negroes only; and provision is also made by the state for the blind and deaf-mutes, both white and black. The penitentiary has about 1300 convicts, but most of them are hired out by contract.

History.—In 1584 Raleigh's first expedition landed

on Roanoke Island, and was kindly received. In 1585, 1586, and 1587 Raleigh planted colonies on the island, but the first returned with Drake in 1586, and the others were destroyed. In 1629 Charles I., claiming under Cabot's discovery, granted to Sir Robert Heath the territory, also claimed by Spain and called Florida, from lat. 30° to 36° as *Carolana Florida*. By the English it was called both Carolana and Carolina. In 1653 a colony from Virginia settled on the banks of the Roanoke and Chowan rivers: this was the first permanent settlement in North Carolina. In 1663 Charles II. granted the region across the continent between lat. 31° and 36° to eight of his favourites, under the name of Carolina. In June 1665 the king extended the limits of Carolina to 29° on the S. and to 36° 30' N. The proprietors, 'to avoid erecting a numerous 'democracy' in Carolina, adopted a utopian form of 'fundamental constitutions,' prepared by John Locke and Shaftesbury, which recognised a nobility of landgraves and cassiques. The eldest proprietor was palatine, and the other seven had high-sounding titles. The proprietary rule ceased in 1729, when the king bought out the claims of the proprietors for £2500 each, and North Carolina became a royal province. Under the administration of the second royal governor, Gabriel Johnston (1734–53), the colony increased in population from 14,000 to 45,000, and became very prosperous. The arbitrary rule of Governor Dobbs (1754–66) and Governor Tryon (1766–73) served to intensify the dislike of the people to the taxation policy of parliament; and when the colonial assembly at Wilmington protested against taxation without representation it was dissolved by Governor Tryon. The Mecklenburg Convention met at Charlotte and adopted a declaration of independence on May 20, 1775. The early years of the war (1775–83) were marked by bitter local and partisan conflicts between Whigs and Tories. In the years 1779–81 North Carolina furnished about one-tenth of the American army; still, it was the last state but one to ratify the federal constitution, November 21, 1789. It was the last, too, of the eleven Confederate States to pass in convention an ordinance of secession, May 21, 1861, which was not submitted to the people. The capture of Fort Fisher in January 1865 led to the federal occupation of Wilmington, the advance of the union forces on Raleigh, and the surrender of General Johnston, which practically ended the war of secession. Pop. (1800) 487,103; (1840) 753,419; (1880) 1,399,750; (1890) 1,617,947—making North Carolina the sixteenth state in order of population. Presidents Jackson, Polk, and Johnson were natives; and Flora Macdonald (q.v.) for a time resided here.

Northcote, SIR STAFFORD. See IDDESLEIGH.

North Dakota, one of the two states constructed in 1890 out of the former territory of Dakota (q.v.). Area, 70,795 sq. m. Pop. (1890) 182,719.

Northern Territory. See SOUTH AUSTRALIA.

North German Confederation. See GERMANY, Vol. V. p. 184.

Northmen, or NORSEMEN, the name given in the middle ages by the coast-dwellers of Germany, France, and England to the sea-rovers who came from the north—Denmark, Norway, Sweden. In a narrower sense the word sometimes means the inhabitants of Norway only. The most prominent characteristics of these North Teutonic tribes were their love for the sea and for war. Bolder navigators than even the Phœnicians of old, they sailed east, west, south, and even north into the Arctic Ocean, to indulge their passion for fighting, to win fame, to gain wealth, to plunder, and to slay. We

nowadays should call them pirates; they called themselves sea-kings, vikings, and believed that these expeditions were the noblest and most honourable work they could put their hands to. They believed too that the best title, in the legal sense, to land and other (movable) property was given by winning it with the sword: this gained them the highest respect and influence, and was the surest guarantee of political power. There were likewise powerful economic and political causes co-operating with these to send forth, from the middle of the 8th century to the 13th, and even later, these thronging swarms of Northmen. The natural resources of the lands they dwelt in were very inadequate to the support of the relatively large populations. The system of land tenure, based on the indivisibility and absolute ownership of the family estate, whilst fortifying the sense of family attachment and fostering family pride, frequently imposed galling restraints upon the younger sons, especially the more restless and high-spirited among them. Hence they spent the summer in quest of fame and booty in distant lands; but generally came home again in the autumn, to pass the winter in the enjoyment of the good things they had earned. Still stronger impulses were given to these expeditions when the more powerful chiefs (kings) at home began to subdue their weaker contemporaries and rivals, and the separate kingdoms (Norway, Denmark, Sweden) began to take definite shape, under such strong rulers as Harold Fairhair (Haarfager) and Canute. Many of the free odal proprietors, rather than submit to become the feudal vassals of the conquerors, preferred to abandon their homes, and go and conquer new lands for themselves elsewhere. These strong rulers moreover sternly put down the intestine conflicts in which the Northmen delighted; consequently to get their fill of fighting they were obliged to go abroad.

A favourite plan of the weaker viking chiefs was to lie in wait up some small creek or river-mouth, or behind the shelter of some island, and thence suddenly dart out upon a passing vessel. The larger fleets boldly invaded a district, plundered the inhabitants, slew them if they offered resistance, or carried them off as slaves if they did not, harried the open country, rifled the churches and monasteries—which always yielded the greatest stores of gold and silver—and not infrequently burned them to the ground, as they did the strong cities they took and sacked. Being heathens, worshippers of Thor and Odin, they had no qualms of conscience as to sacrilege, and stood in no awe of the threatenings of the church. One viking fleet would even challenge another to fight it for fighting's sake only. The vessels they sailed in were comparatively small and light of draught, so that they were able to penetrate a long way up the rivers, sometimes into the heart of a country; and as the Northmen were resistless in arms and unrelenting in their wrath, their mere appearance was often sufficient to paralyse an entire district with panic terror. In many churches a special petition, 'From the fury of the Northmen, O Lord, deliver us,' was recited in the litany. But these sea-rovers were also keen traders: on many occasions they first requested permission to land and trade peacefully with the inhabitants, and only when their trading was done did they begin to plunder. There were several recognised trading-places along the shores of the Baltic, and some on the North Sea, which were visited not only by legitimate merchants from England, Flanders, Italy, the East, but also by vikings who had slaves, and gold and silver, and other less valuable booty to dispose of.

The viking age is divisible into two periods: during the first adventure and plunder were the chief incitements—this lasted until the middle of

the 9th century; the second was the period of permanent conquests, in Ireland, France, England, South Italy. The sea-rovers made their first recorded attack upon England, upon Wessex, in 787, and first began to raid along the shores of Frisia, Flanders, and France towards the end of the century. These bands came from Denmark, but may nevertheless have been Norwegians. During the first half of the next century the depredations of the Northmen were more terrible than ever, especially in Frisia and Flanders, during the periods 834–837 and 845–850. They had also gone farther south: in 820 a band reached Aquitaine; fifteen years later another band plundered the French island of Noirmoutier; in 843–844 a fleet sailed up the Loire and Gironde, visited Galicia (Spain), and steered up the Guadalquivir and fought the Moors. From about the middle of the century bodies of Northmen established themselves in permanent camps at the mouths of the French rivers, and repeatedly ascended them on their errands of plunder and slaughter. Three times in quick succession they took Paris and stripped it of its wealth (845, 857, 861); but the most famous siege took place in 885–886. In 859 and 860 an exceptionally adventurous fleet entered the Mediterranean, ravaged the coasts of Spain and Mauretania, and Majorca, spent the winter at the mouth of the Rhone, and in the following summer laid their ruthless hand on the coast towns of Italy, especially on Luna (near Carrara), thinking it was Rome. Yet Flanders and the north of France suffered most during the thirty-six years from 876 to 912. During all this period a large army, or even armies, dominated the coast districts from the Rhine to Brittany, quartering themselves in entrenched camps, and not only routing time after time the armies of the weak kings of Austrasia and Neustria, and their still weaker vassals, but even making disastrous raids far into the interior—to Coblenz, Soissons, Sens—and extorting from kings, dukes, counts, and towns large sums in gold and silver as the price of abstaining from hostilities. The chiefs of these formidable bands were Björn Ironside, Hasting, Siegfred, Godfred, and Rollo or Rolf. Detachments of the main body crossed over more than once to England, where, however, Alfred was a match for them. Rollo (Rou) is probably the same as Rolf the Ganger; if so, he was the son of a chief of the west coast of Norway, and was outlawed by Harold Fairhair shortly after 872. In 912 Charles the Simple of France, seeing that it was hopeless for him to drive away his dangerous and pertinacious foemen, thought it best to disarm them against himself, and at the same time arm them against new-comers, by allowing them to settle in his kingdom, a plan adopted by other rulers before. Accordingly at Clair-sur-Epte he agreed to cede to Rollo the district bounded by the Channel, the Seine, and the Epte, on condition that he would become his man or vassal, and be baptised a Christian. Rollo accepted the terms, and thus acquired the nucleus of the duchy of Normandy (q.v.). There the name Northmen was softened into Normans, a name celebrated in history not only in virtue of the conquest of England by Duke William, but also because of their exploits in Italy and Sicily, and the East, described under GUISCARD and SICILY.

The earliest serious attacks upon England were made in 793 and 794, when Lindisfarne and Jarrow monastery were sacked and Northumberland ravaged. It was about the same time that the sea-kings of Norway began to cross the 'Western Sea' and sail as far as the Syderör or South Islands—i.e. the Hebrides, the Western Isles of Scotland, and Man (q.v.)—and to Ireland, prob-

ably utilising the Faroe (q.v.) and Shetland (q.v.) Islands as resting-stages. They sacked Iona (Hy) in 802 and again in 806, slaying most of the monks. Their visits to Ireland were particularly numerous after 807, and brought great woes upon the unhappy island. A chief named Torgial, a Norseman, conquered most of north Ireland shortly after 840. In or a little before 852 a fleet of Danes arrived and disputed fiercely with the Norsemen, or, as the Irish called them, the Eastmen; but in the year quoted Olaf the White of Norway founded the Scandinavian (chiefly Danish) kingdom of Dublin, which lasted three centuries or more, whilst two of his followers created the separate kingdoms of Waterford and Limerick (see IRELAND, Vol. VI. p. 203). The Faroe, Orkney, and Shetland Islands seem to have been frequently visited by Norsemen after 825, and were permanently colonised during the next quarter of a century. Iceland (q.v.) was discovered and colonised by the same people between the middle and end of the century; and from Iceland they ventured still farther west, and made settlements in Greenland (q.v.), and even visited Vinland (q.v.) in North America. The viking raids on England were incessant after 833, but were checked for a time by the great slaughter inflicted on them by Ethelwulf at Ockley (Surrey) in 851. Fifteen years later they began again, and this time assumed the character of a serious invasion, the invaders being almost exclusively Danes. They made themselves absolute masters of the northern, and more especially the eastern, portions of the island, notwithstanding the heroic efforts of Alfred and his son Edward. The struggle is sketched under England (q.v.).

By the middle of the 8th century the Norwegians had discovered the sea-route to the White Sea by rounding the North Cape. On several occasions down to 1222 they sailed up the Northern Dwina and plundered the people of Bjarmeland or Permia. The most important event in viking history on the east side of the Baltic happened in 862. The Slav (perhaps rather Germanic Russi) tribes who dwelt south of Lake Ladoga as far as the Southern Dwina invited three Scandinavian chiefs (probably from Sweden), brothers, of whom Rurik became the most influential, to go and rule over them. They established themselves at Holmgaard (Novgorod) and laid the foundations of the kingdom of Gardariki, out of which grew the subsequent Russia (q.v.), that was ruled over by Rurik's descendants down to 1598. Contemporaneously with this two other Scandinavian chiefs formed the nucleus of another state at Könugaard (Kieff); and, sailing thence down the Dnieper, they threatened Constantinople, which was only saved by a sudden storm scattering the fleet of the Northmen or Värings (Varangians), as they were called by the Slavic Russians and the Greeks. Three times during the first half of the 10th century these adventurers appeared before the capital of the Eastern empire, and on two occasions (907 and 945) went away carrying with them heavy sums, the price paid by the emperors to save the city from assault. Igor, the son of Rurik, who commanded two of these expeditions, even launched his fleet on the waters of the Caspian, and carried the terror of the Northmen's name among the Mohammedan dwellers on its shores. The expeditions of the Värings gradually ceased after Vladimir introduced Christianity into his dominions in 988. Nevertheless for many years these Scandinavian rulers in Russia surrounded themselves with stout and trusty warriors from the north, their position being precisely analogous to that of the Manchu emperors in China. From the end of the 10th century the emperors of Constantinople had, till

the fall of the city in 1453, a picked bodyguard of Varangians. The men of the north esteemed it a high honour to have served in this chosen cohort at Myklegård (i.e. 'the Great City'); and doubtless they carried back to their countrymen at home many elements or traits of the civilised refinement of the Byzantine court. After the Norman Conquest of England large numbers of English Northmen made their way to Constantinople and enlisted in the Varangian guard; these were the only men whose battle-axes cost Robert Guiscard and his Normans trouble at the great battle of Dyrrhachium (1082).

North Sea. The North Sea, or German Ocean, is a southern extension of the Arctic Ocean (q.v.). It communicates freely with that part of the Arctic Ocean lying between Iceland and Norway which has received the name of the Norwegian Sea. Its northern boundary would be represented by a line drawn from the Shetland Islands to the opposite coast of Norway, and its southern boundary is the Strait of Dover; on the west it is bounded by the east coast of Great Britain, and on the east by the coasts of Norway, Denmark, Germany, Holland, and Belgium. With the North Atlantic Ocean it has communication through the Strait of Dover and the English Channel on the south, and on the north by the Pentland Firth and the channel between the Orkney and Shetland Islands; with the Arctic Ocean as already stated; and with the Baltic by the Skagerrack and Cattegat. The North Sea is over 600 miles in length and about 400 miles in greatest width, and its area is estimated at over 160,000 sq. m. By far the greater proportion of this area is less than 100 fathoms in depth, the only part where deeper water is found being off the coast of Norway (the Norwegian Gully or Norwegian Deep, as it has been called), where a depth of 360 fathoms has been recorded; the mean depth of the whole area is estimated at 61 fathoms. The sea is very shallow towards the south and east, and the coasts in this direction are low and flat, being in some places below the level of the sea, whereas to the north and west, where the water is deeper, the seacoast is high, and the deep Norwegian Gully is faced by the high and bold cliffs of Norway. The sea-bottom is very irregular, a number of banks running across from the Yorkshire coast towards the Skagerrack, the most important of which is the Dogger Bank (q.v.), and there are also depressions like the Silver Pit; off the low-lying coasts of Holland, Belgium, and Britain there are numerous shoals and sandbanks formed of the materials brought down by the rivers. The North Sea is surrounded by continental land and receives the waters of numerous rivers, the principal of which are the Thames, Ouse, Humber, Tyne, Tweed, Forth, and Tay, the Scheldt, Rhine, Weser, and Elbe. The deposits forming on the bottom consequently belong to the class called 'terrigenous,' consisting in the shallower water of sands and gravels and in the deeper water of muds and clays,

containing stones and fragments of rocks and minerals derived from the land, along with calcareous fragments of shells and other organisms.

The salinity of the water of the North Sea varies between 1·025 and 1·027, the lightest water occurring in the southern part and in the Skagerrack, where fresh water comes from the Baltic, and the densest water at the bottom in the deep water off Norway. The mean temperature of the air over the North Sea in summer is about 60° F., and in winter about 36°, the range throughout the year being about 34°—from 31° to 65° F. Except in the summer months, the temperature of the surface water is higher than that of the air, the mean temperature of the surface water in summer being about 58°, and in winter about 42° F. The winds are variable over the North Sea, the most prevalent being from the south-west, and the currents are chiefly dependent on the direction of the wind; fogs, mists, and rain occur at all seasons. The great tidal wave of the Atlantic advancing from the west is divided into two portions on striking the British Islands: the one entering the North Sea round the Orkneys and through the Pentland Firth, the other coming up the English Channel. Captain Tizard, R.N., who has made a special study of the tides in the North Sea, says: 'The former undulation seems to run along the east coast of Britain like a wave along a break-water, and makes it successively high-water along the coast from Duncansby Head to Orfordness; the latter undulation runs along the coasts of France, Belgium, Germany, &c., and finally ends at the Scaw. As the distance from the coast increases, the rise and fall seems to diminish until it is probable that in the centre of the sea there is very little if any. Captain Hewitt found one spot midway between the British and Dutch coasts where there was no rise and fall. The tidal streams do not depend on the times of high and low water at the different ports, but seem to be more dependent on the position where the maximum rise and fall takes place, running towards that spot when the tide is rising there and away from it when falling there; I have not worked it all out yet, but certainly on the east coast from St Abb's Head to the Wash the stream is always running to the southward when the tide is rising in the Wash and to the northward when falling there. From Cromer to the Downs the tide is affected greatly by the undulation from the Channel, and the two undulations seem to pass through each other; but there is a very curious fact in connection with the two tides—viz. all the light-vessels in the North Sea affected by the Channel tide rotate with the hands of a clock, and all affected by the tide round the Orkneys rotate against the hands of a clock.'

The North Sea has been from the earliest times one of the most important highways of the world, and is surrounded by some of the most prosperous commercial nations, famous for their maritime exploits. The fisheries of the North Sea are among the most important in the world, providing employment for thousands of fishermen from the surrounding countries; all the varieties of food-fishes abound, as well as edible molluscs and crustaceans, such as oysters, mussels, lobsters, crabs, and shrimps. The value of these fisheries depends to a great extent upon the abundance of the fauna and flora living on the sea-floor, all the various groups of invertebrates being met with in great profusion in the North Sea, while the surface waters swarm with algæ, such as diatoms, &c., which sometimes form extensive floating banks.

See North Sea Pilot and Admiralty publications; also *Expedition zur physikalisch-chemischen und biologischen Untersuchung der Nordsee im Sommer 1872* (Berlin, 1875).

Northumberland, the most northern county of England, separated from the Lowlands of Scotland by the Tweed, and from the county of Durham by the Tyne and Derwent. The German Ocean bounds it on the E., and the county of Cumberland, with a part of Roxburghshire, on the W. Among the English counties it ranks fifth in regard to size, having an area of 1,290,312 acres. Its greatest length is 70 miles and its greatest breadth 47 miles. The surface of the county, except near the coast, is picturesquely broken into rounded and conical-shaped hills and high moorland ridges. The main valleys are fertile and well wooded. The principal heights belong to the Cheviot Hills (q.v.), and are seated in the north-west part of the county. These are Cheviot (2676 feet), Hedgehope (2348 feet), Cushat Law (2020 feet), Bloody Bush Edge (2001 feet), and Windy Gyle (1963 feet). The Simonside Hills near Rothbury attain a height of 1447 feet. The chief rivers are the Tyne (formed by the confluence of two streams, the North and South Tyne, a little above Hexham), the Wansbeck, the Coquet, the Aln, the Breamish, the Till, and the Tweed. In the south-west of the county are some small sheets of water called the Northumbrian Lakes, the largest of which is Greenley Lough. Off the coast lie a few islands—Lindisfarne or Holy Island, the Farne Islands, and Coquet Isle. The geology of the county is simple in its broad features. The beds as a whole slope to the sea, the direction of the general dip lying between south-east and east; hence the oldest rocks—the Silurian—appear in the north-west, near the head of the Rede and Coquet, and the later formations—the Triassic and Permian beds and the coal-measures—near the coast. The strata have been dislocated and broken by volcanic disturbances, during which were intruded the igneous rocks. The Cheviots, which cover an area of 200 sq. m., owe their origin to the earlier of these upheavals. They consist chiefly of andesites and porphyrites. The Whin Sill, a great sheet of basalt stretching across the county from Kyloe near Berwick to Greenhead in Cumberland in a series of columnar crags, was injected among the sedimentary rocks during the later eruptions which took place, it is supposed, at the close of the Carboniferous period. A number of basaltic dykes also cross the county. The coal-measures occupy the south-east part of the county, and the lead-measures (belonging to the Upper Limestone series or Yoredale rocks) the south-west.

The climate is cold, especially from March to the middle of June, when the prevailing winds are from the east and north-east. The winters, however, are often much milder than they are in the south. The average rainfall, too, except in the Cheviot district, is considerably less than in the counties of Devon, Dorset, Hampshire, and Sussex. Northumberland contains 541 civil parishes, and, ecclesiastically, is in the province of York. For the purposes of civil government the county is divided into nine wards (answering to hundreds or wapentakes), three of which formed part of Durham till 1844. It comprises four parliamentary divisions—the Tyneside, Wansbeck, Hexham, and Berwick-upon-Tweed, returning four members. The principal towns are Alnwick, Morpeth, Hexham, and North Shields. Newcastle-upon-Tyne (q.v.) is a city and county of itself. A large portion of the county is agricultural, especially the fertile tracts along the principal valleys and near the coast. The usual rotation of crops is oats, turnips, and a small quantity of potatoes, spring wheat and barley, clover and other grasses, and then pasture. Turnips grow well, the cultivation of them on raised ridges being peculiar to the county, and known as the Northumbrian system. The western portion of the county is pastoral, the slopes of the Cheviots

affording sustenance to large flocks of hardy sheep. In Chillingham Park there is preserved a herd of wild cattle said to be of the original British stock. The staple trade of the county is in coal, and the chief manufactures are connected with its mining and transit. The number of collieries working in the county is about 114. The salmon-fisheries of the Tyne and Tweed have long been famous. The county is traversed by the North-Eastern and North British railways. Pop. (1801) 168,078; (1841) 266,020; (1881) 434,086; (1891) 506,096.

Northumberland in the time of the Romans was inhabited by a branch of the Celtic people, the tribe of the Ottadini. In the 6th century it was conquered and colonised by the Angles. It then formed part of the kingdom of Bernicia. Being a border county, it suffered much during the Scottish wars, and from the 11th to the 17th century was frequently the scene of much bloodshed. The battles of Otterburn, Homildon Hill, and Flodden were fought on its soil. Northumberland is very rich in memorials of the past. No county, indeed, has a more interesting collection of military antiquities, from the rude circular camps and entrenchments of the old inhabitants to the great castles and peel-towers of mediæval times. The Romans have left a mighty monument of their power in the great barrier erected across the southern portion of the county, and in the stations and roads connected with it. Other antiquities, also noticed separately, are at Bamburgh, Dunstanburgh, Hexham, Alnwick, Holy Island, Norham, &c. Northumberland is the birthplace of Bishop Ridley, Thomas Bewick, Akenside, Lord Eldon, George and Robert Stephenson, Grace Darling, the second Earl Grey, Birket Foster, and Lord Armstrong.

Works treating on the history, antiquities, geology, &c. of the county are: the *Histories of Wallis* (1769), *Hutchinson* (1778), *Mackenzie* (1825), and *Hodgson* (1820-40); *Hodgson Hinde's General History of Northumberland*, an addition to Hodgson's great work (1858); *Hartshorne's Feudal and Military Antiquities of Northumberland* (1858); *Gibson's Northumbrian Castles, Churches, and Antiquities* (1848-54); *Bruce's Roman Wall* (1874); *Lebour's Geology of Northumberland and Durham* (1886); *Tomlinson's Comprehensive Guide to Northumberland* (1888); the *Proceedings of the Society of Antiquaries of Newcastle-upon-Tyne*, and the *Surtees Society*.

Northumbria, the most northern of the ancient English kingdoms, stretching from the Humber northwards to the Firth of Forth, and separated westwards from Cumbria and Strathclyde by the Pennine range and the Ettrick Forest. Bernicia, the district north of the Tees, had for its first king Ida (547-559), who built Bamburgh as his capital. His grandson, Ethelfrith, mounted the throne in 593, and having married the daughter of Ella, who in 560 had formed the kingdom of Deira out of the district between the Tees and the Humber, set aside the rights of his boy brother-in-law Edwin, and so united both Bernicia and Deira into one kingdom. But the ousted Edwin, returning to defeat and slay the usurper in 617, thereupon himself became king of the Northumbrians as well as Bretwalda. Under him Northumbria was Christianised. In 633 he fell in battle against Penda of Mercia and the Welsh Cadwallon, but a year later St Oswald, son of Ethelfrith, cleared the country of the invaders, and united both divisions under his rule. His brother and successor, Oswy, was forced to yield Deira to Oswin, son of Osric, his cousin, but in 654, by a great victory in which Penda perished, was able anew to unite his kingdom, and reigned till 670 the most powerful of all Northumbrian kings. Under later kings—Egfrid (670-685), Aldfrid (685-705), a great patron of learning, and as many as fourteen obscure successors, most of whom came to a violent end—

Northumbrian influence gave way before the rise of Mercia, internal tumults, and Danish ravages, until 806, when the chroniclers cease to give a regular succession of kings, and 827, when at length Northumbria became tributary to Egbert. See the *Histories of Green, Skene, and Freeman*.

North-western Provinces, a lieutenant-governorship of British India, constituted under an Act of 1835, and occupying the upper basin of the Ganges and Jumna, extending from Bengal to the Punjab. Oudh, till 1877 a separate government, is now under the lieutenant-governor of the North-western Provinces, but in some respects has separate institutions. The province, which constitutes the great part of Hindustan proper, is mainly a great alluvial plain, sloping from the Himalayas, and comprises the Doab, Rohilkhand, Bundelkhand, &c., and the Upper Ganges valley. It is the great wheat country of India, but is not on a level with Bengal as to resources or trade. The headquarters of Hinduism, and containing some of the most sacred memorials of the Aryan race, it was nevertheless long subject to Moslem sway; and in 1881 13·4 per cent. of the population were Mohammedans, as compared with 86·3 per cent. Hindus. The divisions of the North-western Provinces are Meerut, Agra, Rohilkhand, Allahabad, Benares, Jhansi, Kumaon, and the four divisions of Oudh—Lucknow, Sitapur, Fyzabad, Rai Bareilly. Total area under direct British administration (with Oudh), 106,111 sq. m.; pop. (1881) 44,107,869. The native states have a further area of 5125 sq. m., and a pop. (1881) of 741,750. With the native states the area is about the size of Italy, and the population is larger. If we exclude the Himalayan districts, the population is denser than England and Wales. The capital is Allahabad. See INDIA, OUDH.

North-west Passage, a route for ships from the Atlantic to the Pacific by the north of America. The *North-east Passage* is that by the north of Asia. See POLAR EXPLORATION, ARCTIC OCEAN, FRANKLIN (SIR JOHN), NORDENSKIÖLD.

North-west Territories. See CANADA, Vol. II. p. 690, and the articles on ALBERTA, ASSINIBOIA, ATHABASCA, and SASKATCHEWAN.

Northwich, a market-town of Cheshire, on the river Weaver and the old Watling Street, 18 miles ENE. of Chester. Underneath the town and all around it are great numbers of brine-springs, which have been used for the preparation of salt since before the Christian era. The town is being gradually undermined by the pumping of the brine, and the cavities so formed have caused many houses and buildings to fall. Several of those that still stand are propped up or bolted together. The streets are narrow and irregular, and many of the dwelling-houses are of an antique type. In 1670 rock-salt mines began to be worked, and now great quantities of this mineral are extracted. The town was taken by the parliamentarians in 1643. Pop (1881) 12,246; (1891) 14,914.

Norton, ANDREWS, American theologian, was born at Hingham, Massachusetts, December 31, 1786, graduated at Harvard in 1804, was appointed mathematical tutor there in 1811, and in 1813 librarian of the university and lecturer on biblical criticism and interpretation. In 1819-30 he was Dexter professor of Sacred Literature. Norton was among the most distinguished exponents of Unitarianism, equally determined in his protest against Calvinism and in his opposition to the school of Theodore Parker and the naturalistic theology. His chief writings are *Reasons for not believing the Doctrines of Trinitarians* (1833), and

two works on *The Genuineness of the Gospels*. He died at Newport, Rhode Island, September 18, 1853, leaving also a translation of the gospels, which was edited (1855) by Dr Ezra Abbot and his son, CHARLES ELIOT NORTON, who was born at Cambridge, Massachusetts, 16th November 1827, and graduated at Harvard in 1846. He travelled in India and Europe in 1849-51, and again in Europe in 1855-57 and 1868-73, and in 1864-68 was joint editor with Lowell of the *North American Review*. He has published a number of works relating to Italy, and edited Carlyle's letters (see bibliography at CARLYLE).

Norton, THE HON. MRS. Caroline Sheridan, poet and novelist, was born in 1808, the second of the three beautiful granddaughters of Richard Brinsley Sheridan. One of her sisters became Lady Dufferin, the other Duchess of Somerset; and she herself in 1827 married the Hon. George Chapple Norton (1800-75). She bore him three sons, of whom Thomas Brinsley (1831-77), the second, succeeded to the title of fourth Lord Grantley; but the marriage proved a most unhappy one, and her friendship with Lord Melbourne (q.v.), whom she first met in 1831, led her husband to institute five years afterwards a groundless and unsuccessful action of divorce, the damages laid at £10,000. Already she had made by her pen £1400 in one year, and after the separation from her husband she continued her literary activity. Her poems include *The Sorrows of Rosalie* (1829), *The Undying One* (the Wandering Jew, 1830), *The Child of the Islands* (1845), and *The Lady of La Garaye* (1862); her novels, *Stuart of Dunleath* (1847), *Lost and Saved* (1863), and *Old Sir Douglas* (1868). In March 1877 she married Sir William Stirling-Maxwell (q.v.), but died on the 15th June following. Her story beyond doubt supplied the subject for *Diana of the Crossways*, the most charming of George Meredith's novels.

Norwalk, (1) a borough and township of Connecticut, at the mouth of a river of the same name, on Long Island Sound, 41 miles by rail N.E. of New York. There is a good harbour, and extensive oyster-fisheries. Norwalk possesses the largest straw-hat factory in America, and within the township there are large manufactories of felt-hats and cloth, woollens, shirts, shoes, locks, and door-knobs, besides foundries and ironworks: several of these establishments are in South Norwalk. Pop. (1880) 5308; South Norwalk, 3726; township, 13,956; (1890) 17,747.—(2) Capital of Huron county, Ohio, 55 miles by rail W.S.W. of Cleveland. It is a pleasant little town, with streets shaded with maples, and manufactures organs, shoes, ploughs, sewing-machines, tobacco, and fanning-mills. Pop. (1890) 7195.

Norway (Norweg. *Norge*), the western division of the Scandinavian peninsula, extends from lat. 57° 59' N. (Lindesnes) in the south-west to 71° 11' in the north-east, overlapping Sweden and Lapland on the N. and screening them from the Arctic Ocean. Although 1160 miles in length (coast-line 3000 miles), it varies in width from 20 to 100 miles north of 63° N. lat.; below that line it swells out to a club-shaped mass 260 miles in width. It is separated from Sweden by the Kjölen (i.e. Keel) Mountains (3000 to 6000 feet), the backbone of the peninsula, which run parallel to the Norwegian coast from the plateau of Finmark in the north to 63° in the south, and then bifurcate. The main range proceeds southwards, still marking the boundary between the sister kingdoms, though it decreases greatly in height. The other division continues parallel to the coast, in a south-westerly and then southerly direction, to the extremity of the country. But

the mountains in this division no longer form a narrow ridge or 'keel'; they widen out into a broad plateau, undulating between 2000 and 4000 feet and embossed with mountain-knots—Dovre, Jotun, Lang, Fille, Hardanger Fjelde (*felle*)—the separate peaks of which shoot up to 6000 feet and higher (e.g. Galdhöppigen, 8399 feet; Glittertind, 8379; Snehætten, 7566; Lodalskaupen, 6790 feet). The leveller portions of this plateau region consist of dreary moors, covered in winter with snow and in summer with coarse grass and heather, and studded with numerous tarns and belts of forest (conifers, birches, willows). The grass affords pasturage to the sheep and cattle of the dalemen; the *sætre* or huts of the herd-girls and the wood-cutters are the only habitations in these mountain solitudes. But the bear, lynx, wild reindeer, and lemming make their home there; owls, kestrels, and buzzards prey on the smaller animals and birds; snipe, teal, and loom frequent the lakes; and vast numbers of lapwing and plover breed in the tarns. Moreover, in winter the ptarmigan is plentiful on the snows. Besides these creatures, the fox, eagle, sparrow-hawk, raven, crow, and woodcock are common, not only here, but throughout the kingdom. Numerous wild berries—cloudberries, raspberries, bilberries, cranberries, &c.—ripen on these loftier regions in summer.

Norway presents a bold front to the Atlantic. The west side of the peninsular rampart—the 'Westland,' which is nowhere more than 70 miles wide—sinks down abruptly to the ocean, in some cases by steep terraces, in others sheer to the water's edge. On the inner or eastern side—the 'Eastland'—the slope is more gradual; the general versant faces south-east. The greater part of the country lies between the same degrees of latitude as Greenland, and would in all probability be covered with a similar ice-cap to Greenland—as indeed it was in the end of the Tertiary period—were its shores, on west and north, not washed by the Gulf Stream. It is mainly owing to this warm oceanic artery that Norway is habitable; its influence, together with the direction of the parallel mountain rampart, the distribution of the atmospheric pressure, and the presence of deep-sea banks off the coast, determines the predominant climatological features of the country. The isotherms do not run from west to east, but parallel to the coast. Hammerfest, for instance, on the north coast, in 70° 40' N. lat., has a winter mean of 22·6° F., 3° higher than Christiania, which has virtually an inland site, in 59° 55' N. lat. In winter the west coast districts are the warmest, and the cold increases in intensity according to the distance inland; whereas in summer the reverse is the case, though altitude is then a more potent influencing factor than in winter. The places that have the lowest winter mean (11·8°) are all inland, as Elverum and Røros (Röraas), near the Swedish frontier, Kautokeino (in southern Finmark), and Nyborg (at the head of Varanger Fjord); at all these places the mercury has been known to freeze (–40° F.). The places which have the highest summer temperature are Christiania, the south-west extremity of the country, the heads of the western fjords, and the interior of Finmark. The prevalent south-west winds bring considerable rainfall, 40 to 70 inches in the year, to the west coast of southern Norway. In the interior only 12 to 16 inches fall during the year.

The population has doubled since 1820, when it stood at 977,500, the increase having been most rapid since 1850. In 1885 there were only nine towns with populations exceeding 10,000—viz. Christiania, the capital, 128,302; Bergen, 46,552; Trondhjem, 23,753; Stavanger, 22,634; Drammen, 19,391; Christiansand, 12,749; Fredrikstad, 11,239; Fredrikshald, 11,237; and Larvik, 11,084—all sea-

port towns. The density of the population over the entire surface is 15·6 per square mile, much the lowest of any country in Europe; but then fully 70 per cent. of the total area is wholly uncultivable, being barren mountain and waste (2 per cent. under glaciers); in addition 24 per cent. is covered with forest. The table shows the area and population of the districts.

County.	Area. sq. m.	Pop. 1875.	Pop. 1891.

Finmark, which is inhabited chiefly by Lapps, about 18,000 in number, whom the Norwegians call Finns, whilst the true Finns they call Kvæns, is a monotonous undulating plateau (1000 to 2000 feet). The coast is deeply indented with large fjords (Varanger, Tana, Laxe, Porsanger, Alten), and east of the North Cape (q.v.) is low, bare, and bleak, though the banks of Pasvig, the frontier river with Russian Lapland, are green with patches of firs, pines, and birches. Vegetables, barley, and peas ripen on the shores of the fjords, thanks to the Gulf Stream and the eight weeks of uninterrupted sunlight that prevails in summer. At that season too gnats are a terrible plague to man and beast. The cliffs and islands swarm with wild-fowl, and the sea-waters with fish. The wolf and glutton are common, the former being a dangerous enemy to the Lapps' reindeer herds. West of 22° N. lat. the coast breaks rocky, wild, and precipitous, its outline being irregular in the extreme; and these characteristics it preserves right down to below 59° N. lat., to the point nearest Scotland (280 miles distant). From this point up to the North Cape the entire coast is protected from the Atlantic waves by a belt of rocky islands, called the Skjærgaard or 'Skerry Fence,' between which and the coast there are connected navigable roads, sheltered and safe at nearly all seasons. The outermost islands of this belt are the Lofoten and Vesteraalen chains; in both groups the mountains (2000 to 3000 feet) rise in extremely fantastic pinnacles and turrets, with razor-backed saddles and gabled roofs. But wherever, on these and all the other islands of the Skjærgaard, there are level patches and ledges of soil touched by the modifying climatic influences grass grows abundantly. The climate of the Lofotens is indeed so mild that rye and barley easily ripen, and large flocks of sheep are left out all winter, whilst from 27,000 to 31,000 fishermen congregate here in the winter to prosecute the herring and cod fisheries. All the islands of the Skjærgaard are frequented by enormous quantities of sea-birds, chiefly of the duck and gull varieties; they are 'fowled' for the sake of their down (from the eider duck), feathers, flesh, and oil. On some of the islands the red deer still lingers. On the mainland the mountains in the north have the same bare, angular outlines as in the Lofotens, but support in many parts large forests of fir and pine; in southern Norway they

have rounded, dome-shaped summits, and are, next the sea, only sparsely covered with fir (no pine) and other trees. The peninsular rampart is crowned with several gigantic glaciers—e.g. the shores (6000 feet) of Lyngen Fjord in the north are lined with them; from Jökul Fjeld, on an arm of Kvenang Fjord, large masses of ice drop off the glaciers into the sea and float away as icebergs; just north of 67° N. lat. is the enormous snowfield of Sulitjelma (6168 feet), and just south of the same parallel Svartisen (3600 feet), the second largest glacier in Norway, measuring 44 miles by 12 to 25, and sending down glacier curtains to within a few hundred feet of the sea; south Norway possesses the second largest glacier in Europe (Vatnajökull in Iceland being the largest), the roof-shaped Justedal (4600 to 5400 feet), which has an area of 580 sq. m. (87 miles long by 6 to 22 miles wide), and reaches down its icy polypous arms to within 150 feet of the sea; to the south of it lies the snowfield of Folgefond, 40 miles long and 7 to 15 wide (108 sq. m.), and 3000 to 5000 feet in altitude. Throughout Norway the limit of perpetual snow ranges from 3100 feet on Justedal to 5150 on the Dovre Fjeld.

The lofty west coast region is everywhere cleft by gigantic fissures, very narrow and winding, into which the sea-water flows—the fjords. In some cases they are of great depth, much deeper than the sea outside (200 fathoms): Sogne Fjord, for instance, is 2820 feet deeper; Hardanger Fjord, 930 feet; and Vest and Nord Fjords, 840 feet. Some of them penetrate great distances inland and send off numerous branching arms. Sogne Fjord cuts its way to the foot of the Jotun Fjeld, 106 miles from the ocean, and Hardanger Fjord, which encircles the Folgefond, is 68 miles long. Nord and Sogne Fjords clasp the Justedal between them. These three fjords offer some of the grandest and most accessible scenery in Norway. Their landward continuations either rise rapidly to the plateau region above or form narrow valleys at a slightly higher elevation, and in that case generally contain a deep lake separated from the fjord by a moraine or barrier of glacial deposits. The finest of these valleys is Romsdal, where the rounded, pure gneiss mountains tower up to 6000 feet with almost perpendicular walls. The steep sides and extremities (2000 to 4000 feet) of these fjords and valleys are braided with waterfalls, varying in character from trickling ribbons and veils of white foam to full-volumed streams like Skjæggedal (530 feet), Vöring (475 feet), and Vetti (900 feet). The inner reaches of the fjords have as a rule warm summers and mild winters; all the ordinary cereals and hardy fruits ripen easily, and such trees as fir, birch, hazel, elm, mountain ash, aspen, bird-cherry, oak, ash, lime, and alder grow according to the elevation. The only considerable break in the lofty coast-wall is the basin of Trondhjem, a little north of 63° N. lat. This district was the centre of the ancient national life of the country, and in the cathedral of Trondhjem city (called Nidaros to the middle of the 16th century) the kings of Norway are still crowned. The southern coast-lands, bordering the Skagerrack and the wide Christiania Fjord, are comparatively low and tame.

On the eastern side of the peninsular rampart the valleys trend south and south-east, and converge upon Christiania Fjord. At their upper extremities they are generally narrow and deep; and many are filled with chains of lakes, which make fine waterfalls (Rjukan, 800 feet, in Telemarken) as they drop from level to level; their lower reaches get wider and shallower as they proceed south. Most of these valleys are traversed by mountain torrents and streams, the longest being the Glommen (350 miles), Drammen (163), with

its tributary the Hallingdal (113), Nummedal Laagen (143), and Otteren (140). Some of these streams in their lower courses expand into long narrow lakes of considerable size: Lake Mjøsen is 60 miles long, and its bottom is 1080 feet below the level of the sea; others are Randsfjord (43 miles long), Tyrifjord (19 miles), and Fæmund (35 miles long and 2300 feet above sea-level). The slopes of these valleys, especially in the southern and eastern parts of the country, are planted for miles upon miles with forests, chiefly fir. In these forest regions the elk is still found, and the blackcock, capercaillie, and hazel-grouse abound. The trees are felled principally in winter, and floated down the streams in early spring to the sawmills at their mouths.

Geology.—The great mass of the Norwegian plateau consists almost entirely of Archæan rocks, chiefly granite and gneiss, with quartz and hornblende schists in a subordinate degree, in very many cases clearly stratified. In central and western Norway (the fjeld region) the primary rocks are covered with layers of metamorphosed clay-slate and quartzite, whilst large masses of eruptive rocks of later date, such as granite, syenite, gabbro (especially in the Jotun Fjeld), porphyry, greenstone, labradorite, serpentine, have pierced through both formations and overspread them in broad sheets or coverlets. The prevailing formation in eastern Norway is called Sparagmite, a loose accretion of conglomerates and breccias, sandstone and quartz. Bands of Silurian rocks extend across the southern part of the country from south-west to north-east, the two most clearly-defined belts stretching from Hardanger Fjord to Trondhjem and from Skien Fjord (on the south coast) to Lake Mjøsen. Most of the rocks of the plateau have been greatly crumpled, folded, twisted, crushed, and dislocated. The prevailing formation throughout northern Norway is granite. Nearly all parts of the country bear conspicuous traces of the scratching, grinding, and polishing to which the structural rocks were subjected during the Glacial age and the period of its departure. Incised and striated lines, and polished surfaces, occur at all altitudes up to 5000 feet, and generally follow directions radiating outwards from the highest mountain-knots of the peninsular rampart. Boulders litter the surface of the country nearly everywhere; moraines are numerous, and transverse ridges of glacial detritus block the mouths of many of the valleys; 'giant kettles,' the basins that received the glacial cataracts, occur in numerous districts near the sea. Moreover, the lines of ancient beaches, whether of the ocean or of glacial lakes, are distinctly traceable at many points along the coast from Bergen to the North Cape; sometimes there are two, or even more, one above another. The coast of northern Norway is estimated by some authorities to have risen between 400 and 600 feet. See UPHEAVAL.

Industries and Occupations.—Norway's natural wealth lies in her fisheries, her forests, and her shipping; her manufactures, her mines, and her agriculture are all unable to meet the home demands.

By far the most important of the fisheries are the cod and herring. Cod are taken by 80,000 to 90,000 men on the west coast from January to April. They are cured chiefly in two ways, being either dried on wooden frames (hence called *tørfisk* = 'dry fish') or slightly salted, carried to the mainland, split open, and dried on the rocks (hence *klippfisk* = 'split fish'). The former are exported to Italy to the average annual value of £374,000, the latter to Spain to a value ranging from £599,000 to £981,000 a year. Besides, cod-liver oil is exported to an annual average of £338,000, salted roe

to £289,000, and heads and offals, powdered for manure, to £37,000 to £63,000. Herrings are taken all the year round and exported to an annual value varying from £575,000 to £639,000. Mackerel (£83,300) and oysters are taken off the south coast, and salmon and sea-trout (£43,400) and lobsters (£26,200) off the west coast. Off the north coast of Finmark cod, saithe, flounders, smelt, &c. are taken in summer and bartered to Russian merchants for flour; this fishery engages about 13,000 men. The fishery in the Polar seas for whales, walrus, seals, dog-fish, sharks, &c. is prosecuted by about 1000 men in less than 100 small vessels, sailing from Tromsø and Hammerfest, with a few from Vardø; their total earnings in a season vary between £175,000 and £378,000. The inland lakes and rivers contain an abundance of salmon, trout, and red charr, and some of the southern lakes have also grayling, bream, perch, and pike.

The forests cover about 24 per cent. of the entire surface, though the area has been of late years very greatly diminished. Trees are, however, being systematically planted in several parts. The sawmills (340 in number) give employment to 10,300 men, whilst 1600 more are engaged in the preparation of wood-pulp and cellulose (42 factories in 1885). Timber of all kinds is exported to a total value of £1,785,000 (1888; £2,111,000 in 1890), wood-pulp and cellulose to £509,500 (a steady increase from £130,300 in 1880), matches to £97,400, and articles manufactured from wood to £23,600.

Agriculture is carried on chiefly in the vicinity of Christiania, the lower ends of the eastland valleys, in the level district of Jæderen in the extreme south-west, and around Trondhjem. The farms are mostly small; 94 per cent. of the entire number measure less than 50 acres each, and more than half the farmers own the land they cultivate. Of the total population 53 per cent. are engaged in or connected with agriculture. The rearing of cattle, sheep, and goats—in the north reindeer—are important branches. The area under cultivation is only 2 per cent. of the entire surface of the country, and meadows and grazing land add another 2·8 per cent.

A century ago and down to about 1870 the copper and iron mines of Røros and the silver-mines of Kongsberg yielded considerable outputs; but they have since greatly declined. The only vigorous mine is at Vigsnes (on Karmø, at the entrance to Bukken Fjord), which yields £61,000 worth of pyrites in the year. The total mineral output of Norway (iron pyrites, silver, copper, apatite, nickel) was worth £181,300 in 1885, one-half the value of 1882. The silver mined is, however, still worth £57,700 a year. Barely 2000 men are employed in this occupation.

The purely industrial establishments are grouped mainly around Christiania, and do not employ more than 45,500 persons altogether. Besides some already mentioned, the more important are textile manufactures (6037 employees and 143 factories), machine-shops (4282 men in 50 establishments), chemical factories (75 with 3002 men), iron and metal works (67 with 2881 men), brick-works (105 with 2354 men), flour-mills (387 with 1787 men), tobacco-factories (43; 1677), breweries (47; 1411), and in a minor degree tanneries, distilleries, and factories for matches, glass, oil (fish and vegetable), and paper. Water is the favourite motive power, only 502 out of 1925 establishments using steam in 1885.

The Norwegians rank amongst the busiest sea-carriers of the world, close upon nine million tons of merchandise having been carried in Norwegian vessels, in all parts of the world, in 1888, the owners of which earned the aggregate sum of

£5,168,000. Yet the mercantile marine of Norway only embraced in the same year a total of 6697 sailing-vessels of 1,396,998 tons and 536 steam-vessels of 137,542 tons. But, as in nearly all other countries, steam-vessels are supplanting sailing-vessels. Shipbuilding is carried on (1888) in seventy-nine establishments, employing 1846 men, and situated chiefly in the south. Sails are made by 906 men in fifty-eight workshops. The coast fishermen use for the most part heavily-built wooden vessels, of small tonnage, with high, square sterns.

The ports of Norway were entered in 1888 (an average year) by 11,258 vessels, having an aggregate tonnage of 2,303,225, of which 63 per cent. entered under the Norwegian flag and 16 per cent. under the British. The exports during the ten years ending 1888 ranged between £4,957,000 (1879) and £6,831,000 (1882) in value, the imports between £7,346,000 (1879) and £9,167,000 (1881). The figures were lowest in 1885 and 1886, but since then have been rising; by 1888 they had got back to the level of 1882. The United Kingdom sends 28 per cent. of the imports and receives 32½ per cent. of the exports. Germany comes next with 27 per cent. of the imports and 14 per cent. of the exports, and Sweden third, with 13 and 13½ per cent. respectively. The principal articles of import are rye, barley, and wheat and rye flour (altogether £1,595,000 in 1888), textiles (£1,527,600), bacon, butter, and other provisions (£780,000), iron and other metals, raw and manufactured (£766,300), coffee (£564,600), coals (£473,300), ships (£389,800), sugar and molasses (£293,000), timber from Sweden, in transit (£249,900), oils and glycerine (£236,400), hides (£224,900), wines and spirits (£173,100), and smaller quantities of salt, tobacco, fruits and vegetables, paper, &c. The more important of the exports are fish (£2,559,400 in all in 1888), timber, &c. (£2,415,600), minerals and metal-ware (£414,100), oils, tallow, tar, &c. (£342,900), hides, horns, &c. (£312,400), textiles (£197,400), and paper and dyestuffs. In addition meat, groceries, and timber to the total value of £318,100 pass out of the country in transit. Close upon 64 per cent. of the total foreign trade passes through the three principal ports—Christiania (33½ per cent.), Bergen (17½ per cent.), and Trondhjem (7½ per cent.).

People.—The Norwegians share with the Swiss the honour of being the most democratic people in Europe. They are proud of their freedom and independence, are simple, honest, and straightforward, sober and frugal, and in general unaffectedly pious, though in some districts liable to violent outbursts of passion. Otherwise they are slow of action and take life leisurely. The rural population, embracing five-sixths of the total, are decidedly more democratic than the urban. All titles of nobility were abolished in 1821, and none but townsfolk use the equivalent of our 'Mr.' Owing to the insufficiency of the natural resources of the country to support the people, nearly 20,000 emigrate every year; between 1880 and 1888 inclusive 183,267 persons in all left their country for good, almost all going to settle in the United States. Those who remain behind are fairly prosperous on the whole, for, though £380,000 to £390,000 are distributed every year in poor-relief to between 65,000 and 67,000 persons, there are (1889) 345 savings-banks, holding deposits to the total amount of £10,364,200 in the name and behalf of 452,736 depositors (23 per cent. of the total population), giving an average of £22, 17s. 10d. for each depositor. In the matter of illegitimacy the record is not so good: in the ten years ending 1885 of the total number of children born 8·25 per cent. were illegitimate; the figure stands in England at 4·8; in Scotland, 8·3; in Ireland, 2·9.

Since 1871 earnest endeavours have been made to diminish the consumption of spirituous liquors, the instrument chiefly relied upon being the Gothenburg licensing system. This system was by 1888 established in all but three out of the fifty-four towns of the kingdom. By this means, in spite of the rapid growth of the population, the consumption of spirituous liquors decreased from 2,698,960 gallons in 1876 to 1,325,060 gallons in 1888, a reduction of more than one-half. Moreover, after paying expenses, granting 5 per cent. to the shareholders, and compensating the sellers of spirits whom the system supplants, there remains an annual surplus of £42,800 to £55,500, which is spent in the maintenance of schools, public roads and parks, water-works, poor-relief, and charitable institutions. As road-makers the Norwegians vie with the Swiss; their difficult country has compelled them to perform some feats of engineering skill of no mean order. But the principal means of communication are steamboats, which ply all along the coast, on the fjords, and the inland lakes. There are, however, some 15,000 miles of well-kept national and communal roads, and 970 miles of railway (all but 42 miles managed by the state), and close upon 5000 miles of telegraph lines (not wires). The railway lines radiate chiefly from Christiania. One connects Trondhjem with the capital, and in 1891 there were three built and one building to connect Norway with Sweden. Norway is now visited every summer by great numbers of tourists; the number increased from 13,569 in 1886 to 23,403 in 1890, one-third being British, the rest chiefly Swedes, Danes, and Germans.

The people are on the whole well educated and intelligent. Attendance at school is free, and compulsory upon all children between seven (six and a half in towns) and fourteen. The country is well equipped with primary schools, and for the higher branches there are fifty-four middle-class schools, seventeen lyceums, and the university of Christiania, with five faculties, and (in 1888) 1650 students and fifty-four lecturers. In addition there are numerous excellent private schools. The state contributes about one-third of the total cost of the public educational establishments throughout the country. Except for about 4000 persons, the entire population belong to the Lutheran Church. For purposes of ecclesiastical government the country is divided into six dioceses (*stifts*), each administered by a bishop—viz. Christiania, Hamar, Christiansand, Bergen, Trondhjem, and Tromsø.

Constitution.—Norway is a free, independent state, nominally a kingdom, but practically to all intents and purposes a republic. The supreme executive rests with the king, who is at the same time king of Sweden; but the responsibility for his acts is borne by a council of state, appointed by himself from Norwegians above thirty years of age, and consisting of two ministers and at least seven councillors. One minister and two councillors must always be in attendance on the king when he is not in Norway. The other minister and the remaining councillors administer the internal affairs of the country, the minister presiding over the deliberations of the council (sometimes also taking a portfolio), and the councillors directing each a special department—at present seven, Religion and Education, Justice, Interior, Public Works, Finance, Defence, Revision of all Public Accounts. As viceroy in Norway the king may appoint his eldest son, or his eldest son, but none other; if there is a viceroy, he presides over the council of state. The king declares war and peace, and makes treaties and agreements on his own initiative, but cannot use the army and fleet for an aggressive war without the consent of the Norwegian parliament. Both countries are represented by one and the same

diplomatic corps. The people participate in the government through the Storting or parliament, which consists of 114 members, 76 representing the country districts and 38 the towns. All Norwegians above twenty-five years of age who satisfy certain conditions of residence and property qualification, or station, meet once in every three years in the parish church and choose one man from every hundred of their number to select the members of parliament for the county. Every man so selected, even though it be against his will, is obliged to sit in one parliament (of three years), but not in a second. If a sitting member dies his place is taken by the man who stands next on the list of representatives selected by the electors. As soon as the Storting meets (in February every year in Christiania) one-fourth (29) of the assembled members are chosen to form an upper house (*Lagthing*); the remainder constitute the lower house (*Odalsting*), in which all legislative measures are proposed either by a member of the house or by a member of the government. The upper house may send back a bill twice; but after the second rejection both houses vote together as one, though in that case a majority of two-thirds is necessary. The king's signature makes a bill law. But if he refuses to sign, and the bill is passed by three successive parliaments (not sessions), it becomes law in spite of the king's veto. Every member of the parliament is allowed 13s. 4d. a day with travelling expenses. The affairs of each county are directed by a special administrative officer. Both the counties and the communes enjoy a liberal degree of self-government. Justice is administered locally by sheriffs; from them an appeal is allowed to one of the four so-called diocesan courts, and from them to the supreme court sitting at Christiania. The national expenditure averages slightly under two and a half millions per annum, and the revenue somewhat less. The national debt amounted in 1888 to £5,849,070. There are two national banks, a joint-stock bank with a capital of £2,973,300, and a hypothec bank with a capital of £611,100. The monetary unit is the *krone* (= 1s. 1½d.), divided into 100 *øre*. The metric system of weights and measures prevails; and Norway has her own national flag distinct from Sweden. The national defences embrace an army and navy. All men, not incapacitated or specially exempt, above the age of twenty-three serve ten years with the colours, but are only called out for a few weeks' exercise every summer. Close upon 6300 men are drawn by conscription annually. The inhabitants of the counties of Nordland, Tromsø, and Finnmark, with a certain proportion of the coast population farther south, are liable to conscription for the navy, and serve from twenty-two to thirty-five years of age. The naval dockyards are at Horten, on the west side of Christiania Fjord. The fleet consists of about a dozen gunboats (first and second class), four iron-clad monitors, and some thirty other vessels, with a torpedo service.

See Kiar, *Norges Land og Folk* (1886); Kirchhoff, *Länderkunde* (pt. ii 1890); in English, see Du Chaillu, *Land of the Midnight Sun* (2 vols. 1881); F. Vincent, *Norsk, Lapp, and Finn* (1881); Mary Godwin, *Letters from Norway* (1796); J. D. Forbes, *Norway and its Glaciers* (1853); and numerous modern books of travel, such as C. W. Wood, *Round about Norway* (1880); Lovett, *Norwegian Pictures* (1885); Corning, *From Aalesund to Tetuan* (1889), and others. For the geology, see Kjerulf, various works in Norwegian (1855-79); for the plant-life, Schübel, *Norges Væxtrige* (3 vols. 1885-89), and other works; and for the statistics, the publications of the Norwegian statistical department, partly duplicated in French. The best guidebooks to the country are those by Yngvar Nielsen, Baedeker, Tönsberg, Bennett, Jörgensen, and Wilson.

History.—It is not until the 9th century that the story of Norway begins to emerge from the obscurities of myth and legend. At the time the tribes of Gothic descent crossed the Baltic and settled in the southern parts of the Scandinavian peninsula they found the Lapps or Finns in possession. These people they drove north towards the Arctic Ocean. When this immigration took place cannot be determined exactly. Indeed, if, according to one theory, the original home of the Aryans was in Scandinavia, it probably never took place at all. At the dawn of the historical period Norway was parcelled out among the free men of the race (Norroeni, Norsemen, Norwegians), whose slaves—prisoners taken in war—tilled the soil, whilst they and their free dependents spent their time in fighting, viking raids, and similar pursuits. The ties that united these free men were personal rather than political or territorial, though for judicial purposes all who dwelt in a well-defined district (*fylki*) met at stated intervals and at fixed places to adjudicate in common, on terms of strict equality. Several of these districts were associated together in a higher unity—the *thing*. Of such *things* or meetings there came to be eventually three, the Frosta for the north, the Gula for the west and south, and the Eidsifia for the east; at a later date the Borgar *thing* for the south-east was separated from the Eidsifia. Each of these *things* had its own independent code of purely customary laws. The chief men, calling themselves kings, later jarls (earls), had no official authority; their power was due solely to their personal influence—their character, wealth, warlike renown, and long descent (compare NORTHMEN).

The cradle of the future kingdom of Norway was the district of Vestfold, on the western side of Vik (now Christiania Fjord). There a royal race from Sweden established themselves, seemingly in the 7th century. A descendant of these kings, Black Halfdan (died 860), reduced the petty kings to the north of him, as far as Lake Mjøsen. His greater son, Harold Haarfager or Fairhair (king 863-930), extended his sway as far north as Trondhjem, in which district, as being his first conquest in lands that owed no allegiance to the chief king in Sweden, he established the seat of his power, just as the elector of Brandenburg called himself Frederick I. king of Prussia. After that in three great sea-fights, the last near Stavanger in 883, he conquered the kings of the west and south-west, and proclaimed himself chief king in Norway. But many of the defeated chiefs (kings) refused to submit to Harold, especially when he asserted the right of conquest, seized their odal lands, and introduced a form of feudalism. They sailed across the Western (North) Sea, and colonised the Faroe, Shetland, and Orkney Islands, the Hebrides, Man, Ireland. But they so harassed the men (jarls) to whom Harold had given their lands in Norway that the king, pursuing them, slew many of them and reduced the islands to his sway, and appointed earls over them (Orkneys, Hebrides). Those who were still disaffected escaped his rule by sailing on farther to Iceland. In Harold's reign the skalds or improvisatore court-poets began to compose, and were held in great honour. Harold's son, Erik Blood-axe, was driven from Norway by a younger brother Haco in 935, and for many years the country was distracted by Erik's sons trying to recover their father's power. After Haco died (961) their principal opponent was Earl Haco of Trondhjem, who ruled Norway west of the mountain plateau until he was killed in a revolt (995). Olaf Tryggveson, a descendant of Harold Haarfager, a man who had won great fame as a viking in England (991-994) and elsewhere, stepped into the gap. Like his great-uncle Haco, he was a Christian,

and like him he attempted to make his people Christian, and he did make them Christian, at least nominally and superficially. The beau-ideal of a sea-king, and the pride and admiration of his people, Olaf died a hero's death, fighting against a host off the north coast of Prussia (1000). After an interval of fifteen years another Olaf, likewise a descendant of Harold Haarfager, landed and won the kingdom from the sons of Earl Haco. This Olaf, St Olaf, made his people's Christianity more real, first thoroughly welded the kingdom into a united state, made all the western islands tributary, and ruled sternly but well. Ever since the days of Harold Haarfager the king of the Danes had claimed supremacy over at least southern Norway; in 1028 the great Canute came with a large fleet to make good his claim. Olaf fled to Russia, and in attempting to win back his crown perished in battle at Stiklestad near Trondhjem (1030). Five years later the chiefs of the land made Olaf's son Magnus king, and he became king of the Danes also in 1042. But this office he found so difficult that in 1046 he associated with himself as king his uncle Harold Haardraada, who had served in the Væring guard at Constantinople and had fought against the Saracens in Sicily. War between the Danes and Norsemen was almost chronic all through the reigns of Magnus and Harold, who became sole king in 1047. Harold's love of adventure led him to his death at Stamford Bridge in England in 1066. During the peaceful reign of Harold's son, Olaf Kyrre (1067-93), commerce thrived, industrial guilds were formed, and the land prospered greatly. The next king, Olaf's son, Magnus Barefoot, waged war in the Orkneys, Hebrides, and Ireland, till he fell in this last island in 1103. Two sons of Magnus, Eystein (died 1122) and Sigurd (died 1130), then reigned in concert, Eystein being a quiet stay-at-home prince, whilst Sigurd, who had inherited all the adventurous enterprise of his ancestors, sailed to the Levant, and visited Jerusalem and Constantinople (1107-11). After his return he greatly fostered the church. At this period the towns began to be prosperous.

From 1130 to 1240 the country was torn by internal feuds, three predominant parties contesting for power—an oligarchical party amongst the chief men; the bishops' party, who claimed the right to elect the king; and after 1174 the nationalist Birkebeiner (i.e. 'Birch-legs'), who generally had the first two parties allied against them, but who in the long-run got the victory. After defeating the earls and bishops, and slaying their nominee or puppet, King Magnus, in Nord Fjord (1184), they made their leader Sverre (died 1202), a Faroe islander, and a clever man, king. Nevertheless, the civil strife went on until the twenty-third year (1240) of the reign of Sverre's grandson Haco. This king reigned twenty-three years longer, and during that time the land recovered from her distractions. Iceland acknowledged the supremacy of the king in Norway in 1262. Haco died at Kirkwall (1263), shortly after being defeated at Largs in an attack upon Scotland. It was during the first half of the 13th century that the Old Norse literature began to be written down. The laws were put in writing during the reign of Haco's son, Magnus the Law-betterer (1263-80), who, in 1266, gave up the Hebrides to Scotland. The pretensions of the bishops' party were finally crushed by Erik (died 1299), son of Magnus, and father of the little Margaret, Maid of Norway. Erik's successor, his brother Haco, dying (1319) without a son, the throne passed through a daughter to the Swedish royal house, and again through marriage to the Danish (1380). The great Queen Margaret of Denmark united all three kingdoms by the Union of Kalmar (1397).

And now evil days fell upon the land. The extraordinary exertions of Norway's youth seem to have worn her out early; her high spirit and enterprise were gone; her literature died out, and her intelligence burned down to a dull glimmer; her commerce passed into the tyrannical hands of the Hanseatic merchants of Bergen; her old colonies, Orkney and Shetland, were pledged to Scotland for ever in 1468; Denmark, which at first respected her national rights, treated her from 1536 as a conquered province, and forced the Reformation upon her, yet the Norwegians never seriously resented the harsh and oppressive treatment of their rulers. In 1612 some 300 men from Scotland, whilst making their way to join the army of Gustavus Adolphus in Sweden, were cut to pieces by the Norwegian peasantry in the pass of Kringelen in Gudbrandsdal.

The national spirit began to stir again in the awakening of the peoples occasioned by the French Revolution; and the transference of Norway to Sweden in 1814 gave back to the Norwegians their national rights, a liberal constitution, and their sense of national unity. At first they resisted the transference. Prince Christian of Denmark headed the movement for independence, and summoned a national assembly, which at Eidsvold (17th May) drew up a liberal constitution. But Sweden marched her forces into the country, and on 10th October Christian abdicated. Charles XIII. of Sweden, having recognised the constitution, was elected king on 4th November. In 1821 the Norwegians abolished all titles of nobility. The spirit of independence and of nationality has grown stronger as the years have passed, industry has thrived, commerce has prospered and brought wealth, and, intellectually, Norway stands in the van of progress. The principal event since the union with Sweden was the overwhelming protest of the people against the right claimed by the king to veto absolutely bills duly passed by their elected representatives, the struggle lasting through the years 1872-84.

Morris and Magnusson (vols. iii.-vi. of Saga Library, 1891) or by Laing (3 vols. 1844; new ed. 1890); Boyesen, *History of Norway* (new ed. 1890); T. Michell, *History of the Scottish Expedition to Norway in 1612* (1886); and Powell and Vigfusson, *Corpus Poeticum Boreale* (1883). Carlyle's *Early Kings of Norway* (1878) is adapted from Laing's *Heimskringla*.

Literature.—Like Germany, Norway has an ancient and a modern period of literary history—the interval between being mostly blank. The ancient period of Norwegian literature is that of the Sagas (q.v.), and see also ICELAND, SNORRO, EDDA. What writers Norway gave birth to between the 13th and the 19th century, except Peder Dass (1647-1708) and Dorothea Engelbretdatter (1634-1716), are counted amongst the Danes, in whose language they wrote. These men, Holberg, Tullin, Weasel, Fasting, Brun, Frimann, and others—some of them the brightest ornaments of Danish literature—have been already mentioned under Denmark (q.v.).

The modern period begins with the re-awakening of the national life; it received its first impulses from the Norwegian Society, a band of patriotic men living in Copenhagen in 1772, from the founding of a native university at Christiania in 1811, and from the recovery of national independence in 1814. The earliest writers of the new era, the poets Bjerregaard (1792-1842), M. C. Hansen (1794-1842), and Schwach (1793-1860), though the ring of patriotism is in their work, possessed little originality. The creator of the modern national literature was Wergeland (1808-45), the Schiller

of his country, who believed that in the free peasant proprietor lay the hope of Norway's future, and who laboured earnestly to make him worthy of that high calling. The nebulous thought and disregard of æsthetic law and taste shown in his earlier works provoked the satirical attacks of Welhaven (1807-73), a master of poetic form, and the representative of the intellectual aristocracy of the country, the mercantile and official classes. This gave rise to a keen literary feud. But, apart from Andreas Munch (1811-84), the ladies' poet, who stands by himself, and the poets J. Moe (1813-82), Jensen (1812-67), and Th. Kjerulf (1825-88), who were more or less influenced by Welhaven, nearly all subsequent writers have worked in the spirit of Wergeland, and for the same ends. Monsen (1815-52) penned lyrics which sometimes approach the best of Wergeland's later work in quality. Aasen (born 1813), Vinje (1818-70), K. Janson (1841), Sivle (1857), and Garborg (1851), the *Maalstræver*, have tried to create a literary language by collating and fusing together the various peasant dialects, the first named more especially in philological works, the others in tales and novels, and even in poetry. Garborg is a writer of striking individuality. Asbjørnsen (1812-85) and Moe, the poet, and Faye collected the folk-tales; Landstad (1802-81), the hymn-writer, and Bugge (1833) collected the popular songs. Daa (1809-77) popularised the history of his country, and Vig (1824-57) laboured in the same direction in various works for the people. Schultze (1823-73), Friis (1821), Østgaard (1812-73), Magdalena Thoresen (1819), and others have described well and lovingly their native land and its people. Bjørnson (1832), M. Thoresen, and Lie (1833) have written good tales from the life of the provinces; the peasant tales of Bjørnson are of great merit. Ellert Sundt (1817-75) strove to educate the country-people through his treatises on their social and economic circumstances. The chief writers of the latest phase of Norwegian literature are Ibsen (1828), Bjørnson, Lie, Kjelland (1849), Garborg, Camilla Collett (1813), Elster (1841-81), M. Thoresen, Jæger (1854), Flood (1837), Gloersen (1838), Amalie Skram (1847), Kristofersen (1851), Krogh, Gunnar Heiberg, Hamsun, and others. Speaking generally, these authors, all novelists except Ibsen and Heiberg, show a strenuous desire for truth, great earnestness, a strongly realistic way of looking at things, keen delight in intellectual and moral strife, remarkable directness, vigour, and freshness of style, a decided leaning to satire, and frequently, too, a charming naïveté and striking originality. Ibsen, a writer of conspicuous power and genius, has written nothing but plays, historical, lyrical, and socio-satirical; Bjørnson, Kjelland, Lie, and M. Thoresen have also produced dramatic works, all, except the lady's, of considerable merit. The poems of Ibsen and Bjørnson likewise take high rank; Gloersen and Lie write respectable verse. Kjelland satirises the classes of whom Welhaven was the representative; he has strong cosmopolitan, especially French, tendencies. Poulsen (1850), 'Marie,' and Marie Colban (1814-84) must be mentioned as voluminous and popular authors of works of a light character.

In other departments than pure literature the subjoined must be named: in literary history, Botten-Hansen (1824-69), H. Lassen (1824), Jæger, Skavlan (1838), Dietrichson (1834); in history, P. A. Munch (1810-63), Keyser (1803-64), Lange (1810-61), Daa (1834), E. Sars (1835), G. Storm (1845), B. Moe (1814-50), Faye (1802-69), Nielsen (1843); in philosophy, Treschow (1751-1833), Monrad (1816), a Hegelian; in theology, Caspari (1814), Hauge (1771-1824), Wexels (1797-1866), F. W. Bugge (1838); in philology, P. A.

Munch, Keyser, Bugge, Aasen, Unger (1817), Fritzner (1812), Stockfleth (1787-1866); and, as orientlists, Caspari and C. Lassen (1800-76); in archaeology, Rygh (1833); in jurisprudence, Schweigaard (1808-70), Lassen (1798-1873), Aschehong (1822), Stang (1808), Hallager (1816-76); in mathematics, Hansteen (1784-1873) and Abel (1802-29); in science, Michael Sars (1806-69) and his son, G. O. Sars (1837), as biologists, and Keilhau (1797-1858) and Th. Kjerulf (1825-88) as geologists. The best Norwegian painters have been Tidemand (1814-76), C. F. S. Hansen (1841), Gude (1825), M. Müller (1828), S. Jacobsen (1833), Munthe (1841), and Sinding (1842); the best sculptor, Middelthun (1820-86); the best musicians, Ole Bull (1810-80), H. Kjerulf (1815-68), Grieg (1843), and Svendsen (1840).

See Schweitzer, *Geschichte der Skandinavischen Literatur* (3 vols. 1886-90); Gosse, *Northern Studies* (2d ed. 1882); Halvorsen, *Norsk Forfatter-Lexikon, 1814-80* (1881 et seq.); Jæger, *Norske Forfattere* (1883); and Botten-Hansen's excellent bibliography, *La Norvège Littéraire, 1824-66* (1869).

Norway Haddock. See BERGYLT.

Norwich, a cathedral city of England, the capital of Norfolk, and a parliamentary, county, and municipal borough (the first returning two members), is situated on the Wensum, immediately above its confluence with the Yare, 18 miles W. of Yarmouth and 114 NNE. of London. Pop. (1801) 34,975; (1831) 61,110; (1881) 87,842; (1891) 100,964. Built on the summit and slopes of a hill which gradually rises from the river, the city, with its hamlets, covers an area of 7472 acres, as compared with that of two miles enclosed by its ancient walls (1294-1342), and its narrow, winding streets are rich in examples of early architecture—as Pull's Ferry and the Bishop's Bridge (1295), both on the river-banks; St Giles' Hospital (founded 1249); the Ethelbert Gateway (circa 1272); Bishop Salmon's Gateway (circa 1325); the Guildhall (completed 1413); Erpingham Gate (1420); the Music House (partly Norman, and once a residence of Sir Edward Coke); the Bridewell (Decorated and Perpendicular, circa 1400); and the Dolphin Inn (1587). The cathedral, almost wholly Norman in style, but the growth of more than four centuries, occupies a site close to the river, and was founded in 1096 by Bishop Herbert Losinga: its dimensions are 407 feet in length by 72 in breadth (or 178 across the transepts), and it is surmounted by a noble (Norman) tower and (Decorated) spire of 315 feet—the highest in England next to Salisbury: special features are the relics, consisting of two glorious arches, of its Early English Lady Chapel (demolished 1573-89); its cloisters, 175 feet square (1297-1430); the Decorated Beauchamp Chapel (in which is preserved the Bible used at the coronation of Queen Victoria), and the vaulted roof of the nave and transept, rich in mediæval sculptured bosses. Close by is the grammar-school, founded (as a Mortuary Chapel) in 1319, and famous as the place of education of Lord Nelson, Rajah Brooke, and other celebrities; also St Andrew's Hall (Perpendicular; formerly the church of the Black Friars), in which are held the triennial musical festivals, first established at Norwich in 1824. Next after the cathedral the most striking edifice is the castle, crowning the summit of a sugar-loaf mound in the centre of the city, and originally, with its defences, extending to the picturesque market-place: its massive quadrangular Norman keep, the only portion now standing, was used as a prison till 1886. In it and the adjacent prison-buildings has been placed the local museum, famous for its collection of raptorial birds. On the cattle-market beneath the castle is held annually, on Maundy Thursday, the famous cattle and sheep

fair, formerly held on Tomblond, and so graphically described in Borrow's *Lavengro*. The churches, forty-four in number, are for the most part built of flint, and in the Perpendicular style: those of St Peter Mancroft (where once Archbishop Tenison ministered), St Andrew, St Giles, St Lawrence, St Michael Coslany, and St Stephen are the finest examples; whilst of public buildings of modern date mention should be made of the hospital (founded 1771 and rebuilt 1879-83), an Agricultural Hall (1882), and a Volunteer Drill-hall (1886). Formerly one of the largest seats in England of the worsted-weaving trade, the city is still noted for its textile fabrics—especially its crapes; but the principal manufactures now carried on are those of mustard, starch, ornamental ironware, boots and shoes, whilst extensive breweries and a vinegar distillery, as well as large nursery-gardens on the outskirts of the town, give employment to many hands.

Often pillaged by the Danes, and in 878 Guthrum's headquarters, Norwich in 1004 was burned by Sweyn, and thirteen years later was held by his son Canute. Subsequent to the Norman Conquest the principal incidents in its history have been the translation of the bishopric hither from Thetford (1094); the granting of its first charter of self-government (1194); its sacking by Louis the French Dauphin (1216); the riotous attack by the citizens on the cathedral monastery (1272); its first representation in parliament (1295); settlements of Flemish weavers (1336) and of Dutch and Walloon refugees (1558-1603); a hurricane (15th January 1362), which blew down the spire of the cathedral; John Litester's rebellion (1381); disastrous fires (1463 and 1509), on the last occasion the roof of the cathedral being destroyed; the encampment of Ket's rebels on Mousehold Heath (1549); many royal visits, and outbreaks of the plague, the worst being the Black Death in 1349, when half the population is supposed to have perished, in 1602, when 3076 persons died, and in 1665, when 2251 succumbed; and a collision on the railway 2 miles to the east of the city (10th September 1874), when twenty-five persons lost their lives. Among the sixty-five bishops of Norwich have been Pandulph (the pope's legate), Salmon (the builder of the grammar-school), Bateman (the founder of Trinity Hall at Cambridge), Despenser ('the fighting Bishop of Norwich'), Corbet (the poet), Hurnett and Manners-Sutton (afterwards Archbishops of York and Canterbury), Wren (father of the celebrated architect), Joseph Hall, and Reynolds (the composer of the General Thanksgiving in the Prayer-book). Of citizens the best known are Sir Thomas Erpingham (builder of the gate which bears his name, and chamberlain to Henry IV.); Thomas Bilney; Archbishop Parker; Dr Caius; Greene (the poet and dramatist); Bishops Cosin and Tanner; Sir Thomas Browne; Dr Samuel Clarke; Sir James Edward Smith; 'Old' Crome, his son, Cotman, Stark, and Vincent (the 'Norwich school' of painters); Mrs Opie; Crotch (the musical composer); Wilkins (the architect and R.A.); Professors Taylor and Brewer; Sir W. J. Hooker; Gurney (the philanthropist) and his sister, Elizabeth Fry; Lindley (the botanist); and Harriet Martineau and her brother James.

See works by Stacy (1819), Bayne (1858), Goulburn (1876), Jarrold (1883), and Jessopp (1884); also those cited under Norfolk.

Norwich, capital of New London county, Connecticut, is at the head of the Thames River, 13 miles by rail N. of New London. The chief portion of the city lies on an eminence that rises between the Yantic and Shetucket rivers, which here unite to form the Thames. There are numerous manufactories of paper, cotton and woollen

goods, worsted, picture cords, pistols, wood-type, files, locks, iron pipes, &c., besides rolling-mills and ironworks: abundant water-power is supplied by the branches of the Thames. Steamboats ply between Norwich and New York. The land on which the city stands was granted by Uncas the Mohican to an English ensign who in 1656 reached him by night with a canoe-load of provisions, when he was besieged in his stronghold by the hostile Indians, and nearly forced by hunger to surrender: a granite obelisk bearing the name of Uncas was erected in 1825. Pop. (1890) 16,156.

Norwood, a south suburban district of London, hilly, healthy, and pretty, long the seat until 1797 of a Gypsy settlement. Pop. 24,797. See A. M. Gale's *Norwood and Dulwich* (1890).

Nose, the organ of smell, and also part of the apparatus of respiration and voice. Considered anatomically, it may be divided into an external part—the projecting portion, to which the term *nose* is popularly restricted—and an internal part, consisting of two chief cavities, or *nasal fossae*, separated from each other by a vertical septum, and subdivided by spongy or turbinated bones projecting from the outer wall into three passages or *meatuses*, with which various cells or *sinuses* in the ethmoid, sphenoid, frontal, and superior maxillary bones communicate by narrow apertures.

Fig. 1.—Longitudinal Section of the Nasal Fossae of the Left Side, the Central Septum being removed:

1, frontal bone; 2, nasal bone; 3, part of ethmoid bone; 4, sphenoidal sinus. a, superior turbinate bone; b, superior meatus; c, middle turbinate bone; dd, middle meatus; e, inferior turbinate bone; f, inferior meatus; gg, a probe passed into the nasal duct.

The external portion of this organ may be described as a triangular pyramid which projects from the centre of the face, immediately above the upper lip. Its summit or root is connected with the forehead by means of a narrow bridge, formed on either side by the nasal bone and the nasal process of the superior maxillary bone. Its lower part presents two horizontal elliptical openings, the *nostrils*, which overhang the mouth, and are separated from one another by a vertical septum. The margins of the nostrils are usually provided with a number of stiff hairs (*vibrissae*), which project across the openings, and serve to arrest the passage of foreign substances, such as dust, small insects, &c., which might otherwise be drawn up with the current of air intended for respiration. The skeleton or framework of the nose is partly composed of the bones forming the top and sides of the bridge and partly of cartilages, there being on either side an upper lateral and a lower lateral cartilage, to the latter of which are attached three or four small cartilaginous plates, termed *sesamoid cartilages*; there is also the cartilage of the septum which separates the nostrils, and in association posteriorly

with the perpendicular plate of the ethmoid, and with the vomer, forms a complete partition between the right and left nasal fossæ. It is the lower lateral, termed by some writers the alar cartilage, which by its flexibility and curved shape forms the dilatable chamber just within the nostril. The nasal cartilages are capable of being slightly moved, and the nostrils of being dilated or contracted by various small muscles.

The *nasal fossæ*, which constitute the internal part of the nose, are lofty and of considerable depth. They open in front by the nostrils, and behind they terminate by a vertical slit on either side in the upper part of the pharynx, above the soft palate, and near the orifices of the Eustachian tubes, leading to the tympanic cavity of the ear.

The mucous membrane lining the nose and its cavities is called *pituitary* (Lat. *pituita*, 'rheum'), from the nature of its secretion; or *Schneiderian*, from Schneider, the first anatomist who showed that the secretion proceeded from the mucous membrane, and not, as was previously imagined, from the brain; it is continuous with the skin of the face at the nostrils, with the mucous covering of the eye through the lachrymal duct (see EYE), and with that of the pharynx and middle ear posteriorly. This membrane varies in its structure in different parts of the organ. On the septum and spongy bones bounding the direct passage from the nostrils to the throat the lining membrane contains ample and capacious submucous plexuses of both arteries and veins, of which the latter are by far the more large and tortuous. These plexuses, lying as they do in a region exposed more than any other to external cooling influences, appear to be designed to promote the warmth of the part, and to elevate the temperature of the air on its passage to the lungs. They also serve to explain the tendency to hemorrhage from the nose in cases of general or local plethora. In this, the respiratory part of the nose, the mucous membrane

Fig. 2.—Distribution of the Olfactory Nerve on the Septum of the Nose :

1, frontal sinus; 2, nasal bone; 3, sphenoidal sinus of left side; 4, posterior opening of the left nostril; 5, opening of Eustachian tube; 6, section of soft palate; 7, section of hard palate. a, olfactory nerve; b, its three roots; c, its bulb; d, nasal branch from the ophthalmic division of the fifth nerve; e, naso-palatine nerve; g, h, its branches; i, the septum of the nose.

is lined by ciliated epithelium. In the upper third of the nose—which, as the proper seat of the sense of smell, may be termed the *olfactory region*—the mucous membrane is very thick and coloured by a brown pigment. The olfactory nerve, or nerve of

smell, terminates in the olfactory mucous membrane. It passes into the nasal cavity in several small branches; these ramify in the soft mucous membrane (fig. 2), and end in tiny varicose fibres which terminate in elongated epithelial cells projecting into the free surface of the nose. These cells—the olfactory cells—which in some animals are provided with little hairs, are affected by odorous particles, and the excitement thus set up travels to the brain by the branches of the olfactory nerve. In order to smell a substance it must be in the form of vapour. A scent such as Eau de Cologne when poured into the nostril is odourless; its little particles must be disengaged, and be carried freely by the atmosphere into the nasal cavity before we are affected by its odour. So sensitive is the nose, however, that odorous particles of inconceivable smallness are capable of producing powerful sensations. When we remember that a grain of musk will scent the air in its neighbourhood for years, and that this can only be by the continual loss of particles of its substance, these particles must be infinitely minute. Still more wonderful is the development of the sense of smell in many of the lower animals. A hare passes rapidly over the ground and the scent will under favourable circumstances remain for hours, and be sufficiently strong to enable the well-trained harrier to follow it with unerring accuracy. In savage tribes the sense of smell is vastly more acute than among civilised nations; nevertheless by practice it is possible for any one to cultivate this sense to a very considerable extent. Well-authenticated cases are recorded of persons obliged by the loss of the other senses to train this, the only one left for their use, to such a degree of acuteness that they have been able to recognise both objects and persons by the sense of smell alone.

Most persons imagine that we are largely beholden to 'taste' for our gustatory pleasures. In reality our sense of taste only enables us to distinguish sweet from sour or bitter, and all the flavour of the food or wine is smelt. Close the nose and shut the eyes, and one cannot distinguish port from sherry, a raw potato from an apple, or beef from mutton.

Until recent years it was impossible to connect the *quality* of a smell with the *kind* of substance that produced it. In hearing and sight the character of the vibrations—of air or ether—determines the kind of sensation. The sound peculiar to the violin or piano depends entirely on the character of the sound vibrations given out by them. The rose appears red because it reflects to the eye vibrations which are chiefly characterised by their big oscillations. The writer of this article has been able to establish a similar relationship between the character of a smell and the character of the vibrations associated with odorous particles. He finds, in studying the odours of elements and their compounds, that in the 'Groups' of Mendeleëff (see ATOMIC THEORY, Vol. I. p. 552) the odours are similar or vary with the atomic weight of the element. Exactly similar properties in respect to the production of colour sensations have been observed by Carnelly.

DISEASES OF THE NOSTRILS.—Acute inflammation of the nasal mucous membrane has been already described under the title of Catarrh (q.v.); the conditions which cause an offensive smell from the nostrils are discussed in the article OZÆNA; and Polypus is a separate article.

Hemorrhage from the Nostrils, or Epistaxis (Gr., 'a dropping'), is by far the commonest form of bleeding from a mucous membrane. It may be produced by direct injury, as by a blow on the nose, or a scratch in the interior of the nostrils; and by other local conditions, as ulcerations or

morbid growths in the nasal cavity. According to Sir Morell Mackenzie, 'constitutional causes are of four kinds: (1) the blood itself may be diseased; (2) the vessels may be diseased; (3) there may be obstruction to the circulation through the lungs, liver, kidneys, or other organs, causing a sudden tension or strain of the whole system, which gives way at a weak part—viz. the nose . . . ; (4) the blood-flow may be a vicarious discharge' (*Diseases of the Throat and Nose*). It is most common in children and young adults, least so in the prime of life. It is much more often met with in the male sex than the female. The bleeding usually occurs drop by drop, but may be very profuse. Sir Thomas Watson wisely says: 'Sometimes it is a remedy; sometimes a warning; sometimes in itself a disease.' The first question to be considered therefore in any particular case is whether the hemorrhage ought to be arrested. Generally speaking, in plethoric children and young people, in cases of venous obstruction, and in vicarious hemorrhage, it should not be stopped unless the loss of blood prove excessive.

When it is desirable to arrest the hemorrhage the patient should be placed in the sitting posture at an open window, with the head erect or slightly inclined backwards; and amongst the simpler means to be first tried are compression of the nostrils by the fingers, maintained for five or ten minutes, the application of a key or other piece of cold metal to the back of the neck, and the bathing of the face or whole head with cold water, especially if accompanied by a drawing-up of the water into the nostrils; should these means fail, recourse must be had to astringent injections (for example, twenty grains of alum dissolved in an ounce of water) thrown up the nostrils by a syringe, or to astringent powders (as finely-powdered galls, kino, matico, alum, &c.) blown up the nostrils by means of a quill or other tube, or snuffed up by the patient. As a final resource the nostrils must be plugged with strips of lint, absorbent wick, or a piece of sponge. Cases occasionally occur in which it is necessary also to plug the posterior orifices of the nostrils by an operation, into the details of which it is not necessary to enter.

Post-nasal Catarrh is a chronic and very troublesome disease, most common in America, especially the United States; so much so that it is there usually called simply catarrh, and elsewhere is sometimes spoken of as American catarrh. The symptoms are discomfort at the back of the nose, leading to frequent 'hawking' to clear away the tenacious mucus which is formed there, and sometimes indistinctness in articulation. The causes are not well understood: Sir Morell Mackenzie believes that the chief is the inhalation of irritating dust. Treatment must be chiefly directed to the local condition; alkaline sprays or washes should be used to remove the adherent secretion, and then an astringent powder or a thin ointment snuffed up the nostrils: catechu, red (Eucalyptus) gum, or sulphate of iron, diluted with starch, and soft vaseline, either alone or with one-eighth of finely-powdered boracic acid, are among the most useful applications. Health otherwise defective may indicate the importance of constitutional treatment; and change of climate is sometimes useful.

When the nose or a portion of it has been destroyed by disease or accident, the defect may be partly made good by the Rhinoplastic (q.v.) operation.

See Sir Morell Mackenzie, *Diseases of Throat and Nose* (1884); Crosswell Baber, *Guide to Examination of Nose* (1886); Greville Macdonald, *Diseases of the Nose* (1890).

Nosology (Gr. *nosos*, 'disease') is that branch of medicine which treats of the distribution and arrangement of diseases into classes. See DISEASE.

Nossi-Bé, or NÔSIBÉ, a volcanic mountainous island on the north-west coast of Madagascar (q.v.), belonging to the French. It has an area of 115 sq. m. and a pop. of 11,299.

Nostalgia (Gr. *nostos*, 'the return home'; *algos*, 'pain'), a technical term for home-sickness which, when as sometimes it takes the form of acute melancholia, becomes ruinous to health, and even fatal. It is said that inhabitants of mountainous countries suffer more keenly than others; but it seems to have less to do with affection for the physical features of home than with inability to break with old habits and modes of life. In armies it has been found necessary to adopt measures to prevent desertion on this ground. In Canada the playing of *Lochaber no More* by the pipers of Highland regiments had to be interdicted; and so in France it was forbidden under pain of death to sing or play the *Ranz des Vaches* in the hearing of Swiss mercenaries.

Nostoc, a genus of plants of the natural order Algae, sub-order Confervaceae, found upon moist ground, rocks near streams, &c., and consisting of a somewhat gelatinous hollow tumid frond, filled with simple filaments resembling strings of beads. *N. commune* is frequent in Britain, springing up suddenly on gravel-walks and pasture-grounds after rain. It is a trembling, gelatinous mass, often called Star Jelly, and vulgarly regarded, owing to the suddenness with which it makes its appearance, as having fallen from the skies, and as possessed of important medicinal virtues. *N. edule* is employed in China as an article of food.

Nostradamus, the assumed name of Michel de Notredame, an astrologer of Jewish descent, who was born at St Remi in Provence, 14th December 1503. He studied at Avignon, and next medicine at Montpellier, took the degree of doctor of medicine in 1529, and practised the profession at Agen, afterwards at Salon near Aix. Next year when the plague was raging at Lyons he was conspicuous for his skill and devotion. He first fell upon his prophetic vein about the year 1547, but in what light he himself regarded his pretensions it is now impossible to say. The first collection of famous *Centuries* appeared at Lyons in 1555. These were predictions in rhymed quatrains, divided into centuries, of which there were seven; the second edition, published in 1558, contained ten. Astrology was then the fashion, and these quatrains, expressed generally in obscure and enigmatical terms, brought their author a great reputation. Catharine de' Medici invited him to visit her at Blois; the Duke and Duchess of Savoy went to Salon expressly to see him; Charles IX. on his accession appointed him his physician-in-ordinary. Nostradamus died at Salon, 2d July 1566. His predictions have given rise to a vast illustrative or controversial literature. The *Centuries* were formally condemned by the papal court in 1781.

See Jaubert's *Vie de M. Nostradamus, Apologie et Histoire* (Amst. 1656); Haites's *Vie de Michel Nostradamus* (Aix, 1712); Astruc's *Mémoires pour servir à l'Histoire de la Faculté de Montpellier* (Paris, 1767); *Apologie pour les Grands Hommes Soupçonnés de Magie* (Paris, 1825); and E. Barceste's *Nostradamus* (Paris, 1842).

Notables, the name formerly given in France to persons of distinction and political importance. As the States-general were inconvenient to the despotism of the monarchy, the kings of the House of Valois adopted the expedient of calling in their stead *Assemblies of the Notables*, the time of calling them and the composition of them being entirely dependent on the pleasure of the crown. For more than a century and a half even this poor acknowledgment of any other mind or will in the nation

than that of the sovereign ceased to be made; but when the state of the finances brought the monarchy into difficulties and perils Louis XVI., at the instigation of the minister Calonne, had recourse again to an Assembly of Notables, which met 22d February 1787, and was dissolved 25th May. It consisted of 137 members, among whom were seven princes of the blood, nine dukes and peers, eight marshals, eleven archbishops, twenty-two nobles, eight councillors of state, four masters of requests, thirty-seven judges, twelve deputies of the Pays d'Etats, the civil lieutenant, and twenty-five persons belonging to the magistracy of different cities. See LOUIS XVI., NECKER, FRANCE.

Notary-public is an officer of the law or professional person whose chief function is to act as a witness of any solemn or formal act, and to give a certificate of the same; which certificate, if duly authenticated, is accepted as good evidence of the act done in his presence, and attested by him. Solicitors are sometimes notaries-public, but in England there are fewer notaries, comparatively, than in Scotland, where notarial acts and certificates are more largely used. The English courts take notice of the seal of a notary, but his certificate is not generally received as proof of the facts certified. A notary is employed in the noting and protest of foreign bills of exchange in case of non-acceptance or non-payment. In the United States the powers of notaries are defined by the laws of the different states. See Brooke, *On the Office of a Notary* (ed. by Leone Levi, 1876); and Proffatt, *Law of Notaries-public in the United States* (1877).

Notation. For Chemical Notation, see CHEMISTRY; for Musical Notation, MUSIC, SOLFEGGIO; for Mathematical Notation, NUMERALS, ALGEBRA, CALCULUS, GEOMETRY, QUATERNIONS.

Noto, an ancient episcopal town of Sicily, 16 miles SW. of Syracuse by rail. Pop. 15,925.

Notochord. See EMBRYOLOGY, AMPHIOXUS.

Notornis, one among many of the family of Rails, with wings so much reduced as to be incapable of flight, and which have within historical times become partially or completely extinct. Notornis inhabited New Zealand, and within the 19th century three specimens have been taken, one of them in 1881, so that possibly there are still a few survivors in out-of-the-way districts.

Nototherium, a genus of gigantic fossil kangaroo-like marsupials, found in Australia.

Not Proven. See CRIMINAL LAW.

Notre Dame (Old Fr., 'Our Lady'), the name of many churches dedicated to the Virgin Mary in France, particularly the cathedral of Paris.

Nottingham, a town of England, the capital of Nottinghamshire, and a parliamentary, municipal, and county borough (the first returning three members), is seated on the Trent, 126 miles NNW. of London, 15 E. of Derby, and 38 S. by E. of Sheffield. Formerly surrounded by ancient walls (910-1285), of which all traces have now disappeared, the town covers an area of about 16 sq. m., and its appearance of late years has been much improved by the widening of its streets; by the erection of a new town-hall, University College, and other public buildings; by the opening and laying out of an arboretum of 17 acres, of a public park and recreation grounds of over 150 acres, and of a tract of open land, called 'Bulwell Forest' (135 acres); as also the spanning of the Trent—which is here about 200 yards wide—with a broad granite and iron bridge in the place of a former narrow structure of seventeen arches. Crowning a precipitous rock, which rises 133 feet above the river, stands the castle, built (1674-83) on the site of an ancient Norman fortress, dismantled during the Par-

liamentary wars, and itself much damaged by fire during the Reform Bill riots of 1831. It was restored in 1878, and transformed into an art museum. Near to it are the county hall (1770); St Mary's Church (restored 1867-85), a cruciform building in the Perpendicular style, 216 feet in length; and a spacious market-place, 5½ acres in extent, having at its eastern end the exchange, with a richly-decorated façade (rebuilt 1814). In another group not far off are the guildhall and other municipal offices (1888), in the French Renaissance style of architecture; two theatres (1865-84); and University College (1879-81), mainly a science school, but accommodating in its wings a free library and natural history museum. Other edifices worthy of mention comprise a hospital (1781, with additions 1829-79); a Roman Catholic cathedral (1844), cruciform and Early English; and the high school, founded as a grammar or free school in 1513, moved into new buildings in 1867, and since 1882 controlled under a new scheme; it has a large income from endowment, and annually offers for competition eight exhibitions of an aggregate value of £435, besides numerous scholarships. On the outskirts of the town race-meetings were held annually in March and October for a hundred years until 1890; the Trent Bridge cricket-ground is the scene of the county's home matches; whilst mention must not be omitted of the annual goose fair held at Michaelmas. Of the various manufactures carried on in the town the most important are those of lace and hosiery; baskets, bicycles, cigars, and needles are also made, whilst several iron-foundries are in operation, and malting and brewing are extensively carried on. One of the most successful sewage farms in the country has been laid out 5 miles from the town, the whole of whose sewage is here dealt with. Pop. (1801) 28,801; (1831) 50,220; (1881) 186,575; (1891) 211,984. In the history of Nottingham (which was one of the Five Boroughs) the principal incidents have been its occupation by the Danes, and their withdrawal on the conclusion of a treaty for peace (868); its destruction by fire (1140 and 1153); the granting of its first charter (1155); the convening here of three parliaments (1330-37); the appointment of its first suffragan bishop (1534); the raising by Charles I. of his standard at the commencement of the Parliamentary war (1642); and riots (1795-1816), partly on account of a bread famine and partly owing to the Luddites (q.v.). See local works by Dickinson (1816), Wylie (1853-65), Hine (1876), and W. H. Stevenson (4 vols. 1890), besides those cited under the county.

Nottinghamshire, or NOTTS, an inland county of England, bounded on the N. by Yorkshire, E. by Lincolnshire, S. by Leicestershire, and W. by Derbyshire. Its greatest length is 50 miles; average breadth, 20 miles; and area, 824 sq. m., or 527,752 acres. Pop. (1801) 140,350; (1831) 225,400; (1881) 391,815; (1891) 445,599. Apart from the valley of the Trent, which is very flat, the general aspect of the county is undulating and well wooded, the highest ground—600 feet above the sea-level—being in the west, in the vicinity of Sherwood Forest (q.v.). In the south are the Wolds, consisting of upland moors and pasture-lands broken up by many fertile hollows, whilst the northern boundary for upwards of 15 miles is skirted by the Car, a tract of low-lying land, formerly a swampy bog, but since 1796 drained and brought into cultivation. The Trent, with its tributaries, the Erewash, Soar, and Idle, is the principal river; and the Fosse Dyke and Notts and Grantham canals, and Midland, Great Northern, and Manchester, Sheffield and Lincoln railways also traverse the county. The climate, especially in the east, is remarkably dry, and the soil varies, sand and gravel, clay, limestone, and coal-land prevailing

in different districts. As regards productiveness it is not above mediocrity, except in the Vale of Belvoir to the east of Nottingham. Of the total area under cultivation in 1889 corn and green crops covered 175,924 acres, and permanent pasture 202,178, whilst 2780 acres were laid out as orchards and market-gardens. The cultivation of hops has been discontinued. The principal mineral products are coal—of which 6,582,582 tons were raised in 1889—gypsum, iron ore, and limestone. The manufactures are noticed under the chief towns—viz. Nottingham, Newark, Mansfield, Retford, and Worksop, the two former also being the scene of most of the historical events connected with the county. Lying wholly in the diocese of Southwell, Notts is divided into six wapentakes, nine poor-law unions, and 273 parishes, and returns seven members to parliament, one for each of its four divisions (Bassetlaw, Newark, Mansfield, and Rushcliffe), and three for Nottingham (its capital and assize town). The county council consists of sixty-eight members. Of its natives the best known are Archbishops Cranmer, Secker, Sterne, and Manners-Sutton; Garnet (the Jesuit); Denzil Lord Holles; General Ireton, and his contemporary Colonel Hutchinson; Lady Mary Wortley Montagu; Bishop Warburton; Dodsley, Kippis, and Wakefield (the authors); Admiral Earl Howe; Sandby and Bonington (the artists); Dr Erasmus Darwin; Edmund Cartwright; Fynes Clinton (the scholar); Kirke White and Bailey (the poets); Lord Byron; 'Speaker' Denison; and 'General' Booth. See the county histories by Thoroton (3 vols. 1797), Bailey (4 vols. 1852-55), Briscoe (1881), and White (1885).

NOUMEA, capital of the French penal colony of New Caledonia (q.v.). Pop. 5000.

NOVALIS, the pen-name of Friedrich von Hardenberg, German writer, who was born at Wiedersdorf, near Mansfeld, in Prussian Saxony, 2d May 1772. Whilst being educated at Jena, Leipzig, and Wittenberg he came under the influence of Schiller, and became acquainted with Fichte, Fr. Schlegel, and Tieck, studied deeply the works of Boehme, and imbued himself with the spirit of Romanticism to such an extent that he was afterwards designated the 'Prophet of Romanticism.' He made his start in life as a mining official. At Weissenfels (1795) he fell in love with a beautiful young girl, whose early death left a lasting impression upon him. Ere many years were past he himself, delicate from his boyhood up, was seized with consumption, and died 25th March 1801. The principal tenets of his two philosophical romances, both left incomplete, *Heinrich von Ofterdingen* and *Lehrlinge zu Sais*, were that life ought to be poetry realised in practical conduct, and that there are in the universe many verities and realities the truth of which cannot be grasped by the cold, critical intellect; they can only be known by the sympathetic intuition of feeling. His *Hymnen an die Nacht* are a glorification of his sorrow at the loss of his mistress. These, together with his *Poems* and *Sacred Songs*, are the only finished productions he has left. Novalis penned many thoughtful and suggestive sentences, often in very graceful language; but on the whole his writings lack precision of thought and robust common sense; their prevailing atmosphere is a mystic twilight, where is much obscurity, but also much beauty and much deep feeling. His *Sämmtliche Werke* (2 thin vols.) were published by Tieck and Fr. Schlegel in 1802. To these a third volume, containing a supplement to the *Life* printed in vol. i., together with poems and philosophic fragments by Novalis, was added in 1846. See

Carlyle's *Miscellaneous Essays* (vol. ii.), the German *Life of Novalis* published at Gotha (2d ed. 1883), and his correspondence with the Schlegels (Mainz, 1880).

Novara, capital of a North Italian province, 60 miles N. of Turin by rail, with several fine churches, a trade in silk, grain, and wine, and manufactures of silk, cotton, and linen. Here the Sardinians were utterly defeated by the Austrians under Radetzky, on 23d March 1849. Pop. 19,557.

Nova Scotia, a province of the Dominion of Canada, lying between 43° 25' and 47° N. lat. and 59° 40' and 60° 25' W. long., consists of a long, narrow peninsula, and the island of Cape Breton, which is separated from the mainland by the Strait of Canso. It is bounded on the N. by Northumberland Strait (which separates it from Prince Edward Island) and by the Gulf of St Lawrence; NE., S., and SE. by the Atlantic Ocean; W. by the Bay of Fundy; and NW. by New Brunswick, with which it is connected by an isthmus only 11 miles wide, separating the Bay of Fundy from Northumberland Strait. Across this isthmus is the Chignecto Ship-railway (1889-92).

The greatest length of the province is 350 miles, the greatest breadth about 120 miles, and the area 20,907 sq. m. (13,380,480 acres)—one-third less than that of Scotland. It is estimated that about one-fifth part of the area consists of lakes, rivers, and inlets of the sea. About 5,000,000 acres are fit for tillage; about 1,839,020 acres are in crop and pasture, and 21,624 acres are devoted to fruit cultivation. Pop. (1806) 67,515; (1851) 276,117; (1871) 387,800; (1891) 500,000.

The coast-line is about 1000 miles in length, and the shores abound with excellent harbours, of which the chief are Halifax Harbour, Chedabucto, St Margaret's, Mahone, and St Mary's bays, Annapolis, Mines, and Chignecto basins, and Victoria Harbour. There are numerous rivers, but few of them are more than 50 miles long. The most important are the Avon, Annapolis, and Shubenacadie. Of the rivers of Nova Scotia fifteen flow into the Northumberland Strait, four into St George's Bay, seventeen into the Atlantic, and twenty-four into the Bay of Fundy. Among the lakes the chief is Great Bras d'Or Lake (which is really an inland sea), about 50 miles long, and with an area of about 500 sq. m., and a depth of water varying from 12 to 60 fathoms. The next largest lakes are Lake Rossignol, 20 miles in length; Ship Harbour, 15 miles long; Grand Lake, and College Lake. The most remarkable body of water in the province is Mines Basin, the east arm of the Bay of Fundy, penetrating 60 miles inland, and terminating in Cobequid Bay. The tides rise in the basin with great impetuosity, and form what is called a 'bore.' At the equinoxes they have been known to rise from 40 to 50 feet. On an average, however, the rise is about 30 feet, while in Halifax Harbour, on the opposite side of the coast, the spring-tides rise only from 6 to 8 feet. The country is beautifully variegated by ranges of hills and broad valleys, both of which run longitudinally through the province. The Cobequid range of mountains, as they are called, run through the interior of the province. On each side of these mountains are two extensive ranges of rich arable lands. The Annapolis valley is especially favourably situated, and is noted for the magnificent apples grown there. The southern part of Cape Breton is very much the same in appearance as the northern part of the mainland, but the northern part of the island is bold and steep, the land at North Cape being 1800 feet above the sea-level. The distance from North Cape to Cape Ray on the Newfoundland coast is 48 miles.

The principal cities and towns are Halifax (40,000), Dartmouth (4000), Yarmouth (6000), Truro (7000), Pictou (5000), Amherst (4000), Windsor (8600), Kentville (4000), Annapolis (2000), and Digby (1500). The climate of Nova Scotia is remarkably temperate considering its northern latitude. The extreme of cold is 20° below zero, and the extreme of heat 98° in the shade. The western counties average from 6 to 8 degrees warmer than the eastern, and in Annapolis county the mercury rarely falls below zero. Vegetation is very rapid; and the autumn forms a delightful season. Spring is rather tedious, and the winter variable. Fogs are prevalent along the coasts, but do not penetrate inland to any extent.

Agriculture and horticulture are among the principal industries in the province. Rye, oats, and barley, buckwheat, Indian corn, tomatoes, potatoes, turnips, and all root-crops grow in abundance. Wheat is not grown to any great extent, although there is nothing to prevent its cultivation. Apples, pears, plums, cherries, and other garden fruits attain the utmost perfection. The apple-orchards in Annapolis and King's counties are very productive. They extend along the roadside in an unbroken line for 50 miles, and in the autumn form a sight which, once seen, is not soon forgotten. More attention is now being devoted to dairying and to the raising of live-stock than was formerly the case. The manufactures of the province are yet limited, but are being developed. Cottons and woollens are manufactured in various parts of the country. There are ironworks at Londonderry, steel-works at New Glasgow, and stove and hardware works at Amherst; and there are also several sugar-refineries, paper-mills, boot and shoe and other manufactures of leather, manufactories of agricultural and other machinery, furniture and wooden ware, and many sawmills. The shipbuilding industry was formerly a most important one, but has suffered from the substitution of iron for wooden vessels. Endeavours are, however, being made to develop the iron shipbuilding trade. Mining is extensively carried on. The annual production of gold has risen from 16,000 oz. in 1884 to 26,000 oz. in 1889; and the total yield from the time mining was commenced is recorded as 482,316 oz. The average yearly earnings per man are estimated to be £135. Coal and iron are abundantly distributed and extensively worked; and the manufacture of iron and steel is likely to be much increased. Upwards of 1,500,000 tons of coal are raised annually, and are sent to different parts of Canada, the West Indies, and South America. Notwithstanding that the export of coal to the United States fell off considerably when the reciprocity treaty with that country came to an end in 1866, the output of coal has increased year by year, the falling off in the United States trade being more than counterbalanced by the great increase in the consumption in the Dominion. Other minerals are also abundant, including tin, silver, manganese, gypsum, slates, and several varieties of precious stones. The fisheries of Nova Scotia are regarded as among the finest in the world. A large number of men and boats are engaged in the industry, which is valued at from seven to eight million dollars annually. The waters abound with mackerel, cod, herring, shad, salmon, halibut, haddock, lobsters, &c. The value of the imports into Nova Scotia in 1889 was \$9,700,909, of which \$4,022,007 came from Great Britain, and \$2,848,007 from the United States. The exports in the same year were valued at \$8,832,281, of which \$2,011,982 went to Great Britain, \$2,729,547 to the United States. The chief exports are fish-products, minerals, lumber, agricultural products, and general manufactures.

There are 700 miles of railway in the province, and many new lines are projected. The province is connected with both the Canadian and United States railway-systems. There are two canals in the province, one from Halifax to Cobequid (not now in use), and the other connecting St Peter's Bay and Bras d'Or Lake. The Chignecto Ship-railway, already referred to, is meant to carry ships by railway over the isthmus of Chignecto, so as to avoid the long detour necessary to pass from the Gulf of St Lawrence to the Bay of Fundy and the United States by way of the Nova Scotia coast.

The religious denominations according to the census in 1881 were as follows: Roman Catholics, 117,487; Presbyterians, 112,488; Baptist, 83,761; Church of England, 60,255; Methodist, 50,811. Education is free, and there are numerous public schools and academies, besides a normal and middle school, several convents, and the following six colleges: Dalhousie College and University, St Mary's College (Roman Catholic), and the Presbyterian College, Halifax; Acadia College (Baptist), Wolfville; St Francis College (Roman Catholic), Antigonish; and King's College and University, Windsor. The last, belonging to the Church of England, was founded in 1787.

The public affairs of the province are administered by a lieutenant-governor, and executive council of nine members, and a legislative assembly of thirty-eight members elected by the people for four years. The province is represented in the Dominion parliament by ten senators and twenty-one members of the Lower House. The annual revenue of the province in 1888 was \$712,951, of which \$432,867 represented the contributions from the Dominion treasury, under the terms by which Nova Scotia became a member of the Confederation; the rest was made up of mining royalties, receipts from crown-lands, &c. The expenditure in the same year was \$668,400.

The government offer land on reasonable terms—100 acres for \$40. The wild land is, however, covered with bush, and has to be cleared before cultivation is possible. Improved farms can be purchased in different parts of the province at prices ranging from \$4 to \$20 per acre, including buildings, &c. Excellent shooting and fishing are to be found all over the province, especially in the less accessible parts, where big game is still fairly abundant.

History.—Nova Scotia was first visited by Cabot in 1497, and the first colonisation recorded is that in 1604 of the French under De Monts, who attempted for some years to form settlements at Port Royal—now Annapolis—St Croix, &c. The settlers were finally expelled by the colonists of Virginia, who claimed the country by right-of the discovery of Cabot. Other attempts were made at colonisation, but with small success. The country was ceded to France by the treaty of Breda in 1667; its possession, however, remained a source of contention between England and France, until it was finally ceded to England by the treaty of Utrecht in 1713. A memorable event in the history of the province was the expulsion of the Acadians (q.v.) in 1755, some of the events connected with which are the subject of Longfellow's *Evangeline*. Cape Breton was the scene of many struggles between the French and British, especially in the neighbourhood of Louisburg (q.v.). In 1763 it was annexed to Nova Scotia. It was subsequently made a separate province, but again united to Nova Scotia in 1819. Many attempts were made to develop the province, but the foundations of its present position date from the immigration in 1784 of the loyalists who preferred to take up their homes in British territory rather than remain under the dominion of the United States. The province of

New Brunswick was created in 1784 out of Nova Scotian territory.

See Haliburton's *Nova Scotia* (1839), Murdoch's *History of Nova Scotia* (1867), Hannay's *Nova Scotia* (1879), Kingford's *History of Canada* (1889), and the government handbooks.

Novatian, a priest of the Roman Church in the 3d century, and the leader of a sect called after his name. The place and time of his birth are not known with certainty. Novatian is said to have been a stoic philosopher, but after his arrival in Rome was converted to Christianity, and, being seized with sudden illness while still a catechumen, received what was called *clinical baptism*—i.e. baptism administered on a sick-bed and without the solemn ceremonial. Such baptism was in ordinary circumstances an impediment to holy orders. Notwithstanding this irregular baptism, Novatian was promoted to orders by Fabian the Roman bishop, and soon acquired great reputation by his learning and eloquence. Soon after the Decian persecution a great controversy arose about the manner of dealing with the lapsed—i.e. those who fell away during persecution. Novatian at first inclined to the milder side, but on the election of Cornelius to the Roman bishopric (March 251), and on Cornelius taking the indulgent course towards the lapsed, Novatian, together with Novatus and some other discontented priests of Carthage, opposed his authority, and eventually Novatian was chosen by a small party and actually ordained bishop in opposition to Cornelius. The party who espoused his cause was called by his name. They were confined mainly, in the first instance, to Rome and to Carthage, where a similar conflict had arisen. They held that in the grievous sin of idolatry through fear of persecution the church had no power to absolve the penitent; and therefore, although it does not appear that they excluded such sinners from all hope of heaven, yet they denied the lawfulness of readmitting them to the communion of the church. This doctrine they extended at a later period to all grievous sins of whatever character. In this view the church was merely a community of saints whose very existence is endangered by the presence of one sinner. Cyprian (q.v.), at first rigorous against the lapsed, gradually abated his severity.

Novatian may thus be regarded as the first anti-pope. The churches throughout Italy, Africa, and the East adhered to Cornelius; but the Novatian party set up bishops and established churches not only at Carthage, but at Constantinople, Alexandria, Nicomedia, in Phrygia, Gaul, Spain, and elsewhere. They claimed for themselves a character of especial purity, and assumed the appellation of Cathari (Puritans). The time and manner of the death of Novatian is uncertain. According to Socrates he died a martyr in the persecution of Valerian, but this is improbable. His sect survived long after his death. An unsuccessful effort was made in the Council of Nice to reunite them to the church; and traces of them are still discoverable in the East down to the end of the 6th century. See the *Letters of Cyprian*, Eusebius; also Walch's *Ketzerhistorie* (vol. ii.).

Nova Zembla (Russ. *Novaja Zemlja*, 'New Land'), an Arctic island lying between the Kara Sea and Barents Sea, and separated at its southern extremity from the island of Vaigatch by Kara Strait, 30 miles wide. Long and narrow, it measures 600 miles from north to south and 60 in average width, and is cut in two nearly midway up by a narrow winding sea-passage, the Matochkin Shar. The western side is broken by several bays, often studded with islands. The southern portion is apparently—little authentic is known about the interior—a plateau of moderate height; the centre

and north are mountainous, rising to 4000 feet and perhaps higher, and are covered with snow and ice. The continuation of the Gulf Stream reaches the western shores and prevents them from being always icebound. Although not permanently inhabited, it is visited by Russian and Norwegian seamen and hunters for the capture of the numerous sea-fowl, whales, walrus, seals, and dolphins which frequent its coasts. It was known to the hunters of Novgorod in the 11th century, but was rediscovered by Sir Hugh Willoughby in 1553, and has been frequently visited since then, much scientific information about its animal and plant life having been collected since 1868. See Markham, *Polar Reconnaissance* (1881).

Novellæ. See JUSTINIAN.

Novello, VINCENT, musical composer and publisher, was born in London, of an Italian father and English mother, on 6th September 1781. He officiated as organist in various chapels in London, and was one of the founders of the Philharmonic and similar musical societies. His musical compositions, chiefly sacred, are considered to have contributed much to the improvement of cathedral music. But it is as a painstaking editor of unpublished works of eminent musicians that he deserves chiefly to be remembered. He died at Nice, 9th August 1861.—His daughter, CLARA ANASTASIA, a distinguished vocalist, was born in London in 1818; won great triumphs in the chief cities of Europe; but having in 1843 married Count Gigliucci, she quitted the stage in 1860.

Novels. 'Novel,' as the name of a thing, came to us with the thing itself from Italy early in the reign of Elizabeth. Boccaccio, from whom Painter took the 'excellent nouelles' in his *Palace of Pleasure*, applies 'novella' somewhat indiscriminately, and in his preface speaks of 'novels or fables or parables or stories' as if they meant pretty much the same thing; but in Provençal, and according to the *Cento Novelle Antiche*, 'noella' or 'novella' seems to have meant originally some new drollery, jest, or bon-mot—something, as Borghini explains, that pleased by its freshness, and the 'noellaire' or 'novellatore' to have been a kind of jester who collected and retailed such things. Most of the *Cento Novelle* and a large number of Boccaccio's, notably those of the sixth, seventh, and eighth days, are of this sort, and in the collections of Sacchetti and Ser Giovanni the proportion is still greater. In fact the primitive novella was something much more akin to the *facetie* of Poggio, the *Cent Nouvelles nouvelles*, the stories of the *Heptameron*, the *Hundred Merry Tales*, and even their humble relatives, the jests attributed to Joe Miller, than to the long, grave, and often tragic narratives that appeared under the title when it had grown elastic in the 16th century. But if 'novel' has departed from its original signification, 'romance' has wandered still farther. The word originally had nothing whatever to do with any form or species of composition. It was simply the name given in the middle ages to the spoken language of the commonalty, particularly in France and Spain, in contradistinction to the Latin or Letra, the language of the learned classes and the language used in documents and writings of all kinds. In time, however, it came to mean not only the vehicle but also the thing conveyed; anything in Romance was called romance, and naturally the term was extensively applied to the great source of popular recreation, the songs of the minstrels and *trouvères*, by which it was in the end almost monopolised. Hence the two meanings of 'romance' in Spanish—(1) the vernacular ('en buen Romance' is the precise equivalent of our phrase 'in plain English'); (2) a piece of popular

narrative poetry such as we mean by the word 'ballad.' In France the place of the ballad was supplied by much longer and more elaborate compositions, like the *chansons de geste*, and to these the title of 'romans' was very generally given. But it is noteworthy that, 'romance' or 'romans,' it was applied, in Spain exclusively and in France all but exclusively, to compositions in verse, and that the prose-works which we now call the romances *par excellence* were not so styled in their own time. The romances of chivalry were called by their authors or editors chronicles, histories, or books; but, except in one edition of *Lancelot*, never romances; and the still more typical romances, the heroic romances of the 17th century, *Polexandre*, *Cassandre*, *Pharamond*, *Ibrahim*, and the like, seem to have been indebted to Scarron, but certainly not to their authors, for the name. Neither 'novel' nor 'romance,' in short, has any historical or etymological claim to stand for the latest development of prose fiction; nor is there any warrant for a distinction between the novel and the romance founded on a predominance of the real or the ideal, the ordinary or the extraordinary, the comic or the tragic, a distinction which, in practice, it would be impossible to draw. The names are purely conventional. What we call a novel the French call a *roman*; if they shared our somewhat contemptuous feeling for the romantic perhaps they would have followed our example, as we perhaps might have followed theirs if, instead of bad news, we talked of hearing bad novels.

For the origin of the thing so called there is no need to search very far. To ask where fiction came from, or what particular race or people were the inventors of it, is very much like asking who invented singing. If we must find a source for it, or fix it upon someone, a child in a corner telling a story to itself, with its playthings for *dramatis personæ*, or Maggie Tulliver unfolding the tale of the earwig's domestic troubles to her cousin Lucy, will be as near the fountain-head of fiction as we need go. The demand for fiction seems to follow very closely upon the demand for food. 'Tell me a story' is among the earliest expressions of our wants in life, and so far as we can see it has been one from time immemorial, and everywhere and always story-tellers of one sort or another are to be found striving as best they can to comply with the call. It is true that we cannot see very far back, and that our only available sources of information convey a very imperfect idea of story-tellers and story-telling in the remote past. The fragments and specimens that have come to us through tradition and literature can no more give a complete view of the fiction of the age they belong to than the fossils in a cabinet of the fauna and flora of the globe when they were living things. They have been preserved by accident, or by the possession of some property or feature conducing to preservation, while types and species less favoured have left no trace behind them of their existence. To take an example, every one at all acquainted with it must have noticed how strongly the didactic element asserts itself in early eastern fiction. By far the greater number of the specimens that have come down to us through the *Panchatantra*, *Hitopadesa*, Bidpai, Lokman, *Æsop*—for in strictness he must be counted among the Orientals—and other channels are fables with a moral attached. Now it is obvious that these cannot be the earliest type of fiction. Children call for stories, but not (in real life at least) for instruction or improvement until some years have passed over their heads; and what is true of children is true of humanity. But the very earliest productions of the fable family are entirely destitute of this

appendage, and are mere stories told for their own sake. Properly they belong to a still earlier type than the fable, the story where animals and inanimate things speak and act like human beings, the immediate descendant, no doubt, of the story the child tells to itself about such objects as take its fancy (see *BEAST-FABLES*). It is easy to see how the moral came to be added, and how, once added, it became protective. The story furnished with a moral was preserved by and for the sake of its moral when those told for the story's sake alone dropped out of circulation; and in virtue of its moral it found its way into literature as soon as there was a literature to receive it. It is simply an instance of survival of the fittest; not necessarily of the best, but of the best fitted to survive in the struggle for existence.

The case of *Æsop* above referred to is an illustration of the connection between oriental and European fiction. Some critics maintain that he was an Oriental himself, and identify him with Lokman; but without going so far it may be safely said that the fables bearing his name are mainly of oriental origin, and from some source in common with the *Panchatantra*. But this is not the only instance. It is significant that, with scarcely an exception, Greek prose fiction came from Asia Minor, or from islands off the coast, and in most instances the Asiatic influence is distinctly perceptible. Of the Milesian tales we know little, but from that little it seems likely that they were compositions somewhat in the nature of the French *fabliaux*, and like them largely indebted to the eastern story-tellers. Iamblichus, the author of the more famous *Theagenes and Chariclea*, were both Syrians, and clearly drew their inspiration from the same quarter. Achilles Tatius, the follower of Heliodorus, was of Alexandria. Xenophon, who wrote the tale of *Abrocomas and Anthia*, was of Ephesus. *Josephat and Barlaam* was by John of Damascus. Lucian was another Syrian, but he cannot be properly included among those who wrote stories for the story's sake, nor indeed among those distinctly influenced by eastern fiction, any more than the author of the graceful pastoral of *Daphnis and Chloe*, whoever he may have been, for 'Longus' is probably a mere clerical error. As M. Chassang says, in his *Histoire du Roman*: 'The taste for the romance passed from the East to Greece;' but it was to the artistic instinct of the Greeks that the novel or romance owed the remarkable development we see in *Daphnis and Chloe* and *Theagenes and Chariclea*. The taste passed into Italy also about the same time, but more probably through the medium of the Milesian and Sybarite tales than directly from the East; and it bore fruit in the *Satyricon* of Petronius Arbiter and the *Metamorphosis*, or *Golden Ass*, of Apuleius, in each of which the best-known episode is derived from an eastern story. The *Cupid and Psyche* of Apuleius and Petronius' *Widow of Ephesus* are found in divers forms, and of the latter there is even a Chinese variant.

The collection of fables, partly from the *Panchatantra* and *Hitopadesa*, called *Kalila wa Dimna* had a great share in the spread of oriental stories in the middle ages throughout western Europe, but chiefly in Spain, where, introduced probably by the Arabs, it helped to furnish material for the *Disciplina Clericalis* of Pedro Alfonso and the *Conde Lucanor* of Don Juan Manuel. But even more influential was a work that still circulates as a chap-book in most European countries, *The Seven Wise Masters of Rome*, which, under a variety of titles, *Erastus*, *Dolopathos*, *Syntipas*, *Sindebad Nameh*, *Sandabar*, *The Seven Vizirs*, and through Latin, Greek, Hebrew, Arabic, and Persian, may be traced back

to Sanskrit. Such collections of fables, apologues, and tales, each in a setting more or less ingenious of its own, and borrowing freely from its predecessors—story-books of a class that has been made familiar by *The Thousand and One Nights*—were very numerous at the time, and served as a mine of oriental fiction to mediæval Europe. The *Gesta Romanorum*, which is in fact a European story-book on the oriental model, was largely indebted to this source, but not nearly so much as the fabliaux (properly 'fableaux,' diminutive of 'fables') of the trouvères, who found in the inventions of the eastern story-tellers precisely the sort of tale which their easy verse and *esprit gaulois* could readily adapt to the taste of their audiences. It was from the fabliaux that the Italian *novellieri*, from Boccaccio to Bandello, and not only they, but also the compilers of the *Cent Nouvelles nouvelles* and of the *Heptameron*, and the gay novel-writers of the 16th century in general, chiefly took their lightest, liveliest, most satirical, and sometimes most licentious tales; and in this way the fiction of the East came in numberless instances to be incorporated in the literature of Europe.

But the trouvères were at the same time laying the foundations of another very different species of novel. There were audiences for whom the fabliaux were too light and trivial, and who demanded a lay of a more serious and earnest character and of deeper interest, and for these they had the *chanson de geste*, a sort of minor epic, dealing for the most part with the deeds or adventures of some real or legendary hero, and standing in much the same relation to the fabliaux as tragedy, or at least serious drama, to light comedy and farce; and from these *chansons de geste* in process of time, as reading became a more common accomplishment, and books began to take the place of the lays of the minstrels, came the prose romance of chivalry. Not, of course, that every romance of chivalry had its origin in the verse of a trouvère; there is no evidence, for instance, that the story of Lancelot was ever the subject of a *chanson de geste*, though there can be little doubt that it furnished a theme for Welsh and Armorican ballads long before Walter Map took it in hand. But unquestionably the early romances of chivalry were as a rule made from earlier metrical romances, as these again, no doubt, from shorter and ruder pieces of verse; the process being, presumably, first legend or tradition, then ballads of some sort embodying incidents of the legend, then the isolated ballads connected, unified, and polished into a *chanson de geste* by a bard of a higher order, and finally the prose romance, sometimes curtailing, but oftener expanding the *chanson*. The process is well seen in the romances of the Charlemagne cycle: the connecting-link between the legend and the *chanson* has, of course, disappeared, but it has left its traces plainly visible in the *Chanson de Roland*, the germ of the whole; and we find the legends of Gascony and the Ardennes and of Charlemagne's troubles with his foes and vassals first furnishing a subject for the trouvère, and then passing into prose romances like *Huon de Bordeaux*, *Les Quatre fils Aymon*, *Fierabras*, and *Ogier le Danois*. Nor is it confined to the romances of chivalry proper, of Arthur and the Round Table and Charlemagne and the Peers; for the romances of the borderland between chivalry and faerie, *Parthenopex of Blois*, *The Knight of the Swan*, *Melusina* (q.v.), and the like, were all apparently sung by the trouvères before they sought readers in prose. See ROMANCES.

The Spanish family of romances of chivalry came into the world long after the age of the trouvères, though it is very likely that Amadis of Gaul, the founder of it, may have made his first appearance

in verse. He is mediæval, but all his progeny, which includes not merely the Amadis series, but also the Palmerins and isolated romances, are of modern birth, and a connecting-link between the novel of the middle ages and the novel of our own day. They were the products of a variety of causes—the taste created by the Amadis, the recent invention of printing, which made such reading a comparatively cheap luxury, and, above all, the condition of Spain at the time. M. Chassang, in the book already quoted, has a remark not wholly complimentary to novelists and novel-readers, to the effect that story-telling flourishes most where the people are most idle. The peoples of the East were, and still are, the most prolific of story-tellers, because, living under paternal governments, they have always had a surplus of time upon their hands. The Greeks and Romans did without stories so long as their republics lasted, for his share in the affairs of the state gave each man employment enough for his spare time and thought, and it was not till Greece became subject to Rome and Rome to the emperors that the Greek and Latin romances came into existence. This theory, if we accept it, will account for the passion for romances that raged in Spain in the 16th century, until cured by the drastic remedy of Cervantes. The end of the great national struggle with the Moors, the establishment of the Inquisition, the absorption of all political power and authority by the sovereign, and the general stagnation in public life left the upper and middle classes to a great extent without occupation. Only a few could follow Cortes and Pizarro, and the majority had to resign themselves to inaction, made all the more irksome by the memories of a stirring past, and warm their blood as best they could with the imaginary adventures and sound and fury of the chivalry romances. The chief charge brought by every assailant of these productions, from Pedro Mexia to Cervantes, is that they infected their readers with their own extravagance, and made them think in their style and fancy themselves acting the scenes they read of. But this was the great attraction; they were indulged in, like bang or opium, for the sake of the pleasant insanity that attended indulgence. Don Quixote's madness, if an extreme, was not a solitary case; and astute romancers, like Feliciano de Silva and Marcos Martinez, knew well that the stronger they made the dose the better they pleased their readers, and on principle kept them well plied with rant, bombast, and absurdity, and fooled them to the top of their bent.

But if Cervantes purged his country of sham chivalry, from the bonfire of Don Quixote's books—to borrow the witty image of M. Demogeot—'an unlucky phoenix rose up for the ennui of the 17th century,' the heroic romance, *Polexandre*, *Cléopâtre*, *Cassandre*, *Ibrahim*, *Clélie*, and the rest. Another variety of romance, however, the pastoral, had some share in the genesis of the heroic romance. The Spanish pastorals, supposed by some to have been the descendants of *Daphnis and Chloe*, were in reality, through the *Arcadia* of Sannazaro, the offspring of the Renaissance worship of Virgil, of which were born all the pining shepherds and obdurate shepherdesses that haunt the poetry of the 16th century. For a time they disputed in a feeble way the ascendancy of the chivalry romances, and were threatened with the same fate by Cervantes; but they were left to live out their innocent lives in peace and die at last of their own insipidity. To them, or rather to Montemayor's *Diana*, the first and best of them, we owe one of the patriarchs of the English novel, Sidney's *Arcadia*, and the French owe Honoré d'Urfé's *Astrée*, the precursor of the heroic romances. These were based partly

on chivalry, partly on pastoral romance; their strength lay in their combination of sentiment and swagger, the latter borrowed from the chivalry romances, the former from the pastorals; and their one merit, perhaps, was that they provoked some excellent satires, such as Boileau's 'Héros de Roman,' Furetière's *Roman Bourgeois*, Sorel's *Berger Extravagant*, Scarron's *Roman Comique*, and Mrs Lennox's *Female Quixote*.

But a far more important variety of fiction came into existence in Spain in the time, and partly through the influence, of the chivalry romances. These were every day growing wilder and wilder and more and more regardless of all common sense and observance of decent probability, when a little book, called *The Life of Lazarillo de Tormes*, made its appearance. It did not pretend to be a satire or even a protest against the romances in fashion; it merely suggested that a story just as interesting and amusing might be got out of real, everyday life, without magicians, giants, flying dragons, or enchanted palaces, seeing that tastes varied, and that, as Jean Saugrain of Lyons put it in the French translation of 1560, it was not everybody that took delight in reading of heroic deeds. And in fact the *Lazarillo* is studiously unheroic, and the exact opposite of a romance of chivalry. The hero is a beggar boy, or rather a beggar-man's boy; hunger and thrashings are the dragons and giants he has to encounter; his adventures and achievements are cheating and outwitting his masters; the empire of Trebizond that crowns his career is the office of town-crier of Toledo, and the princess that bestows her hand upon him, the doubtful house-keeper of a sly old priest. It was the first genuine attempt at realism in literature, and for the first time in the history of fiction readers found themselves taking pleasure in the creations of the storyteller, not because they were remote from ordinary experience, but because they were familiar. Finding favour, as a matter of course it had successors. It was followed by the *gusto picaresco* novels, the tales of Spanish rogue and vagabond life, of which *Guzman de Alfarache*, *Marcos de Obregon*, and Quevedo's *Vida del Buscon* are the best-known examples. They took up with this phase of life partly in deference to the precedent of *Lazarillo*, partly because it was a life rich in adventures and incidents, but chiefly because it was a phase of life familiar and real to all readers in Spain in the 17th century. And not in Spain alone, apparently, for the truth of the picaresque novels seems to have been recognised wherever there were readers in Europe; the best of them were translated almost immediately into French, and very soon into English, Italian, German, and Dutch, and, as repeated editions show, took their place everywhere among the acknowledged purveyors of amusement. In Germany, indeed, they may be said to have laid the foundation of the novel in Grimmshausen's *Simplicissimus*, and in England we need only turn to Defoe for proof of their influence. *Colonel Jack* and *Moll Flanders* are picaresque novels pure and simple, with their parentage stamped upon their features, and there are marks about *Captain Singleton* and *Roxana* that show them to be of the family.

But it was through Le Sage that the picaresque novel came to be influential in shaping modern fiction. Like a keen-eyed horticulturist who detects in some wild plant useful properties that may be indefinitely developed by cultivation, or germs that only need the gardener's skill to expand into endless varieties of form and colour, Le Sage saw the capabilities of this rough growth of Spanish humour, and how its asperities might be removed without impairing its virtues. It may be said it was no great discovery to perceive that disreput-

able life is not the only one that affords material available for a story of real life, that rascality and roguery are not the only qualities from which amusement may be extracted, and that whatever may be the artistic advantages of a scoundrel, there is on the whole more to be made of a hero who will be accepted by the reader as a man and a brother. But this is only what is said of every discovery as soon as men have come to look upon its consequences as matters of course. Great or small, however, this was Le Sage's discovery, and whether it was of importance or not the modern novel of real life and character will show. It would be difficult, perhaps, to define with precision the extent of Le Sage's share in the formation of this great necessary of 19th-century existence, but of its reality there can be no question. To take only one illustration out of many—in *David Copperfield* and elsewhere Dickens has left it on record that the favourite stories of his boyhood were *Roderick Random* and *Peregrine Pickle*, a training which shows its fruits in *Pickwick* and all his early works; but if *Gil Blas* was not in the same way Smollett's primer in fiction we have his own word for it that it was the model he set before him when he undertook to 'point out the follies of ordinary life.' This much, at least, cannot be disputed, that he was one of the great masters of the art of story-telling, the first to show an artist's knowledge of the value of details and the right use of realism, and the first to make clear the distinction between the novel and prose fiction in general. *Pantagruel* and *Gulliver's Travels* are not novels, not because the ordinary characteristics of the novel are wanting, but because Rabelais and Swift have merely assumed the disguise of a storyteller for the sake of gaining access to quarters otherwise inaccessible, precisely as Burton put on a pilgrim's dress in order to get into Mecca. In *Don Quixote* and *Robinson Crusoe* there may be just as little of the conventional features of the novel, but there is no disguise; they take their places among the novels unchallenged, while the title of *Tristram Shandy* must remain at least questionable, for though it may be called 'The Life and Opinions of Tristram Shandy,' it is in reality 'the freaks and grimaces of the Rev. Laurence Sterne.' Le Sage's theory, so far as we may infer one from his practice, seems to have been that to tell a story is the novelist's business, and to keep to it with singleness of purpose his duty as an artist.

In the foregoing necessarily brief outline of the history of the novel it will be seen that in its growth there has been at work a process very much like that which regulates other growths. One form springs from another, supplants it through being better adapted to surrounding circumstances, and lasts just so long as the adaptation lasts. In the novel, too, as in other cases, forms that have been in this way pushed aside have a tendency to reappear if circumstances favour them. The long-winded sentimental novels of the 18th century were only a reversion of the *romances de longue haleine* of the 17th in a soil that happened to suit them; and in the novels of Horace Walpole, Clara Reeve, and Mrs Radcliffe the spirit of the later romances of chivalry asserted itself, just as the spirit of the older and truer chivalry romance found expression in Scott. *Quentin Durward* is a genuine romance of chivalry, modified only by genius and modern influences. In its extraordinary powers of multiplication and variation also the latter-day novel seems to be subject to natural law. The varieties of wild animals and plants are few, and seldom strongly marked; but no sooner does man for his pleasure or comfort appropriate any living thing, dog or pig, rose or cabbage, than it acquires a

variability and fertility apparently limitless. Thus it has fared with the novel ever since Le Sage undertook the domestication of an adaptable species. Having become not merely a source of amusement, but a necessary adjunct of modern life, it now rivals the rabbit in fecundity, and runs into varieties more widely different than greyhound, bulldog, and toy-terrier. This luxuriance of growth, however, cannot be regarded with unmixed satisfaction. It would be no small evil if the novel from an honoured branch of literature were to degenerate into a manufacture, and yet a certain tendency that way cannot be denied. Another, due to the same cause, is the tendency of the modern novel to usurp functions that do not properly belong to it. In some cases, to be sure, the pretence of lofty motives is sufficiently transparent. It is no more true that excursions into the slums of realism and naturalism have for their object the scientific study of social evils than that exhibitions of fasting men are got up in the interests of science. But the novel that is a preachment, a treatise, a dissertation in disguise, though less disingenuous and disagreeable, is no less an abuse. The prodigious development of novel literature in recent times seems to have led to overweening pretensions. We are sometimes told that the novelist has become the hierophant of the age, the teacher who holds the keys of philosophy, science, all human knowledge. But fine words will not alter facts. The *raison d'être* of the novelist is the old craving for a story, and those of the craft who have most frankly recognised this have always been those most beloved in their own generation and most honoured by posterity. Scott, the master of them all, claimed to be no more than a story-teller, and was proud of the title.

The best histories of the novel are Dunlop's *History of Prose Fiction* (1814; 3d ed. 1845; German trans., with large additions, by F. Liebrecht, 1851; a completely new edition by H. Wilson, 1888); O. L. B. Wolff's *Allgemeine Geschichte des Romans* (Jena, 1850); and Alexis Chassang's *Histoire du Roman, et de ses Rapports avec l'Histoire* (Paris, 1862). To these may be added D. Masson's *British Novelists and their Styles* (Camb. 1859); W. N. Senior, *Essays on Fiction* (1864); Landau's *Beiträge zur Geschichte der Italienischen Novelle* (Wien, 1875), and *Quellen des Dekameron* (2d ed. Stuttgart, 1884); Professor Erwin Rohde, *Der Griechische Roman und seine Vorläufer* (Leip. 1876); F. Robertag's *Geschichte des Romans in Deutschland* (Breslau, 1876-79); B. Tuckerman, *History of Prose Fiction* (1882); H. Courthope Bowen's *Descriptive Catalogue of Historical Novels and Tales* (1882); S. Lanier, *The English Novel and Principles of its Development* (New York, 1883); Ten Brink, *Causarien oder moderne Romans* (1885); Vta. E. M. De Vogüé, *Le Roman Russe* (2d ed. 1886); André Le Breton, *Le Roman au Dix-septième Siècle* (Paris, 1890); Huet's *Traité de l'Origine des Romans*; Lenglet du Fresnoy's *De l'Usage des Romans, and Bibliothèque des Romans*; and Bougeant's amusing satire on them, the *Voyage du Prince Fan-Féredin dans la Romancie*; M. Jusserand's *The English Novel in the Time of Elizabeth*; Quaritch's *Catalogue of Romances of Chivalry, &c.*; and for examples of fiction in its primitive form, Miss Frere's *Old Deccan Days* and Miss Stokes's *Indian Fairy Tales*.

The more important novelists of foreign lands are discussed in connection with the literature to which they belong in the sections on literature under the several heads, FRANCE, GERMANY, ITALY, SPAIN, NORWAY, RUSSIA, &c., and are also dealt with in separate articles in this work. It may, however, be convenient to append here a list of the more eminent British and American novelists, referring for details and criticisms to the articles on each of them.

BRITISH.

John Lyly (1553-1606).
Sir P. Sidney (1554-96).
Thomas Lodge (1556-1625).
Robert Greene (c. 1560-92).
Thomas Nash (1567-1601).
Aphra Behn (1640-89).

BRITISH.

Daniel Defoe (1660-1731).
Samuel Richardson (1689-1761).
Henry Brooke (1703-83).
Henry Fielding (1707-54).
Laurence Sterne (1713-68).
Sarah Fielding (1714-68).

BRITISH.

Horace Walpole (1717-97).
Tobias Smollett (1721-71).
Clara Reeve (1725-1808).
Oliver Goldsmith (1728-74).
Henry Mackenzie (1745-1831).
Madame D'Arblay (1752-1840).
Elizabeth Inchbald (1753-1821).
W. Godwin (1756-1836).
W. Beckford (1759-1844).
Mrs Radcliffe (1764-1823).
Maria Edgeworth (1767-1849).
Walter Scott (1771-1832).
Jane Austen (1775-1817).
M. G. Lewis (1775-1818).
Jane Porter (1776-1850).
John Galt (1779-1839).
James Morier (1780-1849).
Miss Ferrier (1782-1854).
T. L. Peacock (1785-1866).
T. Hook (1788-1841).
Captain Marryat (1792-1848).
J. G. Lockhart (1794-1854).
Mary W. Shelley (1797-1851).
G. P. R. James (1801-60).
Miss Martineau (1802-76).
Douglas Jerrold (1803-57).
Lord Lytton (1803-73).
Beaconsfield (1804-81).
W. H. Ainsworth (1805-82).
Charles Lever (1806-72).
Samuel Warren (1807-77).
Mrs Gaskell (1810-65).
Thackeray (1811-68).
Dickens (1812-70).
Charles Reade (1814-84).
Anthony Trollope (1815-82).
Charlotte Brontë (1816-55).
Emily Brontë (1818-48).
Charles Kingsley (1819-76).
'George Eliot' (1819-90).
Anne Brontë (1820-49).
Mrs Henry Wood (1820-87).
Whyte Melville (1821-73).
Mrs Lynn Linton (b. 1822).
Miss Yonge (b. 1823).
Julia Kavanagh (1824-77).
Wilkie Collins (1824-89).
George MacDonald (b. 1824).
Annie Keary (1825-79).
R. D. Blackmore (b. 1825).
Mrs Craik (1826-87).
George Meredith (b. 1828).

BRITISH.

Mrs Oliphant (b. 1828).
G. A. Sala (b. 1828).
Laurence Oliphant (1829-90).
Henry Kingsley (1830-76).
Justin M'Carthy (b. 1830).
James Payn (b. 1830).
Miss A. B. Edwards (b. 1831).
Edmund Yates (b. 1831).
J. H. Shorthouse (b. 1834).
Miss Betham-Edwards (b. 1836).
Miss Braddon (b. 1837).
Rhoda Broughton (b. 1837).
Miss Thackeray (b. 1837).
Walter Besant (b. 1838).
Thomas Hardy (b. 1840).
'Ouida' (b. 1840).
William Black (b. 1841).
W. Clark Russell (b. 1844).
H. Rider Haggard (b. 1856).
R. L. Stevenson.
'Edna Lyall'.
'Lucas Malet'.
'Sarah Tytler'.
Mrs Ward.

AMERICAN.

C. Brockden Brown (1771-1810).
Washington Irving (1783-1859).
Fenimore Cooper (1789-1851).
N. Hawthorne (1804-64).
N. P. Willis (1806-67).
W. G. Simms (1806-70).
E. A. Poe (1809-49).
O. W. Holmes (b. 1809).
Mrs Beecher Stowe (b. 1811).
J. G. Holland (1819-81).
Susan Warner (1819-85).
Herman Melville (b. 1819).
Bayard Taylor (1825-78).
Theodore Winthrop (1828-61).
F. R. Stockton (b. 1834).
T. B. Aldrich (b. 1836).
W. D. Howells (b. 1837).
E. P. Roe (1838-88).
Bret Harte (b. 1839).
Henry James (b. 1843).
G. W. Cable (b. 1844).
Eliz. S. Phelps (b. 1844).
Julian Hawthorne (b. 1846).
Frances H. Burnett (b. 1849).
F. Marion Crawford (b. 1854).

November (Lat. *novem*, 'nine') was among the Romans the ninth month of the year (the Ger. *Wind* month) at the time when the year consisted of ten months, and then contained 30 days. It subsequently was made to contain only 29, but Julius Caesar gave it 31; and in the reign of Augustus the number was restored to 30, which number it has since retained. Its festivals are All Saints (1), St Hubert (3), St Martin (11), St Catharine (25), and St Andrew (30).

Novgorod ('new-town'), a famous city of Russia, capital of a government, is situated on the Volkhof, near where it issues from Lake Ilmen, 110 miles SSE. of St Petersburg by rail. It is the cradle of Russian history. In 864, according to tradition, Rurik (a Varangian, apparently a Scandinavian) was invited hither by the neighbouring tribes, and from him begins the history of the country and the line of its sovereigns. As early as the 12th century it had important connection with the Hanse cities, and it became the market of north-east Europe. During the time of its prosperity the town was called Novgorod the Great, and had 400,000 inhabitants, and extended its sway to the White Sea and the river Petchora. Its government was a sort of republic. The greatness of Novgorod provoked the jealousy of the princes of Moscow, and in 1471 the czar Ivan III. nearly destroyed the town, bereft it of its liberties, and exiled the most influential citizens; and when Archangel was opened for English trading-vessels, but especially after the foundation of St Petersburg, its trade fell away, and the town rapidly declined, till now it is but the shadow of its former self. Of the existing ancient buildings the most remarkable are the church of St Sophia, founded

in the 11th century, and built on the model of St Sophia at Constantinople, possessing some remarkable paintings and tombs; several others of more than thirty churches; and wall surrounding the Kremlin. There is a little trade, but hardly any manufactures. Pop. (1885) 20,000.—The *government*, which lies immediately east of that of St Petersburg, has an area of 47,236 sq. m. and a pop. (1885) of 1,213,058. It has some 3000 lakes and many marshes. Three-fifths of this area is covered with forest.

Novi, a town of Italy, 30 miles NW. of Genoa by rail. Pop. 9917. Here in 1799 the French were defeated (15th August) and victorious (6th November).

Novibazar (also *Jenipasar*, sometimes *Rascia*), the capital of a sanjak, situated on the river Rashka, an affluent of the Morava, 120 miles SE. of Bosna Seral. Pop. 12,000. The sanjak of Novibazar (3842 sq. m.; pop. 168,000) is mountainous and barren, but as lying between Serbia and Montenegro is of strategic importance. The western part is occupied by Austria; but the civil administration is nominally at least reserved to the Porte.

Novogeorgievsk, a Russian fortress of the first rank, on the Vistula, 20 miles NW. of Warsaw. With Warsaw, Ivangorod, and Brest Litovsk, it constitutes the Polish Quadrilateral.

Novorossisk, a fortified port on the Black Sea, to the SE. of Anapa in Russian Caucasasia; the completion of a projected railway to Tzaritzin on the Volga would make it command the Volga trade. A breakwater and quay were begun in 1890. Pop. 2988.

Novotcherkask, a town of southern Russia, capital of the province of the Cossacks of the Don, on the Aksai, a tributary of the Don, 40 miles from the Sea of Azov, a distance of 12 miles from its right bank, and about 70 miles ENE. of Taganrog. The central administration of the territory was transferred hither from Tcherkask in 1905; but the choice was not a happy one, the distance of the town from the Don, the great commercial artery, being much felt. Drinking-water has since 1867 been brought by an aqueduct 18 miles long. Pop. 37,091, who carry on agriculture, cattle-breeding, fishing, wine-growing, and the making of candles and bricks.

Noyades (Fr., 'drownings'). See CARRIER (JEAN).

Noyau. See LIQUEUR.

Noyes, J. HUMPHREY. See PERFECTIONISTS.

Noyon, a town in the French department of Oise, 67 miles NNE. of Paris by rail. It has a fine cathedral in the Transition style of the 12th century, an hôtel-de-ville (1485–1523), and a former episcopal palace. Pop. 5753. The *Noviodunum* of Caesar, Noyon was a residence of Charlemagne and Hugo Capet, and the birthplace of Calvin. See Lefranc, *Histoire de Noyon* (Paris, 1888).

Nubia is a comparatively modern name for a large region of Africa, formerly a portion of Ethiopia (q.v.), and extending on both sides of the Nile from Egypt to Abyssinia; touching the Red Sea on the east and the desert on the west. *Nubia Proper*, or *Lower Nubia*, extends from Assouan on the Egyptian frontier to Dongola; beyond that is *Upper Nubia*. But of late the name of *Egyptian Soudan*, properly applicable to a section of Upper Nubia, has come to be used for Nubia in its widest sense, together with the once Egyptian territory actually in the Soudan, and the equatorial provinces (see SOUDAN, also NILE). Under the Pharaohs Nubia was called Cush, but under the twentieth dynasty it was recovered by a series of native rulers, who adopted the civilisation of the Egyptians, and

at a later date were Christianised (see ETHIOPIA). At present the country is occupied by races belonging to several different stocks, which have in most places become much mixed in blood. The chief elements are Arab, more or less mixed with Nilotic and Negro blood, mainly in Upper Nubia; Ababdeh and Bisharin between the Nile and the Red Sea; and Nubas and Barabira in Lower Nubia, on and near the Nile between Assouan and Dongola. The Semitic Arabs are comparatively recent intruders to this region. They entered Nubia after occupying Egypt in the 7th century, but were resisted by the Christian Dongolawi kings till the 14th century, when the Arabs, assisted by a large contingent of Bosnians, became masters of the land. Presumably, the aboriginal negro population and tongue have been gradually modified by the admixture of Hamitic and Semitic elements. The various tribes, most of them active and warlike, are Moslems by faith, and till 1820 were ruled by their own chiefs. In that year Ismail Pasha made Nubia an Egyptian territory; and till 1881 it shared the fate of Egypt. For its later history, see EGYPT, SOUDAN. Both in its lower and upper sections Nubia is for the most part an expanse of steppes or rocky desert, with patches where grass sometimes grows, and ravines in which moisture enough is found to keep alive a few mimosas or palms, and to raise pasture for gazelles and camels. There are also wells and small oases here and there, as on the chief caravan routes. The great 'Nubian Desert' lies east of the Nile, opposite the great western bend of the river. Below Khartoum rain is almost unknown; the climate is accordingly excessively hot and dry, and, except in the river-ports after the fall of the Nile, is very healthy. The only exception to the general aridity is the narrow strip of country on both sides of the Nile, which nowhere exceeds four miles in breadth, and in many places is only a quarter of a mile wide. The most fertile part is near Dongola. A mountain barrier bounds the valley on both sides of the Nile, and consists of granite and sandstone.

Nuble, an inland province of Chili. Capital, Chillan (q.v.).

Nucleobranchiata, or HETEROPODS. See GASTEROPODA.

Nucleus. See CELL.

Nudibranchiata. See GASTEROPODA.

Nueva Esparta. See MARGARITA.

Nuevo Leon, a northern state of Mexico, of which Monterey (q.v.) is the capital.

Nuggets. See GOLD, Vol. V. p. 280.

Nuisance, in English legal language, is used to denote whatever causes hurt to one's neighbour, or impedes him in the enjoyment of his property or the exercise of his liberties. A nuisance is either private (e.g. the creation of noxious vapours which make a neighbour's house unhealthy) or public (e.g. the diffusion of noxious vapours in a populous neighbourhood). It is not every slight annoyance that is described in law as a nuisance; there must be some serious interference with the property, health, or comfort of the party who complains. The remedies provided for this form of wrong are various. A court of common law would entertain an action for the recovery of damages; courts of equity went a step further, and granted injunctions forbidding the nuisance to be continued. An injunction may be obtained pending the trial of an action, and it is usual to apply for an injunction in any case where immediate relief is desired. Where the nuisance is injurious to health or life, and where it amounts to obstruction of a right of way, the injured party may abate (remove) the nuisance without resorting to a court of law; but in doing so he must take care not to

cause unnecessary disturbance or destruction of property. Where the nuisance is public an indictment will lie. If a highway, for instance, is in a dangerous state for want of repair, an indictment lies against the parties who are bound to repair it; but if an individual has suffered special damage, over and above what he suffers as one of the public, he may bring an action. These legal remedies are now reinforced by the extensive powers conferred on local authorities. The acts passed for the removal of nuisances are now consolidated in the Public Health Act, 1875. Sanitary authorities (the guardians in rural districts, and the council or local board in towns) are empowered to appoint inspectors and medical officers, and to take measures for the removal of nuisances. The act contains an elaborate code of rules in regard to sewers, privies, ditches, gas-works, cellars, common lodging-houses, offensive trades, sale of unsound meat, infectious and epidemic diseases, &c. Bylaws may be made by the local authority in regard to these matters; such bylaws require to be confirmed by the Local Government Board. Besides the provisions of the Public Health Act, which are too voluminous to be even summarised within our present limits, there are other acts which empower local authorities to deal with alkali-works, chimneys emitting black smoke, and other forms of nuisance. The Rivers Pollution Act, 1876, was intended to prevent the fouling of streams. Special acts have been passed for the metropolitan district and for the river Thames; and the local acts which have been obtained by town-councils and other public bodies make numerous additions to the already complicated rules of the general law. For the enactments in regard to the suppression of brothels, see PROSTITUTION.

In Scotland the remedies provided in cases of nuisance are substantially the same as in England; and the Public Health Act of 1867 consolidates the statutory powers of local authorities. As to Ireland, see the Public Health Act of 1878. The United States law closely follows the English law; in the legislation of some states the term is used in a narrower sense to denote houses of ill-fame, &c. The powers of municipal authorities are defined by the law of the state to which they belong.

Nukha, a town of Russian Transcaucasia, in Elizabethpol; it is on the southern slope of Caucasus, and 120 miles E. of Tiflis. Pop. 24,994.

Nullification, in the history of the United States, refers especially to the action of the legislature of South Carolina in 1832, declaring certain acts of congress unconstitutional and therefore null and void. In 1828 congress passed what became known as the 'tariff of abominations,' which discriminated unfairly against the people of the southern states. There cotton was the staple product, and any step tending to impose restrictions on the commercial intercourse with Europe, where its principal markets lay, was bitterly opposed; whereas in the north, with its manufacturing interests, a protectionist policy had steadily grown in favour. In 1832 congress readjusted the tariff, modifying some of the objectionable features, but still leaving the southerners unjustly treated. In November a state convention in South Carolina passed an ordinance nullifying the tariff of 1828 and 1832, and declaring their right and intention, in the event of any attempt at coercion, to withdraw from the Union and organise a separate government. In December President Jackson (q.v.) issued a vigorous proclamation against the ordinance, and the governor of South Carolina replied with a counter-proclamation, and volunteers, in addition to the state militia, were organised to resist the national government. But in

February 1833 Clay, the 'great pacificator,' introduced a Compromise Bill, providing for the gradual reduction by the year 1842 of all higher duties to 20 per cent.; congress passed this on March 2, and on March 15 the South Carolina convention repealed the ordinance of nullification and secession. See CALHOUN; and for the whole question out of which this movement grew, see STATES' RIGHTS.

Numantia, the chief town of the Celtiberian people called Arevaci, in Hispania Tarraconensis, was situated on a steep hill on the Durus (Douro), in the neighbourhood of the present Soria in Old Castile. The site is probably marked by the present Puente de Guarray. Numantia is celebrated for the heroic resistance which it made to the Romans. After a siege of fifteen months, in the course of which famine and the sword had left alive very few of its 8000 brave defenders, it was taken and destroyed by Scipio the younger, 134 B.C. Scipio's army numbered no fewer than 60,000 men.

Numa Pompilius, in the legendary history of Rome, its second king, the successor of Romulus. He was a native of Cures in the Sabine country, and was universally revered for his wisdom and piety. Unanimously elected king by the Roman people, he soon justified by his conduct the wisdom of their choice. After dividing the lands which Romulus had conquered, he proceeded, with the assistance of the nymph Egeria, who gave him interviews in a grove near the city, to draw up religious institutions for his subjects, and thus stands out in the primitive legend as the author of the Roman ceremonial law. His reign lasted for thirty-nine years, and was a golden age of peace and happiness.

Numbers. See PENTATEUCH, BIBLE, APOCALYPTIC NUMBER.

Numbers, THEORY OF, the most subtle and intricate, and at the same time one of the most extensive branches of mathematical analysis. It treats primarily of the forms of numbers, and of the properties at once deducible from these forms; but its principal field is the theory of equations, in as far as equations are soluble in whole numbers or rational fractions, and more particularly that branch known as Indeterminate Equations. Closely allied to this branch are those problems which are usually grouped under the Diophantine Analysis (q.v.), a class of problems alike interesting and difficult; and of which the following are examples: (1) *Find the numbers the sum of whose squares shall be a square number*; a condition satisfied by 5 and 12, 8 and 15, 9 and 40, &c. (2) *Find three square numbers in arithmetical progression*; Answer, 1, 25, and 49; 4, 100, 196, &c.

Forms of Numbers are certain algebraic formulas, which, by assigning to the letters successive numerical values from 0 upwards, are capable of producing all numbers without exception—e.g. by giving to m the successive values 0, 1, 2, 3, &c., in any of the following groups of formulas, $2m$, $2m + 1$; $3m$, $3m + 1$, $3m + 2$; $4m$, $4m + 1$, $4m + 2$, $4m + 3$, we can produce the natural series of numbers. These formulas are based on the self-evident principle that the remainder after division is less than the divisor, and that consequently every number can be represented in the form of the product of two factors + a number less than the smaller factor.

By means of these formulas many properties of numbers can be demonstrated without difficulty. To give a few examples. (1) *The product of two consecutive numbers is divisible by 2*: Let $2m$ be one number, then the other is either $2m + 1$ or $2m - 1$, and the product $2m(2m \pm 1)$ contains 2 as a factor, and is thus divisible by 2. (2) *The product of three consecutive numbers is divisible by 6*: Let

$3m$ be one of the numbers (as in every triad of consecutive numbers one must be a multiple of 3), then the others are either $3m - 2$, $3m - 1$; $3m - 1$, $3m + 1$; or $3m + 1$, $3m + 2$. In the first and third cases the proposition is manifest, as $(3m - 2)(3m - 1)$ and $(3m + 1)(3m + 2)$ are each divisible by 2, and therefore their product into $3m$ is divisible by 6 (= 1.2.3). In the second case the product is $3m(3m - 1)(3m + 1)$, or $3m(9m^2 - 1)$, where 3 is a factor, and it is necessary to show that $m(9m^2 - 1)$ is divisible by 2: if m be even, the thing is proved; but if odd, then m^2 is odd, $9m^2$ is odd, and $9m^2 - 1$ is even; hence in this case also the proposition is true. It can similarly be proved that the product of four consecutive numbers is divisible by 24 (= 1.2.3.4), of five consecutive numbers by 120 (= 1.2.3.4.5), and so on generally. These propositions form the basis for proof of many properties of numbers, such as that the difference of the squares of any two odd numbers is divisible by 8. The difference between a number and its cube is the product of three consecutive numbers, and is consequently (see above) always divisible by 6. Any prime number which, when divided by 4, leaves a remainder unity, is the sum of two square numbers: thus, $41 = 25 + 16 = 5^2 + 4^2$, $233 = 169 + 64 = 13^2 + 8^2$, &c.

Besides these there are a great many interesting properties of numbers which defy classification; such as that the sum of the odd numbers beginning with unity is a square number (the square of the number of terms added)—i.e. $1 + 3 + 5 = 9 = 3^2$, $1 + 3 + 5 + 7 + 9 = 25 = 5^2$, &c.; and the sum of the cubes of the natural numbers is the square of the sum of the numbers—i.e. $1^3 + 2^3 + 3^3 = 1 + 8 + 27 = 36 = (1 + 2 + 3)^2$, $1^3 + 2^3 + 3^3 + 4^3 = 100 = (1 + 2 + 3 + 4)^2$, &c.

Numbers are divided into *prime* and *composite*—prime numbers being those which contain no factor greater than unity, composite numbers those which are the product of two (not reckoning unity) or more factors. The number of primes is unlimited, and so consequently are the others. The product of any number of consecutive numbers is even, as also are the squares of all even numbers; while the product of two odd numbers, or the squares of odd numbers, are odd. Every composite number can be put under the form of a product of powers of numbers; thus, $144 = 2^4 \times 3^2$, or generally, $n = a^p b^q c^r$, where a , b , and c are prime numbers, and the number of the divisors of such a composite number is equal to the product $(p + 1)(q + 1)(r + 1)$, unity and the number itself being included. In the case of 144 the number of divisors would be $(4 + 1)(2 + 1)$, or 5×3 , or 15, which we find by trial to be the case. *Perfect numbers* are those which are equal to the sum of their divisors (the number itself being of course excepted); thus, $6 = 1 + 2 + 3$, $28 = 1 + 2 + 4 + 7 + 14$, and 496 are perfect numbers. *Amicable numbers* are pairs of numbers, either one of the pair being equal to the sum of the divisors of the other; thus, $220 (= 1 + 2 + 4 + 5 + 10 + 11 + 20 + 22 + 44 + 55 + 110 = 284)$ and $284 (= 1 + 2 + 4 + 71 + 142 = 220)$ are amicable numbers. For other series of numbers, see FIGURATE NUMBERS.

The most ancient writer on the theory of numbers was Diophantus, who flourished in the 3d century, and the subject received no further development till the time of Vieta and Fermat (q.v.), who greatly extended it. Euler next added his quota, and was followed by Lagrange, Legendre, and Gauss, who in turn successfully applied themselves to the study of numbers, and brought the theory to its present state. Cauchy, Libri, and Gill (in America) have also devoted themselves to it with success.

See Barlow's *Theory of Numbers* (1811); Legendre's

Essai sur la Théorie des Nombres (3d ed. Paris, 1830); and Gauss's *Disquisitiones Arithmeticae* (1801; new ed. 1860; Fr. trans. 1807); H. J. S. Smith, in *Brit. Ass. Reports* (1859-65); Cayley, in *Brit. Ass. Reports* (1875).

Numerals. The invention of signs to represent numbers is doubtless much older than any form of writing. But the origin of counting, such as would involve the use of signs, is not so ancient as might be thought; the power of apprehending even comparatively small numbers comes but late in the development from savage to civilised life. Even yet the aborigines of Australia work with only the numbers 1 and 2; 3 being 2 and 1 or 1 and 2; 4 being 2 and 2; and, as a rule, no Australian black can count as high as 7. The earliest visible signs are doubtless the fingers held up; and the denary system of notation is due to the fact that we have ten fingers. The rude method of finger-counting has been developed into a highly-complicated system of reckoning, still in use in eastern Europe by pedlars; various positions and arrangements of the ten digits allowing of reckoning as high as 10,000. For permanent purposes a system of single strokes is the most obvious method; and series of strokes as high as four or five are found in various countries in old inscriptions. But strokes, when numerous, are inconvenient and confusing; hence additional symbols are found to make their appearance for 5, 10, 100, and 1000. In Babylonian inscriptions two Cuneiforms (q.v.) serve to express all the numbers from 1 to 99. The Egyptian scheme is explained and illustrated at *HIEROGLYPHICS* (Vol. V. p. 707); and from these hieroglyphs were derived the Phœnician, Palmyrene, and Syriac numerals.

After alphabetic writing was in use, the alphabetic signs obviously lent themselves to employment as numerals—either following the order of the letters, each having a successively greater value than its predecessor; or the initial letter of the word for the several numbers might be used. Thus, according to the latter method, the Greek inscriptions used I for 1, II (ἑβτε) for 5, Δ (δέκα) for 10, H (the old sign for the rough breathing in ἑκατόν) for 100, X (χίλια) for 1000, and M (μύρια) for 10,000. Then a II with a Δ inscribed in it stood for 50 (5×10), and with H inscribed (5×100) for 500. In this connection the capitals or uncials were used of course. Otherwise, following simply the order of the letters, the twenty-four letters of the Ionic alphabet were used for the numbers 1 to 24; the books of the *Iliad*, for example, are often thus numbered. But a more ingenious method was soon adopted by the Greeks, as also by the Hebrews. The alphabet (cursive) was divided into three groups, of which the first did duty for the units, the second for the tens, the next for hundreds. The Hebrew square character had twenty-two distinct letters, and double forms for five of them, so that three groups, each of nine characters, were available. The Greek alphabet, as ultimately arranged, had twenty-four letters; the three additional signs required to make up three nines were obtained by keeping two of the old Phœnician letters Ϝ or ϝ (see DIGAMMA) for 6, and 5 or 4 (koph) for 90, and adding the superfluous sibilant Ϟ (sampi) for 900. Then α to θ were 1 to 9; from ι to κoph were 10 to 90; ϱ to sampi were 100 to 900. The thousands were made by subscribing an ι beneath the units; thus α was 1000; αωθα is 1891. Sometimes a sort of algebraic method was employed for larger numbers; βM = ($2 \times 10,000$) 20,000.

The cumbrous Roman method of using the capitals is familiar enough to ourselves yet. The C has been understood to be the initial of *centum*, and M of *mille*. But some (as Canon Taylor) contend that the Latins, when they dropped the Greek

phi, *chi*, and *theta* as phonetic signs, retained them as numerals, with arbitrary values. In this case the C would be originally Θ, assimilated to C, because C was the initial of *centum*. The old Φ, used for 1000, came to be written CIO, afterwards confounded with (V) or M, the initial of *mille*. The L would be a derivative from an old Chalcidian form of *chi*, inscribed for lapidary purposes L, and then simplified. Those who do not accept the theory of the dropped Greek letters suppose that M is from a circle with a vertical stroke, the C a circle with a horizontal stroke or a cross, Φ. The X, V, and L might all come from this letter. In any case, X is twice V (whether or not the latter originated in the hand held with the thumb to one side and the other fingers together); and D (for 500) or IO is half CIO. See the articles in this work on the letters C, D, L, and M.

It is doubtful how far the Abacus (q.v.) has to do with the development of the system of numerals, in which the value of the cipher depends on its position. There were abacus boards so arranged that the first column meant units, the second tens, the third hundreds, the fourth thousands; or, conversely, a method of writing numbers derived

c	x	i
VI	V	IV
VI	V	IV
VI	V	IV

from this was actually used in Europe in the middle ages; we show the columnar arrangement simplifying the reading in the several cases, 654, 650, 604, 54.

In the decimal scheme of figures as now used by us, the nine numerals with the zero, which enables the value of the position to be secured without abacus or columnar arrangement, are known as the Arabic numerals, but are unquestionably of Indian origin. From India they were apparently brought to Bagdad after the middle of the 8th century, and their value and use was set forth early next century by the Arab mathematician Abu Ja'far Mohammed Ben Musa, or Al-Kharizmi ('native of Khwarizm'—Khiva); whence the system came to be known in Europe, where it became familiar in the 12th century as *Algorism* (erroneously *Algorithm*). The earliest European forms of these characters are found in MSS. of the 12th century; by the 14th they were practically of the same shape as now. The 12th century numerals are evidently forms of the Gobar or western Arabic numerals used in

a 1 2 3 4 5 6 7 8 9 0
 b 1 2 3 4 5 6 7 8 9 .
 c 1 2 3 4 5 6 7 8 9 0

a, Indian, 10th century; b, Gobar, 10th century;
 c, European, 12th century.

Persia in the 10th century. These can be traced to the contemporary Indian Devanagari numerals, which again are as certainly based on an old series of characters used in cave-inscriptions in the 1st and 2d centuries. These Canon Taylor contends are (mainly, at least) degraded forms of the Indo-Bactrian alphabet. See ALPHABET, Vol. I. p. 188. The modern arithmetic was not practised in England till about the middle of the 16th century, and for a long time after its introduction was taught only in the universities.

The decimal system, possessing only nine symbols—viz. 1, 2, 3, 4, 5, 6, 7, 8, 9 (called the nine digits)—adopts the principle of giving to each symbol or 'figure' two values, one the absolute value, and the other a value depending upon its

position, a figure moved one place to the left being held to be increased in value ten times. When such a number as 6473 is analysed, it is seen to mean (6 times 1000) + (4 × 100) + (7 × 10) + (3 × 1); and 6004 becomes (6 × 1000) + (4 × 1). In this latter instance the peculiar importance of the figure 0 is seen (see DECIMAL SYSTEM).

It should be mentioned that European nations do not all read the numerals in the same way, as regards larger numbers. Let us take the figures 56,084,763,204,504; these, read after the fashion of the French and other continental arithmeticians, are fifty-six *trillions*, eighty-four *billions*, seven-hundred-and-sixty-three millions, two-hundred-and-four thousands, five-hundred-and-four units; and so also in America. In Britain, instead of billions, we have, according to the current usage, thousands of millions; after this, tens of thousands of millions and hundreds of thousands of millions, and then billions, which are the same as the French trillions. The above number, according to the British mode, would be read fifty-six *billions*, eighty-four-thousand-seven-hundred-and-sixty-three millions, two-hundred-and-four thousands, five-hundred-and-four units. The British trillion has nineteen figures, the continental has thirteen.

As to the Indian origin of our numerals, see Canon Taylor, *The Alphabet* (1883; vol. ii. p. 263-268); Woepke, *Memoire sur la Propagation des Chiffres Indiens* (1863); Burnell, *South Indian Palaeography* (1874); Treutlein, *Geschichte unserer Zahlzeichen* (1875).

Numidia (Gr. *Nomadia*, 'land of Nomads'), the name given by the Romans to a part of the north coast of Africa, corresponding to some extent with the modern Algiers, and lying between Mauritania and the Roman province of Africa; on the south it reached to the chains of Mount Atlas. The inhabitants of Numidia, as of Mauritania, belonged to the race from which the modern Berbers are descended. They were a warlike race, and excelled as horsemen, but were proverbially faithless and unscrupulous. Of their tribes the *Massyli* in the east and the *Massesyli* in the west were the most powerful. In the grand struggle between the Carthaginians and the Romans they at first fought on the side of the former, but subsequently the king of the Eastern Numidians, Massinissa, joined the Romans, and rendered them effectual service in the war with Hannibal. Favoured by the conquerors, he united all Numidia under his sway. Of his successors in this kingdom Jugurtha and Juba are the most famous. After the victory of Cæsar over Juba I. in the African war Numidia became a Roman province (46 B.C.); but Augustus afterwards gave the western part, with Mauritania, to Juba II., and the name Numidia became limited to the eastern part. Among important places were Hippo Regius, Zama, and Cirta (the residence of the Numidian kings), afterwards called Constantina, a name still preserved in Constantine. For the modern history of Numidia, see ALGIERES.

Numismatics (Gr. *nomisma*, from *nomos*, 'law,' 'a legally current coin') is the science which embraces the study of the current coins of all nations. In the wider, though less accurate, acceptance of the term it includes also that of medals, both artistic and historical. The various branches of numismatics are (1) Greek, Phœnician, &c.; (2) Roman and Byzantine; (3) Mediæval and Modern; and (4) Oriental. The chief value of numismatics consists in the light which coins throw upon history. The secondary importance of the science is purely artistic. The study of coins is also of great use in elucidating the mythology of the ancients, in fixing the chronology of the different systems of alphabetical writing

(Paleography), and in indicating the origin and gradual extension over the civilised world of the principal systems of weighing the precious metals (Metrology). Historically, coins are of the utmost importance as being contemporary and authentic documents furnishing us with in many cases the only means of ascertaining the names of obscure cities and peoples, together with the chronological succession of their kings, tyrants, or chief-magistrates. Artistically, they faithfully record the successive phases of art from its earliest beginnings to its culminating point, and through all the stages of its decline, subsequent temporary revival, and second decadence, to the present day.

I. *Greek Coins*.—The use of the precious metals as mediums of exchange may be traced back to the remotest ages of which we possess any historical accounts. Thus, for instance, we read that Abraham was 'very rich in cattle, in silver, and in gold' (Gen. xiii. 2; xxiv. 35), and in the account of his purchase of the cave of Machpelah (Gen. xxiii. 16) it is stated that 'Abraham weighed to Ephron four hundred shekels of silver current with the merchant.' This use of gold and silver as uncoined money, weighed in the balance, must, however, be carefully distinguished from its use as 'coin,' a word which implies that the ingot or piece of metal is impressed with an official device, mark, or 'type,' serving the purpose of a guarantee of just weight and value. 'So far as we have any knowledge,' says Herodotus (i. 94), 'the Lydians were the first nation to introduce the use of gold and silver coin.' The adoption of this apparently simple means of facilitating exchanges appears to have been due in the first instance to the custom of depositing treasure for safe custody in the sacred temples of the gods. Ingots or small lumps of gold or silver, committed to the care of the priests, were consecrated to the local divinity by being impressed with a badge or symbol, usually the head of some sacred animal. These pieces of metal were subsequently put into circulation, the sacred badge being known and accepted in the district as a reliable guarantee of value. The earliest Lydian coins which have been handed down to our times belong probably to the reign of Gyges, who ascended the throne about 700 B.C. They are bean-shaped lumps of the native Lydian gold ore, which contained a large admixture of silver, and went by the name of *electrum* or pale gold. The face or *obverse* of the coin bears the figure of a lion, the sacred symbol of the goddess Cybele, and the *reverse* consists merely of the impress of the rude unengraved punch or nail-head which served to keep the ingot in its place while it was being struck. The ingot, held in position by a pair of tongs, was placed on this square nail-head, and on the top of the ingot the engraved die was laid while the moneyer struck it with successive blows of a heavy sledge-hammer until the impressions of the engraved die on the obverse and of the square nail-head on the reverse were brought into sufficient relief and intaglio respectively.

These one-sided coins with an intaglio or 'incuse' square on the reverse are characteristic of the early stages of the art of coining not only in Lydia, but in all the Greek cities, for the use of coined money rapidly spread from Lydia over all the coasts and islands of the *Ægean Sea*, each city issuing money bearing the symbol of its local divinity. In Greece proper the earliest coins were of silver, and are said to have been struck by Pheidon, king of Argos. They bear the symbol of a tortoise, a creature sacred to the goddess Aphrodite, in whose temple at *Ægina* these earliest Greek coins were issued. On this occasion it is related that Pheidon hung up in the temple of the goddess Hera at Argos specimens of the cumbrous bronze and iron bars,

δραχμοί, which served the purpose of money before his time, in memory of the old order of things. From the time of Pheidon onwards the coinage of Greece and of the East may be classified historically in the following eight periods:

(i.) 700-480 B.C.—Period of archaic art, ending with the Persian wars.—The art work on the coins of these two centuries is characterised at first by a rude strength of style, and afterwards by a gradual development into clearly-defined forms, which, however, are always distinguishable by their angularity and stiffness from the freer work of later times. Thus, for instance, the eye of the human face is always drawn, even when in profile, as if seen from the front; both corners being visible, while the mouth wears the fixed and formal smile with which we are familiar on the Egyptian monuments. Towards the end of the archaic period a type in relief begins to appear within the incuse square of the reverses. The coins which circulated most widely were, in silver, those of *Ægina* with the tortoise above referred to; the tetradrachms of Athens, first introduced by Solon 590 B.C., obverse, head of Athena, reverse, owl, the sacred bird of that goddess; and, in gold, the famous Darics, on which the Persian king is represented as a kneeling archer. In the west the chief coins were those of the Greek colonies in Southern Italy, Sybaris, Croton, Tarentum, &c., which differ from those of Greece proper in having the figures on the reverse in intaglio instead of in relief.

(ii.) 480-400 B.C.—Period of transitional and early fine art, to the end of the Athenian supremacy.—The coins of this period are characterised by a great advance in the technical skill with which the dies were engraved. The name of the city or of the chief-magistrate now occurs frequently on the reverse, usually in an abbreviated form.

In Asia Minor the chief coinage of this period is the *electrum* currency of the flourishing commercial city of Cyzicus on the Propontis, so often alluded to under the name of 'Cyzicene staters' by Xenophon and other historians. In Greece proper the Athenian money was still the chief, though by no means the only medium of exchange, and in the West the Corinthian staters, with the figure of Pegasus on the obverse, had a wide circulation. In Sicily Syracuse affords a larger variety of types than any other Greek city, though the finest specimens of the Syracusan monetary art fall into the next period.

(iii.) 400-336 B.C.—Period of finest art, age of the Spartan and Theban supremacies, and of Philip of Macedon.—The art of die-engraving attained in this period a higher point of excellence than it has ever since reached. The coin-types are remarkable for sculptural reserve, intensity of action, or rich and varied ornamentation, according to the requirements of the subject represented. These are most frequently ideal heads of divinities on the obverses, and mythological figures on the reverses, or agonistic types referring to the local games and religious festivals, such as the victorious quadrigæ on the famous Syracusan medallions, which are generally recognised as the finest and most beautifully executed coins that have ever been struck. In this age the practice of coining money had become universal; the number of mints throughout the civilised world was enormous, every little town striking its own 'autonomous' silver or bronze, and, in some cases, gold currency. In European Greece the gold staters of Philip of Macedon obtained a wide circulation, and his conquests in Greece gradually put an end to the independent issues in that country.

(iv.) 336-280 B.C.—Period of later fine art; age of Alexander the Great and the Diadochi, charac-

terised by the introduction of the portrait of the reigning monarch in place of the head of the divinity on the obverse.—Before Alexander's time no tyrant, however despotic, had ever ventured to place his own head upon the coinage of the state, for hitherto the coinage had continued to maintain intact its original religious character. The regal money of Alexander and his successors now gradually superseded the autonomous coinage of the smaller Greek states, except in the west, which was beyond the sphere of Alexander's conquests, and where the cities of Italy and Sicily continued to strike gold and silver until they were in turn brought under subjection by the growing power of Rome (see below).

(v.-vii.) 280 B.C. to the Christian era.—Periods of early and later decline; age of the Epigoni, the Attalids, and of Mithradates the Great.—The silver and gold coinage during these three centuries is almost exclusively regal, and presents us with a remarkable series of lifelike portraits of the long succession of the Seleucid kings of Syria, of the Ptolemies of Egypt, of the kings of Macedon, of Pontus and Bithynia, of the Attalids of Pergamum, and of the successors of Alexander in Northern India, many of whom are known to us only from their coins. The chief characteristic of the art of numismatic portraiture, which attained its highest perfection about 250 B.C., is its realism, which is carried in some cases almost to the verge of brutality, as for instance on the tetradrachms of some of the kings of Pontus, the ancestors of Mithradates the Great. It is to this period that the earliest coins of the Jews belong—the well-known shekels of Israel, struck at Jerusalem by Simon Maccabæus, 143–135 B.C. Among the latest portraits on Greek coins is that of the famous Cleopatra on a coin of Ascalon. She is represented with wide-open and eager eyes, a prominent and slightly aquiline nose, and a large and expressive mouth, but with none of the seductive beauty which we should expect to find on the coins of this fascinating princess. Among the non-regal coins of the 2d century B.C. the large tetradrachms of some of the Greek cities of the western coast of Asia Minor, which regained their freedom after the defeat of Antiochus the Great by the Romans, 190 B.C., are worthy of note; those of Cyme, Myrina, Smyrna, and Magnesia being especially remarkable. Throughout the greater part of this period Athens continued to coin very plentifully her tetradrachms with the helmeted head of the chryselephantine statue of Athena Parthenos by Phidias on the obverse. These coins formed the chief currency for the trade between Europe and the East.

(viii.) From the Christian era to the reign of the Emperor Gallienus.—During this period of nearly three centuries the Romans permitted the Greek cities in the eastern half of the empire to strike bronze money for local use. It is known to collectors as the 'Greek imperial' coinage. Artistically it is quite without interest, but archaeologically it is perhaps more important than the matchless silver and gold currency of the free and independent cities of more ancient times. The Greek imperial coins illustrate the local festivals, religious rites, and municipal institutions which prevailed in the outlying provinces of the Roman empire, and are also of value as recording the names of the successive chief-magistrates and high officials of the various cities, who appear to have been responsible for the coinage in each locality.

II. *Roman and Byzantine Coins.*—The Romans for the first four centuries of their history had no regular coinage, the chief medium of exchange

being bronze, circulating by weight, *aes rude*, in lumps of irregular form. It was probably about the middle of the 4th century B.C. that the pound-weight of bronze (12 oz.) was first cast into large unwieldy pieces of circular shape, *aes grave*, having on the obverse a head of Janus, and on the reverse the prow of a galley. This was the Libral As; and its divisions were the Semis (6 oz.), the Triens (4 oz.), the Quadrans (3 oz.), the Sextans (2 oz.), and the Uncia (1 oz.), each of which bore a distinct type and mark of value. As time went on the As was gradually reduced in weight until (circa 264 B.C.) it stood at no more than 2 oz. At this point the law stepped in and endeavoured to check the further debasement of the coin by fixing the weight legally at 2 oz. (sextantal reduction), and by issuing for the first time a silver coin, the Denarius, equivalent to ten asses. The fractions of the silver piece were the Quinarius (five asses) and the Sestertius (two and a half asses). In 217 B.C. the weight of the as was further legally reduced to 1 oz. (uncial reduction), and again in 89 B.C. to half an ounce (semuncial reduction). All these successive reductions were financial expedients, the object of which was to bring a little order into the state currency, which continually

Medallion of Syracuse.

tended to become more and more deteriorated. The types of the silver coins, at first constant and uniform, were subsequently varied according to the pleasure of the *triumviri monetales*, as the officers were called who were entrusted with the supervision of the coinage. The long series of the Republican silver money, which extends from 264 B.C. to Imperial times, is now incorrectly known as the Consular or Family series, because the types usually allude to events connected with the family history of the *triumviri monetales*. The Imperial series commenced in 2 B.C., when Augustus abolished the office of the *monetarii* and reserved for himself all rights connected with the coinage of gold and silver, though leaving to the senate the privilege of striking bronze, which was henceforth distinguished by the letters S.C. (*Senatus Consulto*). All coins now bore the portrait of the reigning emperor, or of some member of the imperial family, and on the reverse, for the most part, allegorical personifications, representations of historical events, architectural monuments, or public buildings. Their inscriptions furnish us with the exact date of issue. The chief denominations were, in gold, the aureus; in silver, the denarius; and in bronze, the sestertius (now known as the large bronze), tariffed at four asses; the dupondius (middle bronze), two asses; and the as and its divisions (small bronze). The large bronze from Augustus to Commodus supplies us with a magnificent series of imperial portraits, but from Septimius Severus onwards there is a rapid deterioration both in art and workmanship. From the reign of Caracalla to that of Diocletian the utmost disorder prevailed in the coinage, each successive

emperor debasing it more and more, until the so-called silver denarius became merely a copper coin washed with tin. In 296 A.D. Diocletian entirely reformed the currency, which was again modified by Constantine, who reduced the weight of the aureus from sixty to seventy-two to the pound. The new gold piece was henceforth known as the Solidus, and it maintained its full weight and purity of metal as long as the empire lasted. This coin received in western Europe the name of Bezant or Byzant, from Byzantium or Constantinople, the capital of the eastern empire. The types of the coins of the Christian emperors retained for a time their pagan character, though little by little Christian symbolism crept in, until at length all pagan influence disappeared, and figures of Christ and the Virgin took the place of the allegorical representations of pagan times. The Latin language in the inscriptions on Byzantine coins continued to be used until the latter part of the 11th century, when it was finally displaced by the Greek.

III. *Medieval and Modern Coins.*—The coinage of western Europe, down to the time of Charlemagne, consisted mostly of imitations of the Byzantine coins. That emperor (circa 768 A.D.) introduced a new silver coin called the *new denier*, which soon came into general use.

English.—The *denier* was introduced into England, under the name of the *penny*, by Offa, king of Mercia (ob. 794), previous to whose time the currency of the Anglo-Saxons had consisted of small silver coins (*sceattas*) and copper coins (*stycas*), which were rude copies of the Merovingian money. Under the Anglo-Saxon and early Norman kings local mints were established at all the considerable towns in England, and the penny bore on its reverse both the name of the town and of the moneyer by whom it was struck. The earliest English gold coins were struck by Henry III., but gold money did not come into general use until the reign of Edward III., who introduced the gold *noble* (6s. 8d.) and the gold *florin* (6s.), with their divisions. This king also first struck multiples of the penny, *groats* (4d.) and *half-groats*. Edward IV. added new denominations called the *rose noble* and the *angel*, so called from its type, St Michael slaying the dragon. With the accession of the Tudor dynasty authentic portraits of the reigning sovereign make their first appearance on the coins of the realm, and many new denominations, such as *ryals* or *sovereigns* in gold, and *crowns*, *half-crowns*, *shillings*, &c. in silver, were added. In the time of Charles I. we note a remarkable improvement in the art of die-engraving, of which the celebrated *Oxford crown* is a good example; on the obverse of which is the king on horseback, with a view of the city of Oxford in the distance. In this reign a Frenchman named Briot, employed in the English mint, introduced the use of the mill and screw. On the coins of the Commonwealth the inscriptions are in English instead of Latin, and some of Cromwell's portraits by the famous engraver, Thomas Simon, are worthy of the highest praise. To the series of Charles II. belongs the beautiful *Petition crown*, also by Simon. This coin takes its name from Simon's petition to be reinstated as engraver to the mint, inscribed on the edge: 'Thomas Simon most humbly prays your majesty to compare this, his tryal piece, with the Dutch, and if more truly drawn and embossed, more gracefully ordered, and more accurately engraven, to relieve him.' In Charles II.'s reign the first *guineas* were struck from gold brought from the Guinea Coast, and copper coins, consisting of *halfpennies* and *farthings*, were first regularly established. From this time onwards the English coinage declines very greatly in artistic interest,

George IV.'s crown by Pistrucci being perhaps the only modern piece worth noticing.

Scottish.—The coinage of Scotland down to the reign of Robert III. followed closely the English types. From this time original designs became more frequent. It reached its highest point of artistic excellence in the reigns of James V. and Mary; and few modern pieces are more beautiful than the *bonnet-piece* of the former, representing the king wearing a bonnet, and the *ryal* of the latter, bearing the queen's portrait in profile.

Irish.—The earliest Irish coins were struck by the Danish and Norse invaders, 929–1029. They were copied, as a rule, from the pennies of Ethelred II. After this we have no Irish coinage until the partial conquest of the country by Henry II., in whose reign mints were established at Dublin, Cork, Drogheda, Limerick, Trim, Waterford, and Wexford. Among the more modern Irish coins the gun-metal money of James II. is historically interesting. This was 'money of necessity,' struck after his flight from England. It was decried in the reign of William and Mary, and redeemed only at metal value.

Western Europe.—The mediæval and modern coinage of the various European states, from the time of the issue of the *new denier* by Charlemagne in the 8th century down to the middle of the 17th century, is no less interesting than that of Britain. The Italian and Papal coins are artistically superior to the rest, especially in portraiture, where the influence of the Renaissance of art may be clearly traced. An important landmark in the numismatic history of western Europe is the re-introduction of gold money, dating from the first issue of the *florino d'oro* in Florence, 1252. In France the coins of Francis I. and Henry II., and in Germany those of the Emperor Maximilian I., are especially noteworthy; some of the latter being ascribed to the hand of Albert Dürer. Many of the later German *thalers* are also of considerable historical value, as their types record the chief events in the history of the cities by which they were struck.

IV. *Oriental Coins.*—Oriental coins fall into three principal divisions: (i.) The coins of India beginning with those of the successors of Alexander the Great in the 3rd century B.C. in Bactria and the Punjab, and extending down to recent times. The gold and silver coins of the Pathan kings and of the Mogul emperors may be here particularised, more especially the gold *mohurs* and silver *rupees* of Jehangir with the signs of the zodiac engraved in bold relief.

(ii.) The coins of the numerous Arab dynasties in Asia, Africa, and Spain, consist of *dinars* in gold and *dirhems* in silver. The interest of these Mohammedan issues is purely historical, as they bear no representations of living beings, all such images being forbidden to true believers. Many of these coins possess, however, a beauty of their own as specimens of oriental caligraphy. The inscriptions consist of formulæ of the faith from the Koran, together with the name of Calif, the place of mintage, and the date of issue. The Kufic coins are the subject of a special article.

(iii.) The coins of China, Japan, and the far East.—Those of China date from the 7th century B.C., the earliest being in the form of tools, such as adzes, chisels, spades, knives, &c. In the 1st century B.C. these pieces are replaced by circular discs of brass called *cash*, with a square hole in the centre, a form of coin which has survived until quite recent years. The coins of Japan begin about the 7th century A.D., and are modelled on the later Chinese pattern. Among the more modern Japanese issues are oblong pieces of gold and silver, and large oval plates, called *cho-ban*

and *ko-ban*, some of which are more than 6 inches in length. Like China, Japan has now adopted a currency modelled on the European pattern.

The standard works on Greek Numismatics in general are Eckhel's *Doctrina Numorum* (1792-98); Mionnet, *Description des Médailles grecques* (1807-37); B. V. Head, *Historia Numorum* (Oxford, 1887), and *Guide to the Principal Gold and Silver Coins of the Ancients* (3d ed. 1889); and the *Catalogues of Greek Coins in the British Museum* (1873 et seq.). On Roman coins the chief works are Mommsen, *Histoire de la Monnaie romaine* (trans. by Blacas, Paris, 1865-75); E. Babelon, *Monnaies de la République romaine* (1885); and J. Sabatier, *Monnaies byzantines* (1862). On mediæval, modern, and oriental coins there are L. W. Wellenheilm, *Catalogue de Monnaies et Médailles* (1845); C. F. Keary, *Coinages of Western Europe* (1879); *Coins and Medals* (ed. by S. Lane-Poole, 1885); J. A. Blanchet, *Numismatique du Moyen Âge et Moderne* (1890); A. Engel and R. Serrure, *Traité de Numismatique du Moyen Âge* (1891); Ruding, *Annals of the Coinage of Great Britain* (1840); Hawkins, *Silver Coins of England* (1887); Kenyon, *Gold Coins of England* (1884); and the *British Museum Catalogues of Oriental Coins*, by S. Lane-Poole and E. S. Poole (1875-90).

Nummulites, or NUMMULINA ('money-fossils'), a genus of fossil foraminifera, the shells of which form immense masses of rock of Eocene age. They are circular bodies of a lenticular shape, varying in magnitude from the merest point to the size of a florin or larger. The shell is composed of a series of small chambers arranged in a concentric manner. The growth of the shell does not take place only around the circumference, but each whorl invests all the preceding whorls, so as to form a new layer over the entire surface of the disc, thus adding to the thickness as well as the breadth, and giving the fossil its lenticular form. A thin

Nummulites.

intervening space separates each layer from the one which it covers, and this space at the margin swells out to form the chamber. All the internal cavities, however, seem to have been occupied with the living sarcodæ, and an intimate connection was maintained between them by means of innumerable parallel tubuli, which everywhere pass from one surface to another, and which permitted the passage of the sarcodæ as freely as do the minute pores or foramina of the living foraminifera. The name is given to them from their resemblance to coins. The genus appears first in the Carboniferous system, where it is represented by one small form. Several species are also met with in Jurassic and Cretaceous rocks, but the genus reached its maximum in Eocene times. It is represented at present by only a few small forms.

NUMMULITE LIMESTONE, an important member of the Eocene system of southern Europe, &c., consists of a limestone composed of nummulites held together by a matrix formed of the comminuted particles of their shells, and of smaller foraminifera. It attains a thickness of several thousand feet, and has been traced over a vast area. It occurs on both sides of the Mediterranean basin, in Spain and in Morocco. It enters largely into the composition of the Apennines, the Alps, the Carpathians, and the Balkans; it extends through Greece, Egypt, and Asia Minor, and thence through Persia and the Himalayas to the coasts of China and Japan.

Nun (A.S. *nunna*; Low Lat. *nunna* or *nonna*, 'mother'; Gr. *nannē*, *nenna*, 'aunt'; Sansk. *nandā*, a familiar word for 'mother,' corresponding to Sansk. *tatā*, 'father'), a member of a religious order of women. The general characteristics of the religious orders will be found under the head **MONACHISM** (q.v.) and under those of the several orders. Of arrangements peculiar to the religious orders of women the most striking perhaps is the strictness in the regularly authorised orders of nuns taking solemn vows, nuns of the 'cloister,' or enclosure, which no extern is ever permitted to enter, and beyond which the nuns are never permitted to pass, without express leave of the bishop. The superiors of convents of nuns are called by the names Abbess, Prioress, and, in general, Mother Superior. They are, ordinarily speaking, elected by chapters of their own body, with the approval of the bishop, unless the convent be one of the class called exempt houses, which are immediately subject to the authority of the holy see. The ceremony of the solemn blessing or inauguration of the abbess is reserved to the bishop, or to a priest delegated by the bishop. The authority of the abbess over her nuns is very comprehensive, but a precise line is drawn between her powers and those of the priestly office, from which she is strictly debarred. The name of nun is given in general to the sisters of all religious congregations of females who live in retirement and are bound by rule; but it is primitively and properly applicable only to sisters of the religious orders strictly so called. In most cases, soon after the foundation of the orders for men corresponding orders have been established for women. The usages as to diet, fasting, clothing, &c. are very various in the different communities. The veil of reception given to a postulant at the beginning of her novitiate is white; that of profession, given at the end of it, is black in some orders, white in others.

Nunc Dimittis, the name given to the canticle of Simeon (Luke, ii. 29-32), which forms part of the compline office of the Roman Breviary, and is retained in the evening service of the Anglican Church when it follows the second lesson.

Nuncio. See **LEGATE**.

Nuncomar. See **HASTINGS** (WARREN).

Nundydroog (*Nandidrug*), a fortified hill in Mysore, 31 miles N. of Bangalore, and 4810 feet above the sea. The extensive fortifications on the plateau-summit were erected by Hyder Ali and Tippoo Saib, and were stormed by a British force in 1791. The place is now used as a health-resort by Europeans from Bangalore.

Nuneaton, a market-town of Warwickshire, on the river Anker and the Coventry Canal, 14 miles NNW. of Rugby, 9 N. by E. of Coventry, and 22 E. of Birmingham. It has a good Gothic parish church, some remains of a 12th-century nunnery, with a modern church built thereon, and a grammar-school (1553). The ribbon manufacture has given place to worsted, cotton, and woollen spinning. 'George Eliot,' born at Griff, 2 miles to the south, went to school at Nuneaton, and here witnessed the riot described in *Felix Holt*. Pop. of parish (1851) 8133; (1881) 8465; (1891) 11,580.

Nuraghe, or **NURHAG**, the name of round towers, in shape truncated cones, of which 3000 are scattered about the island of Sardinia. They vary from 20 to 60 feet in diameter, rise 30 or 40 feet above the ground, with two or three stories of domed chambers connected by a spiral staircase, and are made of granite, limestone, basalt, porphyry, sandstone, and schist, built in regular courses of roughly-hewn stone, without cement. Some of the stones in the lower courses weigh 12 tons each. Believed to be of Phœnician origin, they closely

resemble the Brochs (q.v.) of Scotland. Nurhage is regarded by some as an aboriginal word meaning 'fire-circle' or 'hearth'; by some as derived from *Nura*, an old name of Minorca, where such towers (called *talyots*) are common.

See Canon Spano's *Nuraghi di Sardegna* (1867); James Fergusson's *History of Rude Stone Monuments* (1872); and Lieut.-col. Sir R. Lambert-Playfair's *Handbook to the Mediterranean* (1890).

Nur ed-Din Mahmūd. MALEK AL-ADEL, emir and sultan of Syria, was born at Damascus in 1117. His father, Ōmad ed-Din Zenghi, originally governor of Mosul and Diarbekir under the Seljuk sultans, had established his independence, and extended his authority over northern Syria. Nur ed-Din Mahmūd succeeded him in 1145, and changed the seat of government from Mosul to Aleppo. From this time onwards his life was one long duel with the Christians—the Crusaders, Hospitallers, Templars, and Knights of the Latin Kingdom of Jerusalem. The most notable incidents in this contest may be briefly summarised. Count Joscelin, in an attempt to recover his capital, Edessa, was signally discomfited under its walls, and his army almost annihilated. This gave occasion to the second Crusade. The Crusaders were, however, foiled by Nur ed-Din before Damascus, and, being defeated in a number of conflicts, abandoned their enterprise. The emir next conquered Tripolis and Antioch, the prince of the latter territory being defeated and slain in a bloody conflict in June 1149; and before 1151 all the Christian strongholds in Syria were in Nur ed-Din's hands. He next took possession of Damascus (which till this time had been ruled by an independent Seljuk prince) in 1153. About this time a terrible earthquake devastated Syria, levelling large portions of Antioch, Tripolis, Hamath, Hems, and other towns; and Nur ed-Din devoted all his energies to repairing the damage done. In 1157 the Christian orders suffered a severe defeat near Paneas; but an illness which prostrated their enemy in 1159 enabled them to retake some of their lost territories. Recovering, Nur ed-Din soon won back what had been taken from him, and turned his attention to Egypt, then governed by the effeminate and degenerate Fatimites. In 1168 his brother, Asad al-Din Shirkoh, overran Egypt, but, dying soon afterwards, was succeeded by his nephew, the celebrated Saladin (q.v.), who completed the conquest of the country, and restored the Sunnite faith. This won for Nur ed-Din the gratitude of the calif of Bagdad, who created him sultan of Syria and Egypt. Nur ed-Din, however, grew jealous of his able young lieutenant, and was preparing to march into Egypt in person, when he died at Damascus in May 1173. This prince is one of the great heroes of Moslem history. He was not a savage conqueror, but zealously promoted the cultivation of the sciences, arts, and literature, and established a strict administration of justice throughout his dominions; he was revered by his Moslem, and greatly respected by his Christian, subjects.

Nuremberg (Ger. *Nürnberg*), a city in the Bavarian province of Middle Franconia, in a sandy but well-cultivated district, on the little Pegnitz (a sub-affluent of the Main), 95 miles N. by W. of Munich and 145 ESE. of Frankfort. It is the quaintest and most interesting town of Germany, on account of the wealth of medieval architecture which it presents in its many-towered walls, its gateways, its picturesque streets with their gabled house-fronts, its bridges, and its beautiful Gothic fountains. The Burg or royal palace, built (c. 1024–1158) by Conrad II. and Frederick Barbarossa, commands a glorious view of the surrounding country, and is rich in paintings and wood-

carvings; in its courtyard is a coeval linden-tree. Of eight fine churches the two finest are St Lawrence (1274–1477), with two noble towers 233 feet high, exquisite stained glass, the famous stone tabernacle (1495–1500) by Adam Krafft, and the wood-carvings of Veit Stoss; and St Sebald's (c. 1225–1377), with the superb shrine of Peter Vischer. Other noteworthy objects are the Italian Renaissance town-hall (1622); the new law-courts (1877); the gymnasium, founded by Melanchthon (1526); the Germanic museum (1852); an industrial museum (1871); a library of 70,000 volumes; Albert Dürer's house; and the statues of him, Hans Sachs, and Melanchthon, with the 'Victoria'

Schönerbrunnen Fountain, Nuremberg.

or soldiers' monument (1876). Although the glory of Nuremberg's foreign commerce has long since passed away, the home trade is still of high importance. It includes the specialities of metal, wood, and bone carvings, and children's 'Dutch' toys and dolls, which, known as 'Nuremberg wares,' find a ready sale in every part of Europe, and are largely exported to America and the East. In all there are close on 200 factories, producing also chemicals, ultramarine, type, lead-pencils, beer, &c.; and the town besides does a vast export trade in hops, and import trade in colonial wares from the Netherlands. Pop. (1818) 26,854; (1875) 91,018; (1885) 115,980, of whom 24,213 were Catholics and 3738 Jews.

First heard of in 1050, Nuremberg was raised to the rank of a free imperial city by Frederick II. in 1219. In 1417 the Hohenzollerns sold all their rights to the magistracy. This put an end to the feuds which had hitherto raged between the burghs and the municipality; and Nuremberg for a time became the chief home in Germany of the arts and of inventions—watches or 'Nuremberg eggs,' air-guns, globes, &c. Simultaneously it grew rich with the fruits of the great commerce which it maintained between the traders of the East and the other European marts. The discovery of the Cape passage to India deprived it of its monopoly, and the Thirty Years' War completed the decay of the

city, which a century before had embraced the Reformed doctrines. Still, in 1803 it was allowed to retain its independence, with a territory of 483 sq. m., containing 80,000 inhabitants; but, in consequence of disputes with Prussia, it entered into the Rhenish Confederation, and in 1806 was transferred to Bavaria.

See German works by Voigt (1862), Lachner (4th ed. 1873), Priem (1874), Stockbauer (1879), Roth (1884).

Nursery Rhymes, metrical jingles transmitted in folklore and mechanically repeated by children at their play, without knowledge of their significance or origin. Being in verse form they are easily preserved, either as mere traditional rhymes, or as formulas to be used in games; and, as unconscious survivals of a remote antiquity, they not infrequently preserve for the scientific inquirer fragments of ancient incantations for healing diseases or revealing the future, and invocations combined with ceremonial observances, while the intimate nature of the religious conceptions involved points back unmistakably to a mediæval origin. Children with all their inventiveness and imagination are slaves of the letter, and most of their game-formulas are handed down from generation to generation along with the games themselves. In their characteristic directness, point, and quaintness of phrase, they defy imitation, and in their faculty of arresting the imagination from age to age they reveal the instinct of perpetuity. Many of them are beyond doubt survivals among children of May games, ring-songs and dances, rounds, and kissing games which in old England were played by grown-up people, and these of the higher grades of society. And Mr Newell has proved that many of these are still current in America which are now forgotten in the mother-country, although they not infrequently have equivalents on the continent of Europe.

Under the same general head we include nursery rhymes proper, and counting-out rhymes (to decide who shall begin a game), cumulative rhymes, courting and love games, playing at work, flower oracles, and riddle and guessing games; while on the other hand popular mottoes, old saws and maxims relating to husbandry, the weather, or the like, and all the wealth of local rhymes and sayings belong to the popular rhymes of folklore generally. The verses usually consist either of a rhyming couplet, or of four lines in which the second and fourth rhyme; they are often accompanied by a refrain, which may be a single added line, or may be made up of two lines inserted into the stanza; and in place of exact consonance, any assonance, or similarity of sound, will answer for the rhyme.

See FOLKLORE, PROVERBS, and RIDDLES; also J. O. Halliwell's *Nursery Rhymes of England* (1842; 6th ed. 1860); R. Chambers, *Popular Rhymes of Scotland* (1842); E. Rolland, *Rimes et Jeux de l'Enfance* (Paris, 1883); and especially W. Wells Newell's admirable *Games and Songs of American Children* (New York, 1884), the best work of its class, and a contribution of the first importance to scientific folklore. Appended is a list of sixty-five works bearing on the subject.

Nursing. There are few subjects affecting our social and domestic life in which more interest is taken at the present time than in the nursing of the sick, and there are not many in which time has brought about so great an improvement. Fifty years ago a well-trained and qualified nurse was almost unknown, and, consequently, the care of the sick often devolved upon persons totally unfit for, and ignorant of, the duties required of them. Now there are large numbers of refined and sympathetic women, thoroughly trained in all the different branches of nursing, whose services can be obtained at a moment's notice. It was Miss Nightingale (q.v.) who first awakened the public mind to the

need that existed for trained nurses, and who thus opened up, what has proved to be, such a large field for the employment of women taken from all classes of society. Dating from the time of her heroic services in the Crimea, the interest taken in sick-nursing has gone on steadily increasing. As a national recognition of her self-devotion the first training-school for nurses was in 1860 founded in London in connection with St Thomas's Hospital, under the title of the 'Nightingale Fund Training-school for Nurses.' The number of probationer nurses, at first 15, had in 1871 increased to 32; and up to 1889 upwards of 500 trained nurses had been sent out from the school. The different branches of nursing are hospital nursing, private nursing, district nursing, army and navy nursing, and workhouse infirmary nursing. Monthly nursing, massage, and attendance on the insane may be regarded as special developments arising out of ordinary sick-nursing.

For those who desire to make nursing a profession, a thorough hospital training is now absolutely necessary. Hospital training may be had in two ways, either by paying a certain board for a limited period, or by receiving wages and being under agreement to remain in the hospital for a certain term after training. The duties of a hospital nurse are arduous, and can only be successfully performed by those who are possessed of both bodily and mental strength, as well as of a real interest in attending on the sick. Some of the work is simply that of a housemaid, such as dusting the ward and cleansing the utensils. At the Glasgow Western Infirmary, for instance, the probationer is trained in 'the dressing of blisters, burns, sores, wounds, and in applying fomentations, poultices, and minor dressings; in the application of leeches, both externally and internally; in the administration of enemias; in the best method of friction to the body and extremities; in the management of helpless patients—i.e. feeding, moving, changing, their personal cleanliness, preventing and dressing bedsores; in bandaging, making bandages, padding and lining splints; in making the beds of patients, and removing sheets while the patients are in bed; in sick-cookery, such as the making of egg-flip, gruel, &c.' The probationer has usually to wait on the doctor and staff-nurse or sister as well as on the patients, and she must attend the lectures on various medical and surgical subjects that now form part of the training in most hospitals. After training as a probationer in the management of medical and surgical cases, including both day and night work, the usual course is to become ward- or staff-nurse, or to leave the hospital for the special kind of nursing which is intended to be followed. A certificate is usually given at the close of the period of training. The age at which probationers enter the adult hospitals is from twenty-five to thirty-five, and from twenty to thirty at the children's hospitals. The salaries are usually £10 the first year, £15 the second, £20 the third. Uniform is provided in addition, and a certain amount of washing allowed for. Sisters or head-nurses receive from £30 to £80, matrons from £100 to £250. It is often necessary to wait for months before getting into any of the large hospitals, as there are always many more applications than vacancies. At the Edinburgh Royal Infirmary there are usually over 500 applications yearly for the 25 vacancies. The principal training-schools in London are London Hospital, St Bartholomew's, St Thomas's, Guy's, and St Mary's; in Scotland, the Edinburgh Royal Infirmary and Glasgow Western Infirmary; in Ireland, the principal hospitals in which training may be obtained are Sir Patrick Dun's, Adelaide, and Meath in Dublin, and the Royal Hospital in Belfast.

Probationers are also trained at the Hospital for Sick Children, Great Ormond Street, W.C.; Manchester General Hospital and Dispensary for Sick Children, Pendlebury; and Royal Hospital for Sick Children, Edinburgh. Application should be made in writing to the matron of any of these hospitals. Many of the Irish hospitals, such as the Mater Misericordiae in Dublin—the largest and finest hospital in Ireland—are nursed by Sisters of Mercy.

Private nursing is in some respects both more difficult and more trying than hospital nursing. The responsibility is greater as the doctor is not always at hand, and the nurse has sometimes to attend to her patient both night and day. The pay is usually from 1½ to 3 guineas per week.

Queen Victoria, taking great interest in district nursing, devoted the surplus of the Women's Jubilee Offering, amounting to £70,000, to the foundation of a systematic scheme for the training and support of district nurses, to which was given the name of Queen Victoria's Jubilee Institute for Nurses. The interest of this sum, about £2000, is employed in the maintenance of central institutions, where nurses are trained for this special work. There are at present four of these centres, in London, Edinburgh, Dublin, and Cardiff. Nurses who have gone through the required training at any of these Homes are eligible to be entered on the roll of the Queen's Institute, and are entitled to wear the badge as Queen's nurse. The special teaching required, after a year of hospital work, consists of six months' approved training in a central district home, and, for country members, three months' approved training in midwifery. The scheme, started in 1887, has already made great progress, and in different divisions of the United Kingdom many branches are now working with much acceptance. This system offers a rapidly extending field of usefulness to those who wish to follow the profession of nursing, and there is an increasing demand for candidates to fill the growing number of vacancies created by the spread of the movement.

The army and navy nurses must all be ladies of good social position, and require to undergo three years' training in a general hospital. They are called Her Majesty's Nursing Sisters, and may be ordered on active service in any war. As a reward for special service they receive the order of the Royal Red Cross. It is only of late years that trained nurses have been employed in our workhouse infirmaries, but it is now becoming quite common to find them there. There is a great demand for trained nurses to go abroad. The Royal National Pension Fund for nurses was established in 1887, and promises to be of signal service in providing for those who spend themselves in the struggle against disease and death.

Most of the large hospitals in the British colonies follow the example of the mother-country in regard to nursing arrangements. In America the practice of nursing is very thoroughly taught in many of the hospitals, particularly those in the north-eastern states, such as the Bellevue Hospital in New York, the Long Island Hospital in Brooklyn, the Philadelphia and Pennsylvania Hospitals in Philadelphia, and the Massachusetts General Hospital in Boston. On the continent of Europe the employment of male nurses to attend male patients is common, and in the Roman Catholic countries the nursing of the hospitals is for the most part in the hands of Sisters of Mercy. In Germany a great impetus was given to improvements in nursing by the interest shown in the matter by the late Empress Augusta, the Empress Frederick, and the late Princess Alice of Hesse. The training of nurses on the lines adopted in Britain was

instituted in Paris during 1877, by the establishment of l'École de Garde-malades et d'Ambulancières.

Bruen, *Outlines for the Management of Diet* (Phila. 1888); and for much useful information, *Burdett's Hospital Annual*.

Nut, in popular language, is the name given to all those fruits which have the seed enclosed in a bony, woody, or leathery pericarp, not opening when ripe. Amongst the best-known and most valuable nuts are the Hazel-nut, Brazil-nut, Walnut, Chestnut, and Cocoa-nut, all of which are edible. Other nuts are used in medicine and for purposes connected with the arts. Some of the edible nuts abound in a bland oil, which is used for various purposes.—In Botany the term nut (*nut*) is used to designate a one-celled fruit, with a hardened pericarp, containing, when mature, only one seed. The Achene (q.v.) was by the older botanists generally included in this term. Some of the fruits to which it is popularly applied scarcely deserve to be so called. The hazel-nut is an excellent example of the true nut of botanists.—The name nut, without distinctive prefix, is popularly given in Britain to the hazel-nut, but in many parts of Europe to the walnut. Many nuts have a considerable commercial value, from their being favourite articles of food: these are the Hazel-nut and its varieties, the Black Spanish, the Barcelona, the Smyrna, the Jerusalem filbert, and the common filbert; the Walnut, Chestnut, Hickory, and Pecan; the Souari, the Cocoa or Coker nuts, and the Brazil or Para nut. For the Pea-nut, see GROUND-NUT.

Nutation is a slight oscillatory movement of the earth's axis which disturbs the otherwise circular path described by the pole of the earth round that of the ecliptic, known as the 'precession of the equinoxes.' It is produced by the same causes—viz. the attraction of the sun, moon, and planets (the attraction of the last mentioned being so small as to be quite imperceptible) upon the bulging zone about the earth's equator, though in this case it is the moon alone that is the effective agent. It also, for reasons which need not be given here, depends, for the most part, not upon the position of the moon in her orbit, but of the moon's node. If there was no precession of the equinoxes nutation would appear as a small elliptical motion of the earth's axis performed in the same time as the moon's nodes take to complete a revolution, the axes of the ellipse being respectively 18"·5 and 13"·7, the longer axes being directed towards the pole of the ecliptic. But this motion, when combined with the more rapid one of precession, causes the pole of the earth's axis to describe a wavy line round P, the pole of the ecliptic.

The effect of nutation, when referred to the equator and ecliptic, is to produce a periodical change in the obliquity of the ecliptic and in the velocity of retrogradation of the equinoctial points.

It thus gives rise to the distinction of 'apparent' from 'mean' right ascension and declination, the former involving and the latter being freed from the fluctuations arising from nutation.

Nut-cracker (*Nucifraga*), a genus of birds of the family Corvidæ, with a straight, stout, conical bill, both mandibles terminating in an obtuse point, and tail nearly square at the end. Four species are known, ranging from northern Europe and Arctic Siberia to the Himalayas and China. One species (*N. caryocatactes*) is occasionally seen in Britain and is not uncommon in many parts of Europe and of Asia, particularly in mountainous regions covered with pines. It is about 12 inches long. The plumage is light brown, speckled with white, except on the wings, rump, and tail, which are nearly black. The female shows a somewhat redder brown colour on the wing-feathers. The nut-cracker frequents the tops of the high pine-trees, its favourite food being the seeds of the pine cones, which it extracts, holding the cone in its foot. Its diet, however, is often very varied. Its nest is built of sticks, roots, and grass, and lined with moss or lichens, on the bough of a tree near the

Nut-cracker (*Nucifraga caryocatactes*).

stem and at some distance from the ground.—A closely allied species (*N. multipunctata*) is found in Cashmere, and a larger species (*N. hemispila*), with browner plumage, in the Himalayas.

Nut-galls. See GALLS, GALL-FLY.

Nut-hatch (*Sitta*), a genus of birds of the family Sittidæ, having a straight conical or prismatic bill, short stout legs, the hind-toe very strong, and large hooked claws. They run up and down trees with great agility, moving with equal ease in either direction, and without hopping, so that the motion is rather like that of a mouse than of a bird. They feed on insects, in pursuit of which they examine the crevices and remove large pieces of the bark; at other times on seeds, as those of pines, and the kernels of nuts, to obtain which they fix the nut in some crevice and then hammer it with their bill until the shell is broken, each blow being delivered with the whole strength of the body working from the hip-joint; hence the name of Nut-hatch or Nut-hack. Seventeen species are known, ranging south in the Old World to Southern India and Burma, and in the New World to Mexico, being well represented in North America. One species (*S. cæsia*) is fairly common in many districts of England containing old timber. It occurs in the south of Scotland, and has been reported as seen in Skye and in the Shetlands; but as yet it is unknown in Ireland. It extends through central and southern Europe to Persia and even south-eastern Siberia. Its whole length is about 5½ inches. The upper parts are generally of a blue slate colour; the wing-quills grayish

brown; the middle tail-feathers more slate-gray, the remainder black at their bases and barred and

Nut-hatch (*Sitta cæsia*).

tipped with white and gray; a black band runs from the base of the bill through the eye to the nape of the neck; the throat and under parts are of a pale cinnamon or rich buff colour; the bill, legs, and feet are brown. The plumage of the female is somewhat duller. Its nest is made of dry leaves or scales of cones, generally in the hole of a tree. From five to seven eggs are laid, of a white colour spotted with reddish brown.—A closely allied species (*S. europæa*), with nearly white under parts, is found in the Danish Islands and throughout northern Europe and northern Asia as far as Japan. The nut-hatch is absent from Malta and Sardinia, but in Corsica a distinct species (*S. whiteheadi*) is found, the under parts being white and the head jet-black in the male. The nut-hatches of Australia and New Guinea belong to a distinct though closely allied genus, *Sitella*. The Blue Nut-hatches (genus *Dendrophila*) are found from Ceylon and India to Burma and Malaya. The Coral-billed Nut-hatch, the only species of another genus (*Hypherpes*), is found only in Madagascar.

Nutmeg. This well-known and favourite spice is the kernel—mostly consisting of the albumen—of the fruit of several species of *Myristica*. This genus belongs to a natural order of exogens called *Myristicaceæ*, which contains about forty species, all tropical trees or shrubs, natives of Asia, Madagascar, and America. They generally have red juice, or a juice which becomes red on exposure to air. The leaves are alternate and without stipules. The flowers are unisexual, the perianth generally trifid, the filaments united into a column. The fruit is succulent, yet opens like a capsule by two valves. The seed is nut-like, covered with a lacinated fleshy aril, the albumen penetrated by its membranous covering. All the species are more or less aromatic in all their parts; their juice is styptic and somewhat acrid; the albumen and aril contain both a fixed and an essential oil, and those of some species are used as spices. The species which furnishes the greater part of the nutmegs of commerce is *M. fragrans*; but the long nutmeg (*M. fatua*), from the Banda Isles, is now not uncommon in our markets. The common nutmeg-tree is about 25 feet in height, with oblong leaves and axillary few-flowered racemes; the fruit is of the size and appearance of a roundish pear, golden yellow in colour when ripe. The fleshy part of the fruit is rather hard, and is of a peculiar consistence, resembling candied fruit; it is often preserved and eaten as a sweetmeat. Within is the nut enveloped in the curious yellowish-red aril, the *Mace* (q.v.), under which is a thin shining brown shell, slightly grooved by the pressure of the mace, and within is the kernel or nutmeg. Up to

1796 the Dutch, being the possessors of the Banda Isles, jealously prevented the nutmeg from being transplanted; but during the British occupation plants were sent to Penang, India, the West Indies, Brazil, Réunion, where they are now successfully

cultivated. Nutmegs are very liable to the attack of a beetle, which is very destructive, and it is a common practice to give them a coating of lime before shipping them to Europe to kill the vitality of the germ. The nutmeg yields by expression a peculiar yellow fat, called oil of mace, because from its colour and flavour it was generally supposed to be derived from mace; and by distillation is obtained an almost colourless essential oil which has very fully the flavour of the nutmeg. Nutmegs are chiefly used as a spice, but medicinally they are stimulant and carminative. They possess narcotic properties, and in large doses produce stupefaction and delirium. Great Britain imports from 300,000 to 700,000 lb. annually, besides mace to the extent of 60,000 to 80,000 lb. The culture of nutmeg is somewhat peculiar. The plantations are always made from seed, and the plants do not produce flowers till they are eight or nine years old. The sexes being on different trees, when the plants are two years old the greater number composing a plantation are headed down and grafted with scions taken from the female tree, a few only being grafted with scions of the male to ensure fecundation. Other species of *Myristica* besides those already named yield nutmegs sometimes used, but of very inferior quality. The fruits of several species of Lauraceæ also resemble nutmegs in their aromatic and other properties, as the cotyledons of *Nectandra puchury*, the Pichurin Beans of commerce, and the fruit of *Acrodiclidium camara*, a tree of Guiana, the Camara or Ackawai nutmeg. The clove nutmegs of Madagascar are the fruit of *Agathophyllum aromaticum*, and the Brazilian nutmegs of *Cryptocarya moschata*. All these belong to the order Lauraceæ. The Calabash Nutmeg is the fruit of *Monodora myristica*, of the natural order Anonaceæ.

Nutria. See COYPU, FURS.

Nutrition. See the articles on BLOOD, CIRCULATION, DIET, DIGESTION.

Nux Vomica is the name given to the seed of *Strychnos Nux Vomica*. The seeds are imported from the East Indies, and are flattish and circular, about an inch in diameter, umbilicated and slightly convex on one side, externally of an ash-gray colour, thickly covered with short satiny hairs, internally translucent, tough and horny, taste intensely bitter, inodorous. The tree is a native of Coromandel, Ceylon, and other parts of the

East Indies. It is a tree of moderate size, with roundish-oblong, stalked, smooth leaves, and terminal corymbæ. The fruit is a globular berry, about as large as a small orange, one-celled, with a brittle shell, and several seeds lodged in a white gelatinous pulp.—The bark is sometimes known as *False Angostura Bark*, having been confounded with *Angostura Bark*, which is non-poisonous, and simply has the action of a bitter. The seeds contain (in addition to inert matters, such as gum,

Nux Vomica (*Strychnos Nux Vomica*) Branch with Flowers:
